Abstract book for the ISBNPA 2023 Annual Meeting

Published by: International Society of Behavioral  
Nutrition and Physical Activity

ISBN: 978-1-7324011-5-0

Note about the content of the abstract book:  
The organizing and abstract review committees have not made  
any edits to the content of the abstract. The abstracts are,  
therefore, presented as they were submitted by the authors.

Erica Hinckson  
ISBNPA President

## DEAR ISBNPA COLLEAGUES,

It is with great pleasure that I welcome you all to our 2023 International Society of Behavioral Nutrition and Physical Activity conference in Uppsala, Sweden. This year's conference is particularly special as we broke several of our conference records: 1287 registrations, 1412 total presentations,

60 Symposia, 9 Dare2Share sessions, 11 workshops, 34 awards orals, 162 orals and 270 short orals. We have also reached the highest numbers of members joining our Society at 1087 and counting! Consequently, we have built an exciting programme with a diverse range of topics in a variety of formats. Thank you everyone for responding to our calls and submitting your best work.

The conference venue, Uppsala Konsert & Kongress (UKK), provides the best space for us to re-connect, network, share and collaborate with our colleagues from around the world. We will be offering many opportunities to connect throughout the conference, during lunch and other breaks, poster sessions, Meet the Mentors lunch-time session, and this year we are providing you with a booking system to book your own team/collaborator meetings. Our social programme starts with morning running and HIIT sessions and finishes with sporting activities in the afternoon including street basketball tournament "Professors" vs "Youth Team" and "Walking Football". Take the time also to explore Uppsala, a stunning and very walkable and accessible city. I encourage you to maximise on the opportunities provided, share ideas, forge new relationships, and foster new friendships.

As the President of our society, I am proud to see how much progress we have made in the last year, ensuring the advancement and financial security of our society. We are excited to share this with you at the conference. Particularly around our strategic initiatives: Growing the Next Generation, Research Impact, Climate Action and Inclusive Culture.

It is also my pleasure to welcome our four keynote and invited speakers, who promise to deliver thought-provoking and shifting the dial type of presentations. Welcoming Professor Claire Collins, Professor Ulf Ekelund, and Distinguished Professors Abby King and Edward Maibach. Also welcoming our invited speakers Dr Lena Maria Nilsson, Dr Isaac Warbrick, Dr Jairo Hidalgo Migueles, Dr Maria Somaraki and Dr Jenny Rossen.

I would like to offer a massive thank you to the local organising committee chaired by Marie Löf, the scientific programme committee chaired by Scott Duncan and Meg Bruening, executive director Antonio Palmeira, and our executive committee for their dedication and hard work in putting together such a fantastic program and conference. Special thanks to our session chairs, judges, volunteers and Venue West for supporting us in running a smooth conference. I would also like to thank our sponsors and exhibitors for their support, that make certain aspects of the conference possible.

Once again, a warm welcome to all. I hope you find the conference to be intellectually stimulating, thought-provoking, and enjoyable. It has been my absolute privilege serving our Society. Thank you and have a wonderful conference!

Nga mihi nui (Warm Regards)

—Professor Erica Hinckson  
ISBNPA President

## WELCOME TO UPPSALA SWEDEN

Uppsala is one of Sweden's oldest cities. It was known as Östra Aros up until the 13th century, when the name Uppsala took over. Today, Uppsala is one of Sweden's four major cities with a population of 230 000 inhabitants.

Uppsala has a rich and inspiring range of cultural activities and exciting events together with history—all in one place. The tourist attractions are numerous and exciting and include something for everyone. In addition, there is beautiful nature, both in the centre of town and close by. For travelers Uppsala is only 30 minutes away from Stockholm and 18 minutes from Stockholm Arlanda Airport by train. In the city the distances are short, and you can easily walk or bike to any sight or attraction.

Uppsala is today a modern city yet retains a small-town feel. It is Sweden's fourth largest city and home to two universities, the archbishopric of the Church of Sweden, a rich cultural life and beautiful scenery. Uppsala is rich in history and science and the prestigious Uppsala university is older than universities in many other countries. At the same time, the modern city is vibrating with life and is well known for its progressive research, innovation and position as a leader in modern technology. Whether you want to eat a lot or a little, outdoors or inside, Uppsala has a wide selection of pubs, cafés and outdoor restaurants. Don't forget to enjoy a Swedish fika, a Swedish social institution: a friendly, relaxing break with coffee and cake.

## DEAR ISBNPA COLLEAGUES,

**W**arm welcome to Uppsala, Sweden, for the 2023 International Society of Behavioural Nutrition and Physical Activity conference! I am particularly excited as you will be visiting us at the best time of the year. Mid-June marks the beginning of summer in Sweden, with a lot of beautiful flowers and bright long summer evenings to be spent outside. Uppsala is a perfect city for our conference as you can walk everywhere. Why not start the day with an early morning walk with some colleagues? Or take the opportunity to see more of Uppsala with Maria and Jairo in their morning running and HIIT sessions? In the evenings we offer outdoor activities such as “Walking football” with Andreas or join the street basketball tournament at the Summer Zone arena.

Uppsala is one of Sweden’s oldest cities, rich in history and science and hosts the prestigious Uppsala university. We are delighted that our opening ceremony will be held in Uppsala University’s Grand Auditorium from 1887, which is a very beautiful building. Uppsala can be described a modern city vibrating with life and is well known for its progressive research, innovation, and position as a leader in modern technology. The city has a wide selection of pubs, cafés, and outdoor restaurants. And when in Sweden you should not forget to enjoy a “fika” which means a friendly, relaxing break with coffee and cake. Thank you for the opportunity to organise ISBNPA 2023, and a big thank you to the Organisation committee for all your contribution. A special thank you to the executive director António Palmeira who has guided us through the planning of the conference in a brilliant way (we do not know what we would have done without you), Anne Keller at Venue West and Lisa Wästberg at Destination Uppsala for all your excellent support and help.

I wish you all a wonderful meeting with inspiring scientific discussions, catching up with old friends and establishing new collaborations, and a great time in Uppsala!

Warm regards,

Marie Löf  
ISBNPA 2023 Chair

—Marie Löf  
ISBNPA 2023 Chair

**O**n behalf of the ISBNPA Scientific Program committee, we thank everyone for submitting excellent science to share in Uppsala. We had close to a record-breaking number of submissions (1,435) for this conference. Each abstract was reviewed and scored by three independent, expert reviewers. Once scored, the Scientific Program Committee, the Local Organizing Committee, and SIG leaders worked together to create a scientific program that includes the strongest research coming out of our field. We want to extend our gratitude to the reviewers and volunteers for their time and efforts! We hope that you leave Uppsala, inspired by the science and fulfilled by old and new connections to ISBNPA members.

## SILVER SPONSOR

### The Gretchen Swanson Center for Nutrition

The Gretchen Swanson Center for Nutrition is a nonprofit research institute providing expertise in measurement and evaluation to help develop, enhance and expand programs focused on healthy eating and active living, improving food security and healthy food access, promoting local food systems and applying a health equity lens in all we do. With expertise in public health nutrition, we are dedicated to building measurement strategies to assess the impact of innovative health-related programs. We work nationally and internationally, partnering with other nonprofits, academia, government and private foundations to conduct research, evaluation and scientific strategic planning.

## BRONZE SPONSORS & EXHIBITORS

### BioMed Central Limited/Springer Nature

At BMC we are dedicated to publishing the best open access journals across our portfolio of over 250 titles and are always striving to drive progress in biology, health sciences and medicine. With over 20 years of expertise in pioneering open access, you can trust our extensive experience to deliver high quality, impactful research and provide a supportive publishing experience for authors. If you believe, like we do, that openness, transparency and community focus should be at the heart of research publishing, then we would like to welcome you to the BMC family of journals. BMC is part of Springer Nature.

### Pal Technologies Ltd. / activPAL™

22 years ago we launched the activPAL™, the world's first single-sensor solution for free-living Posture and Activities Logging. Using a discrete thigh-worn sensor combined with innovative software tools, we give researchers objective measures of person-centered free-living physical activities providing the evidence to link physical behaviors with health outcomes. Our approach

is based on the three tenets of objective body-worn sensor measurement: sensor location, data fidelity and data processing. The thigh-segment location provides the ground-truth for our outcomes; a horizontal thigh is sitting (or lying) and vertical is upright. When repeatedly reciprocating, the wearer is either stepping or cycling. Free-Living Outcomes (FLO) are based on an analysis of the patterns of participation in the primary activities of Lying, Sitting, Standing and Stepping (and the travel choices of Cycling and Seated Transport). The activPAL is unique in this ability to quantify time cycling and in-car travel, providing the opportunity to measure commuting choices (active travel vs car). New for 2023, the software tools characterize the locus of activity providing a measure of the time spent in the primary household locus in contrast with the wider community loci. The latest generation of the activPAL, the activPAL4+, can quantify stair climbing and straight-line stepping.

### Pennington Biomedical Research Center

Pennington Biomedical Research Center, a campus of Louisiana State University, is a world-renowned leader at the forefront of medical discoveries related to obesity, diabetes, cardiovascular disease, cancer and dementia. The scientists conduct basic,

clinical and population health research and are dedicated to solving the world-wide obesity epidemic by 2040. Our mission is to improve human health throughout the lifespan.

Research Ideas Catalogue = Knowledge & Impact

## Research Ideas Catalogue – Knowledge & Impact

RIC-KI is an online platform that connects scientists worldwide for collaborations in health, wellbeing, weight management, dietary behaviour, and sport, allowing research ideas to go further and faster and have greater impact. RIC-KI is hosted by Loughborough University, UK, and led by Professor Amanda Daley, a leading expert in behavioural medicine.

## SENS Innovation ApS

SENS Innovation ApS is a Copenhagen based scale-up company specializing in medical devices for activity monitoring, for use within the research and healthcare sector.

Our technology platform SENS motion®, is a cloud-backed and medical approved activity tracker in the form of a patch, that can be discretely worn 24/7, and automates the monitoring of various parameters related to physical activity and sleep. It has been developed together with researchers and clinicians in Denmark and is especially well suited for use in the healthcare sector and for large research projects where data security (GDPR) and validity is a main concern.

## Washington State University

Washington State University, a top-ranking public research university, has six campuses offering 200+ undergraduate fields of study and nearly 150 graduate and professional degree programs preparing you for a wide range of careers in exercise physiology, dietetics, public health, behavioral health, research, and academia. Learn more at <https://wsu.edu/tp>.

## SUPPORTING SPONSORS

## World Class Uppsala

## Uppsala City

## movisens

movisens provides technologies for ambulatory assessment, mobile psycho-physiological measurement and expertise in the field of stress- and lifestyle-monitoring and analysis. The movisens product line combines innovative and cutting-edge products such as wearable sensors for physical activity, ECG and electrodermal activity with suitable data analysis software. Our EMA platform movisensXS is the leading solution for experience sampling with smartphones. Today movisens provides Europe's most complete wireless ambulatory assessment and analysis package for unobtrusive monitoring of human physiology, mood, stress, behaviour and performance. movisens sensors and systems are used by top researchers all over the world.

## Travelling to Uppsala

Stockholm Arlanda Airport offers Sweden's strongest route network with more than 181 different national and international destinations. Its proximity to Arlanda makes Uppsala an easily-accessible destination for travellers from around the world.

If you decide to take the train to the airport, it gets you there in just 18 minutes. Trains to Uppsala stop at Arlanda Central Station, which is located in SkyCity between terminal 4 and 5. But you can also travel by bus, car or taxi. Links to various bus and taxi companies can be found on the conference mobile app.

## Travelling in Uppsala

Once you are in Uppsala, you easily get around the city by public transport, taxi, on foot, or by bike.

While more attractions are easily accessible on foot, UL manages the regional buses, and has a customized range of travel options so that travellers can choose to travel by public transport wherever possible and appropriate. Your journey by bus shall be perceived as simple, reliable and secure at the same time that it will facilitate your stay throughout our region. UL promotes a greener world with biogas in the tank.

You can also choose to travel in Uppsala by taxi. The majority of the city's taxis are environmentally friendly cars and taxi companies not only take into account the city's environment but also work actively to improve it.

When travelling in Uppsala ISBNPA urges you to be cautious and mindful of your carbon footprint, whenever possible.

## Evidence Empowers

*Gretchen Swanson Center for Nutrition (GSCN) provides expertise in measurement and evaluation to help develop, enhance and expand programs focused on food and nutrition security, healthy food access, promoting food systems, as well as healthy eating active living, while applying a health equity lens.*

- ✦ External program evaluation
- ✦ Measurement development/shared measures
- ✦ Program development and capacity building
- ✦ Strategic planning
- ✦ Research partnerships

*GSCN proudly leads the Nutrition Incentive Hub which was created by the Nutrition Incentive Program Training, Technical Assistance, Evaluation and Information Center (NTAE), funded by the Gus Schumacher Nutrition Incentive Program (GusNIP).*

[www.centerfornutrition.org](http://www.centerfornutrition.org) | [www.nutritionincentivehub.org](http://www.nutritionincentivehub.org)

## Language & currency:

The official language in Uppsala is Swedish, but most Swedes speak English fluently. The Swedish currency is the Swedish Crown (SEK).

## Nearby Banks:

- Swedbank
  - Monday to Friday: 10:00 – 15:00 hours
  - Saturday and Sunday: Closed
- Handelsbanken
  - Monday to Friday: 10:00 – 16:00 hours
  - Saturday and Sunday: Closed

## Weather in Uppsala

In June, we can expect average highs of 15–20 degrees Celsius with overnight lows of 10 degrees. Pack layers as you will need something warmer for the evenings.

## Destination Uppsala Info Points:

### TRAVEL CENTER – UL Center

- Olof Palmes plats, inside Uppsala Central Station
- Open: Monday to Friday 07:00 – 19:00 hours, Saturday 09:00 – 17:00 hours

### CITY CENTER – Contact Center Uppsala

- Uppsala Town Hall, Stadshusgatan 2
- Open: Monday to Wednesday 08:00 – 17:00 hours, Thursday 08:00 – 18:00 hours, Friday 08:00 – 17:00 hours

### Uppsala Konsert & Kongress

- Vaksala torg 1
- Open: Monday to Friday 10:00 – 16:00 hours

### HISTORICAL DISTRICT – The Uppland County Museum

- S:t Eriks torg 10
- Open: Tuesday to Sunday 12:00 – 17:00 hours

### Uppsala Art Museum: Uppsala Castle, Entrance E

- Open: Tuesday to Wednesday 11:00 – 17:00 hours, Thursday 11:00 – 20:00 hours, Friday to Sunday 11:00 – 17:00 hours

### IN THE COUNTRYSIDE – Fullerö Handel

- Open: Monday to Friday 11:00 – 18:00 hours, Saturday & Sunday 11:00 – 17:00 hours

## FRIDAY, JUNE 16

### ISBNPA Dinner

19:00 – 23:00 hours

Rikssalen at Uppsala Castle

Distance from UKK: 15 mins walk

Dress Code: Smart/Casual

The ISBNPA Dinner will be held in the Rikssalen at Uppsala Castle.

The castle was seriously damaged by fire in 1702, being essentially reduced to a ruin. Reconstruction took many years and was indeed hampered by the remains of the castle being used as a quarry for stone to be used in building Stockholm Palace. The castle was the administrative centre of Uppland for many years and is today the residence of the County Governor of Uppsala County. Rikssalen, the former Hall of State, was fully restored in 1932 and is now Uppsala's most glittering festive location.

Guests will enjoy a 3-course menu, music and dancing.

## STAY ACTIVE!

ISBNPA offers a variety of physical activities during the conference for participants to attend. Pre-registration is required.

**Thursday, June 15**  
**18:00 – 20:00 hours**

### Summer Zone Uppsala

Summer Zone is a 6,360 square meter activity area open to everyone. Here there are courts for floor ball, futsal, volleyball, mini tennis, street basketball, badminton, and other areas with various games, café, pump track and lots of fun.

Uppsala Municipality together with ISBNPA is organising a chance to see, experience and actively try out the Summer Zone activity area.

There are two options for participation, either as a player in the street basketball tournament that will be arranged between “Professors” and young people (limited number of places) or if you only want to cheer your peers and perhaps try other sport activities offered. There will be special t-shirts for the players! The event is funded by Världsklass Uppsala.

**Thursday, June 15**  
**17:45 – 19:30 hours**

### Walking Football

Walking football is a moderate-intensity activity that has shown to be associated with multiple health effects, and has been

identified as a sport with great potential to be adopted by a wide range of groups. At the same time, Walking football has the advantage that participation in the game is perceived as fun and can motivate people to continued activity. Walking football is usually played 6 v 6, but can be adapted according to the number of participants. Walking football is a team-based sport that is played on a smaller pitch and only at a walking pace with no tackles allowed.

The session will be led by a Walking football ambassador for the Uppsala region appointed by the Swedish Football Association together with researcher Andreas Caspers.

We will meet outside of UKK (entrance facing Vaksala torg) at 17:45 hours. In the event of rain, we will be indoors in Svandammshallarna next to the park.

**Thursday and Friday, June 15 and 16**  
**07:00 – 07:30 hours**

### Combined Running and HIIT Session – Get sweaty and see Uppsala!

This is an outdoor session, built around a few stations where you will be performing bodyweight exercises that can be adapted to your level of fitness/abilities. In between sets, there is a short run before moving on to the next station. You can make this session as tough as you want to! How many bodyweight squats can you do in 30 seconds? Is there a better way to see a new town?

## **Thursday, June 15th** **11:15 – 11:45 hours**

Facilitated by the SIG Leaders

### **Policies and Environments**

Room: Hall B

### **Participatory Research in Health Promotion**

Room: Hall C

### **Indigenous Group**

Room: K2

### **Young Adults**

Room: K1

### **SocioEconomic Inequalities**

Room: K3+4

## **Friday, June 16th** **11:15 – 11:45 hours**

Facilitated by the SIG Leaders

### **Children and Families**

Room: Hall B

### **Implementation and Scalability**

Room: Hall C

### **e- and mHealth**

Room: K7

### **Ageing**

Room: K1

### **Early Care and Education**

Room: K2

Premier state-of-the-art research facility  
Internationally-known investigators  
Top 10 place for postdoctoral training  
Benefits & travel

## **Abby C. King, PhD**

*Recipient of Stanford University's David and Susan Heckerman Endowed Professorship, Dr. King serves as Professor and Vice Chair for Academic Affairs of Epidemiology & Population Health and Professor of Medicine at Stanford University School of Medicine. She is the founder and Faculty*

*Director of the Our Voice Citizen Science Initiative and Global Network. Recipient of the Outstanding Scientific Contributions in Health Psychology Award from the American Psychological Association, her research focuses on the development, evaluation, and translation of public health interventions to reduce chronic disease and its key behavioral risk factors. She uses state-of-the-art communication technologies, community-based participatory research perspectives, and citizen science approaches to address health disparities among disadvantaged populations worldwide. Dr. King has served on a number of government taskforces in the U.S. and abroad, including membership on the U.S. Department of Health and Human Services' Scientific Advisory Committee on National Health Promotion and Disease Prevention Objectives for 2020. She co-chaired the USDHHS 2018 Physical Activity Guidelines for Americans Advisory Committee and was one of 10 U.S. scientists honored by the Association of American Medical Colleges in 2014 for outstanding research targeting health inequities. She served as President of the Society of Behavioral Medicine (SBM) from 2011-2012. Her research on citizen science to promote healthy environments for all has been honored with an international excellence award in addition to Stanford Medical School's inaugural 2018 faculty Community Engagement Award, SBM's 2018 Research to Practice Award, and Stanford Medicine's 2021 STAR Award. She received the International Society of Behavioral Nutrition and Physical Activity's inaugural lifetime achievement award in 2019, and the Society of Behavioral Medicine's Distinguished Scientist Award in 2020. In 2022, Dr. King was the winner of Stanford University's Miriam Aaron Roland Prize for Volunteer and Public Service.*

## **Mobilizing Community-engaged Citizen Science to Advance Healthy Lifestyles & Health Equity Worldwide**

**Wednesday, June 14, 14:30–15:30**

**ABSTRACT:** A growing evidence base supports the promise of “research-to-action” citizen science in helping to generate locally relevant, real-world solutions to some of today's most vexing challenges. Establishing productive partnerships between communities and researchers also can help to mitigate mistrust of science that has increasingly surfaced among some portions of the public. Yet, can such multi-component, qualitatively

driven methods attain the scientific rigor often craved by many in the scientific community? The Our Voice Global Citizen Science Research Initiative represents one example of how this form of community-engaged mixed methods research can be built across the continuum of translational science. Global examples will be presented of the initiation of early exploratory studies in the field, followed by enhanced reproducibility, increasing scientific rigor, expanding levels of knowledge and impact, and methods for attaining global scalability. The presentation will end with an exploration of the future of such research-to-action approaches as a resource-efficient means for advancing health equity, environmental justice, and authentic community-researcher partnerships.

## **Clare Collins, PhD**

*Laureate Professor Clare Collins is an Accredited Practising Dietitian, NHMRC Leadership Research Fellow and winner of the 2021 NHMRC Elizabeth Blackburn Investigator Grant Award (Leadership in Clinical Medicine and Science). She is Director of the Hunter Medical Research*

*Institute Research Program in Food and Nutrition. Her research focusses on personalised nutrition technologies and programs evaluating impact on diet-related health in chronic disease and across life stages.*

- *L/Prof Collins is a Fellow of the Australian Academy of Health and Medical Sciences, Fellow of the Nutrition Society of Australia and Fellow of the Dietitians Australia (DA). She has been awarded \$29M in grant funding, published 450 research paper and supervised 35 PhD candidates to completion.*
- *L/Professor Collins is a sought-after nutrition science media commentator, most read Australian author on The Conversation with >14 million readers and co-created the EdX Massive Open Online Course, Science of Weight Loss – Dispelling Diet Myths, completed by >67,000 people across 180 countries.*

## **Making an impact in behavioral nutrition! Are we there yet?**

**Thursday, June 15, 09:50–10:50**

**ABSTRACT:** Poor diet impacts one in five deaths globally. If population eating patterns were consistent with nutrition recommendations the global disease burden would drop dramatically. For example heart disease burden would drop by 58% and type 2 diabetes by 41%. There is a massive disparity between health costs incurred due to nutrition and weight-related poor health and the limited funding for nutrition

prevention and treatment. While over 40% of the global population can't afford a healthy diet, the worldwide revenue attributed to vitamin and mineral supplements was estimated at \$US27 billion in 2022.

In terms of prevention an OECD report on obesity prevention estimated that policies targeting food labelling, advertising restrictions and mass media campaigns across 36 countries analysed has the potential to prevent 76,000 new non-communicable disease cases per year, while also increasing GDP through reduced health expenditure and increased participation in the workforce.

Additionally, members of the public do appear very interested in food and nutrition. For example, each month Instagram accounts for more than 250 million #food posts. Celebrity nutrition misinformation abounds and can seriously undermine evidence-based nutrition recommendations and guidelines endorsed by nutrition organisations.

How does ISBNPA's mission statement, which calls for 'stimulation of impactful research in behavioural nutrition and physical activity to improve health and wellbeing worldwide', address these current challenges? We face stiff competition from self-proclaimed food and nutrition gurus. But are we partly to blame for not meeting consumer needs? What should ISBNPA, that's all 1000+ members, do? Can ISBNPA and IJBPA lead the way in terms of communicating the research on nutrition to facilitate evidence translation and impact?

It is timely to reflect on past success, while planning for evaluation of future impacts. When it comes specifically to making an impact in behavioural nutrition, we must strategically turn the volume up on our collective voices to influence development, implementation and evaluation of evidence-based nutrition policy and programs. This will ensure that we do 'get there' and achieve impact that is dynamic, quantifiable, and valuable.

## **Ulf Ekelund, PhD**

*Professor in Physical Activity and Health at the Norwegian School of Sport Sciences and a senior researcher at the Norwegian Public Health Institute (20%). Before moving to the Norwegian School of Sport Sciences in 2012, Ekelund lead a research program in physical activity epidemiology at the MRC*

*Epidemiology Unit, University of Cambridge, UK. Ekelund is leading or co-leading large international research projects, including the International Children Accelerometer database (ICAD), the world largest pooled database of device measured physical activity in young people. Ekelund is also leading an international consortium examining the dose-response and joint*

*associations between device-based measures of sedentary time and physical activity with non-communicable disease outcomes and act on the scientific advisory committee for the ProPASS consortium. Ekelund has lead work packages in several EU funded research projects such as the InterAct and DEDIPAC projects. Ekelund is member of the steering group for the Lancet series on physical activity 2012, 2016, 2020 and 2024. He also serve on the steering committee for the Global Observatory for Physical Activity (GoPA) and has served on the American College of Sports Medicine board of trustees (2016-2019). Ekelund was on the International Society for Physical Activity and Health (ISPAH) executive committee between 2012 and 2016. In 2019 to 2020 he served on the WHO physical activity guideline development group and was an international expert for the UK physical activity guidelines in 2018. Ekelund currently serves on the editorial board for Medicine and Science in Sports and Exercise, Journal of Physical Activity and Health and the Journal of Sport Sciences. Ekelund's main research areas include assessment of physical activity and sedentary time; patterns and trends in population levels of physical activity; the role of sedentary time and physical activity for preventing chronic diseases across the life course. Ekelund have published more than 400 original publications since 2000 including papers in The Lancet, JAMA, The Lancet Public Health, Science, Nature and The BMJ. Three of his publications were listed on the Altmetric Top 100 list in 2012, 2016 and 2019. Ekelund's current H-index is 93 and he was listed as highly cited researcher in 2018, 2019, 2021 and 2022 according to Clarivate analytics.*

## **Dose-response associations, physical activity intensity and deaths attributable to physical inactivity – lessons learned from device-measured physical activity**

**Friday, June 16, 09:50–10:50**

**ABSTRACT:** Dose-response associations, physical activity intensity and deaths attributable to physical inactivity - lessons learned from device-measured physical activity Studies have shown a non-linear dose-response association between physical activity and the risk of non-communicable diseases and mortality. National and international public health authorities, including the World Health Organization (WHO), have recommended population levels of physical activity, primarily based on self-reported data. However, self-reporting is prone to bias and overestimates physical activity participation. Self-reporting may also overestimate the amount of physical activity needed to reduce the risk of chronic diseases, underestimate the magnitude of associations with these outcomes, and not capture all intensities of physical activity.

Recent studies using accelerometry have shown that the shape of the dose-response association is similar to that of self-

reporting, but the maximal risk reduction is larger and observed at lower levels of physical activity. Total physical activity and all intensities of physical activity assessed by accelerometry are associated with a lower risk of premature mortality, and high levels of physical activity can mitigate the negative impact of sedentary time.

The population attributable fraction (PAF) is a measure that estimates the number of events that can be averted if a risk factor is removed from the population. Recent estimates suggest that 4–5 million deaths every year globally are due to physical inactivity. In contrast, the Global Burden of Disease study estimated less than 1 million deaths annually due to physical inactivity. These studies used self-reported physical activity data and estimated the population-attributable fraction as a dichotomous variable or methods that deviated from established thresholds. Others have estimated that an increase in device measured moderate to vigorous intensity physical activity by 10 and 30 minutes per day, respectively were associated with 7% (245,000 deaths) and 17% (595,000 deaths) decrease in the number of deaths per year in the US population. However, this study estimated the PAFs for a fixed increase in moderate-to-vigorous intensity activity using the same referent and did not consider the nonlinear dose-response association between physical activity and risk for mortality.

The lecturer will discuss how device-measured physical activity in large cohort studies has advanced our understanding of the association between physical activity and chronic disease risk. I also discuss differences in methodology when estimating the number of deaths that can be prevented by physical activity at the population level. Finally, I will discuss a method to estimate the theoretical number of deaths averted, taking into account the non-linear dose-response association between physical activity and the risk of death.

## **Edward Maibach, PhD**

*Edward Maibach is a Distinguished University Professor and Director of the George Mason University Center for Climate Change Communication. His research illuminates public understanding of climate change and strategies for improving it. Dr. Maibach previously served as an Associate*

*Director of the National Cancer Institute and Worldwide Director of Social Marketing at Porter Novelli; he is currently a Fellow of the American Academy for the Advancement of Science and a Member of the U.S. National Academy of Medicine.*

## **Protecting human and planetary health: New unique and necessary roles for health professionals**

**Saturday, June 17, 15:45–16:30**

**ABSTRACT:** Climate change and the burning of fossil fuels—which is the principal cause of climate change—are arguably the leading causes of preventable morbidity and mortality worldwide. In this talk Dr. Maibach will make the case that helping to lead efforts to rapidly decarbonize the world's energy supplies and limit global warming to the fullest extent possible is a necessary role for health professionals. Further, he will make the case that because health professionals are among the most trusted voices in communities worldwide, and because the climate/health narrative is uniquely effective in increasing public engagement with the issue, health professionals have a unique leadership role to play in the global effort.

## **Isaac Warbrick**

**Director of Taupua Waiora Māori Health Research Centre, Auckland University of Technology (AUT)**

*Dr Isaac Warbrick is of Ngāti Te Ata, Te Arawa, and Ngā Puhi descent, Māori tribes of New Zealand's North Island. He is the director of Taupua Waiora Māori Health Research*

*Centre at Auckland University of Technology (AUT). Isaac's background is in exercise physiology and research exploring the role of physical activity in improving Māori health and reducing health inequities. His current research focuses on applying kōrero tuku iho (Māori narratives, knowledge, and stories) as a driver and motivator for living a healthy lifestyle, and the role of ancestral knowledge in realigning with the natural environment, strengthening cultural identity, and improving health and holistic well-being.*

## **'Moon walking' before Michael – Environmental rhythms and Indigenous systems of well-being'**

**June 17th, 11:15 – 11:45 hours, Hall B**

**ABSTRACT:** Indigenous knowledge and systems of well-being highlight the close connection between the natural environment and the health of people. Our relationship with the environment relates to our ability to provide food, the way we move and are active, and the maintenance of spiritual well-being, and cultural identity. Contemporary scientific literature has also shown that engagement with natural environments improves physical health, mental well-being, and management of stress. On the other hand, modern lifestyles are characterised by a disconnection from the natural environment and the natural rhythms and cycles that were once closely observed by our tūpuna (ancestors).

Our ancestors observed the seasons, cycles, and rhythms on land, in oceans and waterways, and in the sky above to determine optimal times to perform certain activities, including when to plant, harvest, hunt, and collect food. In Aotearoa (New Zealand), this system of observation is known as the maramataka (often termed the 'Māori lunar calendar'). Although some of these practices, and the knowledge underpinning this system have been diminished or lost due to colonisation, Indigenous peoples continue to observe, record, and pass down their observations, and align their lives and activities to natural cycles. What's more, communities are leading the rejuvenation of these practices throughout Aotearoa and the Pacific.

Our culture and the reclamation of cultural knowledge are drivers for lifestyle change. Thus, many are reclaiming culturally relevant approaches to health, where physically activity, healthy

eating, and a lifestyle more attuned with the environment become secondary outcomes of strengthening cultural knowledge and identity.

## **Lena Nilsson**

**Epidemiology and Global Health, Umeå University**

*Lena Maria Nilsson's Sámi roots are from Malå in Västerbotten, Sweden, a Forrest Sámi area highly affected by industries such as mining, forestry, energy production and tourism. She is a nutrition epidemiologist by*

*training and employed as a research project coordinator at the Arctic Centre and the Department of Epidemiology and Global Health at Umeå Universitähäta (the official Sámi name of Umeå University). In 2012 Nilsson defended her PhD thesis focusing on traditional Sami food as a determinant of health. As of April 2023, her total scientific production included 79 peer reviewed papers and 11 book chapters. Recently she also contributed to the IPCC report Climate change 2022: impacts, adaptation and vulnerability, with a scoping literature review on Indigenous peoples' health and well-being in a changing climate. In 2020 Lena Maria Nilsson was honored by being appointed a knight in the French Order of Academic Palms. At present she is deeply involved in the research group Lávvuo – research and education for Sámi health, a group of Sámi and non-Sámi professionals at the department of Epidemiology and Global Health with the goal to improve the health and well-being of the Sámi people in Sweden through high quality research and education activities.*

## **Indigenous Sámi food systems in Sweden – resiliency, threats and possibilities**

**June 17th, 11:15 – 11:45 hours, Main Hall**

**ABSTRACT:** Sámi people are the only Indigenous people of the European Union with their traditional homelands situated in the northern half of Norway, Sweden, Finland and the Kola Peninsula of Russia. Sámi people live all over Sweden, with the highest population density in the northern inland. Traditional Sámi food is mainly based on natural resources in the Arctic environment such as wild berries, plants, fish, game and semi-domesticated reindeer. Some trade-based foods such as cereals and stove-top or campfire boiled un-filtered coffee are also significant for the Sámi cuisine.

Previous studies based on data from the Northern Sweden Diet Database as well as recent indicators of traditional Sámi diet from the large registry population based cross-sectional study Sámi Health on Equal Terms (SamiHET, 2021) confirms a continued strong importance of traditional Sámi food in

the Sámi population in Sweden. However, climate change and the so-called green transition is threatening the Sámi food system. In addition, EU legislation as well as knowledge gaps and ignorance of the nutritional value and health aspects of traditional Sámi food, means an obstacle to traditional knowledge transfer necessary for a sustainable and sovereign future food system in Arctic Sweden.

This presentation is partly based on a book chapter, published last year in the Anthology "The Sámi word" edited by Sanna Valkonen et al, and partly on data from the SamiHET study.

## **Jairo H Migueles**

**Department of Biosciences and Nutrition, Karolinska Institutet, Huddinge, Sweden**

*Jairo H Migueles is a physical activity researcher with expertise in the measurement of physical activity using accelerometers and the use and processing of data from wearable*

*sensor data in general. In 2020, Jairo defended his PhD thesis on the measurement of physical activity with accelerometers and its relationship with health outcomes. In 2023, his research trajectory shows more than 80 peer-reviewed publications, including two "highly cited papers" according to the Thomson Reuters Essential Science Indicators (Web of Science). Jairo provided support to conduct the systematic reviews of evidence behind the 2020 World Health Organization's Guidelines on Physical Activity and Sedentary Behaviour. He is currently heavily involved in the development of methods for measuring physical activity and sleep, being co-developer of the R package 'GGIR', and main developer of the R package 'actilifecounts', among other tools. His passion is to develop methods and provide consultancy to facilitate research on physical activity and sleep and related outcomes using wearable sensors.*

## **Lessons learnt on the measurement of physical activity with movement sensors**

**June 17th, 11:15 – 11:45 hours, Hall C**

**ABSTRACT:** Accelerometers were first used to estimate energy expenditure and physical activity in the early 1980s. The vertiginous advancements in the technology made it possible to access to the raw data, increase precision in the recordings, measure different planes of movement, or record longer periods of time without having to recharge the devices. Researchers have developed methods to clean and analyse such amount of information as they had access to the data, which has led to many parallel efforts to address similar challenges. As a result, a myriad of methods with limited comparability to process the raw data and extract physical activity, sedentary behaviour, and

sleep related characteristics have been developed. The flip side is that the harmonisation of the accelerometer-based measure of movement behaviours remains a challenge today.

At a time when the field is moving from closed (proprietary) to open-source algorithms and methods, now is the time to reflect on what we can do as a field to address this challenge. This presentation will take a critical look at the measurement of physical activity with accelerometers, from the concepts to the decisions that should be made to process the accelerometer signal. Some of the contents shared in this presentation are personal opinions based on years of research and as such is open for discussion.

## **Jenny Rossen**

**Department of Health Promoting Science, Sophiahemmet University**

*Dr Jenny Rossen is a senior lecturer at Sophiahemmet University in Stockholm, Sweden. She teaches nursing students in public health, health promotion, behavior change, and research methodology. Her*

*background is in nutrition and sport science.*

*Jenny defended her thesis in 2018 at Karolinska Institutet, Stockholm, the title of the thesis was "Support for physical activity in individuals with prediabetes and type 2 diabetes in primary care-the Sophia Step Study". Her research as a post-doc and junior researcher at Sophiahemmet University has since taken two main paths, one is physical activity epidemiology, which includes studying patterns of physical activity and sedentary behavior in relation to health outcomes. The other path is intervention and behavior change research. Jenny has an interest in developing and evaluating behavioural interventions that are optimised and adapted to individual needs, preferences, and circumstances.*

## **Behavioural intervention research – the value of formative and process evaluation**

**June 17th, 11:15 – 11:45 hours, Rooms K3+4**

**ABSTRACT:** Human behaviours such as lifestyle habits are challenging to change and complex to study. Whether implementing interventions in health care settings or using digital platforms a thorough planning phase including an underpinning programme theory and undertaking a process evaluation are key phases for a better understanding of what works.

I will present some of my experiences from behavioural intervention research. We followed the Medical Research Council guidance for evaluating complex interventions to undertake a process evaluation of a two-year pedometer intervention with or without counselling in primary care. The process evaluation included the delivery of the interventions,

intervention dose, and patterns of behavior change. Further, we studied intervention mechanisms as perceived by the participants through qualitative interviews. For an upcoming real-world study, we have performed a formative research phase, including focus group interviews, a systematic review, and co-development of the intervention in close collaboration with a tech company.

**Maria Somaraki**  
**Researcher, MoISA, Univ Montpellier,**  
**CIRAD, CIHEAM-IAMM, INRAE, Institut**  
**Agro, IRD, Montpellier, France**

*I am a researcher at UMR MoISA (Montpellier Interdisciplinary center on Sustainable Agri-food systems) in France. My research interests revolve around healthy and*

*sustainable diets adopting an epidemiological approach to identify relevant actions to promote public health through nutrition.*

*I am a dietitian-nutritionist with a background in Public Health Sciences. My studies were carried out in different settings, which has enriched my perspective on different aspects of eating and food environments. In December 2020, I defended my doctoral thesis entitled: "Parent-child feeding dynamics and childhood obesity: The importance of foreign background and effects of early obesity treatment" at Uppsala University (Sweden). During my post-doctoral studies at the Centre for Taste and Feeding Behaviour (CSGA) in Dijon, France, I focused on early neurodevelopmental outcomes in a French birth cohort investigating the immediate food environment –defined by parent-child feeding dynamics during the first year of life.*

## **Food behaviours and the environment: a social-ecological perspective**

**June 17th, 11:15 – 11:45 hours, Hall D**

**ABSTRACT:** Food behaviours are integral components of health behaviours that mobilise interdisciplinary research processes. The social-ecological framework describes the different levels of influence on individual food behaviours and health outcomes. These levels of influence involve different food environments encompassing socio-cultural processes and their interactions to shape how and what humans eat.

My research has acknowledged such processes in regard to children's food behaviours in the context of childhood obesity and neurodevelopment. I focused on the home food environment that shapes children's eating habits and behaviours. This is defined by the parent-child feeding dynamics involving different components, namely parental feeding practices and child food behaviours. Obesity-related feeding practices and food behaviours were associated with mother's foreign

background, i.e. a broader level of influence. In addition, early feeding practices that pertain to introduction to food texture were associated with lower scores for child developmental milestones, i.e. motor and cognitive skills, which represent the individual level of influence.

Against a backdrop of higher obesity rates among children from disadvantaged backgrounds, I evaluated the effects of a treatment programme involving parents and how they can re-shape the home food environment. The findings showed that parents may influence the home environment, beyond their feeding practices, through clear rules and routines with the child. In addition, involvement of all caregivers is noteworthy, including fathers who are typically underrepresented in research.

My current research seeks to unravel sustainable diets and food supply practices applying this social-ecological understanding of food behaviours. To this end, I am interested in further understanding levers for sustainable diets at the consumer level, considering different production modes, changing food environments and diverse backgrounds.

## Ageing

**Time:** Wednesday, 16:15 – 17:30 hours

**Location:** UKK – K3+4 (Level 3)

- **Juan Miguel Fernández Alvira**, *Centro Nacional De Investigaciones Cardiovasculares (cnic)*  
The accumulation of social vulnerabilities directly associates with obesity and weight gain over adolescence (387)
- **Andrea Mudd**, *Utrecht University*  
Socioeconomic inequalities in health and health behavior mapped out from a complex systems perspective: A systematic review (575)
- **Luiza Ricardo**, *MRC Epidemiology Unit, University of Cambridge*  
Gender gap for accelerometer-measured physical activity throughout the lifespan: A longitudinal analysis using five Brazilian cohort studies (582)

## Participatory research in health promotion

**Time:** 16:15 – 17:30 hours

**Location:** UKK – K3+4 (Level 3)

- **Laura Belmon**, *Amsterdam UMC*  
Perspectives of Spanish children on drivers of their energy balance-related behaviors: “¡Chic@s en Acción!” (1025)
- **Alan Coffey**, *Technological University of The Shannon*  
The barriers and facilitators to reducing sedentarism amongst home-office employees: An employer’s perspective (923)

## Chaired Poster Session: Ageing

**Time:** 17:30 hours-18:45 hours

**Location:** Level 2

- **Jessica Stroope**, *Louisiana State University*  
Active Transportation and Community Participation in Older Adults: Results from the WHO Survey of Global Ageing and Adult Health (450)
- **Sara Rosenkranz**, *University of Nevada, Las Vegas*  
Evaluating correlates of healthy eating and dietary quality among older adults: A mixed-methods approach to development and application of a new survey instrument (456)
- **Andrew Putman**, *University of Ontario Institute of Technology*  
Neighbourhood greenness moderates the association between physical activity and geriatric relevant health outcomes: An analysis of the CLSA (1033)
- **Irmina Klicnik**, *Ontario Tech University*  
Social Engagement during a Sedentary Time Reduction Intervention in Assisted Living (1089)
- **Irmina Klicnik**, *Ontario Tech University*  
Associations of Neighbourhood Greenness and Walkability with Social Participation among Older Canadians: An Analysis of the CLSA (1090)
- **Dori E. Rosenberg**, *Kaiser Permanente Washington Health Research Institute*  
Associations between profiles of the 24-hour activity cycle and cognitive function in older adults (358)
- **Mikael Anne Greenwood-hickman**, *Kaiser Permanente Washington Health Research Institute*  
Pre-pandemic Sleep and Activity Behaviors and Associated Change in Depressive Symptoms during the COVID-19 Pandemic (1059)

## Chaired Poster Session: Children and families

**Time:** 17:30 hours-18:45 hours

**Location:** Level 6

- **Nan Zeng**, *University of New Mexico Health Sciences Center*  
Effects of Home-based Exergaming on Preschool Children's Cognition, Sedentary Behavior, and Physical Activity: A Randomized Crossover Trial (599)
- **Gregory S Kolt**, *Western Sydney University*  
Physical activity and inactivity during youth sport and dance: A systematic review and meta-analysis (722)

- **Amaya de Cos-Gandoy**, *She Foundation*  
Influence of parental health on children's health behaviors from the SI! Program for Elementary Schools (451)
- **Daniela Rodrigues**, *University of Coimbra*  
Sex differences and family determinants in children's time use throughout the day (583)
- **Sarah Overgaard Sørensen**, *University of Southern Denmark*  
Study protocol for the Screen Free Time with Friends Feasibility Trial (674)
- **Nicole McCarthy**, *University of Newcastle*  
Cluster randomised controlled trial to determine the impact of an activity enabling uniform on primary school student's fitness and physical activity (708)

## Chaired Poster Session: Cancer prevention and management

**Time:** 17:30 – 18:45 hours

**Location:** Level 2

- **Linda Trinh**, *University of Toronto*  
Changes in Physical Activity, Sedentary Behavior and Cognitive Function among Cancer Survivors During the COVID-19 Pandemic (282)
- **Spencer Allen**, *University of Alberta*  
Associations between Health-Related Fitness Measures and General Health in Newly Diagnosed Breast Cancer Patients from the AMBER Cohort Study (751)
- **Anna Henriksson**, *Uppsala University*  
Exercise adherence trajectory during chemotherapy treatment in patients with breast cancer- Results from the Phys-Can study (800)
- **Judith de Vries-ten Have**, *Wageningen University*  
Design and baseline results of the SoFiT study: a randomized controlled intervention to study the effect of a personalized lifestyle program on cancer-related fatigue in colorectal cancer survivors (887)
- **Cynthia Forbes**, *University of Hull*  
Using Intervention Mapping in adapting a smartphone-based cardiac rehabilitation programme for older adults living with and beyond cancer: A work in progress (158)
- **Grace Brannon**, *UT Arlington*  
A qualitative analysis examining the impact of a biosensor feedback-based physical activity intervention on motivation and behavior change in cancer survivors (462)

- **Ki-Yong An**, *University of Alberta*  
Associations between cancer and cardiovascular disease diagnosis history and physical activity in Korean adults (712)
- **Hania Taha (corresponding author)**, *University of Illinois at Urbana-Champaign*  
Preliminary effects of a carbohydrate-restricted, high-fat diet in head and neck cancer patients undergoing radiotherapy: A pilot randomized controlled trial (1105)

## Chaired Poster Session: e- & mHealth

**Time:** 17:30 – 18:45 hours

**Location:** Level 2

- **Anke Hanssen-doose**, *University of Education Karlsruhe*  
Reliability of the digital physical fitness test digimot (686)
- **Jonah Thomas**, *Loughborough University*  
A systematic scoping review of accelerometer-measured physical activity datasets that include markers of cardiometabolic health: The Global Physical Activity Dataset (GPAD) catalogue (898)
- **Rebecca Krukowski**, *University of Bayreuth*  
Investigating Evidence of a Digital Divide in the Recruitment, Randomization, Engagement, Retention, and Efficacy in Post-Smoking Cessation Weight Management Clinical Trial (29)
- **Matthew McGrievy**, *University of South Carolina Arnold School of Public Health*  
Design, technical challenges, solutions, and participant feedback of the mobile Lifestyle Intervention for Food and Exercise (mLIFE) app (468)
- **Riley C C Brown**, *The University of Queensland*  
Utilizing technology for Diet and Exercise Change In complex chronic conditions across Diverse Environments (U-DECIDE Study): feasibility randomised controlled trial (522)
- **Anna Jansson**, *University of Newcastle*  
Outdoor gym resistance training workouts delivered via mHealth: Process evaluation from the ecofit effectiveness trial (743)
- **Georgina Wort**, *University of Bath*  
Pupils' experiences of physical activity and wearable technologies within primary school (830)
- **Chen-Chia Pan**, *Leibniz Institute for Prevention Research and Epidemiology*  
Smartphone- & Wearable-based Activity Trackers–Determinants of Engagement: Study Design and Instrument Development (880)

## Chaired Poster Session: Early care and education

**Time:** 17:30 – 18:45 hours

**Location:** Level 2

- **Devan Antczak**, *University of Wollongong*  
The Sleep and Activity Database for the Early Years (SADEY) project: International collaboration and data pooling to understand young children's 24-hour movement behaviours. (733)
- **Lynne Lafave**, *Mount Royal University*  
Assessing Physical Literacy Knowledge, Attitudes and Behaviours in Early Childhood Educators: Face and Content Validity Study (1050)
- **Mara Kirschner**, *Open Universiteit of the Netherlands*  
Effect of a physical activity-based lifestyle intervention on mental wellbeing of vocational education and training student (351)
- **Georgie Tran**, *University of Wollongong*  
Developing and testing an online quality improvement tool for service providers and educators in family day care to improve nutrition and physical activity practices (359)
- **Audrey Elford**, *Deakin University*  
Environmentally sustainable, healthy, and affordable food provision in childcare: a fine balancing act. (421)
- **Ana Renda**, *University of Newcastle*  
Assessing the implementation of obesity prevention practices in Early Childhood Education and Care setting in New South Wales, Australia: a cross-sectional study. (813)
- **Bianca Schmidli**, *Department of Health Science, Institute of Sport Science, University of Bern*  
Swiss pre-school children's type and level of physical activity during open gym programs (936)
- **Trish Tucker**, *University of Western Ontario*  
Implementation of the TEACH e-Learning course on physical activity and sedentary behaviour for pre- and in-service early childhood educators: A pilot study (1013)

## Chaired Poster Session: Implementation and scalability

**Time:** 17:30 – 18:45 hours

**Location:** Level 2

- **Melanie Nichols**, *Deakin University*  
Nutrition and physical activity data harmonisation across complex community interventions to support pooled analysis and generate generalisable insights (510)

- **Marlinde L. van Dijk**, *Amsterdam Umc*  
Barriers and facilitators for implementing a 'lifestyle is medicine' model of care in hospitalized care: a qualitative study (593)
- **Caitlin Golden**, *University of Nebraska Medical Center*  
Customer Discovery for Scale Up: Enhancing the Acceptability and Scalability of the Building Healthy Families Program (604)
- **Caitlin Golden**, *University of Nebraska Medical Center*  
Comparing direct and indirect assessments of fidelity in a family healthy weight program (678)
- **Josephine Chau**, *Macquarie University*  
What types of brief vigorous intermittent physical activity could workplace interventions try as 'exercise snacks'? A scoping review (613)
- **Ana Renda**, *University of Newcastle*  
Barriers and facilitators to dissemination of obesity prevention research: a mixed methods systematic review. (814)
- **Nina Abrahams**, *University of Bristol; University of Cape Town*  
Using mixed-methods social network research to grow and sustain complex community-based health programmes in low- and middle-income countries: Benefits, limitations, and potential solutions. (955)
- **Emma Ostermeier**, *Western University*  
Implementation Models and Frameworks Used to Guide Community-Based Physical Activity Programs for Children: A Scoping Review (1082)

## Chaired Poster Session: Motivation and behavior change

**Time:** 17:30 – 18:45 hours

**Location:** Level 2

- **Uthman Albakri**, *Maastricht University and Albaha University*  
The association between sleep quality and the need for recovery among nurses working irregular shifts: A cross-sectional study (555)
- **Uthman Albakri**, *Maastricht University and Albaha University*  
Strategies and lifestyle behaviors that nurses working irregular night shifts use to improve sleep quality: A qualitative interview study among good and bad sleepers (564)
- **Christine Pellegrini**, *University of South Carolina*  
A cross-country ecological momentary assessment of joint association between outdoor and social contexts on movement behaviors (588)
- **Katja Dierkes**, *Institute of Sports Science, University of Tübingen*  
Does Exercise Modality Matter Affectively? Contrasting Type and Sequence of Moderate-Intensity Continuous Training versus High-Intensity Interval Training in a Randomized Within-Subject Study (858)
- **Rebecca Coulter**, *University of Victoria*  
Examining Exercise Motivation and Physical Activity Patterns Among Users and Non-Users of Wrist-Worn Wearable Activity Trackers (1071)
- **Pablo Campos-Garzón**, *University of Granada*  
Physical activity energy expenditure of active commuting to/from school: The ENERGYCO Study (371)
- **Carol Curtin, E.k. Shriver Ctr**, *Umass Chan Medical School*  
The Feasibility of a Remotely-Delivered Physical and Food Literacy Program for Youth with Intellectual Disabilities (ID) (609)
- **Pia Laemmert**, *University of Bayreuth*  
The role of nature as a resource for student's health in the university setting (818)
- **Jessica Malloy**, *University of Auckland*  
Co-Designing a Lifestyle-Focused Social Media Intervention for Young Women (355)
- **Thomas Sire**, *Université Du Québec À Trois-rivières*  
Factors that influence firefighters' food choices at the fire station (1053)
- **Ambria Crusan**, *St. Catherine University*  
Using community-based participatory research to support increased compliance to DASH diet recommendations in immigrant, Hispanic/Latinx individuals with cardiovascular disease and obesity (337)
- **Jordan Curry**, *University of Hull*  
The development and testing of a website (ExerciseGuide UK) for people with lung cancer: reflections on the added value of patient and public involvement within a doctoral degree (464)
- **Tina Gingell**, *Qut*  
Connecting with Cultural Foods: Exploring food security among people from refugee backgrounds (489)

## Chaired Poster Session: Participatory Research in Health Promotion

**Time:** 17:30 – 18:45 hours

**Location:** Level 2

- **Sophie Wright-Pedersen**, *Queensland University of Technology*  
The extent and nature of children's participation in investigations of food practice determinants: a scoping review (513)
- **Suzannah D'Hooghe**, *Sciensano*  
Perceived environmental factors affecting recreational walking behavior among socioeconomically disadvantaged adults (963)
- **Ash Cox**, *Edge Hill University*  
The Feasibility and Acceptability of an Online CPD Programme to Enhance PE Teachers' Knowledge of Muscular Fitness Activity (1007)

## Chaired Poster Session: Policies and environments

**Time:** 17:30 – 18:45 hours

**Location:** Level 6

- **Gabriel Wong**, *Saw Swee Hock School of Public Health*  
Understanding the perspectives of the food retail sector towards policies to reduce sodium in the food supply (528)
- **Rebecca Kehm**, *Columbia University*  
Neighborhood environment and physical activity in girls: findings from the LEGACY Girls Study (615)
- **Lisa Quintiliani**, *Boston Medical Center, Boston University*  
Multilevel Physical Activity Intervention for Low Income Public Housing Residents in the U.S.: Protocol for the Community Walks Trial (540)
- **Thera A. M. Peeters (Corresponding Author)**, *Erasmus Mc*  
Effect of Changing Fast-food Environments on Children's Eating Behaviour: A Random Effect Within Between Analysis within the Generation R Study (647)
- **Andrea Barney**, *Brigham Young University*  
Carbon footprint of diets among K-12 students in the USA (716)
- **Jasmine Kaidbey**, *The George Washington University*  
State laws that expand water access are less common and less opposed than state laws that restrict sugar sweetened beverages in the United States (1087)
- **Kamila Tiemann Gabe**, *University of Sao Paulo*  
Is the adherence to the food practices recommended by the 2014 Brazilian Food Guide associated with a healthier diet? (907)

- **Emily Denniss**, *Deakin University*  
Nutrition-related information on Instagram: A content analysis of posts by popular Australian accounts (732)

## Chaired Poster Session: Socio-economic inequalities

**Time:** 17:30 – 18:45 hours

**Location:** Level 6

- **Patrick Brady**, *University of Minnesota*  
Perceptions of Strengths and Needs Emerging During the COVID-19 Pandemic in Minnesota's Emergency Food System (452)
- **Katja Siefken**, *Msh Medical School Hamburg*  
Better Late Than Never?! Five Compelling Reasons for Putting Physical Activity in Low- and Middle-Income Countries High Up on the Public Health Research Agenda (320)
- **Chelsea Pelletier**, *University of Northern British Columbia*  
Rural-urban differences in domain-specific physical activity in Canadian adults (598)
- **Anna Lene Seidler**, *University of Sydney*  
Early childhood obesity prevention interventions – are we reaching the right populations to address this health equity problem? (773)
- **Miika Tuominen**, *University of Turku*  
Changes in self-reported physical activity engagement across retirement transition among retirees from different occupational backgrounds (831)
- **Rachel Liebe**, *Virginia Tech*  
Factors that Predict Interest in Participation in Nutrition Interventions among Audiences with Low Incomes during COVID-19 (870)
- **Rachel Liebe**, *Virginia Tech*  
Accessibility, Quality, and Selection of Nutritious Foods Differ by Food Security Status in Virginia (920)
- **Christian Maino Vieytes**, *University of Illinois at Urbana-Champaign*  
Prevalent Dietary Patterns in U.S. Food-Insecure Cancer Survivors are Associated with Mortality: NHANES 1999-2018 (1045)

## Chaired Poster Session: Young Adults

**Time:** 17:30 – 18:45 hours

**Location:** Level 2

- **Tara Grogan, corresponding, *Norwich University***  
Measuring Resilience and Mental Health as Moderated by Daily Habits of Senior Military College Students. (901)
- **Emily Heying, *College of Saint Benedict***  
Understanding Food Insecurity at Residential Liberal Arts Colleges: Roles of Campus Dining Options and Cooking Habits (1076)
- **Kayla Parsons, *University of Maine***  
The Relationship Between Intuitive Eating and Dining Out Frequency in Undergraduates in the United States (446)
- **Bo Peng, *The Chinese University of Hong Kong***  
Barriers and facilitators to physical activity for young adult women: a systematic review of qualitative research (521)
- **Sarah Jenner, *University of Southampton***  
Identity-based adolescent health interventions: A systematic review (592)
- **Emma Watras, *University of Maine***  
Cooking Self-Efficacy and Nutrition Knowledge Predict Diet Quality in College Students (658)
- **Caera Grady, *University of Limerick***  
Communicating Physical Activity to Adolescents: what works? A scoping review (829)
- **Matthew Savage, *Nottingham Trent University***  
Exploring factors associated with sedentary behaviour pre, during, and post covid-related restrictions in UK university students: A pooled cross-sectional analysis (1121)

## ISBNPA Implementation Science Short Course

**When:** June 12 (09:00 – 18:00 hours) and

June 13 (08:00 – 14:00 hours)

**Where:** Amsterdam UMC/VU University

**Cost:** EUR 250 (exl. VAT) includes 2 lunches and 1 dinner

30 spaces available

### Course Overview

Join us for a two-day implementation science short course designed to equip you (beginner in implementation science) with the skills and knowledge you need to successfully translate research into practice in the field of physical activity, nutrition and health promotion. Led by international experts in the field of implementation science and nutrition and physical activity, this course will cover key topics such as:

- Understanding the principles of implementation science
- Identifying barriers and facilitators to implementation using theories and frameworks
- Developing and testing implementation strategies
- Evaluating the effectiveness of implementation efforts

### Who Should Attend?

Whether you're a researcher, practitioner, or policymaker, this course is for you. You'll gain practical tools and techniques that you can apply to your work immediately, and you'll have the opportunity to network with other professionals in the field. We encourage you to register early to secure your spot as only 30 spaces are available! (ISBNPA members are given priority).

### Course Date and Costing

The course will take place on June 12 (09:00 – 18:00 hours) and June 13 (08:00 – 14:00 hours) at the Amsterdam UMC/VU University. The cost is 250 Euro (ex VAT). Lunch on both days, and a group dinner on Monday in Amsterdam are included in the price.

### Here's what you'll get when you enroll in our implementation science short course:

Two days of expert instruction: Our instructors are experts in the field of implementation science and have years of experience in translating research into practice.

- Hands-on learning: You'll have the opportunity to participate in interactive exercises and case studies that will help you apply the concepts you've learned.
- Networking opportunities: You will connect with other professionals in the field of implementation science and learn from their experiences.
- Course materials: You'll receive a course workbook and other materials to help you review and apply what you've learned.
- Certificate of completion: After successfully completing the course, you'll receive a certificate of completion to add to your professional portfolio.

We look forward to seeing you at our implementation science short course and helping you take your skills to the next level!

## WEDNESDAY, JUNE 14

### Pre-Conference Workshops

The pre-conference workshops will take place at the Biomedical Centre on Wednesday, June 14 and must be pre-registered.

**Address:** Husargatan 3, 751 23 Uppsala

**PUBLIC ENTRANCES ARE:**

**A11:** 1 from Dag Hammarskjöldsväg

**C7:** 2 from Husargatan

**A8:** 1 from Norra vägen

**Entrance SciLife / Hub is C11:** 1 from Dag Hammarskjöldsväg

**How a room number is built**

**Building** **Floor** **Room No.**  
**B7 : 1 25a**

**08:30 – 12:30 hours**

**Biomedical Centre**  
**A9:011**

WS.1.01

**Observational research and causal conclusions: friends or foes?**

Dr. Jelle Van Cauwenberg

Dr. Louise Poppe

**09:00 – 12:00 hours**

**Biomedical Centre**  
**A9:017**

WS.1.02

**Connections Matter: Introduction and Application of Social Network Analysis**

Dr. Tyler Prochnow

Dr. Katherine Arlinghaus

**08:45 – 13:00 hours**

**Biomedical Centre**  
**A9:001**

WS.1.03

**What works for whom under which circumstances and how: an introduction and practical guide to evaluate health behavior interventions using realist review**

Dr. Sofie Compernelle

Mrs. Rebecca Hunter

Miss Laura Van de Velde

**08:00 – 13:00 hours**

**Biomedical Centre**  
**A9:105**

WS.1.04

**Intervention Optimization: An Introduction to the MOST Mindset**

Dr. Kate Guastaferro

Dr. Heather Wasser

**09:00 – 13:00 hours**

**Biomedical Centre**  
**A7:115**

WS.1.05

**Introduction to and hands-on practice with system dynamics using the CO-CREATE model on youth obesity prevention**

Prof. Nanna Lien

Mrs. Anaely Aguiar Rodriguez

**08:00 – 13:00 hours**

**Biomedical Centre**  
**A7:111**

WS.1.06

**Designing interventions to promote community health: a multilevel, stepwise approach**

Dr. Leslie Lytle

Dr. Jess Haines

Dr. Allison Myers

**08:30 – 13:00 hours**

**Biomedical Centre**  
**B7:101**

WS.1.07

**Network of Early Career Researchers and Students of ISBNPA (NESI) Workshop**

Dr. Stephen Barrett

Dr. Emma Lawlor

**08:30 – 13:00 hours**

**Biomedical Centre**  
**A5:001**

WS.1.08

**Data science for nutrition research—an introduction to programming**

Dr. Francesca Pontin

Tamara Garcia del Toro

*Continued...*

# PRE-CONFERENCE WORKSHOPS (CONT'D)

08:30 – 12:30 hours

Biomedical Centre  
B8:001

WS.1.09

## Cognitive interviewing for improved measurement in behavioral nutrition and physical activity

Dr. Cassandra Johnson  
Associate Prof. Katherine Dickin  
Dr. Amanda McClain

08:30 – 12:30 hours

Biomedical Centre  
A3:117

WS.1.10

## Engaging vulnerable or marginalized populations in health behavior research: ethical considerations and lessons learned

Dr. Marilyn Wende  
Ms. Jessica Stroope  
Prof. Renée Umstattd Meyer

09:00 – 12:30 hours

Biomedical Centre  
A7:103

WS.1.11

## Mobile Health App Development Using a “No-code” App Builder

Dr. Sam Liu  
Amanda Willms

## Dare2Share Sessions

09:00 – 13:00 hours

Biomedical Centre  
A9:111

d2s.0.01

## Launching a Digital Citizen Science Observatory: Rapid Systems Mapping to Create a Global Digital Ecosystem for Active Living and Nutrition Research

Dr. Jasmin Bhawra  
Dr. Tarun Katapally  
Claire Buchan

12:00 – 13:00 hours

Biomedical Centre  
A9:117

d2s.0.02

## Towards open and reproducible science in physical activity and behavioural nutrition research - what and how?

Dr. Trynke Hoekstra  
Borja Del Pozo Cruz

11:00 – 13:00 hours

Biomedical Centre  
B8:002

## Learning how to resource the main phase of the study without a grant. Experiences from the SUNRISE International Study

Prof. Tony Okely

## PRE-CONFERENCE WORKSHOPS AND DARE2SHARE SESSIONS

### Wednesday, June 14 • Biomedical Centre (BMC)

Address: Husargatan 3, Uppsala. Entrances A8 (from Norra vägen) and A11 (from Dag Hammarskjöldsväg) are open between 07:30 and 17:00 hrs. BMC's reception is located in room B7: 121a, in the center of the building.

14:00–15:45 Opening Ceremony & Keynote #1 at University Auditorium – Biskopsgatan 3, 753 10 Uppsala													
15:45–16:15 Walk to Uppsala Konsert & Kongress (UKK) – Vaksalagatan 1, 753 31 Uppsala													

# PROGRAM AT A GLANCE

## Wednesday June 14

Room	Foyer Level 6 (K10)	Hall B (Level 3)	Hall C (Level 3)	Hall D (Level 2)	K1 (+K2) (Level 3)	K3+4 (Level 3)
08:15–13:00	ISBNPA Executive Committee Meeting – K3, UKK					
14:00–14:30	Opening Ceremony – University Auditorium					
14:30–15:30	Keynote #1: Abby C. King, PhD <i>Community-engaged Citizen Science to Advance Healthy Lifestyles &amp; Health Equity Worldwide: Building the Science of Citizen Science</i> – University Auditorium					
15:45–16:15	Walk to UKK (30 minute window)					
16:15–17:30	Award Session Motivation and behaviour change   E- & mHealth	Award Session Children and Families	Award Session Implementation & scalability   Policies and environments	Award Session Ageing   Cancer prevention and management	Award Session Early care and education   Young Adults	Award Session Socio-economic inequalities   Participatory Research in Health Promotion
17:30–18:45	Chaired Poster Sessions – Hall D (Level 2) and Level 6					
	Coffee & Networking					

## Thursday June 15

Room	Main Hall (Level 6)	Foyer Level 6 (K10)	Hall B (Level 3)	Hall C (Level 3)	Hall D (Level 2)	K1 (+K2) (Level 3)	K3+4 (Level 3)	Gillesalen (Clarion Gillet Hotel)	Akademien (Clarion Gillet Hotel)	Swedenborg (Clarion Gillet Hotel)
07:00–07:30	ACTIVITY: Combined running and HIIT session (pre-registration required). Meeting point: UKK Entrance (facing Vaksala torg – market square)									
08:15–09:30	S.1.01 Novel approaches for assessing and analysing child eating behaviours	S.1.02 The methodological challenges of understanding and transforming systems to promote healthier dietary and physical activity behaviours: lessons from the LIKE and Mandala programmes	S.1.03 Food insecurity in context: Capturing lived experiences and exploring implications for research and policy	S.1.04 The Quest for a Valid and Reliable Global Adolescent and Child Physical Activity Questionnaire – introducing the GAC-PAQ Project	S.1.05 Measurement and Trends in Physical Activity and Sedentary Time Among Middle Aged and Older Adults in the US and CZ	S.1.06 Measuring health-related features of the natural, built and food environments in low- and middle-income countries: a syndemic approach	S.1.07 Cognitively enriched physical activity interventions for healthy ageing	S.1.08 Supporting sustainment of nutrition and physical activity interventions in schools	S.1.09 The need for and feasibility of using ecological momentary assessment and just-in-time adaptive interventions in vulnerable groups	S.1.10 Implementing exercise and lifestyle support in individuals living with and beyond cancer: a patient-centred approach
09:40–09:50	Impact strategic planning and IJBNPA awards – Main Hall (Level 6)									
09:50–10:50	Keynote #2: Clare Collins, PhD <i>Making an impact in behavioral nutrition! Are we there yet?</i> – Main Hall (Level 6)									
10:50–12:00	Coffee, Posters P.1.01–P.1.07, Exhibits & Networking – Hall D (Level 2), Foyers Level 3 and 6									
	SIG Meetings: 11:15–11:45		Policies and environments	Participatory Research in Health Promotion		K1: Young Adults K2: Indigenous Group	SocioEconomic Inequalities	Meet Our Voice Team (11:15–12:00) – Lounge (Level 7, UKK)		
12:00–13:15	SO.1.01 Latest findings in Epidemiology and COVID-related studies	SO.1.02 Policies for healthy environments	SO.1.03 Hot topics on metabolic health	SO.1.04 Improving measurement of diet and physical activity	SO.1.05 If it's complex, use participatory research designs	SO.1.06 Latest findings in motivational predictors	SO.1.07 Latest findings in Ageing	SO.1.08 Lessons learned from implementation in the school setting	SO.1.09 The Latest Research on Mobile Interventions for Weight-Related Behaviors	d2s.1.03 How to make our research more inclusive (12:00–13:30)
13:15–14:15	Lunch / Posters / Exhibits – Hall D (Level 2), Foyer Level 6 IJBNPA Editorial Meeting – Room K7									
14:15–15:45	O.1.01 How parents and carers behaviors are linked to children behaviors and health	O.1.02 Evidence-based approaches for the promotion of healthy foods	O.1.03 Latest findings on socio-economic inequalities	O.1.04 Improving measurement of movement behaviour in children	O.1.05 What have we learned recently on participatory research designs	O.1.06 How is early child care education linked to child health?	O.1.07 Physical function and ageing – from prevention to intervention	O.1.08 Scaling up interventions in community and health care settings	O.1.09 Multi-source data collection using e- & m-Health methodologies, towards improved mental and physical health	S.1.21 Move, sit, sleep: the co-dependence of physical activity, sedentary behavior and sleep in adults with (pre)diabetes
15:45–16:15	Coffee, Posters, Exhibits & Networking – Hall D (Level 2), Foyers Level 3 and 6									
16:15–17:30	S.1.11 Adaptation of a healthy lifestyle program for fathers and their children (Healthy Dads Healthy Kids) across different countries, settings and cultures	S.1.12 Experiences of policy and research co-creation with young people: Learnings from the COCREATE Project	S.1.13 The latest insights in measurement and analysis of 24-hour movement behaviors in the early years – definitions, measurement tools and analysis	S.1.14 BMI or Not to BMI? Weighing the Value of Body Mass Index as a Measure of Health (Debate)	S.1.15 Let us sleep! Promoting adolescent sleep health: sharing experiences of co-creating sleep health interventions in Belgium and the Netherlands	S.1.16 Leveraging Systems Science to Improve Nutrition and Obesity-Related Policy and Actions	S.1.17 Novel insights on physical behaviour and non-communicable disease from the UK Biobank: A unified physical activity, posture, and sleep framework	S.1.18 Indigenous Health Promotion – A Distinct and Decolonial Approach to Promoting Health Led by Indigenous Communities	S.1.19 The Power of Parks: The role of parks and recreation spaces in promoting youth physical activity	S.1.20 The changing influence of social and physical environments on diet quality across adolescence and early adulthood
17:45–19:30	ACTIVITY: Walking Football. Meeting point UKK Entrance (facing Vaksala torg - market square)									
18:00–20:00	ACTIVITY: Street Basketball Tournament at Summer Zone. Meeting point: Street Basketball courts									
19:30–22:00	NESI Dinner (ticketed event) – Katalin and All That Jazz – Godsmagasinet Östra Station – Roslagsgatan 1									

# PROGRAM AT A GLANCE

## Friday June 16

Room	Main Hall (Level 6)	Foyer Level 6 (K10)	Hall B (Level 3)	Hall C (Level 3)	Hall D (Level 2)	K1 (+K2) (Level 3)	K3+4 (Level 3)	K7 (Level 7)	Gillesalen (Clarion Gillet Hotel)	Akademien (Clarion Gillet Hotel)	Swedenborg (Clarion Gillet Hotel)
07:00–07:30 <b>ACTIVITY: Combined running and HIIT session</b> (pre-registration required). Meeting point: UKK Entrance (facing Vaksala torg – market square)											
08:15–09:30	<b>S.2.21</b> Parental perceptions of risk and safety: Do they undermine child and youth physical activity, and can they be reframed?	<b>S.2.22</b> Relation of home and neighbourhood environments to adolescent physical activity and sedentary behaviour: The IPEN–Adolescent study	<b>S.2.23</b> Sex and Gender Based Analysis: Understanding the Landscape and Improving our Approach	<b>S.2.24</b> Time-efficient accumulation of sufficient physical activity: Vigorous Intermittent Lifestyle Physical Activity (VILPA)	<b>S.2.25</b> Data-driven and compositional data analysis for profiling and assessing the associations of 24-hour movement behaviors and cardiometabolic health	<b>S.2.26</b> Is it feasible to apply a systems approach to nutrition interventions in non-western, low-to middle-income countries? Sharing empirical experience from China, Southeast Asia, South Pacific, and the Middle East.	<b>S.2.27</b> 9 months and 24-hours: Innovations in 24-hour Movement Behaviors during Pregnancy		<b>S.2.28</b> Can school-based high-intensity interval training (HIIT) interventions be scaled-up for population health?	<b>S.2.29</b> Advancing the science of co-creation of health promotion and behaviour change interventions: Health Cascade Network	<b>S.2.30</b> Effectiveness and Implementation of Active Living After Cancer: A Community-Based Program to Increase Physical Activity, Physical Function, and Quality of Life in Cancer Survivors
09:40–09:50 <b>Growing the next generation and awards</b> – Main Hall (Level 6)											
09:50–10:50 <b>Keynote #3: Ulf Ekelund, PhD</b> <i>Dose-response associations, physical activity intensity and deaths attributable to physical inactivity – lessons learned from device-measured physical activity</i> – Main Hall (Level 6)											
10:50–12:00	<b>Coffee, Posters P.2.01–P.2.07, Exhibits &amp; Networking</b> – Hall D (Level 2), Foyers Level 3 and 6										
	<b>SIG Meetings: 11:15–11:45</b>		Childrens and Families	Implementation and Scalability		K1: Ageing K2: Early Care and Education	Cancer and Prevention	e- and mHealth			
12:00–13:15	<b>SO.2.10</b> How movement and nutrition behaviors are associated with mental health	<b>SO.2.11</b> How Our Surroundings Impact Our Health	<b>SO.2.12</b> What have we learned recently on socio-economic inequalities	<b>SO.2.13</b> The Latest Research on Motivation and Emotion Studies	<b>SO.2.14</b> Lifestyle factors and cancer survivorship: Evidence from cross-sectional to intervention studies	<b>SO.2.15</b> Hot topics in young adults nutrition and physical activity	<b>SO.2.16</b> Parenting and health in young children		<b>SO.2.17</b> Experience from implementation research in various settings	<b>SO.2.18</b> From cohort studies to interventions	<b>d2s.2.04</b> Live demonstration of supervision using motivational interviewing and a reflecting team: Tools for supervising counselors to parents of children with weight-related problems
13:15–14:15 <b>Lunch / Posters / Exhibits</b> – Hall D (Level 2), Foyers Level 3 and 6 <b>Meet the Mentor Lunch</b> – Lounge, Level 7											
14:15–15:45	<b>O.2.10</b> Movement behaviors and health in children and families	<b>O.2.11</b> Policies for healthy environments in children and youth	<b>O.2.12</b> Hot topics for children health behaviours	<b>O.2.13</b> What have we learned recently on motivation and behavior change	<b>O.2.14</b> What have we learned recently on cancer prevention and management	<b>O.2.15</b> Cognitive function and ageing – predictors to interventions	<b>O.2.16</b> Predictors of children’s and families’ nutrition and movement behaviors	<b>d2s.2.06</b> Implementation and Translation of Physical Activity Environment Assessment within the context of an International Partnership	<b>O.2.17</b> Translating evidence into practice - with focus on school setting	<b>O.2.18</b> Changing behaviors in early care and education settings	<b>d2s.2.05</b> Church of Fail: The Congregation of Co-creation with Health CASCADE
15:45–16:15 <b>Coffee, Posters, Exhibits &amp; Networking</b> – Hall D (Level 2), Foyers Level 3 and 6											
16:15–17:30	<b>S.2.31</b> Understanding and improving physical activity and sedentary behaviour: From infancy to adolescence	<b>S.2.32</b> Monitoring and assessing physical activity policy from local to national level	<b>S.2.33</b> When moving is the only option: the role of necessity versus choice for understanding and promoting physical activity in Low- and Middle-Income Countries	<b>S.2.34</b> Goldilocks and the Three Postdocs: Exploring the optimal day for health and wellbeing	<b>S.2.35</b> A data driven approach to understand food purchasing behaviour and co-produce instore interventions to encourage healthier and more sustainable purchasing behaviour	<b>S.2.36</b> Online grocery stores as a novel tool for promoting healthy diets	<b>S.2.38</b> Engaging different generations in research to co-create healthy urban spaces in Europe and Africa	17:00–18:00 <b>LPAS4 Team Meeting</b>	<b>S.2.39</b> Opportunities, challenges and strategies for developing digital health interventions for the first 1000 days	<b>S.2.40</b> Physical Activity and Sedentary Behavior Interventions in Older Adults to Address Cognitive Aging	<b>S.2.53</b> Addressing Food Insecurity: Formal and Charitable Food Assistance and Implications for Nutrition Policy and Practice in Community and Clinical Settings
19:00 – 23:00 <b>ISBNPA Dinner</b> – Rikssalen at Uppsala Castle

21 – 24 October 2024

Abstract submission opens  
November 6, 2023

# KEYNOTES

## Community-engaged Citizen Science to Advance Healthy Lifestyles & Health Equity Worldwide: Building the Science of Citizen Science

**Prof. Abby King**

**June 14, 2023, 2:45 PM - 3:45 PM**

A growing evidence base supports the promise of “research-to-action” citizen science in helping to generate locally relevant, real-world solutions to some of today’s most vexing challenges. Establishing productive partnerships between communities and researchers also can help to mitigate mistrust of science that has increasingly surfaced among some portions of the public. Yet, can such multi-component, qualitatively driven methods attain the scientific rigor often craved by many in the scientific community? The Our Voice Global Citizen Science Research Initiative represents one example of how this form of community-engaged mixed methods research can be built across the continuum of translational science. Global examples will be presented of the initiation of early exploratory studies in the field, followed by enhanced reproducibility, increasing scientific rigor, expanding levels of knowledge and impact, and methods for attaining global scalability. The presentation will end with an exploration of the future of such research-to-action approaches as a resource-efficient means for advancing health equity, environmental justice, and authentic community-researcher partnerships.

## Making an impact in behavioral nutrition! Are we there yet?

**Prof. Clare Collins**

**June 15, 2023, 9:50 AM - 10:50 AM**

Poor diet impacts one in five deaths globally. If population eating patterns were consistent with nutrition recommendations the global disease burden would drop dramatically. For example heart disease burden would drop by 58% and type 2 diabetes by 41%. There is a massive disparity between health costs incurred due to nutrition and weight-related poor health and the limited funding for nutrition prevention and treatment. While over 40% of the global population can’t afford a healthy diet, the worldwide revenue attributed to vitamin and mineral supplements was estimated at \$US27 billion in 2022. In terms of prevention an OECD report on obesity prevention estimated that policies targeting food labelling, advertising restrictions and mass media campaigns across 36 countries analysed has the potential to prevent 76 000 new non-communicable disease cases per year, while also increasing GDP through reduced health expenditure and increased participation in the workforce. Additionally, members of the public do appear very interested in food and nutrition. For example each month Instagram accounts for more than 250 million #food posts. Celebrity nutrition misinformation abounds and can seriously undermine evidence-based nutrition recommendations and guidelines endorsed by nutrition organisations. How does ISBNPA’s mission statement, which calls for ‘stimulation of impactful research in behavioural nutrition and physical activity to improve health and wellbeing worldwide’, address these current challenges? We face stiff competition from self-proclaimed food and nutrition gurus. But are we partly to blame for not meeting consumer needs? What should ISBNPA, that’s all 1000+ members, do? Can ISBNPA and IJBNPA lead the way in terms of communicating the research on nutrition to facilitate evidence translation and impact? It is timely to reflect on past success, while planning for evaluation of future impacts. When it comes specifically to making an impact in behavioural nutrition, we must strategically turn the volume up on our collective voices to influence development, implementation and evaluation of evidence-based nutrition policy and programs. This will ensure that we do ‘get there’ and achieve impact that is dynamic, quantifiable, and valuable.

# Dose-response associations, physical activity intensity and deaths attributable to physical inactivity – lessons learned from device-measured physical activity

**Prof. Ulf Ekelund**

**June 16, 2023, 9:50 AM - 10:50 AM**

Dose-response associations, physical activity intensity and deaths attributable to physical inactivity - lessons learned from device-measured physical activity Studies have shown a non-linear dose-response association between physical activity and the risk of non-communicable diseases and mortality. National and international public health authorities, including the World Health Organization (WHO), have recommended population levels of physical activity, primarily based on self-reported data. However, self-reporting is prone to bias and overestimates physical activity participation. Self-reporting may also overestimate the amount of physical activity needed to reduce the risk of chronic diseases, underestimate the magnitude of associations with these outcomes, and not capture all intensities of physical activity. Recent studies using accelerometry have shown that the shape of the dose-response association is similar to that of self-reporting, but the maximal risk reduction is larger and observed at lower levels of physical activity. Total physical activity and all intensities of physical activity assessed by accelerometry are associated with a lower risk of premature mortality, and high levels of physical activity can mitigate the negative impact of sedentary time. The population attributable fraction ( is a measure that estimates the number of events that can be averted if a risk factor is removed from the population. Recent estimates suggest that 4–5 million deaths every year globally are due to physical inactivity. In contrast, the Global Burden of Disease study estimated less than 1 million deaths annually due to physical inactivity. These studies used self-reported physical activity data and estimated the population-attributable fraction as a dichotomous variable or methods that deviated from established thresholds. Others have estimated that an increase in device measured moderate to vigorous intensity physical activity by 10 and 30 minutes per day, respectively were associated with 7% (245,000 deaths) and 17% (595,000 deaths) decrease in the number of deaths per year in the US population. However, this study estimated the PAFs for a fixed increase in moderate-to-vigorous intensity activity using the same referent and did not consider the nonlinear dose-response association between physical activity and risk for mortality. The lecturer will discuss how device-measured physical activity in large cohort studies has advanced our understanding of the association between physical activity and chronic disease risk. I also discuss differences in methodology when estimating the number of deaths that can be prevented by physical activity at the population level. Finally, I will discuss a method to estimate the theoretical number of deaths averted, taking into account the non-linear dose-response association between physical activity and the risk of death.

## Protecting human and planetary health: New unique and necessary roles for health professionals

**Prof. Maibach Edward W.**

**June 17, 2023, 3:45 PM - 4:30 PM**

Climate change and the burning of fossil fuels—which is the principal cause of climate change—are arguably the leading causes of preventable morbidity and mortality worldwide. In this talk Dr. Maibach will make the case that helping to lead efforts to rapidly decarbonize the world's energy supplies and limit global warming to the fullest extent possible is a necessary role for health professionals. Further, he will make the case that because health professionals are among the most trusted voices in communities worldwide, and because the climate/health narrative is uniquely effective in increasing public engagement with the issue, health professionals have a unique leadership role to play in the global effort.

# INVITED TALKS – ‘ONE TO WATCH’

## ‘Moon walking’ before Michael – Environmental rhythms and Indigenous systems of well-being

**Dr. Isaac Warbrick**

**June 17, 2023, 11:15 AM - 11:40 AM**

Indigenous knowledge and systems of well-being highlight the close connection between the natural environment and the health of people. Our relationship with the environment relates to our ability to provide food, the way we move and are active, and the maintenance of spiritual well-being, and cultural identity. Contemporary scientific literature has also shown that engagement with natural environments improves physical health, mental well-being, and management of stress. On the other hand, modern lifestyles are characterised by a disconnection from the natural environment and the natural rhythms and cycles that were once closely observed by our tūpuna (ancestors). Our ancestors observed the seasons, cycles, and rhythms on land, in oceans and waterways, and in the sky above to determine optimal times to perform certain activities, including when to plant, harvest, hunt, and collect food. In Aotearoa (New Zealand), this system of observation is known as the maramataka (often termed the ‘Māori lunar calendar’). Although some of these practices, and the knowledge underpinning this system have been diminished or lost due to colonisation, Indigenous peoples continue to observe, record, and pass down their observations, and align their lives and activities to natural cycles. What’s more, communities are leading the rejuvenation of these practices throughout Aotearoa and the Pacific. Our culture and the reclamation of cultural knowledge are drivers for lifestyle change. Thus, many are reclaiming culturally relevant approaches to health, where physically activity, healthy eating, and a lifestyle more attuned with the environment become secondary outcomes of strengthening cultural knowledge and identity.

## Behavioural intervention research- the value of formative and process evaluation

**Dr. Jenny Rossen**

**June 17, 2023, 11:15 AM - 11:40 AM**

Human behaviours such as lifestyle habits are challenging to change and complex to study. Whether implementing interventions in health care settings or using digital platforms a thorough planning phase including an underpinning programme theory and undertaking a process evaluation are key phases for a better understanding of what works. I will present some of my experiences from behavioural intervention research. We followed the Medical Research Council guidance for evaluating complex interventions to undertake a process evaluation of a two-year pedometer intervention with or without counselling in primary care. The process evaluation included the delivery of the interventions, intervention dose, and patterns of behavior change. Further, we studied intervention mechanisms as perceived by the participants through qualitative interviews. For an upcoming real-world study, we have performed a formative research phase, including focus group interviews, a systematic review, and co-development of the intervention in close collaboration with a tech company.

# Lessons learnt on the measurement of physical activity with movement sensors

**Dr. Jairo H. Migueles<sup>1</sup>**

<sup>1</sup>Department of Biosciences and Nutrition, Karolinska Institutet, Huddinge, Sweden

**June 17, 2023, 11:15 AM - 11:40 AM**

Accelerometers were first used to estimate energy expenditure and physical activity in the early 1980s. The vertiginous advancements in the technology made it possible to access to the raw data, increase precision in the recordings, measure different planes of movement, or record longer periods of time without having to recharge the devices. Researchers have developed methods to clean and analyse such amount of information as they had access to the data, which has led to many parallel efforts to address similar challenges. As a result, a myriad of methods with limited comparability to process the raw data and extract physical activity, sedentary behaviour, and sleep related characteristics have been developed. The flip side is that the harmonisation of the accelerometer-based measure of movement behaviours remains a challenge today. At a time when the field is moving from closed (proprietary) to open-source algorithms and methods, now is the time to reflect on what we can do as a field to address this challenge. This presentation will take a critical look at the measurement of physical activity with accelerometers, from the concepts to the decisions that should be made to process the accelerometer signal. Some of the contents shared in this presentation are personal opinions based on years of research and as such is open for discussion.

## Food behaviours and the environment: a social-ecological perspective

**Dr. Maria Somaraki**

**June 17, 2023, 11:15 AM - 11:40 AM**

Food behaviours are integral components of health behaviours that mobilise interdisciplinary research processes. The social-ecological framework describes the different levels of influence on individual food behaviours and health outcomes. These levels of influence involve different food environments encompassing socio-cultural processes and their interactions to shape how and what humans eat. My research has acknowledged such processes in regard to children's food behaviours in the context of childhood obesity and neurodevelopment. I focused on the home food environment that shapes children's eating habits and behaviours. This is defined by the parent-child feeding dynamics involving different components, namely parental feeding practices and child food behaviours. Obesity-related feeding practices and food behaviours were associated with mother's foreign background, i.e. a broader level of influence. In addition, early feeding practices that pertain to introduction to food texture were associated with lower scores for child developmental milestones, i.e. motor and cognitive skills, which represent the individual level of influence. Against a backdrop of higher obesity rates among children from disadvantaged backgrounds, I evaluated the effects of a treatment programme involving parents and how they can re-shape the home food environment. The findings showed that parents may influence the home environment, beyond their feeding practices, through clear rules and routines with the child. In addition, involvement of all caregivers is noteworthy, including fathers who are typically underrepresented in research. My current research seeks to unravel sustainable diets and food supply practices applying this social-ecological understanding of food behaviours. To this end, I am interested in further understanding levers for sustainable diets at the consumer level, considering different production modes, changing food environments and diverse backgrounds.

# Indigenous Sámi food systems in Sweden – resiliency, threats and possibilities

**Dr. Lena Maria Nilsson**

**June 17, 2023, 11:15 AM - 11:40 AM**

Sámi people are the only Indigenous people of the European Union with their traditional homelands situated in the northern half of Norway, Sweden, Finland and the Kola Peninsula of Russia. Sámi people live all over Sweden, with the highest population density in the northern inland. Traditional Sámi food is mainly based on natural resources in the Arctic environment such as wild berries, plants, fish, game and semi-domesticated reindeer. Some trade-based foods such as cereals and stove-top or campfire boiled un-filtered coffee are also significant for the Sámi cuisine. Previous studies based on data from the Northern Sweden Diet Database as well as recent indicators of traditional Sámi diet from the large registry population based cross-sectional study Sámi Health on Equal Terms (SamiHET, 2021) confirms a continued strong importance of traditional Sámi food in the Sámi population in Sweden. However, climate change and the so-called green transition is threatening the Sámi food system. In addition, EU legislation as well as knowledge gaps and ignorance of the nutritional value and health aspects of traditional Sámi food, means an obstacle to traditional knowledge transfer necessary for a sustainable and sovereign future food system in Arctic Sweden. This presentation is partly based on a book chapter, published last year in the Anthology “The Sámi word” edited by Sanna Valkonen et al, and partly on data from the SamiHET study.

# AWARD SESSION PRESENTATIONS

## Using the Behavior Change Wheel to identify and understand key facilitators and barriers for lifestyle care for postmenopausal breast cancer survivors: A Delphi-study

Mrs. Sandra van Cappellen – van Maldegem<sup>1</sup>, Dr. Floortje Mols<sup>1,2</sup>, Prof. Jacob C. Seidell<sup>3</sup>, Ms. Anja de Kruif<sup>4,5</sup>, Prof. Lonneke van de Poll- Franse<sup>1,2,6</sup>, **Dr. Meeke Hoedjes**<sup>1</sup>

<sup>1</sup>Tilburg University, Tilburg, Netherlands, <sup>2</sup>Netherlands Comprehensive Cancer Organisation (IKNL), Utrecht, Netherlands, <sup>3</sup>VU University, Amsterdam, Netherlands, <sup>4</sup>VUmc, Amsterdam, Netherlands, <sup>5</sup>HAN University of Applied Sciences, Nijmegen, Netherlands, <sup>6</sup>The Netherlands Cancer Institute, Amsterdam, Netherlands

**Award Session - Ageing | Cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Lifestyle and body weight recommendations have been issued to improve health outcomes in postmenopausal breast cancer (PMBC) survivors. However, the majority of PMBC survivors does not meet these recommendations. Although health care professionals (HCPs) could play a key role in the promotion of favorable lifestyle behaviors among PMBC survivors, this is not structurally embedded in clinical care. Optimal approaches to promote sustained adherence to lifestyle and body weight recommendations in PMBC survivors are lacking. This Delphi-study aimed to identify and understand expert-opinion on potential barriers and facilitators for promoting adherence to these lifestyle and bodyweight recommendations in PMBC survivors.

**Methods:** The expert panel consisted of oncology HCPs (N=57), patient advocates (N=5) and PMBC survivors (N=38). They completed 3 questionnaires. Questionnaire 1 aimed to generate ideas. Questionnaire 2 aimed to validate and prioritize the barriers and facilitators obtained from the first questionnaire. Questionnaire 3 aimed to rank barriers and facilitators. The Behavior Change Wheel was used as theoretical framework for analysis. Thematic analysis was applied to identify key overarching themes based on the top-ranked facilitators and barriers. Potential Behavioral Change Techniques (BCTs) and intervention strategies were identified using the Behavior Change Technique Taxonomy version 1 and the Behavior Change Wheel.

**Results:** 11 core categories of key barriers/facilitators for the promotion of adherence to recommendations for lifestyle and body weight among PMBC survivors were identified. For each core category, relevant BCTs and practical potential intervention strategies were selected based on suggestions from the expert panel. These included: increasing knowledge about the link between lifestyle and cancer; enabling self-monitoring of lifestyle behaviors followed by evaluation; offering group lifestyle counselling for PMBC survivors, enhancing social support for favorable lifestyle behaviors; and stimulating multidisciplinary collaboration among HCPs.

**Conclusions:** Findings provide valuable insight for the development of interventions promoting healthy lifestyle behavior among PMBC survivors and on how to stimulate HCPs to provide lifestyle support to their patients.

# Engagement, acceptability, usability and satisfaction with Active for Life, a computer-tailored web-based physical activity intervention using Fitbits in older adults

## **SIG - Primary Choice:** A. Ageing

**Purpose:** Preliminary evidence suggests that web-based physical activity interventions with tailored advice and Fitbit integration are effective and may be well suited to older adults. Therefore, this study aimed to examine the engagement, acceptability, usability, and satisfaction with '*Active for Life*,' a web-based physical activity intervention providing computer-tailored physical activity advice to older adults.

**Methods:** Inactive older adults (n=243) were randomly assigned into 3 groups: 1) tailoring+Fitbit, 2) tailoring-only, or 3) a wait-list control. The tailoring+Fitbit group and the tailoring-only group received 6 modules of computer-tailored physical activity advice over 12 weeks. The advice was informed by objective Fitbit data in the tailoring+Fitbit group and self-reported physical activity in the tailoring-only group. This study examined the engagement, acceptability, usability, and satisfaction of *Active for Life* in intervention participants (tailoring+Fitbit n=78, tailoring only n=96). Wait-list participants were not included. Engagement (Module completion, time on site) were objectively recorded through the intervention website. Acceptability (7-point Likert scale), usability (System Usability Scale), and satisfaction (open-ended questions) were assessed using an online survey at post intervention. ANOVA and Chi square analyses were conducted to compare outcomes between intervention groups and content analysis was used to analyse program satisfaction.

**Results:** At post-intervention (week 12), study attrition was 28% (22/78) in the Fitbit+tailoring group and 39% (37/96) in the tailoring-only group. Engagement and acceptability were good in both groups, however there were no group differences (module completions: tailoring+Fitbit: 4.72±2.04, Tailoring-only: 4.23±2.25 out of 6 modules, p=.14, time on site: tailoring+Fitbit: 103.46±70.63, Tailoring-only: 96.90±76.37 minutes in total, p=.56, and acceptability of the advice: tailoring+Fitbit: 5.62±0.89, Tailoring-only: 5.75±0.75 out of 7, p=.41). Intervention usability was modest but significantly higher in the tailoring+Fitbit group (tailoring+Fitbit: 64.55±13.59, Tailoring-only: 57.04±2.58 out of 100, p=.003). Participants reported that *Active for Life* helped motivate them, held them accountable, improved their awareness of how active they were and helped them to become more active. Conversely, many participants felt as though they would prefer personal contact, more detailed tailoring and more survey response options.

**Conclusions:** This study supports web-based physical activity interventions with computer-tailored advice and Fitbit integration as engaging and acceptable in older adults.

# Reduction in diet quality is associated with a greater healthcare claims and charges over 21-years in Australian women

Dr. Erin Clarke<sup>1,2</sup>, Dr. Jennifer Baldwin<sup>3</sup>, **Prof. Clare Collins<sup>1,2</sup>**

<sup>1</sup>School of Health Sciences, College of Health, Medicine and Wellbeing, The University of Newcastle, Callaghan, Australia, <sup>2</sup>Food and Nutrition Research Program, Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>3</sup>Institute for Musculoskeletal Health, The University of Sydney and Sydney Local Health District, Sydney, Australia

**Award Session - Ageing | Cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Research examining relationships between diet quality (DQ) and healthcare use over time is needed to inform healthcare policy. This study investigated the relationship between 1) baseline DQ and 2) change in DQ over time, cumulative Medicare claims and charges over 21-years in a cohort of mid-aged Australian women.

**Methods:** Secondary analysis of the Australian Longitudinal Study on Women's Health (ALSWH) cohort (1946-51). Dietary data from food frequency questionnaires at Survey 3 (2001, then aged 50-55years) and Survey 7 (2013) were used to construct DQ change trajectories using the Australian Recommended Food Score (ARFS), with higher ARFS scores indicating higher DQ. Cumulative Medicare Benefits Schedule data over the previous 21-years (2001-2021) were reported by baseline ARFS quintile (n=8,228) and category of DQ change (n=6,553). Linear regression models investigating study aims were adjusted for area of residence, socioeconomic status, lifestyle factors, and private health insurance status.

**Results/findings:** Women with higher vegetable ARFS sub-scale scores at baseline were associated with fewer 21-year cumulative Medicare claims ( $\beta=-4.9$ , 95%CI -7.4, -2.5) and charges ( $\beta=-\$AU315.40$ , 95%CI - $\$AU506.60$ , - $\$AU124.20$ ). For all women, baseline higher dairy sub-scale scores were associated with higher Medicare claims ( $\beta=16.3$ , 95%CI 10.3, 22.4) and charges ( $\beta=\$AU1,165.20$ , 95%CI  $\$AU695.10$ ,  $\$AU1,635.30$ ). No association identified between baseline total ARFS or fruit, grains and meat sub-scales with 21-year healthcare claims or charges. Compared to women whose DQ score remained stable, those with worsened DQ over time (change  $\leq -4$  points) made more claims and higher charges; median [Q1, Q3] 413 [277, 588] claims  $\$AU27,073$  [ $\$AU16,723$ ,  $\$AU42,134$ ], compared to 387 [259, 559] claims and  $\$AU25,686$  [ $\$AU15,201$ ,  $\$AU40,309$ ]. Change in total ARFS and ARFS subscales were identified as predictors of 21-year cumulative healthcare claims. For each 10-point increase in ARFS over time, 12 fewer healthcare claims were made (95% CI 3 – 22). Each 10-point increase in vegetable and dairy ARFS sub-scale scores were also associated with significantly fewer claims.

**Conclusions:** Greater baseline vegetable variety was associated with fewer 21-year healthcare claims and charges. Women whose DQ worsened over time had higher 21-year healthcare claims and charges compared with those whose DQ remained stable.

# A higher level of health-related fitness is related to better physical quality of life in newly diagnosed breast cancer patients

**Dr. Ki-Yong An**<sup>1</sup>, Mrs. Fernanda Arthuso<sup>1</sup>, Dr. Gordon Bell<sup>1</sup>, Dr. Andria Morielli<sup>2</sup>, Dr. Jessica McNeil<sup>3</sup>, Mr. Qinggang Wang<sup>2</sup>, Mr. Spencer Allen<sup>1</sup>, Miss Stephanie Ntoukas<sup>1</sup>, Dr. Margaret McNeely<sup>1</sup>, Dr. Jeff Vallance<sup>4</sup>, Dr. Nicole Culos-Reed<sup>5</sup>, Dr. Karen Kopciuk<sup>2</sup>, Ms. Myriam Filion<sup>1</sup>, Dr. Lin Yang<sup>2, 5</sup>, Dr. Charles Matthews<sup>6</sup>, Ms. Leanne Dickau<sup>2</sup>, Dr. John Mackey<sup>1</sup>, Dr. Christine Friedenreich<sup>2, 5</sup>, Dr. Kerry Courneya (corresponding author)<sup>1</sup>  
<sup>1</sup>University of Alberta, Edmonton, Canada, <sup>2</sup>Alberta Health Services, Calgary, Canada, <sup>3</sup>University of North Carolina, Greensboro, USA, <sup>4</sup>Athabasca University, Athabasca, Canada, <sup>5</sup>University of Calgary, Calgary, Canada, <sup>6</sup>National Cancer Institute, Rockville, USA

**Award Session - Ageing | Cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Considerable distress and worries related to diagnosis, prognosis, and treatment in newly diagnosed breast cancer patients can cause poor quality of life (QoL) and potentially even poor treatment and cancer outcomes. Therefore, understanding the correlates of QoL may help breast cancer patients improve QoL and prepare for treatments and recovery. The primary purpose of the present study was to examine the associations between comprehensive health-related fitness (HRF) measures and physical and mental QoL in newly diagnosed breast cancer patients from the Alberta Moving Beyond Breast Cancer (AMBER) Cohort Study.

**Methods:** The current study is a cross-sectional design that was conducted in Edmonton and Calgary, Canada. A total of 1,458 newly diagnosed breast cancer patients who completed HRF and QoL assessments within 90 days of diagnosis were included in the study. HRF assessments consist of  $VO_{2peak}$  treadmill test, predicted one repetition maximum and muscular endurance tests using chest press and leg press, handgrip strength, curl-up, sit-and-reach test, and body composition by dual x-ray absorptiometry. QoL included physical component summary (PCS) and mental component summary (MCS) that were assessed by the SF-36. We analyzed the associations between quartiles of HRF and binary PCS and MCS (bottom 20%) using univariate and multivariate logistic regression adjusted for demographic, medical, and behavioral covariates.

**Results:** In univariate models, all health-related fitness variables except for total lean mass were significantly associated with PCS while only lean/fat ratio was associated with MCS. In multivariate models, relative  $VO_{2peak}$ , relative upper body strength, and lean mass percentage were significantly associated with PCS. More specifically, the least fit groups were 2-3 times (relative  $VO_{2peak}$ : OR=2.08, 95% CI=1.21-3.57; relative upper body strength: OR=3.19, 95% CI= 1.98-5.14; lean mass percentage: OR=2.31, 95% CI=1.37-3.89) more likely to report poor/fair PCS compared to the most fit groups. There were no meaningful associations for MCS.

**Conclusions:** All three major components of HRF (cardiorespiratory fitness, muscular fitness, and body composition) were independently associated with better physical QoL, but not mental QoL, in newly diagnosed breast cancer patients. An exercise intervention to improve comprehensive HRF may help newly diagnosed breast cancer patients maximize their physical QoL.

# Impact of physical activity on dynamic balance & prevention of falls in middle age: systematic review & meta-analysis

Dr. Juliana Oliveira<sup>1,2</sup>, Mr. Junze Chen<sup>3</sup>, Dr. Amabile Borges Dario<sup>3</sup>, Prof. Catherine Sherrington<sup>1,2</sup>, Ms. Geraldine Wallbank<sup>1,2</sup>, Miss Yuwei Lin<sup>4</sup>, Prof. Manuela Ferreira<sup>5</sup>, **Prof. Anne Tiedemann<sup>1,2</sup>**

<sup>1</sup>Institute for Musculoskeletal Health, The University of Sydney and Sydney Local Health District, Sydney, Australia, <sup>2</sup>School of Public Health, Faculty of Medicine and Health, Sydney, Australia, <sup>3</sup>School of Health Sciences, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia, <sup>4</sup>Peking University Clinical Research Institute, Peking University Health Science Centre, Beijing, China, <sup>5</sup>Kolling Institute, School of Health Sciences, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia

**Award Session - Ageing | Cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 14, 2023, 4:15 PM - 5:30 PM**

## **SIG - Primary Choice:** A. Ageing

**Purpose:** To summarise the evidence of the impact of physical activity on dynamic balance and falls among middle-aged people.

**Methods:** We conducted a systematic review and meta-analysis of randomised controlled trials (RCTs). Data Sources included Medline, EMBASE, CINAHL, and LILACS from inception to July 2021. Studies were selected for inclusion if they were RCTs investigating the effect of physical activity on dynamic balance and falls in people aged 40-64 years compared to non-active control. We calculated pooled effect sizes using random-effects models. Standardised mean differences (SMD) and mean difference (MD) were calculated. The GRADE system was used to assess the certainty of the evidence. A meta-regression was conducted to examine the effect of participants' characteristics on the pooled effect size.

**Results/findings:** 16 trials with a total participant of 947 were included. Participation in physical activity improved dynamic balance (n=16 trials; SMD 1.10 95% CI 0.66 to 1.54; low certainty evidence), timed up and go test (n=8; MD=1.07 seconds, 95% CI 0.39s to 1.75s; low certainty evidence) and functional reach (n=5; MD=5.80cm, 95% CI 2.52cm to 9.08cm; very low certainty evidence), among middle-aged people. We found a significant difference in the impact of interventions that involved 3D exercises (i.e., yoga and Tai Chi) versus non-3D (p for comparison=0.006). We did not detect a significant difference in the effect of physical activity on dynamic balance in the trials involving multicomponent exercises compared to single exercises (p for comparison=0.74). Additionally, the size of the intervention effect on dynamic balance was not influenced by the methodological quality or length of the intervention. No included studies investigated falls as an outcome.

**Conclusions:** Participation in physical activity appears to offer significant promise for improving balance in middle-aged people, although the certainty of the evidence is low. Greater effects were seen from interventions involving more coordination, such as yoga and Tai Chi. Our results support the promotion and support of physical activity programs to improve balance during middle age to prepare for healthy ageing and potentially prevent falls. Further studies are needed to investigate the impact of physical activity on falls in this population.

# Feasibility and preliminary efficacy of an online-delivered resistance exercise intervention among racially diverse breast cancer survivors: The B-REP Trial

**Dr. Angela Fong**<sup>1</sup>, Ms. Gabriella Gonzalaz<sup>2</sup>, Dr. Shawna Hudson<sup>1</sup>, Dr. Kathryn Schmitz<sup>3</sup>, Dr. Sharon Manne<sup>1</sup>

<sup>1</sup>Rutgers Cancer Institute of New Jersey, New Brunswick, USA, <sup>2</sup>Rutgers University, New Brunswick, USA,

<sup>3</sup>University of Pittsburgh, Pittsburgh, USA

**Award Session - Ageing | Cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** The purpose is to determine the feasibility, acceptability, and preliminary efficacy of the Breast cancer and Resistance Exercise Program (B-REP) Trial among a diverse sample of breast cancer survivors.

**Methods:** The pilot study used a 2-arm randomized controlled trial design with  $N=47$  breast cancer survivors ( $M_{age}=55.1$ ,  $SD=11.9$ ; 42.6% self-identified as non-White; 58.1% Stage I diagnosis,  $M=35.4$ ,  $SD=18.2$  months since diagnosis). Intervention participants ( $n=28$ ) received 12, once-weekly synchronous 1:1 supervised exercise sessions delivered over Zoom. Minimal care participants ( $n=19$ ) received a printed exercise instruction booklet. All participants received resistance bands and an individualized exercise program based on their baseline strength assessment. Measures included attendance tracked by research staff throughout the study, 10 repetition maximum strength and self-reported physical activity minutes measured at baseline and post-intervention, and follow-up online semi-structured interviews at post-intervention. Descriptive statistics and repeated measures ANOVAs were used to analyze quantitative data. Deductive thematic analysis was used to analyze interviews.

**Results:** B-REP demonstrated high rates for feasibility outcomes of enrollment (78.6%) and post-intervention assessment completion (92.9%). The acceptability outcomes were high for session attendance (97.9%) and satisfaction ( $M_{score}=4.87$  out of 5,  $SD=.18$ ). The 2 x 2 condition by time repeated measures ANOVAs showed that upper body strength significantly increased ( $F(1,38)=7.298$   $p=.01$ ) for the intervention group ( $M_{baseline}=23.9$ ,  $SD=8.4$  and  $M_{post}=28.9$ ,  $SD=8.9$ ) versus minimal control ( $M_{baseline}=24.5$ ,  $SD=7.3$  and  $M_{post}=25.5$ ,  $SD=8.7$ ). Lower body strength also significantly increased ( $F(1,38)=6.209$ ,  $p=.02$ ) for the intervention group ( $M_{baseline}=28.6$ ,  $SD=12.7$  and  $M_{post}=27.7$ ,  $SD=14.9$ ) versus minimal control ( $M_{baseline}=37.7$ ,  $SD=16.2$  and  $M_{post}=30.0$ ,  $SD=16.2$ ). B-REP did not influence self-reported physical activity ( $p=.24$ ). From the interviews, participants enjoyed the focus on resistance exercise and the interventionist's gentle approach. Suggestion for improvement include using different exercise equipment and adding a social support component.

**Discussion:** Online-delivered resistance exercise is feasible, acceptable, and shows promising efficacy for improving strength among a diverse sample of breast cancer survivors. Limitations include a small sample recruited from one cancer center. Strengths include using a rigorous study design and objectively measured outcomes. Future research is needed to determine efficacy on muscular strength and cancer-related outcomes such as health-related quality of life and to incorporate participants' feedback.

# Feasibility of Daughters and Dads Cricket: a program targeting fathers to improve daughters' engagement and skills in cricket.

**Dr. Lee Ashton**<sup>1,2,3</sup>, Dr. Emma Pollock<sup>1,2</sup>, Miss Stevie-Lee Kennedy<sup>1,2</sup>, Dr. Myles Young<sup>1,4</sup>, Associate Professor Narelle Eather<sup>1,2</sup>, Prof. Philip Morgan<sup>1,2</sup>

<sup>1</sup>Active Living Research Program, Hunter Medical Research Institute (HMRI), Lot 1 Kookaburra Circuit, NSW 2305., New Lambton Heights, Australia, <sup>2</sup>Centre for Active Living and Learning, College of Human and Social Futures, School of Education, University of Newcastle, Callaghan, Australia, <sup>3</sup>College of Health, Medicine and Wellbeing, School of Health Sciences, University of Newcastle, NSW., Callaghan, Australia, <sup>4</sup>College of Engineering, Science and Environment, School of Psychological Sciences, University of Newcastle, NSW, Australia., Callaghan, Australia

**Award Session - Children and Families, UKK - Hall B (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Utilising fathers to support their daughters and enhance their cricket skills may be an innovative approach to addressing traditional socio-cultural views of cricket relating to gender, by improving girls' enjoyment of cricket, participation, and long-term retention in the sport. Therefore, the aim of this study was to assess the feasibility of the novel 'Daughters and Dads Cricket' program.

**Methods:** In a single arm, pre-post study, fathers (n=34, 43.1±4.4 years) and daughters (n=34, 9.4±1.5 years) from Newcastle, Australia were recruited. The 9-week program was delivered by trained facilitators and included weekly educational and practical sessions, plus home-based tasks. *A-priori* feasibility benchmarks targeted recruitment (20 dyads), fidelity (≥80%), attendance (≥70%), compliance with home-program (≥70%), program satisfaction (mean score ≥4 out of 5) and retention (≥85%). Preliminary efficacy outcomes were assessed, including cricket skill proficiency, daughters' enjoyment in cricket, intention to keep playing cricket and long-term retention in cricket.

**Results:** Feasibility benchmarks were exceeded for recruitment (n=34 dyads), fidelity (98% education, 100% for practical), attendance (88%), satisfaction (fathers: 4.6/5, daughters: 4.8/5) and retention (97%). The home-program compliance fell short of the compliance goal (64%). Preliminary efficacy was confirmed with medium-to-large effect size changes in 11 of the 13 daughters' cricket skill proficiency outcomes. Promising findings were also identified for daughters' enjoyment of cricket (daughters self-report at 9-weeks:  $d=0.3$ , fathers' proxy at 9-weeks:  $d=0.5$  and at 12-month:  $d=0.1$ ), intention to continue playing cricket (90% of fathers and 97% of daughters agreed/strongly agreed to keep playing informal cricket at end of the program) and long-term retention in cricket (at 12-months fathers were playing cricket with their daughters an average of 1.3 (0.6) days per week, while 67% of daughters (n=20) were playing informal cricket).

**Conclusion:** A cricket-focused program targeting daughters and dads was feasible and led to medium-to-large improvements in cricket skill proficiency among the daughters. At the end of the program, daughters were engaged with cricket, as shown by high levels of enjoyment, intention to continue playing and their long-term retention in cricket at 12-months. Examining the future efficacy in a larger trial is warranted.

# Are sitting, standing and stepping associated with adiposity markers in youth?: A compositional approach

**Dr. Ana Maria Contardo Ayala**<sup>1</sup>, Dr. Simone J.J.M. Verswijveren<sup>1</sup>, Associate Professor Nicola D. Ridgers<sup>1,2</sup>, Prof. Anna Timperio<sup>1</sup>, Prof. Kylie D. <sup>1</sup>Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Sciences, Deakin University, Burwood, Australia, <sup>2</sup>Alliance for Research in Exercise, Nutrition and Activity (ARENA), Allied Health and Human Performance, University of South Australia, Adelaide, Australia, <sup>3</sup>Physical Activity Laboratory, Baker Heart and Diabetes Institute, Melbourne, Australia

**Award Session - Children and Families, UKK - Hall B (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Little research has examined the composition of waking behaviours assessed using postural devices and associations with health. The aim of this cross-sectional study was to examine the associations of posture-based device-measured waking movement behaviour compositions (i.e., sitting, standing [LPA], and stepping) with adiposity markers (i.e., waist circumference [WC] and body mass index [BMI]) among children and adolescents.

**Methods:** Pooled data from eight Australian (Melbourne, Victoria; 2007-2014) studies involving 1,199 children and youth (age range 1.8-20.0 years; age<sub>m</sub> 9.8±4.0; 51.5% girls). activPAL (i.e., posture monitor) measured waking movement behaviours (i.e., sitting, standing, and stepping time), anthropometric (WC and BMI) and demographic data (age, sex) were assessed. Waking 3-part compositions of sitting, standing and stepping were formed using compositional data analysis. Linear regression models, stratified by age bands (<5 years, 5-12 years, >12 years), tested associations of waking composition with standardized zBMI and zWC (adjusted for study and total wear time).

**Results:** No significant associations of overall composition with adiposity outcomes were found for children <5 years old (n=114). For children 5-12 years (n=702), the overall waking composition was associated with zWC but not zBMI. Specifically, a higher proportion of sitting time was associated with lower zWC ( $\beta = -0.230$ , SE=0.092), a higher proportion of standing time was associated with higher zWC ( $\beta = -0.159$ , SE=0.061), and no association was found for stepping proportion. For adolescents (n=304), the overall waking composition was associated with both adiposity outcomes. Specifically, a higher proportion of sitting time was associated with higher zBMI ( $\beta = -0.441$ , SE=0.198), a higher proportion of standing time was associated with lower zBMI ( $\beta = -6.020$ , SE=0.217) and lower zWC ( $\beta = -0.809$ , SE=0.218), and a higher proportion of stepping time was associated with a higher zWC ( $\beta = 0.467$ , SE=0.162).

**Conclusions:** Adiposity markers appear more consistently associated with movement behaviour compositions in adolescents than in younger children, although for waist circumference, some associations were in the opposite expected direction. No associations were detected for children under 5 years. Longitudinal analysis is needed to further understand these relationships.

# Parent-reported child appetite moderates relationships between child genetic obesity risk and parental feeding response

**Dr. Elena Jansen**<sup>1</sup>, Mr. Marcus Naymik<sup>2</sup>, Dr. Gita Thapaliya<sup>1</sup>, Dr. Matt Huentelman<sup>2</sup>, Dr. Sean Deoni<sup>3, 4, 5</sup>, Dr. Susan Carnell<sup>1</sup>

<sup>1</sup>Johns Hopkins School of Medicine, Baltimore, USA, <sup>2</sup>The Translational Genomics Research Institute (TGen), Phoenix, USA, <sup>3</sup>Hasbro Children's Hospital, Providence, USA, <sup>4</sup>Warren Alpert Medical School at Brown University, Providence, USA, <sup>5</sup>Bill & Melinda Gates Foundation, Seattle, USA

**Award Session – Children and Families, UKK – Hall B (Level 3), June 14, 2023, 4:15 PM – 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Background:** Food parenting practices are associated with child weight. Such associations may reflect effects of parents' practices on children's intake and weight. However, longitudinal, qualitative, and behavioral genetic evidence suggests these associations could in some cases reflect parents responding to children's genetic risk for obesity – an instance of gene-environment (GE) correlation. We aimed to test for GE correlation across multiple domains of food parenting, and to explore the role of parent-reported child appetite in GE relationships.

**Materials and methods:** Data on relevant variables were available for N=187 parent-child dyads (7.54±2.67 years; 44.4% girls) participating in RESONANCE, an ongoing pediatric cohort study. Children's polygenic risk scores (PRS) for obesity were derived based on adult GWAS data. Parents reported on their feeding practices (Comprehensive Feeding Practices Questionnaire) and their child's eating behavior (Child Eating Behavior Questionnaire). PROCESS was used to examine interaction effects of child eating behaviors on associations between child obesity PRS and parental feeding practices, adjusting for child age.

**Results:** Of the 12 parental feeding practices, 2 were associated with child obesity PRS, namely restriction for weight control ( $\beta = .182$ ,  $p = .011$ ) and teaching about nutrition ( $\beta = -.217$ ,  $p = .003$ ). Moderation analyses demonstrated that when children had high genetic obesity risk and showed high (vs. low/moderate) food responsiveness, or low (vs. moderate/high) satiety responsiveness, parents were more likely to restrict food intake to control weight.

**Conclusions:** Our results suggest that parents may mold their feeding practices in response to a child's propensity toward higher or lower body weight, and adoption of food restriction to control weight may depend on parental perceptions of child appetite. Research using prospective data on child weight and appetite and food parenting from infancy is needed to further investigate how gene-environment relationships evolve through development.

# Which components of a family-based obesity prevention intervention matter most in predicting change in preschool parents' empowerment and healthy weight parenting practices?

**Dr. Cristina Gago**<sup>1</sup>, Ms. Alyssa Aftosmes-Tobio<sup>2</sup>, Prof. Janine Jurkowski<sup>3</sup>, Dr. Jacob Beckerman-Hsu<sup>4</sup>, Ms. Evelin Garcia<sup>4</sup>, Ms. Kindra Lansburg<sup>5</sup>, Ms. Natalie Grafft<sup>2</sup>, Prof. Sebastien Hanuiese<sup>4</sup>, Prof. Kirsten Davison<sup>2</sup>  
<sup>1</sup>NYU Langone Health, New York, USA, <sup>2</sup>Boston College, Chestnut Hill, USA, <sup>3</sup>University at Albany State University of New York, Albany, USA, <sup>4</sup>TH Chan School of Public Health, Boston, USA, <sup>5</sup>Action for Boston Community Development (ABCD), Boston, USA

**Award Session – Children and Families, UKK – Hall B (Level 3), June 14, 2023, 4:15 PM – 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Researchers partnered with staff and parents of a federally funded preschool program for low-income families to develop and implement a family-centered obesity prevention intervention, known as Communities for Healthy Living, in a northeastern city in the United States. This study estimated associations between parents' perceived exposure (vs. not) to specific intervention subcomponents and changes in both parental empowerment and weight-related parenting practices over an academic year.

**Methods:** Preschool programs (n=16) were randomly assigned one of three start times for transition from control to intervention, following a stepped wedge design. During intervention periods, three intervention subcomponents were delivered: a media campaign (e.g., brochures on weight-related parenting), enhanced nutrition support (e.g., healthy growth letter mailed home, staff provided training regarding healthy weight discussions with parents), and an opt-in 10-week wellness program for parents (PConnect). All parents with children enrolled during intervention periods were invited to complete a survey in fall and spring of the 2017 and 2018 school years assessing empowerment (items=15; e.g., critical awareness, resource recognition, relationship building), weight-related parenting practices (items=9; e.g., diet, activity, sleep), and perceived exposure to intervention subcomponents. Approximately one-in-four eligible parents completed fall and spring surveys (n=363). We used mixed effects linear regression models to estimate adjusted mean change in empowerment and weight-related parenting, by perceived exposure (vs. not) to intervention subcomponents, including brochures (n=268 vs. 95), healthy growth letter (n=251 vs. 79), discussion with staff (n=192 vs. 171), and PConnect graduation (attended ≥ 70% of sessions vs. not, n=48 vs. 301).

**Findings:** Controlling for key confounders, change in weight-related parenting did not significantly differ by recall of any intervention subcomponent. However, parents who recalled exposure to the healthy growth letter (vs. not) and those who graduated from PConnect (vs. not) reported significantly greater mean estimated increases in parental empowerment (b=0.11 [95% CI=0.02,0.20]; b=0.20 [95% CI=0.07,0.33]; respectively).

**Conclusions:** These results suggest unique intervention subcomponents may pose differential impacts on participant outcomes, and underscore important implications regarding intervention design: tailored materials (e.g., growth letter) and sustained interpersonal interaction (e.g., graduating from PConnect) may be associated with meaningful changes in parental empowerment.

# A co-designed system of support for the health of young people experiencing first episode psychosis

**Dr. Matthew Jenkins<sup>1</sup>**, Dr. Victoria Chinn<sup>2</sup>, Ms. Tracey Gardiner<sup>1</sup>, Associate Professor Susanna Every-Palmer<sup>1</sup>

<sup>1</sup>University of Otago, Wellington, New Zealand, <sup>2</sup>Te Herenga Waka, Victoria University of Wellington, Wellington, New Zealand

**Award Session - Early care and education | Young Adults, K1 (+K2), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** J. Young Adults

**Background:** People experiencing psychosis often suffer from poor physical health, the result of complex interactions between medication adverse effects and maladaptive health behaviours (e.g., physical inactivity, unhealthy eating, smoking, substance abuse). Modifiable health behaviours (e.g., regular physical activity, abstinence from smoking, alcohol, and other substances) can significantly mitigate health risks, but it is critical that intervention or support for such behaviours occurs early - at the onset of first episode psychosis (FEP) - before unhealthy habits and associated health conditions take hold. Further, any intervention or system of support must draw from the lived experiences of people living with psychosis and the barriers they face in remaining 'healthy' within the context of healthcare services.

**Methods:** Our research used a process of iterative experience-based co-design to create a system of support for the health of young people experiencing FEP and to create a set of principles to guide healthcare within early intervention services. Participants included FEP service users, members of their family, and mental health service providers. The co-design process incorporated indigenous Māori knowledge and creative outputs by which young people could communicate their lived experiences of psychosis and state what they wanted to see in an ideal system of support. Data collection involved a series of workshops, focus groups, online surveys, and interviews, which resulted in written responses, audio recordings, and creative outputs (e.g., art). The research team are using phenomenographic and thematic analyses to understand the data and to achieve the research objectives.

**Results and implications:** Data are still being analysed, and so we will present an outline of the co-design process and the preliminary outcomes. Co-design processes that account for the lived experience of people living with serious mental illness should guide mental health care. This research will hopefully provide a template for such co-design, in addition to tangible outcomes that support the health and well-being of those experiencing FEP.

# Effectiveness of digital health interventions targeting lifestyle risk behaviours on improving adolescent mental health or wellbeing: a systematic review with meta-analysis

**Miss Rebecca Raeside<sup>1</sup>**, Miss Si Si Jia<sup>1</sup>, Miss Allyson Todd<sup>1</sup>, Dr. Karice Hyun<sup>1,2</sup>, Dr. Anna Singleton<sup>1</sup>, Dr. Lauren Gardner<sup>3</sup>, Dr. Katrina Champion<sup>3</sup>, Prof. Julie Redfern<sup>1,4</sup>, Dr. Stephanie Partridge<sup>1</sup>

<sup>1</sup>Engagement and Co-Design Research Hub, University of Sydney, Sydney, Australia, <sup>2</sup>Department of Cardiology, Concord Repatriation General Hospital, Sydney, Australia, <sup>3</sup>The Matilda Centre for Research in Mental Health and Substance Use, The University of Sydney, Sydney, Australia, <sup>4</sup>The George Institute for Global Health, University of New South Wales, Sydney, Australia

**Award Session – Early care and education | Young Adults, K1 (+K2), June 14, 2023, 4:15 PM – 5:30 PM**

## **SIG - Primary Choice:** J. Young Adults

**Purpose:** Research has established associations between lifestyle risk behaviours (physical inactivity, poor diet) and poor mental health among adolescents. Digital interventions which target multiple lifestyle risk behaviours are efficient, scalable and may improve mental health outcomes (e.g. quality of life [QoL], depression). However, limited evidence exists to determine effectiveness. We aimed to assess the effectiveness of digital health interventions targeting lifestyle risk behaviours on mental health or wellbeing outcomes in adolescents.

**Methods:** Systematic review with meta-analysis of 10 electronic databases from 01 January 2005 to 17 August 2022 including: (i) cluster/randomized controlled trials (cRCT/RCT) of digital health interventions; (ii) participants 10-24 years old, without significant acute or chronic disease(s); (iii) intervention targeting  $\geq 1$  lifestyle risk behaviour (physical activity, diet, sedentary behaviour, sleep, alcohol or smoking); (iv) study outcome of mental health or wellbeing. Review is registered with PROSPERO (CRD42021247738) and conducted and reported in accordance with PRISMA statement guidelines. Primary outcome was objective or self-reported change in any mental health or wellbeing outcome. Outcomes were grouped, summarized qualitatively, and combined using a random effects meta-analysis.

**Results:** 17 studies were identified (13 RCTs, 4 cRCTs) including 9070 participants, mean age  $15.3 \pm 1.2$  years, 55.8% female (16-100%). A variety of digital health interventions were used including text messaging (n=5), mobile applications (n=3), websites (n=4), email (n=1), or a combination of these (n=4). Mental health or wellbeing outcomes identified included QoL (n=4), self-efficacy (n=5), depression (n=6), anxiety (n=4), negative affect (n=2) and self-esteem (n=1). One study measured mental health or wellbeing as a primary outcome. Interventions had small but non-significant positive effects on physical (standardized mean difference 0.30, [95% CI -0.05-0.66];  $p=0.10$ ) and psychosocial QoL (0.38, [-0.08-0.83];  $p=0.10$ ), depression (-0.02, [-0.09-0.05];  $p=0.60$ ), anxiety (-0.13, [-0.45-0.19];  $p=0.42$ ) and negative affect (-0.61, [-1.59-0.37];  $p=0.22$ ) at post intervention follow-up compared to usual care controls.

**Conclusions:** Despite known associations between lifestyle risk behaviours and mental health among adolescents, reporting of effects on mental health is limited. Small changes demonstrate potential for digital health interventions to improve these outcomes among adolescents, yet studies with a greater focus on mental health or wellbeing are needed.

# Nurturing Healthy Teachers: A cluster quasi-experimental trial to improve the health, well-being, and food security of early care and education (ECE) professionals

**Dr. Shreela Sharma**, Dr. Nalini Ranjit, Mr. Michael Pomeroy, Ms. Jill Cox, Dr. William Perkison, Ms. Bethany Jana, Ms. Azar Gaminian, Ms. Mackenzie Senn, Dr. Ru-Jye Chuang, Mr. Miao Tang, Dr. Courtney Byrd-Williams

<sup>1</sup>University Of Texas School Of Public Health, Houston, USA

**Award Session - Early care and education | Young Adults, K1 (+K2), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** More than 2 million early care and education (ECE) providers, mostly women, provide care to over 10 million preschool-age and elementary school age children in the US. Our prior studies demonstrate that over 30% of ECE providers are food insecure with concurrent poor diet quality. We present the conceptual framework, design and study measures of Nurturing Healthy Teachers, a quasi-experimental cluster, non-randomized controlled study to examine the short- and long-term effectiveness of the Nurturing Healthy Teachers (NHT) nutrition intervention on food insecurity, dietary behaviors, mental health and cardiometabolic health among ECE teachers.

**Methods:** A convenience sample of 30 elementary schools with pre-kindergarten classrooms meeting the eligibility criteria are currently being recruited in Houston, Texas. Eligible schools (n=30) are assigned 1:1 into the intervention or comparison group. All teachers/providers in the 15 intervention schools will be eligible to receive NHT intervention, while those in the 15 comparison schools will receive CHF online modules-only in the 2022-2023 and 2023-2024 school years. The primary outcome of is food insecurity. Secondary outcomes include diet quality, mental health, and metabolic health. Metabolic markers and skin carotenoid levels will be assessed using in person assessments (finger-stick blood measure for HbA1c, weight measurement, blood pressure measurement, and Veggie Meter), while all other measures will be obtained via questionnaire. Process evaluation data using mixed methods will measure dosage, reach, fidelity and acceptability.

**Results/findings:** Grounded in the Social Cognitive Theory constructs, NHT combines strategies from two evidence-based programs that are currently being implemented at scale: Create Healthy Futures and Brighter Bites. Developed by Penn State Extension Better Kid Care, CHF is a web-based nutrition education plus peer support strategies to improve nutrition knowledge, self-efficacy, mindfulness, and social support to create healthy dietary habits. Brighter Bites provides a weekly distribution of ~20 pounds of donated fresh fruits and vegetables, plus healthy recipe tastings, and nutrition education. We will present the study design, intervention logic model and results of our baseline data collection.

**Conclusions:** Given the scalability of Brighter Bites and CHF, if found to be effective, a platform for rapid dissemination of NHT among ECE providers already exists.

# Gardening in Childcare Centers: A Cluster Randomized Controlled Trial Examining Effects on Physical Activity among Children

**Dr. Nancy Wells<sup>1</sup>**, Dr. Nilda Cosco<sup>2</sup>, Dr. Derek Hales<sup>3</sup>, Dr. Muntazar Monsur<sup>4</sup>

<sup>1</sup>Cornell University, Ithaca, NY, USA, <sup>2</sup>North Carolina State University, Raleigh, NC, USA, <sup>3</sup>University of North Carolina, Chapel Hill, NC, USA, <sup>4</sup>Texas Tech University, Lubbock, TX, USA

**Award Session - Early care and education | Young Adults, K1 (+K2), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Around the globe, young children fall short of daily physical activity recommendations. Early childhood education and care environments (i.e. childcare) have the potential to shape physical activity habits early in life. Gardening may contribute to children's physical activity however childcare center gardening is seldom studied. We examine the impact of a gardening intervention on children's time in moderate or vigorous (MVPA) and sedentary (SED) activity while at the childcare center.

**Methods:** In this randomized controlled trial (RCT) 15 childcare centers in low-income areas of Wake County, North Carolina, were randomly assigned to: (1) intervention (year 1), (2) waitlist control (year 1-control; year 2 - intervention), or (3) control year 2. The sample includes 325 children aged 3–5 years, with n=293 having physical activity data for at least one time point. The garden intervention comprised six raised garden beds planted with vegetables and fruits, and a booklet of 12 gardening activities. Physical activity was measured at each data collection period for 3 days using Actigraph GT3x accelerometers, secured at the waist. Analyses employ repeated measures linear mixed models (SAS v9.4 proc mixed) accounting for clustering of children within center. Model covariates included number of days with no outside time (0-2), number of days with rain (0-2), cohort (year 1 or 2), and accelerometer wear minutes.

**Results/ findings:** At baseline, children ( $3.9 \pm 0.53$  years; 51% girls;  $58.6 \pm 28.9$  BMI%) accumulated  $34.8 \pm 12.6$  minutes of MVPA and  $273 \pm 37$  minutes of sedentary time each day. Accelerometer wear days were similar across groups (2.5 days). A significant intervention effect was found for both MVPA ( $p < 0.0001$ ) and SED minutes ( $p = 0.0004$ ). With children attending the intervention centers getting 5.8 minutes more MVPA and 15.2 minutes less sedentary time each day.

**Conclusions:** This study employs compelling research design and measures to address an important gap in the empirical literature. Results suggest that FV gardening within childcare centers may be an effective strategy to encourage physical activity early in life.

# Play Active Program for Early Childhood Education and Care: A Pragmatic RCT

**Associate Professor Hayley Christian**<sup>1,2</sup>, Dr. Andrea Nathan<sup>1</sup>, Ms. Emma Adams<sup>1,2</sup>, Dr. Matthew McLaughlin<sup>1</sup>, Ms. Phoebe George<sup>1,2</sup>, Ms. Elizabeth Wenden<sup>1,2</sup>, Prof. Stewart Trost<sup>3</sup>, Prof. Jasper Schipperijn<sup>4</sup>, Associate Professor Kevin Murray<sup>2</sup>

<sup>1</sup>Telethon Kids Institute, University of Western Australia, Perth, Australia, <sup>2</sup>School of Population and Global Health, The University of Western Australia, Perth, Australia, <sup>3</sup>School of Human Movement and Nutrition Sciences, University of Queensland, Brisbane, Australia, <sup>4</sup>Department of Sports Science Clinical Biomechanics, University of Southern Denmark, Odense, Australia

**Award Session - Early care and education | Young Adults, K1 (+K2), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Early Childhood Education and Care (ECEC) services are important for supporting young children to establish positive physical activity (PA) and sedentary behaviours (SB), yet many children do not achieve movement guidelines. Play Active is an evidence-informed PA policy intervention combined with resources and training to enable ECEC services to successfully implement their policy. SB findings from the Play Active pragmatic cluster randomised trial will be presented.

**Methods:** In 2021-22 a pragmatic trial to test the effectiveness and implementation of the Play Active intervention was conducted with 81 ECEC services (646 educators) in Perth, Western Australia. Educator practices associated with children's PA and SB (sitting and screen time, confining equipment use e.g., highchairs) were assessed using established items (EPAO, NAPSACC, PLAYCE) in an online survey. Services randomised to the intervention (n=40) selected 3-5 policy strategies to employ during the 3-month trial implementation period. 38% selected at least one SB-focused policy strategy. Process evaluation outcomes included awareness, fidelity, reach, and acceptability of the intervention and implementation strategies. Analysis included descriptive statistics and generalised linear mixed effects models.

**Results/findings:** Intervention group educators reported high awareness of the Play Active policy recommendations (90%). Play Active acceptability was high for both educators (83%) and directors (78%). Fidelity and reach were high for most implementation strategies (75%-100%). There was a significant increase in the uptake of policy practices, however there were no changes in educator practices related to child sedentary time or use of confining equipment. Approximately 80% of children were expected to sit for <20 minutes at a time and 65% had zero minutes of screen time/day.

**Conclusions:** The Play Active intervention resulted in increased uptake of policy practices. However, there was no change in educator practices related to child sedentary time, which may be explained by the policy focus on PA, the relatively short 3-to-5-month policy implementation period and extensive staff turnover and shortages exacerbated by the impact of COVID-19 on the ECEC sector. Importantly, Play Active had high awareness, acceptability, fidelity and reach. Future research should investigate the effectiveness of Play Active over longer implementation periods and its potential for scale up.

# What predicts food and physical activity tracking among young adults: Results from the longitudinal Canadian NDIT study

Dr. Erin K. O'Loughlin<sup>1,2</sup>, **Ms. Maryam Marashi**<sup>2</sup>, Ms. Catherine M. Sabiston<sup>2</sup>, Dr. Kristen M. Lucibello<sup>2</sup>, Dr. Marie-Pierre Sylvestre<sup>1,3</sup>, Dr. Jennifer L. O'Loughlin<sup>1,3</sup>

<sup>1</sup>Centre de recherche du centre hospitalier de l'Université de Montréal (CRCHUM), Montreal, Canada, <sup>2</sup>Faculty of Kinesiology and Physical Education, University of Toronto, Toronto, Canada, <sup>3</sup>Department of Social and Preventive Medicine, Université de Montréal, Montreal, Canada

**Award Session - Early care and education | Young Adults, K1 (+K2), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** J. Young Adults

**Background & objective:** Monitoring food intake and physical activity (PA) using tracking applications may support behavior change. However, few longitudinal studies identify the characteristics of people who track their behavior, findings that could be useful in the design and targeting of tracking-related interventions. Our objective was to identify predictors of past-year food and PA tracking among young adults.

**Methods:** Data were available for 676 young adults participating in the ongoing longitudinal Nicotine Dependence in Teens Study. Potential predictors were measured in 2017-20, and past-year food and PA tracking were measured in 2021-22 at age 34. Each potential predictor was studied in a separate multivariable logistic regression model controlling for age, sex, and educational attainment.

**Results:** One-third (37%) of participants reported past-year PA tracking and 14% reported past-year food tracking (10% reported both). Attended university, higher household income, being employed, meeting MVPA guidelines, compensatory behaviors after overeating, self-report overweight, trying to lose weight, higher identified behavior regulation, reporting a variety of exercise behaviors, pressure to lose weight, and eating disorder diagnosis predicted past-year PA tracking. Female sex, compensatory behaviors after overeating, self-report overweight, trying to lose weight, body-related embarrassment, higher introjected regulation, reporting a wide variety of exercise behaviors, and pressure to lose weight predicted past-year food tracking.

**Conclusion:** Food and PA tracking is relatively common among young adults. However, the association between tracking and maladaptive behaviors (such as compensatory behaviors after overeating) and the link between tracking and eating disorders, warrant further investigation.

# Effect of Capacity Building Interventions on Classroom Teacher and Early Childhood Educator Perceived Capabilities, Knowledge, and Attitudes Relating to Physical Activity and Fundamental Movement Skills: A Systematic Review and Meta-Analysis

**Dr. Matthew Bourke**<sup>1</sup>, Miss Ameena Haddara<sup>1</sup>, Mr. Aidan Loh<sup>1</sup>, Miss Kendall Saravanamuttoo<sup>1</sup>, Dr. Brianne Bruijns<sup>1</sup>, Dr. Patricia Tucker<sup>1</sup>

<sup>1</sup>Western University, London, Canada

**Award Session - Implementation & scalability | Policies and environments, UKK - Hall C (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**BACKGROUND:** Classroom teachers and early childhood educators (ECEs) play an important role in promoting physical activity and fundamental movement skills in children. However, teachers face several barriers to promoting physical activity and fundamental movement skills, including inadequate training and professional development. Capacity building interventions, such as training and professional development workshops, provision of resources, or communities of practise, may improve teachers' and ECEs' perceived capabilities, knowledge, and attitudes related to physical activity and fundamental movement skills.

**PURPOSE:** This systematic review and meta-analysis aimed to determine the efficacy of capacity building interventions on teachers' and ECEs' perceived capabilities, knowledge, and attitudes relating to physical activity and fundamental movement skills.

**METHODS:** An exhaustive literature search of six electronic databases was conducted and machine-learning assisted systematic review was used to identify relevant studies. Controlled trials and single-group pre-post studies were included if they measured the effect of a capacity building intervention on in-service or pre-service classroom teachers' or ECEs' physical activity or fundamental skills related perceived capabilities, knowledge, or attitudes. The effects of interventions were synthesised using random effects meta-analysis.

**RESULTS:** A total of 22 studies reporting on 25 unique samples were included in the meta-analyses. A total of 19 studies reported on perceived capabilities, eight studies reported on knowledge, and eight studies reported on attitudes. Interventions most commonly included training/professional development, resources and toolkits, communities of practice, mentorships, and ongoing support. Results showed that capacity building interventions significantly improved teachers' and ECEs' perceived capabilities ( $g = 0.614$ , 95% CI = 0.442, 0.786), knowledge ( $g = 0.792$  95% CI = 0.459, 1.125), and attitudes ( $g = 0.376$  95% CI = 0.181, 0.571).

**CONCLUSION:** Findings from this review provide strong support that capacity building interventions are efficacious at improving teachers' and ECEs' perceived capabilities, knowledge, and attitudes related to promoting physical activity and teaching fundamental movement skills. Pre-service teachers and ECEs should be provided training in physical activity and fundamental movement skills as part of their degrees, and continual professional development and capacity building should be offered to in-service teachers and ECEs to promote physical activity and fundamental movement skills in children.

# The effects of the “Grow Green” urban greening improvements on physical activity and other wellbeing behaviours in Manchester UK: A natural experimental study

Dr. Jamie Anderson<sup>1</sup>, **Dr. Jack Benton**<sup>1</sup>, Dr. Matthew Dennis<sup>1</sup>, Prof. James Rothwell<sup>1</sup>, Dr. Jack Wilkinson<sup>1</sup>, Prof. David French<sup>1</sup>

<sup>1</sup>University of Manchester, Manchester, United Kingdom

**Award Session - Implementation & scalability | Policies and environments, UKK - Hall C (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** There is a dearth of robust natural experimental studies examining the effects of urban green space interventions on physical activity and wellbeing. The aim of this study was to examine the impact of a new sustainable “sponge park” in a deprived and high flood-risk area in Manchester (UK) on park use, physical activity and other wellbeing-promoting behaviours. The 1.4-hectare park was co-designed with the local community and includes rain and sunken gardens, a permeable piazza, play equipment and biodiverse planting.

**Methods:** Two comparison sites were matched to two intervention sites using eight correlates of physical activity at neighbourhood (e.g., population density) and site levels (e.g., pedestrian infrastructure). All sites were in the 10% most deprived areas in the UK. The primary outcome (observed walking) and secondary outcomes (vigorous physical activity, socialising, taking notice) were assessed using the MOHAWk behaviour observation tool. Observations involved baseline data collection (2018) before the intervention was implemented in 2020, and follow-ups at 3-months (2020) and 15-months (2021) post-intervention. Negative binomial regression models were used to estimate the effects of the intervention compared to the comparison group, controlling for key covariates. Intercept surveys were also used to assess self-reported outdoor space usage in the intervention and control sites at baseline and 12-months post-intervention.

**Results:** Compared to the comparison sites, the total number of people observed walking at the intervention park increased at 3-months (incidence rate ratio (IRR) 2.18, 95% CI 1.07–4.43) and 15-months post-intervention (IRR 3.44, 95% CI 2.11–5.62). There were also similar observed increases at the intervention sites compared to the comparison sites in vigorous physical activity, socialising and taking notice. Self-reported increases in outdoor space usage from baseline to follow-up were twice as large in the intervention sites compared to the comparison sites.

**Conclusions:** Creating sustainable parks is a promising intervention to encourage walking and support wellbeing activities, especially within deprived areas. Interventions that involve community collaboration may be particularly effective. More robust natural experimental studies like this are now needed to inform policy and decision-makers on the effectiveness of a wider range of urban green space interventions in different contexts.

# Environmental impact of Norwegian self-selected diets and potential benefits of transitions to diets consistent with national and international dietary guidelines

**Ms. Julie Lengle<sup>1</sup>**, Ms. Marie Michaelsen Bjøntegaard<sup>1</sup>, Associate Professor Monica Hauger Carlsen<sup>1</sup>, Prof. Lene Frost Andersen<sup>1</sup>

<sup>1</sup>University of Oslo, Oslo, Norway

**Award Session - Implementation & scalability | Policies and environments, UKK - Hall C (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The purpose of this study was to determine the environmental impact of current Norwegian diets, measured by global warming potential (GWP, kg CO<sub>2</sub>-eq), acidification (ACID, kg SO<sub>2</sub>-eq), freshwater- (EUTF, kg P-eq) and marine eutrophication (EUTM, kg N-eq), water use (WU, m<sup>3</sup>), and land use (LU/LUC, m<sup>2</sup>a). Further, the analysis aimed to compare the environmental impact of the current diet with two scenarios based on the Norwegian Food-Based Dietary Guidelines (FBDGs) and the EAT-Lancet Planetary Health Diet.

**Methods:** Information on current consumption was derived from the Norwegian national dietary survey Norkost 3 (2x24-hour recall; n= 1,787; ages 18-71 years). The two modelled diets were designed to follow the respective guidelines while mimicking the current diet in terms of food choices. Environmental impact values were estimated using a newly developed database including cradle-to-fork life cycle assessment values for foods on the Norwegian market.

**Results:** The food groups contributing most to environmental impact of current Norwegian diets were meat and meat products (GWP, EUTF, ACID, LU/LUC), dairy and dairy products (WU), and cereal grains and cereal grain products (EUTM). Women on average had lower total dietary environmental impact per day than men (25-45% lower across all impact categories), largely due to disparities in energy intake.

Transitioning to a diet following the Norwegian FBDGs resulted in reductions in GWP, EUTF, ACID, WU, LU/LUC, ranging from 4-26%, while an increase was observed for EUTM. Further, a transition to a diet falling within EAT-Lancet Planetary Health Diet ranges resulted in 17-67% reductions in all impact category totals.

**Conclusions:** To our knowledge, this is the first study to estimate the environmental impact of self-reported Norwegian diets using nationally representative environmental impact data. Results indicate that overall environmental burden of Norwegian diets is in line with that seen in other Scandinavian countries and Western Europe, and that an adjustment to diets following the national FBDGs could lead to reductions across multiple impact categories. Further, a more dramatic shift to a diet following EAT-Lancet guidelines could offer additional environmental benefits.

# Using sequential randomised and controlled trials to optimise a physical activity policy implementation strategy: the PACE case study

**Dr. Cassandra Lane**<sup>1,2,3</sup>, Dr. Nicole Nathan<sup>1,2,3</sup>, Dr. Alix Hall<sup>1,2,3</sup>, Mr. Adam Shoesmith<sup>1,2,3</sup>, Prof. Luke Wolfenden<sup>1,2,3</sup>

<sup>1</sup>The University of Newcastle, Newcastle, Australia, <sup>2</sup>Hunter New England Population Health, Newcastle, Australia, <sup>3</sup>Hunter Medical Research Institute, New Lambton Heights, Australia

**Award Session - Implementation & scalability | Policies and environments, UKK - Hall C (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** In the field of public health, optimisation processes (cyclical and data-driven) are increasingly recognised for their potential to improve interventions and maximise health impacts; however, the experimental methods vary greatly. Here, we describe a novel optimisation approach, via sequential randomised and controlled trials (RCTs), that we successfully used to improve a school-based physical activity policy implementation intervention known as *Physically Active Children in Education* (PACE).

**Methods:** In response to an identified need to enhance the suitability of PACE for delivery at scale, we embarked on an optimisation project to improve PACE using a series of three RCTs conducted in primary schools in NSW, Australia. Within each trial we collected data on effectiveness, costs and implementation indicators (e.g., acceptability, fidelity, qualitative feedback) to inform incremental improvements. Effectiveness data was used to ensure that PACE remained an effective model for policy implementation. Other data were used to weigh the relative impact and cost of discrete PACE components to determine, in consult with stakeholders, where potential adaptations could be made.

**Results:** *Trial 1:* A 2017 pilot study in 12 schools showed the efficacy of PACE: school's policy implementation improved leading to increased physical activity of students. Minor changes were made to delivery of components and addition of three components to address outstanding barriers. *Trial 2:* A 2018 implementation-effectiveness trial in 61 schools showed that PACE was effective and cost-effective. Three components that were costly and challenging for scale-up due to in-person delivery were adapted to distance delivery (Adapted PACE). *Trial 3:* A 2019 noninferiority trial in 48 schools showed that Adapted PACE minimised the relative cost of delivery without losing its meaningful effect on policy implementation. The remaining in-person components were adapted for the option of online delivery.-

**Conclusion:** The optimisation of PACE is the first of its kind to employ sequential RCTs to improve an implementation strategy. Through this process we identified a scalable PACE model that is as effective as possible within the resource constraints of end-users (delivery providers and schools). This approach was well-suited to our research setting and may set precedence for optimisation research undertaken in similar contexts.

# Optimising the effectiveness, cost effectiveness, reach and adoption of a school nutrition intervention for national scale up

**Dr. Rachel Sutherland**<sup>1,2,3,4</sup>, Dr. Jannah Jones<sup>1,2,3,4</sup>, Mrs. Alison Brown<sup>1,2,3,4</sup>, Dr. Courtney Barnes<sup>1,2,3,4</sup>, Mrs. Lisa Janssen<sup>1</sup>, Prof. Luke Wolfenden<sup>1,2,3,4</sup>

<sup>1</sup>University Of Newcastle, Newcatsle, Australia, <sup>2</sup>Hunter New England Population Health, Newcastle, Australia,

<sup>3</sup>National Centre for Implementation Science, Newcastle, Australia, <sup>4</sup>Hunter Medical Research Institute, Newcastle, Australia

**Award Session - Implementation & scalability | Policies and environments, UKK - Hall C (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Background:** Everyday in Australia, almost 2 million primary school aged children pack a school lunchbox, containing on average, three serves of discretionary foods. Despite the size of the problem, limited interventions targeting the nutritional quality of school lunchboxes exist. We aim to outline the optimisation process to design and scale-up a school nutrition intervention that is effective at improving the nutritional quality of school lunchboxes that can be implemented with high fidelity, low cost and achieve high reach.

**Methods:** A series of sequential studies were undertaken which aimed to optimise the effectiveness, cost effectiveness, reach and adoption of a school nutrition intervention. An mHealth intervention was developed targeting parents lunchbox packing behaviours. The process to optimise the mHealth intervention included: 1) Formative research to identify parental barriers to packing healthier lunchboxes; 2) a pilot cluster RCT to assess the feasibility, acceptability, effectiveness and cost effectiveness of the mHealth intervention (n= 12 schools, 3022 students); 3) an optimisation study designed to increase parental engagement with the intervention (n=511 parents); 4) a hybrid implementation-effectiveness trial conducted across a broad range of schools to determine effectiveness of the intervention on discretionary lunchbox energy, cost effectiveness and potential for scale-up (n= 32 schools); 5). Comparative effectiveness research to identify core intervention components and 6) dissemination strategies were piloted to inform scale-up to increase program adoption.

**Results:** The mHealth intervention aimed to address four key parental barriers to packing healthier lunchboxes including child preference, convenience, time, and cost. The pilot RCT was effective at increasing lunchbox energy from healthier foods aligned to dietary guidelines (79.2kJ, p=0.04), was acceptable to 95% of parents at a cost of \$31/student. Using optimised parental messages, the implementation-effective trial was effective at decreasing discretionary foods packed in school lunchboxes (--117.26kJ, p=<0.01), at a cost of \$6.02, which was further reduced to \$0.07/student following comparative effectiveness research.

**Conclusions:** The use of sequential studies resulted in the development of an effective, cost effective and highly scalable school nutrition intervention. Dissemination strategies have been identified to inform a national scale-up.

# Investments in community-wide initiative in physical activity: how do we evaluate its implementation and public participation?

**Mr. Narakorn Wongsingha<sup>1</sup>**, Dr. Dyah Anantalia Widyastari<sup>2</sup>, Associate Professor Piyawat Katewongsa<sup>2</sup>

<sup>1</sup>Thailand Physical Activity Knowledge Development Centre (TPAK), Institute for Population and Social Research, Mahidol University, Nakhon Pathom, Thailand, <sup>2</sup>Institute for Population and Social Research, Mahidol University, Thailand Physical Activity Knowledge Development Centre (TPAK), Nakhon Pathom, Thailand

**Award Session - Implementation & scalability | Policies and environments, UKK - Hall C (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Inequality in accessing physical activity (PA) amenities has been shown as a consistent predictor of low levels of PA among the underprivileged population. Community-wide initiative interventions, therefore, are expected to narrow the gaps of inequalities in access and create more opportunities for PA. This study aims to evaluate community-wide program/policies, in terms of their availability, implementation and public participation.

**Methods:** Policy availability was assessed by using Comprehensive Analysis of Policy on Physical Activity (CAPPA) framework in terms of the stage of policy cycle, policy sector, type of policy and policy level - whether each investment covered international, national, subnational, regional or institutional/local. The weighted score is expressed in percentage. Data for evaluating policy implementation and public participation was driven from Thailand's Surveillance on Physical Activity 2021 comprising 7,665 national representative samples from 77 provinces. Policy implementation and public participation was assessed from the public perception and participation in the community-wide initiative programs/policies. Descriptive analysis was employed to evaluate the availability, implementation and participation rate, whereas binary logistic regression was applied to examine sociodemographic factors associated to participation rate.

**Results:** The availability of community-wide initiative policies scored 43.5%, suggesting there have been inadequate amounts of policies/programs available either at the national or community level. Only 11.6% of the investments were accessible to the public, and only 8.7% of the community participated in the programs. Females (OR 0.759, p-value 0.000) and children/ adolescents (OR 0.576, p-value 0.000) were less likely to access and participate in the programs compared to males and adults. Those with secondary and post-secondary education are more likely to participate in community-wide initiative programs than their counterparts with lower educational attainment. Regional differences also determine participation rate to community-wide investments.

**Conclusion:** Low accessibility and public participation in community-wide initiative investments indicated that the existing policies have not been able to serve the whole community members. To improve access and participation rate of community-wide initiative programs, future investments should consider to address more the underprivileged in order to provide a more-equitable access to all community members.

# Drivers with and without obesity respond differently to a multi-component health intervention in heavy goods vehicle drivers

**Miss Katharina Ruettger**<sup>1</sup>, Prof. Stacy A Clemes<sup>1,2</sup>, Dr. Yu-Ling Chen<sup>1</sup>, Dr. Charlotte L Edwardson<sup>2,3</sup>, Dr. Amber Guest<sup>1</sup>, Dr. Nicholas D Gilson<sup>4</sup>, Prof. Laura J Gray<sup>5</sup>, Mrs. Vicki Johnson<sup>6</sup>, Dr. Nicola J Paine<sup>1,2</sup>, Dr. Aron P Sherry<sup>1,2</sup>, Dr. Mohsen Sayyah<sup>1</sup>, Mrs. Jacqui Troughton<sup>6</sup>, Dr. Veronica Varela-Mato<sup>1,2</sup>, Prof. Tom Yates<sup>2,3</sup>, Dr. James A King<sup>1,2</sup>

**Award Session - Motivation and Behavior Change | e- & mHealth, UKK - Level 6 Foyer, June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Introduction:** Physical inactivity and obesity are widely prevalent in Heavy Goods Vehicle (HGV) drivers. We analysed whether obesity classification influenced the effectiveness of a bespoke structured lifestyle intervention (SHIFT study) for HGV drivers.

**Methods:** The SHIFT programme was evaluated within a cluster randomised controlled trial, across 25 transport depots in the UK. After baseline assessments, participants within intervention sites received a 6-month multi-component health behaviour change intervention. Intervention responses (verses control) were stratified by obesity status (BMI <30 kg/m<sup>2</sup>, n = 131; BMI ≥30 kg/m<sup>2</sup>, n = 113) and compared using generalised estimating equations.

**Results:** At 6-months, favourable differences were found in daily steps (adjusted mean difference 1827 steps/day, p<0.001) and sedentary time (adjusted mean difference -57 mins/day, p<0.001), in drivers with obesity undertaking the intervention, relative to controls with obesity. Similarly, in drivers with obesity, the intervention reduced body weight (adjusted mean difference -2.37 kg, p=0.002) and led to other favourable anthropometric outcomes, verses controls with obesity. Intervention effects were absent for drivers without obesity, and for all drivers at 16-18 months.

**Conclusion:** Obesity classification influenced HGV drivers' behavioural responses to a multi-component health-behaviour change intervention. Therefore, the most at-risk commercial drivers appear receptive to a health promotion programme.

# The annual rhythms in physical activity, sedentary behavior and sleep of Australian adults: a prospective cohort study

**Mr. Ty Ferguson**<sup>1</sup>, Dr. Rachel Curtis<sup>1</sup>, Dr. François Frayssé<sup>1</sup>, Prof. Timothy Olds<sup>1</sup>, Dr. Dorothea Dumuid<sup>1</sup>, Prof. Wendy Brown<sup>2</sup>, Prof. Adrian Esterman<sup>1</sup>, Prof. Carol Maher<sup>1</sup>

<sup>1</sup>University of South Australia, Adelaide, Australia, <sup>2</sup>University of Queensland, Brisbane, Australia

**Award Session - Motivation and Behavior Change | e- & mHealth, UKK - Level 6 Foyer, June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Physical activity, sedentary behavior and sleep have fundamental impacts on health and well-being. Their sociodemographic and environmental correlates are well understood. Far less is known about how these behaviors fluctuate across the year. The aim was to explore how device-measured movement patterns change across the week, seasons, and around temporal events (Christmas-New year, daylight saving time [DST] transitions).

**Methods:** This cohort study included 368 parents from Adelaide, Australia (mean age = 40.2 years [SD = 5.9]) who wore Fitbit activity trackers 24 hours a day for 12 months. Minute-by-minute data on sleep, sedentary behavior (SB), light physical activity (LPA), and moderate-to-vigorous physical activity (MVPA) was collected using purpose-design “FitnessLink” data capture software. Temporal patterns of each behavior were analysed descriptively. Associations with specific temporal cycles (day of the week, season) and events (Christmas-New year, DST transitions) were explored using multi-level mixed-effects linear regression.

**Results:** Movement patterns varied significantly ( $p < 0.05$ ) by day of the week and season, and at annual events. Participants slept more on weekends relative to weekdays (+32 min/day), during autumn and winter relative to summer (+4 and +11 min/day), and over Christmas-New Year relative to the week before the holiday (+24 min/day), and slept less in the week after DST ended (April) relative to the week prior (-7 min/day). Participants had longer sedentary time on weekdays, during winter, after Christmas-New Year and after DST ended (+45, +7, +12 and +8 min/day respectively). They also had more LPA in autumn, winter, and during and after Christmas-New Year (-6, -15, -17 and -31 min/day respectively). Finally, participants had less MVPA on weekends and during winter (-5 min/day and -2 min/day respectively). Across the year, 14-day moving averages varied by 30 min/day for sleep (6% of mean sleep duration), 35 min/day for sedentary behavior (6%), 43 min/day for LPA (14%) and 7 min/day for MVPA (21%).

**Conclusions:** Movement behavior fluctuations associated with temporal events are overlaid on a weekly and seasonal rhythm. Understanding these fluctuations may inform the design and timely implementation of health promotion campaigns and interventions.

# Bridging the Gap: Development and evaluation of digital tools to support adoption and implementation of the New Zealand Healthy Food and Drink Policy

**Miss Magda Rosin<sup>1</sup>**, Dr. Sally Mackay<sup>1</sup>, Mrs. Elaine Umali<sup>2</sup>, Prof. Cliona Ni Mhurchu<sup>2</sup>

<sup>1</sup>School of Population Health, Faculty of Medical and Health Sciences, The University of Auckland, Auckland, New Zealand, <sup>2</sup>National Institute for Health Innovation, The University of Auckland, Auckland, New Zealand

**Award Session - Motivation and Behavior Change | e- & mHealth, UKK - Level 6 Foyer, June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** A voluntary National Healthy Food and Drink Policy was released in 2016 to improve the healthiness of food and drinks for staff and visitors in New Zealand healthcare facilities and other public sector organizations. However, tools to support policy implementation were not developed, representing a significant gap. This study aimed to design, develop and evaluate a new tool to support food providers in implementing the National Policy.

**Methods:** The Double Diamond Model was used to co-design and co-develop a new web-based tool. Authors' previous research findings: (i) systematic review of barriers and enablers to workplace healthy food policy implementation, (ii) review of current supportive tools and resources, and (iii) interviews with food providers and public health professionals in New Zealand healthcare facilities, were used by a user experience (UX) designer in the Discover and Define phases. The MoSCoW framework was used to prioritize the functions and features of the prototype. During the Develop phase, project stakeholders and advisers provided feedback on the low-fidelity prototype used in the subsequent stages. UX testing of the high-fidelity prototype through interactive interviews with the end users (food providers) will be completed in the Deliver phase early in 2023. UX testing data will be used to organize and prioritize identified issues to improve the tool's usability.

**Results/findings:** A new digital tool, Healthy Kai (Food) Finder, a searchable packaged food and drink product database, was identified as the most necessary tool to support Policy implementation. Essential functions were basic and advanced searches for policy-compliant products, sorting list options, and compiling a list of selected products. Future features included reporting products missing from the database and the ability for users to self-assess products and recipes against the Policy's criteria.

**Conclusion:** Comprehensive research informing the development of the Healthy Kai Finder, and UX testing with food providers, will enhance the acceptance and usability of the new digital tool. Incorporation of more functions to support implementation of healthy food policies, with the possibility of including foods/drinks compliant with school food policies in the tool's database, would increase Healthy Kai Finder's usefulness.

# Could supporting routinization be key to improving physical activity?

**Dr. Dot Dumuid**<sup>1</sup>, Prof. Tim Olds<sup>1</sup>, Dr. Francois Frayssé<sup>1</sup>, Prof. Wendy Brown<sup>2</sup>, Dr. Ben Singh<sup>1</sup>, Dr. Rachel Curtis<sup>1</sup>, Dr. Ty Ferguson<sup>1</sup>, Prof. Adrian Esterman<sup>1</sup>, Dr. Gilly Hendrie<sup>3</sup>, Prof. Carol Maher<sup>1</sup>

<sup>1</sup>University of South Australia, Adelaide, Australia, <sup>2</sup>University of Queensland, Brisbane, Australia,

<sup>3</sup>Commonwealth Scientific and Industrial Research Organisation (CSIRO), Adelaide, Australia

**Award Session - Motivation and Behavior Change | e- & mHealth, UKK - Level 6 Foyer, June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** It is difficult to increase physical activity (which necessitates compensatory changes in other daily activities), as people quickly return to their old habits once interventions finish. Embedding behavior change in daily routines may be the key to ongoing success. This study aimed to explore how routinization was associated with prospective variation in daily 24-h activity behaviors over a full year, and to examine cross-sectional associations with these behaviors.

**Methods:** At baseline, participants in the ARIA study (n=340, mean age=40y (SD 6), 56% female) completed an 8-item routinization questionnaire. For the 13 months following, they wore Fitbit activity trackers from which daily times spent in moderate-to-vigorous physical activity, light physical activity, sedentary behavior and sleep were derived. Total variation in these behaviors was calculated for each participant using the sum of the values in their 13-month day-to-day compositional variation matrix. Mixed models to account for clustering within families were used to regress the routinization score (independent) against total activity variation (dependent), and to regress routinization (independent) against the baseline (averaged over first month) 24-hour activity composition (independent). All models were adjusted for age, sex, education and study cohort.

**Results:** Higher routinization was associated with lower day-to-day total activity variation over the 13 months (std beta -0.22, p<0.001). Routinization was associated with the baseline activity composition (ChiSq 8.7, p=0.03). A +1 SD difference in routinization was associated with 15 min/d less sedentary behavior, which was compensated by +9 min/d light physical activity, +4 min/d sleep and +2 min/d moderate-to-vigorous physical activity.

**Conclusion:** Subjective measurement of routinization broadly aligns with device measured daily activity variation. Stronger routinization appears to be beneficially related to daily 24-hour activity behaviors. Understanding how to strengthen routinization may contribute to the success of activity behavior interventions.

# Using the Intervention Mapping Framework to develop a mHealth Snackivity™ intervention to promote physical activity

**Dr. James Sanders<sup>1</sup>**, Dr. Kajal Gokal<sup>1</sup>, Mr. Jonah Thomas<sup>1</sup>, Dr. Jonathan Rawstorn<sup>2</sup>, Prof. Lauren Sherar<sup>1</sup>, Prof. Ralph Maddison<sup>2</sup>, Prof. Colin Greaves<sup>3</sup>, Dr. Dale Esliger<sup>1</sup>, Prof. Amanda Daley<sup>1</sup>

<sup>1</sup>Loughborough University, Loughborough, United Kingdom, <sup>2</sup>Deakin University, Victoria, Australia, <sup>3</sup>University of Birmingham, Birmingham, United Kingdom

**Award Session - Motivation and Behavior Change | e- & mHealth, UKK - Level 6 Foyer, June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Background:** Few people meet the weekly recommended guidelines for participation in physical activity, which is unlikely to change without the development and implementation of innovative interventions. One such intervention is Snackivity™. Snackivity™ is a novel and complementary approach that could motivate people to be physically active. It focuses on promoting short (2–5 min) and frequent bouts, or ‘snacks’ of physical activity throughout the whole day. The use of mobile health technologies has been suggested as a mechanism to implement innovative health behaviour change interventions, such as Snackivity™, at scale. This study reports the systematic, theory-driven processes and user testing applied to develop a smartphone-based physical activity application called SnackApp, that aims to support the public with their participation in Snackivity™.

**Methods and Results:** Intervention mapping was used to develop the SnackApp via a six-step process. These steps included a needs assessment and the identification of the determinants of physical activity and behaviour change techniques. SnackApp was based on control theory and the habit formation model. The SnackApp was linked with a wearable device (Fitbit Versa Lite) to facilitate automated capture of Snackivity™. To promote participation in Snackivity™ the SnackApp includes the provision for goal setting, activity planning and social support. The SnackApp was user-tested for 28-days in 15 inactive adults. App engagement (as measured by mobile app analytics) was analysed to determine SnackApp usage to aid further app development.

Over the 28-day study period participants engaged with the SnackApp on average 77 times, for an average total SnackApp time use of 12.6 mins/p/w, with most of this time spent on the SnackApp dashboard (14 bouts lasting 7.5 minutes p/w). On average, engagement with SnackApp was higher among males than females when considering overall use. App rating score (User Mobile Application Rating Scale) was 3.5/5 suggesting the SnackApp was rated as moderate to good on this scale.

**Conclusion:** User testing of the SnackApp suggests that physically inactive adults are keen to engage with novel interventions such as Snackivity™ to promote their participation in physical activity. The SnackApp was considered useful to support engagement with Snackivity™.

# Operationalizing behavioral theory in a communications campaign to improve physical activity (PA) parenting behaviors

**Ms. Breanne Wilhite<sup>1</sup>**, Dr. Erin Hennessy, PhD, MPH<sup>1</sup>, Dr. Christina Economos<sup>1</sup>, Dr. Jennifer Sacheck<sup>2</sup>, Ms. Rachel Zive<sup>3</sup>, Ms. Christine Odalen<sup>3</sup>, Ms. Stephanie Herrick<sup>3</sup>, Dr. Daniel Hatfield<sup>1</sup>

**Award Session - Motivation and Behavior Change | e- &mHealth, UKK - Level 6 Foyer, June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Theory-based strategies are considered best-practice for effective behavior change, yet few studies document how theoretical constructs are operationalized in intervention materials. This study elucidates how two behavior change theories were used to inform a 20-week multichannel communications campaign, nested within a multilevel (school-home) intervention.

**Methods:** Parent communications development included three stages: (1) formulation of evidence-based objectives for improving physical activity (PA) parenting behaviors; (2) identification of priority constructs from Social Cognitive Theory (SCT) and Self Determination Theory (SDT) to advance objectives; (3) operationalization of SCT/SDT constructs in parent communication messages. Messages were deployed during a 20-week pilot trial through printed materials and electronic channels, such as email, text message, Facebook, and activity videos.

**Findings:** Evidence-based objectives for PA parenting behaviors included parental role modeling, social support, and praise/encouragement. For role modeling, priority constructs included knowledge, outcome expectations, observational learning, behavioral skills, self-efficacy, and collective efficacy (SCT) and perceived competence (SDT) (sample message: *"What's your favorite way to add more movement to your day? Adults play a powerful role in helping their kids stay active and healthy. Talk to your kids today about fun and enjoyable ways that you can all be more active together!"*). For social support, priority constructs included knowledge, self-efficacy, overcoming barriers (SCT) and autonomy (SDT) (sample message: *"Creativity doesn't just happen in art class - it can happen in physical activity, too! Getting creative can help your family to get active in fun and new ways, and you don't need a ton of space."*). For praise/encouragement, priority constructs included setting goals and intentions, reinforcement, self-efficacy and collective efficacy (SCT) and perceived competence (SDT) (sample message: *"Giving specific, descriptive feedback encourages kids to keep working at being their very best."*).

**Conclusions:** This study makes a novel contribution to the research by detailing how behavior-change theories can be operationalized in messages to improve PA parenting behaviors. This methodology is valuable for others seeking to translate theoretical constructs into behavior-change messages.

# The accumulation of social vulnerabilities directly associates with obesity and weight gain over adolescence.

**Dr. Juan Miguel Fernández-Alvira<sup>1</sup>**, Mr. Jesús Martínez-Gómez<sup>1</sup>, Miss Patricia Bodega<sup>1,2</sup>, Miss Amaya de Cos-Gandoy<sup>1,2</sup>, Miss Mercedes de Miguel<sup>1,2</sup>, Dr. Anna Tresserra-Rimbau<sup>3,4</sup>, Miss Camila Arancibia-Riveros<sup>3</sup>, Dr. Emily Laveriano-Santos<sup>3,4</sup>, Miss Ana Ruíz-León<sup>5</sup>, Dr. Ramón Estruch<sup>4,5</sup>, Prof. Rosa M Lamuela-Raventós<sup>3,4</sup>, Dr. Gloria Santos-Beneit<sup>1,2,6</sup>, Dr. Rodrigo Fernández-Jiménez<sup>1,7,8</sup>

**Award Session - Socio-economic inequalities | Participatory research in health promotion, UKK - K3+4 (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose.** Childhood obesity usually presents a socioeconomic gradient with higher prevalence in children and adolescents from lower socioeconomic status families, especially in high-income countries. However, less is known about the effect of the accumulation of several social vulnerabilities over time on adolescent's weight status. The main purpose of this study was to explore cross-sectional and prospective associations between the accumulation of social vulnerabilities and weight status in adolescents in Spain.

**Methods.** This study includes data from a large cohort of adolescents enrolled in the SI! Program for Secondary Schools trial in Spain, evaluated at baseline [n=1282 (48.0% girls; 12.5(0.5) years)], at 2-year [n=1174 (48.0% girls; 13.9(0.4) years)] and at 4-year [n=1067 (47.7% girls; 15.8 (0.4) years)] follow-ups. Four socioeconomic vulnerabilities were taken into account to construct a socioeconomic vulnerability score, namely low household income, low parental education, a migrant background (at least one parent/caregiver born outside Spain), and parental unemployment (at least one parent unemployed or living on social assistance). Obesity was defined according to age- and sex-adjusted z-scores using validated cut-off points for body mass index (BMI) at each assessment. Associations between vulnerabilities and BMI/obesity were analysed using generalized linear and Poisson distribution-adjusted models.

**Results.** At baseline, 9.7% of participants presented obesity. Compared to adolescents without any, participants exposed to "one" or "2 or more" socioeconomic vulnerabilities at baseline presented higher obesity prevalence ratio (PR: 1.93 (95% CI:1.65-2.24) and PR: 3.01 (95% CI: 2.79-3.24), respectively). This obesity gradient was observed throughout the study and accentuated over time, especially when considering adolescents with "2 or more" vulnerabilities [2-year follow-up PR: 3.91 (95% CI:2.15-7.10); 4-year follow-up PR: 4.25 (95% CI: 4.25-4.26)]. Additionally, weight gain over time was significantly higher in participants accumulating "2 or more" vulnerabilities compared to adolescents without any [between-group difference in z-BMI between baseline and 4-year follow-up: 0.11 (95% CI: 0.03-0.18)].

**Conclusions.** A significant gradient in obesity linked to the exposure to social disadvantages in adolescents was found, being stronger as the number of vulnerabilities increased and as the adolescent aged. Therefore, tailored preventive policy actions are required in adolescents, particularly targeting the most vulnerable groups.

# Socioeconomic inequalities in health and health behavior mapped out from a complex systems perspective: A systematic review

**Ms. Andrea Mudd**<sup>1</sup>, Assistant Professor Michèle Bal<sup>1</sup>, Ms. Sanne Verra<sup>1</sup>, Dr. Maartje Poelman<sup>3</sup>, Prof. John de Wit<sup>1</sup>, Prof. Frank van Lenthe<sup>2</sup>, Associate Professor Carlijn Kamphuis<sup>1</sup>

<sup>1</sup>Utrecht University, Utrecht, Netherlands, <sup>2</sup>Erasmus University Medical Centre, Rotterdam, Netherlands,

<sup>3</sup>Wageningen University & Research, Wageningen, Netherlands

**Award Session - Socio-economic inequalities | Participatory research in health promotion, UKK - K3+4 (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**PURPOSE:** Socioeconomic inequalities in health and health behavior are increasingly viewed as emerging from complex systems characterized by interrelated mechanisms at multiple levels, feedback loops, and nonlinearities. A systematic review of research that examined this topic from a systems perspective is needed to understand the (shared) drivers of socioeconomic inequalities in health and health behavior and to identify knowledge gaps.

**METHODS:** SCOPUS, Web of Science, and PubMed databases were searched in August 2021 for peer-reviewed studies in English in high-income OECD countries containing a conceptual systems model or a simulation model of socioeconomic inequalities in health or health behavior in adulthood. Two independent reviewers screened abstracts and full texts. For each included publication, data on type of model, extent of application of a complex systems approach, model evidence base, and direction and polarity of model relationships were extracted. Model elements were categorized based on the Commission on Social Determinants of Health framework and relationships were summarized in a conceptual systems map.

**RESULTS:** A total of 34 publications were included; 15 contained a conceptual systems model and 19 contained a simulation model. General health outcomes (e.g., health status, well-being) were more commonly modeled than specific outcomes like obesity. Dietary behavior and physical activity were by far the most commonly modeled health behaviors, and sleep was only included in one model. Intermediary determinants (e.g., material circumstances, psychosocial factors) were included in all but one model, whereas structural determinants (e.g., ethnicity, policies, societal values) were included in 62% of models. The summary conceptual systems map visualizes important feedback loops and shared drivers, like social cohesion and housing, of multiple outcomes. Key concepts of a complex systems approach (i.e., feedback loops, nonlinearities) were explicitly applied by about half of the included studies.

**CONCLUSIONS:** Empirical research applying a complex systems approach to understanding socioeconomic inequalities in health and health behavior is in its infancy. This review analyzes the existing literature on the topic, including the main shared drivers and feedback loops, for researchers to build upon and to guide researchers and policymakers aiming to apply a complex systems approach to understand socioeconomic inequalities in health.

# Gender gap for accelerometer-measured physical activity throughout the lifespan: A longitudinal analysis using five Brazilian cohort studies

**Dr. Luiza Ricardo**<sup>1,2</sup>, Dr. Andrea Wendt<sup>3</sup>, Dr. Debora Tornquist<sup>5</sup>, Dr. Renata Bielemann<sup>4</sup>, Dr. Inacio Crochemore-Silva<sup>2,5</sup>

<sup>1</sup>MRC Epidemiology Unit - University of Cambridge, Cambridge, United Kingdom, <sup>2</sup>Postgraduate Program in Epidemiology - Federal University of Pelotas, Pelotas, Brazil, <sup>3</sup>Programa de Pós-Graduação em Tecnologia em Saúde, Pontifícia Universidade Católica do Paraná, Curitiba, Brazil, <sup>4</sup>Posgraduate Program in Nutrition and Foods - Federal University of Pelotas, Pelotas, Brazil, <sup>5</sup>Postgraduate Program in Physical Education - Federal University of Pelotas, Pelotas, Brazil

**Award Session - Socio-economic inequalities | Participatory research in health promotion, UKK - K3+4 (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Evaluate gender differences in physical activity (PA) across age groups based on five Brazilian cohorts. The main research question is how does the gender gap change with age? The innovative aspect relies on exploring gender inequalities in PA throughout several age groups.

**Methods:** Data comes from four Pelotas birth cohort studies, following all live births in urban area for each respective year (1982, 1993, 2004, and 2015), and the 'Como vai?' Pelotas cohort study (60+y). Wrist-worn accelerometry (Actigraph or GENEActive) data was obtained from 1, 2, 4, 6, 11, 15, 18, 23, 30, and 60+ year-old participants. Raw PA data were processed with GGIR package (v2.2) using five-second epoch. Overall PA (OPA) was defined as the average of ENMO per day (mg). MVPA was defined as the average daily minutes spent >100mg, only calculated from age 6y onwards. Cohort-specific mean and 95%CI for OPA and MVPA were calculated by sex (male/female). To estimate pooled effects, random effects meta-analysis for relative (ratio: male/female) and absolute (difference: male-female) gender inequalities were calculated using Stata 17.

**Results/findings:** The analytical sample per cohort ranged from N=965 to N=3462. Pooled absolute difference was 5 mg for OPA (95%CI 3.1-7), and 19.3 minutes for MVPA (95%CI 12.7-25.9), in favour of males. For OPA the widest gap was found at age 11y (9.8 mg; 95%CI 8.7-11), while for MVPA the largest difference was found at age 18y (32.9 minutes; 95%CI 30.1-35.7). Older adults (60+y) showed no significant absolute gender gap for OPA. Pooled OPA relative ratio results showed males did 0.13 times more OPA than females (1.13; 95%CI 1.09-1.16), with highest ratio for 18-year-olds (1.24; 95%CI 1.23-1.25). Regarding MVPA, the pooled ratio was 1.70 (95%CI 1.57-1.84), with highest relative inequalities among older adults (2.00; 95%CI 1.92-2.08).

**Conclusions:** The PA gender gap begins early in life and remains marked in all age groups, being late adolescence the period with largest absolute gap and older adults the group with highest relative inequalities. PA promotion actions targeting women and efforts to tackle sociocultural barriers to PA are essential and must start early in life.

# The barriers and facilitators to reducing sedentarism amongst home-office employees: An employer's perspective

**Mr. Alan Coffey**<sup>1</sup>, Ms. Iris Parés-Salomón<sup>2</sup>, Ms. Päivi Reckman<sup>3</sup>, Mr. Malcolm Jones<sup>3</sup>, Dr. Judit Bort-Roig<sup>2</sup>, Prof. Karin Proper<sup>3</sup>, Dr. Anna Puig-Ribera<sup>2</sup>, Dr. Anna Señé-Mir<sup>2</sup>, Prof. Cristina Vaqué-Crusellas<sup>2</sup>, Dr. Kieran Dowd<sup>1</sup>

<sup>1</sup>Technological University of the Shannon, Athlone, Ireland, <sup>2</sup>University of Vic, Barcelona, Spain, <sup>3</sup>National Institute for Public Health and the Environment, Utrecht, Netherlands

**Award Session - Socio-economic inequalities | Participatory research in health promotion, UKK - K3+4 (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Office-workers spend up to two-thirds of their daytime sitting. The Covid-19 pandemic resulted in a shift from office-based working to home-office working, or a hybrid of both. Recent evidence suggests that home-office working further increases sedentarism compared to the office environment, which may have further deleterious effects on the health of employees unless addressed. To successfully implement interventions that reduce sedentarism while working remotely, it is important to understand, from an employer's perspective, the barriers and facilitators to reducing sedentarism. The Click2move project aims to support active and healthy jobs in Europe by developing a co-created intervention to reduce sedentarism in home-office workers.

**Methods:** Participants were recruited through an expression of interest form circulated via the European Network for Workplace Health Promotion, through personal communication with companies and social media. Semi-structured interviews were conducted, with all interviews recorded, transcribed and subsequently coded using MAXQDA and thematic analysis, guided by the COM-B model and the Behaviour Change Wheel, was performed.

**Results:** A total of 20 employers, 8 from Spain, 9 from Ireland and 3 from The Netherlands, aged between 18-65, participated in the interviews. Meeting schedules and workload, such as back-to-back meetings or achieving deadlines, were identified as barriers to reducing sedentarism. Adapting the culture to reduce sedentarism through participating in physical activity (PA) during work hours (e.g., normalising taking brief walks between meetings by managers) was identified as a key target to reduce sedentarism in a home-office context. The use of technology as a delivery method, the use of PA competitions amongst employees and offering numerous/personalised approaches for any future intervention were seen as feasible approaches, with all interviewees showing a willingness to promote digital strategies to support this.

**Conclusion:** Future interventions aimed at reducing sedentarism in a home-office context should consider a variety of behaviour change techniques that consider the aforementioned barriers and facilitators. There is a need for managers to lead by example, through normalising increased participation in PA amongst staff, while delivering the intervention in a digital form appears to be a feasible approach that would be supported by managers.

# Perspectives of Spanish children on drivers of their energy balance-related behaviors: ‘¡Chic@s en Acción!’

Dr. Pilar De Miguel-etyay<sup>1,2</sup>, **Ms. Laura Belmon<sup>3</sup>**, Prof. Luis Moreno<sup>1,2</sup>, Dr. Teatske Altenburg<sup>3</sup>, Other - on behalf of the GrowH! consortium<sup>4</sup>

<sup>1</sup>Growth, Exercise, Nutrition and Development (GENUD) Research Group, University of Zaragoza, Zaragoza, Spain. Instituto Agroalimentario de Aragón (IA2), Instituto de Investigación Sanitaria de Aragón (IIS Aragón), Zaragoza, Spain, <sup>2</sup>CIBEROBN, (Physiopathology of Obesity and Nutrition CB15/00043), Institute of Health Carlos III (ISCIII), Madrid, Spain, <sup>3</sup>Amsterdam UMC, Vrije Universiteit Amsterdam, Department of Public and Occupational Health, Amsterdam Public Health research institute, Amsterdam, Netherlands, <sup>4</sup>Department Prevention and Evaluation, Leibniz Institute for Prevention Research and Epidemiology – BIPS, Bremen, Germany

**Award Session - Socio-economic inequalities | Participatory research in health promotion, UKK - K3+4 (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Both Participatory Action Research (PAR) and systems dynamics are increasingly used to tackle the complex problem of childhood obesity. In the ‘¡Chic@s en Acción!’ study, youth-centered PAR is combined with Intervention Mapping and systems thinking tools to develop, implement and evaluate actions aimed at promoting healthy energy balance-related behaviors (EBRBs) together with 9-12-year-old children from a disadvantaged neighborhood in Zaragoza, Spain. In this participatory needs assessment, we aimed to gain insight in children’s perspectives on factors that drive their EBRBs.

**Methods:** During the school year (2021-2022), in so called ‘action teams’, children conducted peer-research to assess the needs of same-aged children in their neighborhood, in terms of EBRBs and aspects in their environment contributing to their EBRBs. Data was collected through 18 participatory group meetings with three groups of 9–12-year-old children (n = 6-8 per group) from two schools. The action teams collected data from their peers through questionnaires, that were completed by 75 children. Based on this data, the action teams created three causal loop diagrams (one focused on physical activity and sedentary behavior, one on dietary behavior, and one on sleep), depicting the most important drivers of children’s EBRBs and its interconnectedness.

**Results:** The most important factors driving children’s EBRBs perceived by children were: being alone at home, using screens before sleep and unhealthy family behaviors (focused on food choices and family rules) are barriers for children’s healthy behaviors. The factor being alone at home showed to be a link between all three CLDs. Children identified the following needs: creating healthy celebrations, providing ideas for healthy recipes, more possibilities for playing outside, availability of parks close by for playing outside, being active within the family context, and increasing individual motivation to being physically active.

**Conclusions:** Our participatory health needs assessment resulted in a comprehensive overview of child-perceived important drivers of children’s EBRBs and their needs. Insights in children’s perspectives on the mechanism through which their EBRBs are shaped are essential for developing better tailored, and thereby potentially more effective, interventions.

# Toowoomba Healthy Towns: A citizen science initiative on active transport in Regional South-East Queensland, Australia

**Prof. Tracy Kolbe-Alexander**<sup>1,2</sup>, Dr. Paul Gardiner<sup>1,3</sup>, Dr. Ann Banchoff<sup>4</sup>, Mr. Adam Schmidt<sup>1</sup>, Ms. Melinda Covey-Hansen<sup>1</sup>, Prof. Abby King<sup>4</sup>

<sup>1</sup>School of Health and Wellbeing and Centre for Health Research, University of Southern Queensland, Ipswich, Australia, <sup>2</sup>Division of Exercise Science and Sports Medicine, Department of Human Biology, Faculty of Health Sciences, University of Cape Town, Cape Town, South Africa, <sup>3</sup>School of Public Health, The University of Queensland, Brisbane, Australia, <sup>4</sup>Stanford Prevention Research Center, Stanford University School of Medicine, Stanford, USA

**Award Session - Socio-economic inequalities | Participatory research in health promotion, UKK - K3+4 (Level 3), June 14, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Engaging in active transport will enable individuals to increase their habitual levels of physical activity. However, 90% of trips in Toowoomba, a town in regional Southeast Queensland Australia, is made with private vehicles despite the average distance being less than 5 km. The aim of this study was to engage citizen scientists (CS) to identify factors that help or hinder their active transport choices.

**Methods:** We used the *Our Voice* citizen science methodology developed at Stanford University. After recruiting CS, they completed a 'discovery walk' in their neighbourhood taking photos of things that help or hinder active transport choices. They rated each photo and provided a narrative explaining their reason for taking the photo. Once all CS in the group has completed the walk, they met for a group discussion. The CS worked together to analyse the data (photo's) arranging them into themes and highlighting priority actions. Two CS from each group were selected to advocate for the actions to decision makers.

**Results:** Three groups of CS were recruited; children aged 10-12 years (n=10), adults (n=10) and adults >65 years (n=10), representing a life course approach. An average of 160 photos, which were geo-coded, was taken per CS group. The children highlighted the need for safer crossings especially from their school to the park. They requested a zebra crossing closer to the school's bus stop. Similar to the children, safety of crossings was a major theme identified by the adults. The adults highlighted that road signs at crossings prioritizes vehicles, not pedestrians, and requested that this be reversed. The CS noted that the poor condition of the pavements made it harder for people with prams or wheelchairs to navigate. Improved maintenance of the paths was requested as they were uneven and could lead to tripping. Four CS delivered a presentation to a local council committee and the Deputy Mayor. The CS recommendations have informed the council's walking program with some of the changes being implemented.

**Conclusion:** Engaging the community as CS using the *Our Voice* methodology highlighted components of the built environment that should be addressed to encourage active transport.

# CHAired POSTER PRESENTATIONS

## Investigating Evidence of a Digital Divide in the Recruitment, Randomization, Engagement, Retention, and Efficacy in Post-Smoking Cessation Weight Management Clinical Trial

**Dr. Rebecca Krukowski<sup>1</sup>**, Dr. Melissa Little<sup>1</sup>, Dr. Zoran Bursac<sup>2</sup>

<sup>1</sup>University of Virginia, Charlottesville, USA, <sup>2</sup>Florida International University, Miami, USA

Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Diverse samples in research trials are important to the generalizability of findings and providing access to cutting-edge treatments. Thus, we evaluated whether there were indications of a digital divide in the recruitment, randomization, engagement, retention, and/or efficacy in a post-smoking cessation weight management trial.

**Methods:** The study initially recruited participants near Memphis, Tennessee, USA and later transitioned to remote assessment and national recruitment, due to the COVID-19 pandemic. All 305 randomized participants (32.1% men, 43.3% identified as Black, 10.5% non-urban, 58.0% with income <\$50,000) received 7-20 telephone-based interventions sessions over 2-8 months (depending on randomization assignment) and cellular scales for self-weighing.

**Results:** Recruitment: Radio advertisements were the best method for recruiting participants who identified as Black, and electronic recruitment strategies (e.g., Google, Facebook advertisements) were most effective for non-urban participants. Randomization: Individuals identifying as Black (OR = 0.53, 95% CI: 0.33-0.84) had decreased odds of proceeding from recruitment to randomization, and individuals residing in non-urban areas (OR = 8.76, 95% CI: 1.15-66.77,  $p = 0.036$ ) had increased odds of being randomized. Engagement: Participants identifying as White self-weighed more frequently than participants identifying with other racial groups (M(SD)=3.0(1.9) days/week vs. 2.3(1.8),  $p=0.002$ ), with no differences observed by rurality or income. Similarly, individuals identifying as White had higher session attendance (47%) compared to those who identified with other racial groups (39% of sessions,  $p=0.01$ ), with no differences by rurality or income. Retention: While 12-month retention was overall high (89%), individuals who identified as Black (16.7% vs. 6.3% for White participants,  $p = 0.005$ ) and participants with lower incomes (i.e., <\$50,000) (15.7% vs. 2.4% of participants with higher incomes,  $p = 0.0002$ ) had significantly higher attrition. Efficacy: All three weight management interventions were successful at reducing or eliminating post-cessation weight gain, and 46.9% of participants were successful at quitting smoking, with no race, rurality, or income-based differences ( $ps > 0.05$ ).

**Conclusions:** Findings indicate that this behavioral intervention trial with minimal technology requirements was successful at recruiting and treating a diverse sample of participants. Future research should test additional strategies for reducing disparities in the recruitment-to-randomization pipeline, retention, and engagement.

# Using Intervention Mapping in adapting a smartphone-based cardiac rehabilitation programme for older adults living with and beyond cancer: A work in progress

**Dr. Cindy Forbes**<sup>1</sup>, Dr. Jonathan Rawstorn<sup>2</sup>, Dr. Judith Cohen<sup>1</sup>, Dr. Chao Huang<sup>1</sup>, Prof. Michael Lind<sup>1</sup>, Prof. Ralph Maddison<sup>2</sup>, Mr. Ciaran McNaughton<sup>1</sup>, Dr. Mark Pearson<sup>1</sup>, Dr. Flavia Swan<sup>1</sup>, Dr. Maureen Twiddy<sup>1</sup>, Prof. Miriam Johnson<sup>1</sup>

<sup>1</sup>University of Hull, Hull, United Kingdom, <sup>2</sup>Deakin University, Melbourne, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** The purpose of this mixed-methods intervention development study is to adapt an existing, feasible, smartphone-based cardiac rehabilitation programme (REMOTE-CR) for older adults LWBC. The overarching study addresses the development, modelling, and formative testing phases of the MRC Framework for Complex Intervention Development. In this abstract, we will focus on Part 1; which aims to explore the needs and preferences of older adults living LWBC and allied/healthcare professionals (A/HCPs) for a smartphone-based, tailored rehabilitation programme.

**Methods:** Recruitment is currently ongoing, however, we aim to recruit 30 older adults LWBC (10 in each age group; 65-74, 75-84, 85+) and 20 A/HCPs. Patient participants are interviewed via web-based video conference or telephone. A/HCPs participate in either focus groups of ~five people or individual interviews. These are held online where possible. Patient interviews ask, i) current mobile and internet use, supportive care needs, previous supportive care advice received during their cancer care pathway, and activity-related behaviour, ii) what they would want to get from (e.g. what they would want to see change in) and would need to be able to use a smartphone-based programme designed to increase physical activity. Examples of content and design from REMOTE-CR and previous research in physical activity counselling and programme preferences and online supportive care among older adult cancer survivors are discussed and apparent gaps explored. Topics for A/HCP focus groups include acceptability of a remote-delivered wellbeing programme, education needs for patients and clinicians for usage and content, supervision requirements, and ideas for potential scalability.

**Results:** Interviews and focus groups are recorded and transcribed verbatim. Data is analysed using a thematic framework, using a deductive and inductive approach. We will report on emerging themes that will guide the mapping of intervention components to desired outcomes for Parts 2 and 3.

**Conclusions:** Part 1 will provide components that will lead to a cancer-specific version (Part 2: REMOTE-GO) of the cardiac programme. Part 3 of this study will be user testing the programme among an older adult cancer population. This study will deliver a co-adapted smartphone-based wellbeing programme with older adults LWBC ready for feasibility testing.

# Changes in Physical Activity, Sedentary Behavior and Cognitive Function among Cancer Survivors During the COVID-19 Pandemic

**Dr. Linda Trinh<sup>1</sup>**, Miss Allyson Tabaczynski<sup>1</sup>, Miss Denise Bastas<sup>1</sup>, Miss Alyssa Neville<sup>1</sup>, Miss Lauren Voss<sup>1</sup>, Miss Alexis Whitehorn<sup>1</sup>

<sup>1</sup>Faculty of Kinesiology and Physical Education, University of Toronto, Toronto, Canada

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Physical activity (PA) and reductions in sedentary time (SED) may mitigate cancer-related cognitive impairment (CRCI). The purpose of this study was to: a) examine the associations between changes in PA, SED, and cognitive function in cancer survivors during the pandemic; and b) examine clinical subgroups that moderate this association.

**Methods:** An online, cross-sectional survey was administered globally to adult cancer survivors. Cancer survivors self-reported demographic and clinical variables, regional COVID-19 restrictions, moderate-to-vigorous PA (MVPA) prior to and during the pandemic using the modified Godin Leisure Time Exercise Questionnaire, and cognitive function using the Functional Assessment of Cancer Therapy Cognitive Scale (FACT-Cog). SED was measured using the Domain-specific Sitting Time questionnaire. Meaningful changes in MVPA (i.e., increase to  $\geq 150$  or decrease to  $< 150$  min/week) and SED (i.e.,  $\geq 60$  min/day) were used to categorize cancer survivors with no change in behavior, a desirable change in behavior (i.e., increase MVPA to meet PA guidelines or decrease SED by  $\geq 60$  min/day) and an undesirable change in activity behaviors (i.e., decrease MVPA to  $< 150$  min/week or increase SED by  $\geq 60$  min/day). Analysis of covariance examined differences in FACT-Cog scores across the activity change categories in the total sample and clinical subgroups. Planned contrasts compared differences in FACT-Cog scores between cancer survivors with (1) no meaningful change vs. any change, and (2) a desirable change vs. undesirable change.

**Results:** Cancer survivors ( $N=372$ ;  $M_{age}=48.7\pm 15.3$  years) were primarily female (71.7%), diagnosed with mainly breast (30.6%), gynecologic (14.2%) and hematologic (13.2%) cancer, and had a mean months since diagnosis of  $87.8\pm 83.1$ . There were no significant differences in FACT-Cog scores across activity change categories in the full sample. Cancer survivors diagnosed  $\geq 5$  years ago ( $t(165)=-2.00$ ;  $p=.048$ ) or received treatment  $\geq 5$  years ago ( $t(106)=-2.24$ ;  $p=.03$ ) that had a desirable change in activity reported better perceived cognitive abilities than those who had an undesirable change. No differences were found in the FACT-Cog for cancer survivors who had no meaningful change compared to those who did.

**Conclusions:** PA promotion efforts during the COVID-19 pandemic should consider reducing SED in addition to maintaining MVPA in long-term cancer survivors to mitigate CRCI.

# Better Late Than Never?! Five Compelling Reasons for Putting Physical Activity in Low- and Middle-Income Countries High Up on the Public Health Research Agenda

**Prof. Katja Siefken**<sup>1</sup>, Prof. Andrea Varela Ramirez<sup>2</sup>, Dr. Temo Waqanivalu<sup>3</sup>, Prof. Nico Schulenkorf<sup>4</sup>

<sup>1</sup>MSH Medical School Hamburg, Hamburg, Germany, <sup>2</sup>Universidad de los Andes, Bogota, Colombia, <sup>3</sup>World Health Organization, Geneva, Switzerland, <sup>4</sup>University of Technology Sydney, Sydney, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** The aim of this manuscript is to acknowledge the uncertainty of evidence in the field of domain-specific physical activity in low- and middle-income countries. The unique disposition of people from low- and middle income countries and their relationship with physical activity (social and cultural norms, priority setting) is discussed and social, cultural, environmental and structural factors that shape physical activity behaviour from low- and middle income country contexts are explored.

**Methods:** 39 established researchers presented their expertise in the field of physical in low- and middle income countries in a discussion. Key messages have been drawn from the expert knowledge to present future avenues for physical activity policy, intervention and multisectoral collaboration.

**Results:** Since 2020, the world has been navigating an epidemiologic transition with both infectious diseases (COVID-19) and noncommunicable diseases intertwined in complex and diverse ways. People in low- and middle-income countries not only have the highest risk of developing chronic diseases, they also develop the diseases at a younger age, they suffer longer, and they die earlier than people in high-income countries.

**Conclusions:** Only through concerted efforts and multisectoral actions—combined with targeted and sustained interventions, as well as local voices—may we succeed in putting LMICs firmly on the global PA agenda and thus create the inclusive change that is long overdue. Therefore, we present 5 compelling reasons for putting physical activity in low- and middle-income countries high up on the public health research agenda and we call for more commitment to inclusive and context-specific public health practices that are paired with locally relevant promotion and facilitation of PA practice, research, and policymaking. The 5 reasons include 1) Preconditions and varying awareness; 2) Limited opportunities; 3) Lifestyle changes; 4) Increased urbanization; and 5) Restricted support.

# Using community-based participatory research to support increased compliance to DASH diet recommendations in immigrant, Hispanic/Latinx individuals with cardiovascular disease and obesity

**Dr. Ambria Crusan<sup>1</sup>**, Ms. Kerrie Roozen<sup>1</sup>, Ms. Anayeli Remache<sup>1</sup>

<sup>1</sup>St. Catherine University, St. Paul, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** The primary aim of this project is to determine preference-based, culturally-appropriate fruits/vegetables (F/V) meeting the Dietary Approaches to Stop Hypertension (DASH) diet recommendations for immigrant, Hispanic/Latinx individuals with hypertension and obesity via a phased, iterative process.

**Methods:** Phase 1, the initial conceptualization of a culturally-appropriate, medically-tailored “DASH box” utilized a 21-question survey of validated tools to understand patient demographics, social determinants of health, and F/V preference. The survey was administered to 49 patients or providers at a community health clinic, originating from varying Latin American countries. Phase 1 informed the development of 3 F/V boxes consisting of culturally appropriate, high-preference F/V in varying modalities (fresh, frozen, canned) and 3 F/V boxes with culturally-appropriate, high carotenoid F/V in varying modalities utilized in the next phase of the study. Phase 2, or the formative intervention, includes 7 individual interviews to gather qualitative feedback on the DASH box contents and perceptions of health.

**Results:** For the 38 women (78%) and 11 men (22%) who completed surveys, highest preferences for fruits were mango (58.3%), watermelon (52.1%), and banana (47.9%), and vegetable preferences included tomato (41.7%), cucumber (43.8%), and lettuce (37.5%). In the patient sample, 41.7% reported food insecurity, and 46.9% indicated they were unable to afford healthful foods for balanced meals. Emerging themes from the formative interviews show participants prefer fresh F/V to frozen, with little preference for canned foods. The F/V boxes containing all fresh items were unanimously preferred over other boxes with some frozen or canned foods. Additionally, all participants expressed that “the foods in the box were appropriate for their culture”, and interviewee 3 said, “all of the [boxes] have something good, I think that the best option is the most natural”. Financial and transportation barriers were identified as challenges to obtaining F/V in the diet.

**Conclusions:** Little research displays the work highlighting community opinions to encompass cultural food preferences. Our study provides formative contributions to research regarding culturally-appropriate fruit and vegetable preferences in a Hispanic/Latinx community.

# Effect of a physical activity-based lifestyle intervention on mental wellbeing of vocational education and training student

**Miss Mara Kirschner<sup>1</sup>**, Dr. Rianne Golsteijn<sup>1</sup>, Mrs. Roelina Kikkert<sup>1</sup>, Prof. Hans Saveberg<sup>2</sup>, Prof. Renate de Groot<sup>1</sup>

<sup>1</sup>Open University, Heerlen, Netherlands, <sup>2</sup>Maastricht University, Maastricht, Netherlands

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Low student mental wellbeing (SMW) is increasingly reported amongst adolescents worldwide. Changing physical activity behaviour (PAB), i.e., increasing moderate-to-vigorous physical activity (MVPA) and decreasing sedentary behaviour (SB) can potentially improve SMW. Vocational education and training (VET) students are a vulnerable group that are prone to insufficient physical activity (PA) and SMW problems. Therefore, this study aims to evaluate the effect of a PA-based lifestyle intervention on PAB and SMW of VET-students.

**Methods:** In a quasi-experimental study 126 VET-students were non-randomly allocated to a 20-week PA-based lifestyle intervention or an education-as-usual control group. Measurements were conducted before and after the intervention. PAB(i.e., SB and MVPA) was measured using the international physical activity questionnaire. SMW, operationalized as lack of depressive symptoms and presence of self-esteem, were measured with the Centre for Epidemiologic Studies Depression scale and the Rosenberg self-esteem scale, respectively. Repeated measures ANOVAs were used to evaluate the intervention effects on PAB and SMW.

**Results:** Repeated measures ANOVA revealed a significant time\*group effect ( $F(1, 89) = 8.40, p = .01$ ) for SB but not for MVPA. SB decreased in the intervention group and increased in the control group. For MVPA a significant negative main effect of time was found ( $F(1, 89) = 5.74, p = .02$ ), thus in both groups MVPA decreased significantly over time. No time\*group effects were found for depressive symptoms or self-esteem.

**Conclusion:** In summary, the PA-based lifestyle intervention significantly decreased the amount of SB, but had no effect on MVPA. Unfortunately, the intervention did not influence any of the SMW concepts. A possible reason could be that the PA-based lifestyle intervention in this study focused on more than only increasing PA. Thus, it is possible that the intervention was not intensive enough to change MVPA levels in the intervention group, resulting in not finding significant effects on SMW. Future research should investigate whether more intensive PA-based lifestyle interventions are more effective in increasing MVPA and subsequently SMW. Future research could also take additional lifestyle factors (e.g. sleep and nutrition) into account, since several lifestyle factors can have an effect on SMW.

# Co-Designing a Lifestyle-Focused Social Media Intervention for Young Women

**Ms. Jessica Malloy<sup>1</sup>**, Dr Rajshri Roy<sup>1</sup>, Dr. Stephanie Partridge<sup>2,3</sup>, Dr. Joya A Kemper<sup>4</sup>, Dr. Andrea Braakhuis<sup>1</sup>

<sup>1</sup>Discipline of Nutrition & Dietetics, Faculty of Medical & Health Sciences, University of Auckland, Auckland, New Zealand, <sup>2</sup>Westmead Applied Research Centre, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia, <sup>3</sup>Prevention Research Collaboration, Sydney School of Public Health, The University of Sydney, Sydney, Australia, <sup>4</sup>Department of Management, Marketing, and Entrepreneurship, University of Canterbury Business School, University of Canterbury, Christchurch, New Zealand

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Young women spend an average of 50 minutes daily on social media. Therefore, social media platforms may be promising intervention tools to address pertinent aspects of women's health including body image and health literacy. We aimed to co-design a lifestyle intervention on social media targeting eating, physical activity, and social well-being behaviours that is evidence-based, acceptable and engaging for young women aged 18-24 years.

**Methods:** The study used a participatory design framework and previously published iterative mixed methods approach between August-October 2022. A participatory needs assessment was conducted with young women, dietitians, and digital marketers. Data were collected in two phases. Phase 1 involved expert discussions (n=12), with experts being consulted on intervention objectives. Phase 2 involved codesign workshops, where 19 young women (n=6-9 in each workshop) and two researchers met weekly over three weeks. We used a structural approach for designing and planning interventions, known as Intervention Mapping.

**Results:** Matrices for the intervention objectives were constructed using expert panel discussions, and feedback was sought from young women in participatory workshops. In collaboration with young women, the intervention is being designed and produced using an iterative process. Preliminary analysis shows that most participants prefer Instagram for daily stories and static posts and TikTok for video content. Regarding health, all participants agreed that self-care and mental health is equally as important as physical health. The participatory groups and professional experts will design the implementation plan. The protocol of the process and effect evaluation will be executed by academic researchers with input from young women.

**Conclusions:** The study involves end-users throughout the process while at the same time developing interventions based on existing evidence. This study may guide other researchers or health professionals seeking to engage young women in the co-design of women's health promotion or intervention content on social media. The effectiveness of the social media lifestyle program will be tested in a pilot randomized controlled trial.

# Associations between profiles of the 24-hour activity cycle and cognitive function in older adults

**Dr. Dori E. Rosenberg<sup>1</sup>**, Mr. Yinxiang Wu<sup>2</sup>, Ms. Mikael Anne Greenwood-Hickman<sup>1</sup>, Dr. Susan M. McCurry<sup>2</sup>, Dr. Pamela A. Shaw<sup>1</sup>

<sup>1</sup>Kaiser Permanente Washington Health Research Institute, Seattle, USA, <sup>2</sup>University of Washington, Seattle, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Studies show that physical activity (PA) and adequate sleep protect cognitive health as people age. Few studies have examined activity patterns across the 24-hour activity cycle (24HAC) which includes PA, sedentary time (ST), and sleep, in older adults, despite interdependencies among these behaviors. We used data from the Adult Changes in Thought activity monitor (ACT-AM) study to explore cross-sectional associations between the 24HAC and cognition in older adults.

**Methods:** Participants (N=1034) in the ACT-AM study were dementia-free adults over age 65 who wore activPAL accelerometers for 7-days between April 2016 and July 2018. We extracted daily activPAL sitting, standing, stepping, and in-bed (representing sleep) time to represent 24HAC behaviors. We used Latent Profile Analysis (LPA) to define 24HAC profiles and assigned each participant to the profile with highest posterior probability using Latent GOLD 6.0 software. Cognitive Abilities Screening Instrument item response theory (CASI-IRT) scores measured global cognition. The association between cognition and 24HAC profile was estimated using a linear regression model adjusted for age, sex, race/ethnicity, BMI, education, depressive symptoms, and self-rated health, and corrected for profile assignment uncertainty. P-values were obtained using a Wald-type test.

**Results:** Participants were mean age 77 +/- 7 years, 55.8% female, 90.2% White, 1.4% Hispanic, with mean CASI-IRT 0.61 +/- 0.69. Participants' average sit, stand, step, and sleep hours/day were: 10 (2), 4 (1.6), 1.4 (0.7), and 8.5 (1.1). We identified 4 classes: 1) "most active/least sedentary" (12.8%); 2) "moderately active low sleepers" (24.9%); 3) "average activity/sleep" (43.8%); and 4) "least active" (18.6%). Compared to class 3, profiles 1 and 2 had more women, were younger, had lower BMI, and better physical function, sleep quality, and CASI-IRT scores. Compared to the "average activity" group, the "least active" class had lower CASI-IRT scores ( $\beta = -0.24$ ,  $p = 0.017$ ) in unadjusted associations that were non-significant in adjusted models ( $\beta = -0.027$ ,  $p = 0.80$ ).

**Conclusions:** LPA is a helpful approach for describing 24HAC behaviors in older adults. We did not see cross-sectional associations between 24HAC classes and cognition in this relatively healthy sample. Future studies can use LPA to link 24HAC profiles to changes in cognition over time.

# Developing and testing an online quality improvement tool for service providers and educators in family day care to improve nutrition and physical activity practices

**Miss Georgie Tran<sup>1</sup>**, Associate Professor Bridget Kelly<sup>1</sup>, Prof. Anthony Okely<sup>1</sup>

<sup>1</sup>University of Wollongong, Early Start, Faculty of the Arts, Humanities and Social Sciences, Wollongong, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** In Australia, family day care (FDC) is a form of childcare where education and care are provided for up to four children below school age and an additional three school-aged children, in a home environment. Research shows that the food and physical activity environments in FDC can be improved to better support healthy behaviours. As online platforms can be a practical method to assist in quality improvement, it is feasible to consider the development of an online support tool in this sector. The aim was to develop an online support tool to improve nutrition and physical activity practices in FDC.

**Methods:** Formative work included review of FDC food and movement policies ( $n=23$ ), an observational study ( $n=33$ ) and online survey ( $n=186$ ) of the healthy eating and active living (HEAL) environments and practices within FDC, and online focus groups ( $n=10$ ) to obtain feedback on the tool from stakeholders. Regular meetings with stakeholders ensured co-development of the tool with the sector. A pilot study will be conducted to test the feasibility and acceptability of the tool, followed by a randomised controlled trial (RCT) to explore efficacy of the tool. An online survey will be used to collect data. For the RCT, the survey will collect data at baseline and at six months after commencement of the intervention to measure improvements in the ways that HEAL policies and practices are reflected in quality improvement planning.

**Results:** Key priority areas for improving HEAL practices in FDC identified in the formative work were role modelling healthy eating behaviours, decreasing screen time, and increasing time for physical activity. For the RCT, the efficacy of the intervention will be tested using an intention to treat approach and linear mixed models. Outcome variables at six months post-intervention will be validated against a checklist, which will be used to rate the quality of the FDC service provider's quality improvement plan.

**Conclusions:** The tool is predicted to serve as a platform for reporting against the National Quality Standard, to identify gaps between policy and practice, and to facilitate HEAL practice improvements.

# Physical activity energy expenditure of active commuting to/from school: The ENERGYCO Study

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Active commuting to/from school (ACS) rate in Spanish youth is around 60%, but cycling trips are very scarce (<1%), and to date it is unknown what is the physical activity energy expenditure (PAEE) derived from different modes of commuting to/from school. Therefore, the ENERGYCO study aims to address this gap through two phases: the phase one will focus on the validation and testing of a protocol to measure Physical Activity Energy Expenditure (PAEE) derived from different modes of commuting to/from school (i.e., walking, cycling, and driving). While the phase two will consist of quantifying the PAEE derived from an eight-week cycling to/from school intervention using the validated protocol and its effect on different health outcomes.

**Methods:** Participants will be Spanish adolescents (phase 1: ~50 adolescents aged 12 to 16 years from one city; phase 2: ~300 adolescents aged 13 to 14 years from 3 cities). In phase one, different instruments will be used to measure the PAEE of commuting to/from school: 1) Global Positioning System + accelerometer, 2) Senseware PRO3 Armband, and 3) COSMED K5. In phase two, a cycling program will be implemented as familiarization and after that, participants will cycle to/from school for a total of 8 weeks. During phase two, participants will self-report their sociodemographic characteristics, mode of commuting to/from school and other destinations, and psychosocial and health status. In addition, PAEE, body composition, physical fitness, and blood pressure will be evaluated.

**Results:** After quantifying the PAEE derived from different modes of commuting to/from school, the real PAEE of these activities will be known. Furthermore, we consider that an intervention based on completing eight weeks of cycling to/from school will impact different health parameters in the adolescents.

**Conclusions:** The ENERGYCO study will contribute substantially to society, providing knowledge about the contribution of a daily behaviour. Moreover, a positive impact in the health and quality of life of adolescents is expected through the increase of their PAEE. Future research on youth health may consider these findings to quantify the PAEE of commuting to/from school that occurs daily and in every scholar.

# Environmentally sustainable, healthy, and affordable food provision in childcare: a fine balancing act.

**Mrs. Audrey Elford<sup>1</sup>**, Dr. Alison Spence<sup>1</sup>, Ms. Margaret Rozman<sup>2</sup>, Prof. Karen Campbell<sup>1</sup>, Dr. Penelope Love<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition, Deakin University, Waurin Ponds, Australia, <sup>2</sup>Healthy Eating Advisory Service, Nutrition Australia, Melbourne, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Childcare centres are opportune settings for cultivating food provision practices that align with both human and planetary health, as they are widely accessed for substantial time periods. This is the first study to describe environmentally sustainable and healthy food provision practices including food budgets and explore staff perceptions on these domains in Victorian (Australian) childcare.

**Methods:** An explanatory sequential design was utilised with quantitative data collection (surveys and audits), followed by qualitative (semi-structured interviews). Surveys captured food cost/child/day and environmentally sustainable food practices based on the World Health Organisation's Sustainable Healthy Diets Guiding Principles. Frequency of practices were assessed via likert scale and scored from 1 (never) to 4 (always). Mann-Whitney U tests analysed differences by centre type, location, and socioeconomic position. Food served/wasted for one day was measured using calibrated scales and entered into a web-based menu assessment tool. Semi-structured interviews explored staff perceptions on the findings. Themes were coded to the Theoretical Domains Framework.

**Results:** Survey results (n=129) showed lowest average scores were for “reduced packaged foods” (2.7/4). Only 23% purchased food locally from farmers/markets. This was lower in regional centres (8%) (p=0.04). Average food cost/child/day was AUD3.80, with 27% spending ≤AUD2.50/child/day and no differences by centre type, location, or socioeconomic position. Less than half (47%) of staff had previous nutrition training. One menu in the audits (n=12) was compliant with nutrition guidelines with the remainder serving insufficient quantities of some food groups, yet 9-64% of food served was wasted. Interview themes (n=12) were “knowledge”- *uncertainty about environmentally sustainable food and the need for resources*, “skills” – *support needed for planning, shopping, and budgeting*, and “belief about consequences” – *local food is expensive and will not fit budgets*.

**Conclusions:** There appears to be a lack of sustainable food knowledge and skills, insufficient training, and restrictive food budgets. The intersection of healthy, environmentally sustainable, and budget-friendly food provision remains under-researched and likely difficult to achieve. This sector requires strong government policy action, research, and practice guidelines that supports food provision that is environmentally sustainable, healthy, and affordable, to contribute positively to human and planetary health at scale

# The Relationship Between Intuitive Eating and Dining Out Frequency in Undergraduates in the United States

**Ms. Kayla Parsons**, Ms. Leigh Neptune, Ms. Amelia Sullivan, Dr. Jade McNamara

<sup>1</sup>University of Maine, Orono, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Intuitive eating (IE) is a non-dieting approach to health, emphasizing internal cue recognition. This cross-sectional study evaluated the relationship between IE and dining out frequency (DOF) in undergraduates, providing insight regarding the role of the college food environment in IE behaviors.

**Methods:** A convenience sample of Northeastern undergraduates were recruited via email to participate in an online health survey assessing IE and weekly DOF. IE was measured using Tylka's IE scale-2, with higher scores indicating greater frequency of IE. Inclusion criteria included undergraduates between 18-25 years old with complete data sets. A MANOVA indicated differences in IE among participants with different DOF. Pearson's *r* identified associations between DOF, IE, and IE subscales.

**Results:** Undergraduates (N=845) were primarily White (90.7%) and female (66.4%). The average IE score was 3.2 ( $\pm 0.5$ ) out of 5. Most dined out 1-2 times per week (61.9%, n=524), followed by participants who never dined out (18.5%, n=155), those who dined out 3-4 times per week (16.4%, n=139), and 5-7 times per week (3.2%, n=27). There was a significant difference in IE based on DOF,  $F(12, 2217.4)=7.96$ ,  $p<.001$ ; Wilk's  $\Lambda = 0.940$ , partial  $\eta^2=.028$ . Tukey's HSD test for multiple group comparisons revealed IE was significantly different between those who never dined out ( $M=3.4 \pm 0.04$ ) and those who dined out 1-2 times per week ( $M=3.2 \pm 0.02$ ), ( $p<0.05$ ), 95% CI= [0.02, 0.26]. There were significant negative associations between DOF and IE scores ( $r(844)= -0.2$ ,  $p<0.001$ ), and several IE subscales including *eating for physical rather than emotional reasons* ( $r(844)=-0.2$ ,  $p<0.001$ ), *reliance on hunger and satiety cues* ( $r(844)=-0.1$ ,  $p<0.001$ ), and *body-food choice congruence* ( $r(844)=-0.2$ ,  $p<0.001$ ).

**Conclusions:** DOF indicated significantly different IE behaviors within undergraduates, suggesting the college food environment is a possible determinant in IE. This research warrants exploration of facilitating wellness interventions within the college food environment to improve health behaviors.

# Active Transportation and Community Participation in Older Adults: Results from the WHO Survey of Global Ageing and Adult Health

**Ms. Jessica Stroope<sup>1,2</sup>**, Dr. Alex Garn<sup>2</sup>

<sup>1</sup>Louisiana State University AgCenter, Baton Rouge, USA, <sup>2</sup>Louisiana State University, Baton Rouge, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Active transportation provides an array of health and societal benefits, including social capital. Previous research examining active transportation and behaviors of community participation has exclusively sampled high-income Western countries. However, little is known about how active transportation relates to community participation in low- and middle-income countries with diverse cultural, political, and physical climates. The current cross-cultural study investigates the relationship between active transportation and community participation to assess if and how this relationship varies across contexts.

**Methods:** This investigation uses a cross-sectional research design with the World Health Association Study on Global Ageing and Adult Health (SAGE) Wave 1 data (2007-2010). SAGE examines health, health behaviors, and aging in adults aged 50 and older (N = 47,103) in China, Russia, Ghana, South Africa, India, and Mexico. Active transportation is a continuous variable (0-7 days per week of walking or biking for transportation). Community participation is a 4-item scale that assesses meeting with local community leaders, working with neighbors to make community improvements, and attending meetings to address community issues. Each country is modeled independently using linear regression to assess the relationships between active transportation and community participation, controlling for an array of important covariates, including education, gender, and self-rated health.

**Results:** Findings show that active transportation has a positive relationship to community participation in Mexico ( $b = .03$ ;  $p = .028$ ), Russia ( $b = .04$ ;  $p = .002$ ), South Africa ( $b = .05$ ;  $p = .044$ ), and Ghana ( $b = .04$ ;  $p = .000$ ). Active transportation was not related to community participation in China. In India, active transportation has a very small negative relationship to community participation ( $b = -.01$ ;  $p = .048$ ).

**Conclusions:** Active transportation has societal benefits beyond individual health, including a positive association with community participation in Mexico, Russia, Ghana, and South Africa in adults aged 50 and older. Infrastructure supportive of active transportation is critical not only for individual health outcomes in older adults, but also to support the involvement of older adults in community affairs. More work is needed to understand cultural dynamics that may change the relationship between active transportation and community participation.

# Influence of parental health on children's health behaviors from the SI! Program for Elementary Schools

**Ms. Amaya de Cos-Gandoy<sup>1,2</sup>**, Ms. Patricia Bodega<sup>1,2</sup>, Miss Mercedes de Miguel<sup>1,2</sup>, Mr. Jesús Martínez-Gómez<sup>2</sup>, Miss Carla Rodríguez<sup>1</sup>, Dr. Xavier Òrrit<sup>1</sup>, Dr. Juan Miguel Fernández Alvira<sup>2</sup>, Dr. Rodrigo Fernández-Jiménez<sup>2,3,4</sup>, Dr. Gloria Santos-Beneit<sup>1,5</sup>

<sup>1</sup>Foundation for Science Health and Education (SHE), Barcelona, Spain, <sup>2</sup>Centro Nacional de Investigaciones Cardiovasculares (CNIC), Madrid, Spain, <sup>3</sup>Hospital Universitario Clínico San Carlos, Madrid, Spain, <sup>4</sup>Centro de Investigación Biomédica En Red en enfermedades CardioVasculares (CIBERCV), Madrid, Spain, <sup>5</sup>The Zena and Michael A. Wiener Cardiovascular Institute, Icahn School of Medicine at Mount Sinai, New York, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Children's health habits tend to worsen as they approach adolescence. Parental health can play an important role in their children's health behaviors. The main purpose of this study was to explore the association between children's health behaviors and parental health throughout middle childhood and preadolescence.

**Methods:** The SI! Program for Elementary schools included 1770 children from 48 schools in Madrid, Spain. Children were assessed at baseline (6.3 years, 47.4% girls), first follow-up (FU) (8.9 years, 47.5% girls) and second FU (12.0 years, 47.0% girls). Families completed a series of validated questionnaires on their children's adherence to the Mediterranean diet, physical activity, screen time, and sleep behaviors. Additionally, families self-reported their Blood pressure, Exercise, (body) Weight, diet (Alimentation), and Tobacco use, which were used to calculate the validated Fuster-BEWAT health score (FBS). Children meeting the recommendations for each health behavior were compared overtime and according to parental FBS.

**Results:** The percentage of children with high adherence to the Mediterranean diet and meeting the recommendations for screen time and sleep behavior decreased over time. Conversely, the number of children meeting the recommendations for physical activity increased. The odds of meeting the recommendations for screen time and sleep behavior significantly decreased from baseline to the second FU (0.09 [95%CI: 0.07; 0.11]; 0.07 [95%CI: 0.05; 0.11], respectively). The odds of meeting the recommendations were significantly higher at baseline in children from families with ideal FBS score in adherence to the Mediterranean diet (2.93 [95%CI: 2.02; 4.25]), physical activity (2.02 [95%CI: 1.40; 2.92]), and screen time (1.52 [95%CI: 1.06; 2.20]) than those with intermediate or poor FBS. This trend was maintained over time for all health behaviors, although no statistically significant differences were found at subsequent assessments.

**Conclusions:** Healthy habits decline during middle childhood, particularly diet, screen time, and sleep behaviors. Children from families with ideal FBS were consistently associated with meeting recommendations more frequently than those from families with intermediate or poor FBS. Parental health behaviors directly influence children's health, and therefore health promotion programs on children should also aim to improve families' health habits.

# Perceptions of Strengths and Needs Emerging During the COVID-19 Pandemic in Minnesota's Emergency Food System

**Dr. Patrick Brady<sup>1</sup>**, Ms. Natalie Vandenburg<sup>1</sup>, Dr. Emily Becher<sup>2</sup>, Dr. Melissa Laska<sup>1</sup>

<sup>1</sup>Division of Epidemiology and Community Health, University of Minnesota School of Public Health, Minneapolis, USA, <sup>2</sup>University of Minnesota Extension, St. Paul, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Food insecurity has been a public health concern throughout the COVID-19 pandemic, with a range of responses to support household food security through governmental action and the emergency food system (food banks, food pantries, and other organizations that distribute food at no cost). Emergency food providers have navigated many changes since the pandemic began. We aimed to capture the experiences of stakeholders in the emergency food system and describe current needs in Minnesota (USA).

**Methods:** We conducted semi-structured interviews with key stakeholders in Minnesota's emergency food system between September and October 2022, including nine state- and regional-level stakeholders and four food pantry managers. State- and regional-level stakeholders worked in government, at food banks, in Cooperative Extension (the community outreach division of the university system), or at non-profit organizations supporting or working with the emergency food system. Each of the food pantry managers we interviewed served rural communities and worked in their positions during the COVID-19 pandemic. We analyzed data using rapid qualitative analysis methods to identify recurring experiences and perceptions across interviews.

**Results:** Key strengths we identified included the presence of established networks of emergency food providers in Minnesota, the ability to share best practices with other providers and adapt to quickly changing contexts, support provided through governmental and non-profit organizations, and on-going provider commitments to ensure receiving emergency food is a dignified experience with choice. Enhancing labor capacity was a key need identified by all state- and regional level and two food pantry managers. All participants described how increased economic and food support early in the pandemic allowed them to adapt, but now support has decreased while, concurrently, inflation and other factors, but particularly high food prices, have limited supply and driven need.

**Conclusion:** The emergency food system successfully adapted to the dynamic situation and safely provided food in their communities during the pandemic. Despite this, emergency food providers require support in the form of quality food, funding, and labor support to enhance their ability to respond to increasing demand. Policymakers and industry should pursue strategies to support the emergency food system's capacity to meet expanded need.

# Evaluating correlates of healthy eating and dietary quality among older adults: A mixed-methods approach to development and application of a new survey instrument

**Associate Professor Sara Rosenkranz<sup>1,2</sup>**, Ms. Anna Biggins<sup>2,3</sup>, Associate Professor Emily Mailey<sup>2</sup>, Prof. Richard Rosenkranz<sup>1,2</sup>

<sup>1</sup>University of Nevada Las Vegas, Las Vegas, NV, USA, <sup>2</sup>Kansas State University, Manhattan, KS, USA,

<sup>3</sup>Georgia Heart Institute, Gainesville, GA, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Community-dwelling older adults face unique challenges related to nutrition and health, but little is known about their unique barriers and facilitators for healthy eating behaviors. Using the COM-B model as a theoretical framework, this study sought to develop a new instrument to measure the capability, opportunity, and motivation for healthy eating behaviors (COM-HE) among community-dwelling older adults. The study also aimed to assess the validity, reliability, and acceptability of the new COM-HE instrument and to examine associations between the instrument and self-reported dietary quality.

**Methods:** A mixed-methods approach was used to obtain both qualitative and quantitative data. Participants were aged 65 years or older, community-dwelling, and English-speaking. Qualitative data were generated through four focus groups ( $n = 12$ ) with semi-structured interview questions. Focus group conversations were transcribed and content analysis was performed to assess the level of understanding of each individual COM-HE item. The instrument was revised according to initial qualitative findings. Quantitative data were generated through pilot-testing the revised COM-HE instrument ( $n = 81$ ) to evaluate the psychometric properties. The REAP-S questionnaire was utilized to examine correlations between the COM-HE instrument and self-reported dietary quality. Cronbach's alpha, principal component analysis, and regression analysis were used to assess psychometric properties and potential relationships between study variables using SPSS (v.27.0).

**Results:** Following content analysis of focus group data on the COM-HE instrument, 26 items (79%) achieved sufficient levels of understanding and did not require revision. After revision, a total of 33 items were pilot-tested. The COM-HE instrument achieved acceptable internal consistency (Cronbach's alpha = 0.847–0.986), displayed varying levels of unidimensionality based on multiple principal component analyses (total variance explained by three components = 86.7%), and was correlated with self-reported dietary quality scores ( $R = .409$ , adjusted  $R^2 = .099$ ,  $p = .031$ ).

**Conclusions:** The new COM-HE instrument demonstrated adequate acceptability, reliability, and validity for assessing influences on healthy eating among a homogenous sample of adults over 65 years of age. There is a need for additional development, evaluation, and refinement of the instrument in diverse populations.

# A qualitative analysis examining the impact of a biosensor feedback-based physical activity intervention on motivation and behavior change in cancer survivors

**Dr. Grace Brannon**<sup>1</sup>, Ms. Madison Ray<sup>1</sup>, Associate Professor Susan M Schembre<sup>2</sup>, Dr. Karen Basen-Engquist<sup>3</sup>, **Dr. Yue Liao**<sup>1</sup>

<sup>1</sup>The University of Texas at Arlington, Arlington, USA, <sup>2</sup>Georgetown Lombardi Cancer Center, Washington D.C., USA, <sup>3</sup>The University of Texas MD Anderson Cancer Center, Houston, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Physical activity (PA) affects blood glucose levels, which can be measured by continuous glucose monitors (CGMs). Feedback based on data from wearable devices like Fitbit and CGMs provide health information to users in real-time and are used for remotely delivered interventions to promote healthy behaviors like PA. Providing feedback via text messages using data collected from sensors provide opportunities for increasingly personalized motivational messages tailored to promote healthy behaviors at an individual level. The objectives of this study were to qualitatively examine participant perceptions of lessons learned and behaviors changed throughout a remotely delivered mHealth PA intervention utilizing wearable sensors.

**Methods:** Twelve insufficiently active overweight/obese cancer survivors (aged 35-75) were recruited from a local tumor registry and participated in a pilot PA intervention study (November 2019 - September 2020). In the study, participants wore a Fitbit wristband and a CGM sensor for four weeks. They received personalized feedback messages 3-4 times a week, based on their real-time Fitbit and CGM data, via text messages during the intervention. At the end of the four-week intervention period, participants answered questions in individual interviews (semi-structured interview guide) on their CGM and Fitbit experience and usage, followed by their thoughts on what they'd learned throughout the study procedures.

**Results:** Participants reported learning about their health habits throughout the study, further indicating that they perceived take-a-ways from their participation that they could continue to carry over into their daily lives post-intervention. These lessons encompassed topics from PA patterns, glucose patterns, and diet, plus combinations of these topics. Because of the CGM, participants were more aware of the biological consequences of their behavior, leading to health behavior rumination and motivating them to change those behaviors – in contrast with mere Fitbit tracking or food diary tracking.

**Conclusions:** This research shows how personalized text messages using biological feedback provided motivation to improve participant's diet and PA, expanding previous research describing barriers to PA engagement. It demonstrates how increasing access to personal biological information can positively relate with motivation to engage in PA. Health messaging should focus on avoiding health-related problems and instead focus on health improvement.

# The development and testing of a website (ExerciseGuide UK) for people with lung cancer: reflections on the added value of patient and public involvement within a doctoral degree

**Mr. Jordan Curry<sup>1</sup>**, Mrs. Helen Roberts<sup>1</sup>, Dr. Mark Pearson<sup>1</sup>, Mr. Alan Smith<sup>2</sup>, Ms. Diane Riley<sup>2</sup>  
<sup>1</sup>Hull York Medical School, Hull, United Kingdom, <sup>2</sup>Involve Hull, Hull, United Kingdom

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** People diagnosed with lung cancer typically have a higher symptom burden than other prevalent cancers. Additionally, people diagnosed with lung cancer are older adults (65y+) with comorbidities. Physical activity has shown to be beneficial for those with lung cancer for physical and psychological health, though few in this group meet physical activity guidelines. Digital technology can provide tailored and relatively low-cost interventions. Older adults are often wrongly assumed to lack digital skills, interest and not engage with digital technology regularly. Would involving intended users in designing these digital interventions result in better engagement?

**Methods:** A Patient Advisory Group (PAG) was formed using online dissemination of a recruitment flyer and the Involve Hull network. All members of the PAG had received or cared for someone diagnosed with lung cancer. In a series of workshops, the PAG helped to adapt a website for those diagnosed with cancer iteratively. After the first two workshops, Think-Aloud interviews were conducted with participants without prior knowledge of ExerciseGuideUK (n=7). Anonymised results were presented to the PAG to discuss potential revisions. All PAG workshops and interviews were conducted via Zoom.

**Results:** Twenty-five of the 41 comments raised in the Think-Aloud interviews were taken to the PAG. Sixteen comments were not presented to the PAG, 13 simple functionality revisions, and three were not feasible. The doctoral researcher (JC) presented suggested revisions to the PAG. The PAG unanimously disagreed with 56% of the initial suggestions, including the phrasing of physical activity information and language regarding behaviour change techniques.

**Conclusion:** It was challenging to hear, after initial revisions, the platform did not meet the needs of those with lung cancer from their perspective. Though often difficult to hear such feedback, it is vital for intervention and personal academic development. Including a sustained PAG over several months with intended users of digital interventions will lead to more relevant, accessible, and usable interventions. Through engaging with those who have cared for or living with a lung cancer diagnosis, JC gained insight into the needs of the study population and what to consider during the development of a digitally-based physical activity intervention.

# Design, technical challenges, solutions, and participant feedback of the mobile Lifestyle Intervention for Food and Exercise (mLIFE) app

**Mr. Matt McGrievy**<sup>1</sup>, Mr. Andrew Hester<sup>1</sup>, Dr. Brie Turner-McGrievy<sup>1</sup>, Mr. Lex Whalen<sup>1</sup>, Dr. Courtney Monroe<sup>1</sup>, Dr. Carolina Delgado-Diaz<sup>1</sup>, Dr. Kelli DuBois<sup>1</sup>, Ms. Halide Aydin<sup>1</sup>, Dr. Sara Wilcox<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** To describe the design of the mobile Lifestyle Intervention for Food and Exercise (mLIFE) app, the technical challenges that were encountered and addressed, and the 3-month participant feedback on intervention components. mLIFE is a 12-month randomized, remotely delivered, behavioral weight loss, physical activity (PA), and nutrition intervention.

**Methods:** The mLIFE app components included self-monitoring of diet (using a nutrient and food database), PA (syncing to FitBit Charge2), and weight (connecting Aria scale), as well as intervention delivery (via podcasts and tips of the day) and activities to facilitate social support. Participants earned points within the app by providing social support to fellow participants. A log of technical challenges with designing and implementing the app was maintained. At 3 months, participants were asked to rate each intervention component on a scale of 1 (completely unsatisfied) to 7 (completely satisfied). Themes for open ended comments were categorized.

**Results:** Technical challenges (n=4) were identified and addressed over the design and implementation of the mLIFE app. These included 1) finding a comprehensive, searchable nutrient database that could be easily integrated into mLIFE, 2) change of FitBit Aria scale from wifi to Bluetooth, which limited automatic syncing, 3) time zone and daylight savings time challenges, and 4) adding interactive discussion features. There were 106 participants in cohort 1 (mean age 49.3±11.8 y, 93% female, mean BMI 33.6±5.5 kg/m<sup>2</sup>) and 83 (78%) completed the 3-month feedback survey. Participants rated the overall study as 5.8±1.4 out of 7. Mean feedback ratings for each of the components from highest to lowest were 6.0±1.2 for tips of the day, 6.0±1.4 for weight monitoring, 5.9±1.5 for PA monitoring, 4.9±1.6 for podcasts, 4.5±1.6 for social interactions, and 4.4±1.9 for diet tracking. Of the 32 written comments on the overall intervention, the major themes identified were related to difficulties with the diet tracking feature (50% of comments), limited discussion interactions (13%), and lack of personalization (13%).

**Conclusions:** The findings of this descriptive analysis can help to inform future mobile health interventions to avoid or resolve these identified technical challenges.

# Connecting with Cultural Foods: Exploring food security among people from refugee backgrounds

**Ms. Tina Gingell<sup>1</sup>**, Ms. Nehal Eltahir<sup>2</sup>, Mrs. Evelyn Pe<sup>3</sup>, Associate Professor Kate Murray<sup>1</sup>, Dr. Ignacio Correa-Velez<sup>1</sup>, Prof. Danielle Gallegos<sup>1</sup>

<sup>1</sup>Queensland University of Technology, Brisbane, Australia, <sup>2</sup>Islamic Women's Association of Australia, Brisbane, Australia, <sup>3</sup>Ethnic Communities Council of Queensland, Brisbane, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** People with lived refugee experiences have fled their homes and that experience is forced, generally sudden and stressful, and often coupled with dislocation from family and friends. Food security is essential for families from refugee backgrounds and is vital to understand the motivations behind food selection behaviours. Food is intimately intertwined with self-identity, connects people to loved ones and therefore plays a vital role following forced displacement. To understand the facilitators and barriers of accessing cultural foods during the settlement journey for refugee-background families, from the perspectives of workers who support the settlement journey

**Methods:** Participatory action research methodology was used and governed by a steering committee of academic researchers and community members. Focus group participants were adult settlement and other workers who regularly interacted with people from refugee backgrounds, spoke English, and preferably self-identified with a refugee background. Participants were recruited through community organisations in Brisbane, Australia, and focus groups were held at organisational workplaces or online. The focus group guide was co-designed, focus groups were co-facilitated (where possible), and data analysis was conducted collaboratively by the steering committee.

**Results:** Eight focus groups (n=32) were conducted between June and October 2021. Food security (specifically cultural foods access), culture and mental health were interrelated. This was fundamental to all discussions, and when cultural food access, culture or mental health were maintained or adversely impacted, all three factors were likewise affected. The behaviours around purchasing cultural foods were motivated by the desire to express and validate culture, which in turn improved mental health. It was also found that individual and community support systems sustained access to cultural foods, while social, environmental, institutional and political structures impacted access to cultural foods, sometimes detrimentally.

**Conclusions:** This study highlights the need for behavioural interventions that foster social capital for refugee-background families, and consider food security, culture and mental health collectively. Additionally, there is need for increased awareness of the settlement journey, and policy makers should incorporate cultural inclusivity into policies, by working with communities and providing opportunities for people to express their culture, improve access to cultural foods, and maintain mental health.

# Nutrition and physical activity data harmonisation across complex community interventions to support pooled analysis and generate generalisable insights

**Dr. Melanie Nichols<sup>1</sup>**, Dr. Jane Jacobs<sup>1</sup>, Dr. Victoria Brown<sup>1</sup>, Prof. Marj Moodie<sup>1</sup>, Ms. Nicole Ward<sup>1</sup>, Prof. Steven Allender<sup>1</sup>

<sup>1</sup>Deakin University, Geelong, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** In the last two decades, there have been many community-wide initiatives aiming to prevent or reduce childhood obesity, and promote healthier nutrition and activity behaviours, with mixed results. Combining primary data in a way that enables analysis across multiple studies and communities will enable us to gain greater insights into the combinations of factors associated with the greatest impact on child behaviours and weight status, and to understand differential effects across population sub-groups. This presentation aims to describe the data harmonisation framework and process used in the 'PRECIS' project, and present the pilot results using data from seven completed Australian initiatives.

**Methods:** Adapting existing best practice data harmonisation guidelines, we implemented a process combining 'top down' (theory-driven) and 'bottom up' (data-driven, iterative) approaches to classify and transform variables in each dataset. This process aimed to find a balance between the conceptual ideals and the pragmatic realities of existing datasets, and will be used to collate and harmonise the nutrition and physical activity data from the evaluations of over 20 diverse, international child obesity prevention initiatives.

**Results:** Pilot data harmonisation included seven Australian childhood obesity prevention interventions, conducted between 2003 and 2022. Combined, these studies included data from 34,342 children, who were each assessed between 1 and 3 times over 2 to 4 year intervention periods. In total there were 94 different activity variables, and 121 diet variables collected across the seven studies, predominantly from child self-report surveys. Following the harmonisation process, there were 8 activity and 11 diet variables in the final dataset. Key challenges included changing data collection practices over time, and adjudicating compromises between coverage and detail for specific concepts and variables.

**Conclusions:** Harmonisation of pre-existing data drawn from multiple complex intervention evaluations presents significant opportunities to advance our understanding of intervention effects and the influence of community, intervention and system variables. The process is, however, challenging and resource intensive and inevitably requires compromises. Progressing toward development and use of core outcome sets for community interventions would contribute to ensuring that future evaluations can more readily contribute to a growing international evidence base.

# The extent and nature of children's participation in investigations of food practice determinants: a scoping review

**Ms. Sophie Wright-Pedersen<sup>1</sup>**, Associate Professor Helen Vidgen<sup>1</sup>, Dr. Foluké Abigail Badejo<sup>1</sup>, Prof. Danielle Gallegos<sup>1</sup>

<sup>1</sup>Queensland University of Technology, Brisbane, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Children as the subject of many investigations into their food practices, should have their voices amplified and included to produce more appropriately and contextually tailored food and nutrition strategies that better cater to their needs and thus are more likely to garner intended nutritional outcomes. However, the extent and nature of children's participation in research investigating factors affecting their food practices is unknown. Therefore, a scoping review was conducted to identify the extent of primary-school age children's (aged 6-11 years) participation in qualitative research investigating food practice determinants across high income countries, and the methods used to perform this research.

**Methods:** Six electronic databases were searched (Cochrane Library, CINAHL, Embase, ERIC, Medline and PsychInfo) for articles published up until February 2022. Hart's Ladder of Children's Participation was used to assess children's level of participation.

**Findings:** The search identified 107 peer-reviewed studies (121 papers). Ten percent (10%, n=11) were classified as non-participatory, 60% (n=64) as participatory, where 30% (n =32) were unable to be assessed due to a lack of information. Of the 64 participatory studies, 69% (n=44) achieved a more passive form of participation at all research stages (Level 4 on Hart's Ladder, assigned but informed). Thirty-one percent (31%, n=20) reached Levels 5 and/or 6 (consulted and informed; and adult initiated, shared decisions with children) within later research stages (i.e., data collection, analysis and dissemination). No studies were found to have any research stage at the most active child-led degrees of participation, Levels 7 and 8.

**Conclusion:** The findings of this review highlight the need for more opportunities to be presented to children to actively participate in food-related research, as well as an exploration of the methods and structures to support this. This review also hopes to inform how future food and nutrition research may more actively incorporate children's perspectives.

# Barriers and facilitators to physical activity for young adult women: a systematic review of qualitative research

**Miss Bo Peng<sup>1</sup>**, Professor Amy Ha<sup>1</sup>, Dr. Johan Y Y Ng<sup>1</sup>

<sup>1</sup>The Chinese University of Hong Kong, Hong Kong, Hong Kong

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Physical activity (PA) has many health benefits for young people. However, young adult women generally face a sharp decline in PA from transition into young adulthood, possibly due to negative societal and cultural norms influences. Therefore, this review aims to identify the self-perceived barriers and facilitators of young adult women's PA by reviewing qualitative studies and providing some contextual implications for future research.

**Methods:** Medline, Pubmed, Scopus, SPORTDiscus, and Web of Science were searched to identify qualitative studies published between January 2000 and February 2022 that examined the barriers and facilitators of young adult women's PA between ages 18 and 40. Research quality was appraised using the Critical Appraisal Skills Programme tool. Data were extracted and thematically analyzed based on the social-ecological model (SEM) tenets.

**Results:** Barriers and facilitators from 23 studies were correspondingly distributed at five levels of SEM. The most frequently cited facilitators at the intrapersonal level were health and body-related goals, and barriers included lacking time and low self-awareness. Interpersonally, social relatedness and support were facilitators, while family commitment and social embarrassment were strong barriers. At the organizational level, organizations (family, workplace, neighbor, etc.) that provide sufficient facilities and a PA-friendly environment were facilitators and vice versa. PA venues (gym, etc.) provide women-centered programs with tailored and inclusive programs were strong facilitators. At the community level, gender stereotypes and norms such as body image concerns and mainstream beauty, femininity and PA choice, mother identity and family obligations, and women's religious identity were outstanding barriers. Facilitators were providing a more inclusive environment and greater social acceptance. At the environmental level, the distinct barriers for women were possible risks like sexual harassment and violence.

**Conclusion:** This systematic qualitative review showed that young adult women's self-report barriers and facilitators to PA are often gendered and beyond the personal level. Research in the future should emphasize the social-cultural influences rather than merely targeting individual education and behavior changes. Future studies may benefit from applying multilevel strategies employing the SEM model. Moreover, qualitative research is also needed to fully understand the implementation context and compensate for the gaps in quantitative analysis.

# Utilizing technology for Diet and Exercise Change In complex chronic conditions across Diverse Environments (U-DECIDE Study): feasibility randomised controlled trial

**Mr. Riley Brown**<sup>1</sup>, Dr. Dev K Jegatheesan<sup>2, 3</sup>, Mrs. Marguerite M Conley<sup>4</sup>, Dr. Hannah L Mayr<sup>3, 4, 5</sup>, Dr. Jaimon T Kelly<sup>6, 7</sup>, Mrs. Lindsey Webb<sup>4</sup>, Ms. Amandine Barnett<sup>6, 7</sup>, Dr. Heidi M Staudacher<sup>8</sup>, Associate Professor Nicola W Burton<sup>9</sup>, Dr. Nicole M Isbel<sup>2, 3</sup>, Prof. Graeme A Macdonald<sup>3, 10</sup>, Prof. Katrina L Campbell<sup>11, 12</sup>, Prof. Jeff Coombes<sup>1</sup>, Dr. Shelley E Keating<sup>1</sup>, Associate Professor Ingrid Hickman<sup>3, 4</sup>

<sup>1</sup>School of Human Movement and Nutrition Sciences, The University of Queensland, Brisbane, Australia, <sup>2</sup>Department of Nephrology, Princess Alexandra Hospital, Brisbane, Australia, <sup>3</sup>Faculty of Medicine, The University of Queensland, Brisbane, Australia, <sup>4</sup>Department of Nutrition and Dietetics, Princess Alexandra Hospital, Brisbane, Australia, <sup>5</sup>Nutrition and Dietetics Research Group, Bond University, Robina, Australia, <sup>6</sup>Centre for Online Health, The University of Queensland, Brisbane, Australia, <sup>7</sup>Centre for Health Services Research, The University of Queensland, Brisbane, Australia, <sup>8</sup>Food & Mood Centre, Institute for Mental and Physical Health and Clinical Translation, Deakin University, Melbourne, Australia, <sup>9</sup>School of Applied Psychology, Griffith University, Brisbane, Australia, <sup>10</sup>Department of Gastroenterology and Hepatology, Princess Alexandra Hospital, Brisbane, Australia, <sup>11</sup>Healthcare Excellence and Innovation, Metro North Health, Brisbane, Australia, <sup>12</sup>Menzies Health Institute Queensland, Griffith University, Brisbane, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Health technologies provide opportunities to deliver lifestyle interventions targeting the metabolic syndrome (MetS). The purpose of this study was to test the feasibility of a health technology-assisted lifestyle intervention with imposed and self-selected components in adults with complex chronic conditions designed to decrease MetS risk.

**Methods:** U-DECIDE was a single-centre, 26-week, randomised controlled trial. The setting was specialist kidney and liver disease outpatient clinics in an Australian tertiary hospital. Patients had at least one feature of the MetS and had been referred for dietetic consultation. All participants received an individualised dietary assessment from a dietitian, an activity monitor (Fitbit® Inspire HR) and usual multidisciplinary care. Intervention participants received all follow-up contacts virtually. Additionally, they had access to a suite of health technology options from which to choose including frequency of text-messages (1-3 per week), online and mobile app-based nutrition and exercise information and group-based telehealth with diet (monthly) and exercise (weekly) specialists. The primary outcome was feasibility of delivery, determined by *a priori* criteria for safety (number of study-related serious adverse events (SRSAEs)), recruitment (≥50% of eligible patients), retention (≥70% participants completing end-of-program assessments), exposure (≥75% of intervention group have greater access to health professional contact than controls) and telehealth adherence (≥80% attendance at scheduled sessions). Secondary outcomes included difference in MetS severity score (MetSSS) at 26 weeks.

**Results:** Of 67 randomised participants (intervention n=33, control n=34), 37 (55%) were men, median (IQR) age was 51 (41-58) years. Amongst intervention participants, 76% chose 2-3 text messages per week, 76% and 79% chose telehealth exercise and diet sessions respectively. The intervention group had no SRSAEs, and exceeded targets for recruitment (52%), retention (81%) and exposure (94%). Telehealth adherence was below target at 46% attendance. There were no differences between groups for changes in MetSSS (N=26; intervention 0.4±1.1AU; control -0.4±2.1AU; MD (I-C), 95%CI: 0.78, -0.52-2.07; *p*=0.23).

**Conclusion:** Health technology-assisted lifestyle interventions for adults with complex chronic conditions are feasible in tertiary healthcare. Targeted solutions to support telehealth attendance are needed. Given the

requirement for physical assessment, the utility of MetSSS as an outcome measure for telehealth interventions requires further consideration.

# Understanding the perspectives of the food retail sector towards policies to reduce sodium in the food supply

Mr. Gabriel Wong<sup>1</sup>, Ms. Xin Hui Chua<sup>2</sup>, **Dr. Salome Rebello**<sup>2</sup>

<sup>1</sup>Ng Teng Fong General Hospital, Singapore, Singapore, <sup>2</sup>Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** High sodium intake remains a pressing public health concern in Singapore with over 90% of the adult population exceeding the WHO daily limit, despite governmental efforts. As over 75% of adults usually eat out daily and given the high level of sodium in popular outside foods, the food service sector is a key focus for policy interventions. We therefore explored the food supply chain stakeholders' experience and perspectives towards existing and potential sodium reduction interventions.

**Methods:** We conducted 22 semi-structured interviews among food service vendors, suppliers and manufacturers. Participants were recruited by purposive sampling and thematic analyses using both deductive and inductive approaches were used.

**Results:** Commercial considerations were a dominant motivating factor. Existing and potential interventions were seen as requiring considerable effort with varying degrees of risk, and without comparable benefits. Systemic issues such as limited healthier food supplies challenged the implementation of interventions while strong institutional leadership was viewed as an important facilitator. Technical barriers including lack of nutrition knowledge increased the perceived effort for programme implementation. Perceived fairness was key to policy acceptability and compliance. However, constructs of fairness varied. Mandatory regulations were seen as a way of facilitating fairness and driving systemic change. Policies leveraging on negative emotional appeals such as warning labels were thought to be more effective in influencing supply chain and consumers' behaviour. Yet, if the policy posed reputational or earnings risks, it was perceived as being restrictive and prompted participants to consider measures of evasion. Vendors viewed themselves as having to negotiate between policy requirements and customers' expectations. The suitability of the policy was viewed to be context dependant, with certain settings being more appropriate for healthier food policy measures.

**Conclusion:** A comprehensive suite of policy measures are needed to shift the current status-quo where the benefits of selling healthier foods are vastly outweighed by the perceived efforts and risks involved. Key efforts to support this shift include creating a dominant supply of alternative healthier options, generating consumer demand for healthier foods, and reducing technical barriers for policy implementation

# Multilevel Physical Activity Intervention for Low Income Public Housing Residents in the U.S.: Protocol for the Community Walks Trial

**Dr. Lisa Quintiliani**<sup>1,2</sup>, Ms. Marislena Amezcuita<sup>2</sup>, Ms. Melibea Sierra<sup>2</sup>, Dr. Melody Goodman<sup>3</sup>, Dr. Julien Dedier<sup>1,2</sup>, Mr. John Kane<sup>4</sup>, Mr. Iolando Spinola<sup>5</sup>, Dr. Scott Crouter<sup>6</sup>

<sup>1</sup>Boston University, Boston, USA, <sup>2</sup>Boston Medical Center, Boston, USA, <sup>3</sup>New York University, New York, USA, <sup>4</sup>Boston Housing Authority, Boston, USA, <sup>5</sup>WalkBoston, Boston, USA, <sup>6</sup>The University of Tennessee, Knoxville, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Many physical activity behavioral interventions to change individual-level drivers of activity, like motivation, attitudes, and self-efficacy, are often not sustained beyond the intervention period. One possible cause of this lack of sustainability is that insufficient attention was paid to environmental factors that facilitate physical activity. A focus on interventions at both the environmental and individual levels might facilitate change in the long-term. This community-based study seeks to test a new multi-level (both environmental and individual levels), multi-component intervention to increase moderate intensity physical activity among people with low-incomes living in U.S. public housing developments, over a 2-year period.

**Methods:** The design of this study is a prospective, cluster randomized controlled trial, with housing developments (n=12) as the units of randomization. In a four-group, factorial trial, we will compare an environmental intervention (E) alone (3 developments), an individual intervention (I) alone (3 developments), an environmental plus individual intervention (E+I, 3 developments), against an assessment only control group (3 developments). The E only intervention consists of community health workers leading walking groups, an advocacy program for residents, and provision of walking maps/signage. The I only intervention consists of a 12-week automated telephone program to increase physical activity motivation and self-efficacy. All residents are invited to participate in the intervention activities being delivered at their development. The primary outcome is moderate intensity physical activity measured by accelerometry among an evaluation cohort (n=50 individuals at each of 12 developments) at 2-year follow up. Mediation (e.g., neighborhood walkability, social support, motivation) and moderation (e.g., neighborhood stress) of our interventions will be assessed. Lastly, we will interview key informants to assess factors from the Consolidated Framework for Implementation Research domains to examine future implementation of multi-level physical activity interventions among public housing residents.

**Results:** This ongoing trial is currently recruiting the baseline evaluation cohort; 154 individuals have been enrolled to date. Final results are anticipated in 2025.

**Conclusions:** Findings will inform whether a community-based multi-level approach will lead to sustained physical activity promotion over two years. If effective, this trial has the potential for implementation through other federal and state housing authorities.

# The association between sleep quality and the need for recovery among nurses working irregular shifts: A cross-sectional study

**Mr. Uthman Albakri<sup>1,2</sup>**, Mr. Nick Smeets<sup>3</sup>, Ms. Elizabeth Drotos<sup>1</sup>, Prof. IJmert Kant<sup>4</sup>, Assistant Professor Andrea Gabrio<sup>5</sup>, Associate Professor Ree Meertens<sup>1</sup>

<sup>1</sup>Department of Health Promotion, NUTRIM School of Nutrition and Translational Research in Metabolism, and Care and Public Health Research Institute (CAPHRI), Maastricht University, Maastricht, Netherlands,

<sup>2</sup>Department of Public Health, Faculty of Applied Medical Sciences, Albaha University, Albaha, Saudi Arabia,

<sup>3</sup>Maastricht University Medical Center (MUMC+), department Human Resources, Maastricht, Netherlands,

<sup>4</sup>Department of Epidemiology, Care and Public Health Research Institute (CAPHRI), Maastricht University, Maastricht, Netherlands, <sup>5</sup>Methodology & Statistic, School for Public Health and Prim Care (CAPHRI), Faculty of Health, Medicine & Life Sciences, Maastricht, Netherlands

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** The purpose of this study was to investigate the sleep quality of nurses working irregular shifts (including night shifts) and to determine whether sleep quality is associated with the need for recovery.

**Methods:** A descriptive cross-sectional study design was used. The study was conducted with 405 nurses working irregular shifts at Maastricht University Medical Center in Maastricht, the Netherlands, from September 2019 to January 2020. Data were collected using an online questionnaire that included sociodemographic characteristics, health, lifestyle behaviors, the Sleep-Wake Experience List, sleep problems, sleep duration, and the Need for Recovery scale. Data analysis was performed using descriptive statistics, chi-square tests, *t*-tests, AN(C)OVA's and multiple linear regressions.

**Results:** In general, nurses working irregular shift experienced bad sleep quality. Nurses who worked irregular shifts, including night shifts, had even poorer sleep quality than those who did not work night shifts. Nurses who worked irregular shifts, including night shifts, demonstrated more difficulties in daily functioning than nurses who did not work night shifts. Sleep quality was significantly associated with the need for recovery and remained so after controlling for confounding variables ( $\beta = .554$ ,  $p = .001$ ).

**Conclusion:** First, the study findings show that nurses who work irregular shifts suffer from low sleep quality. Second, the study results show that nurses working night shifts had poorer sleep quality than those who work shifts but no night shifts. Third, this study is the first to find evidence that sleep quality is significantly associated with the need for recovery of nurses working irregular shifts. Given that a high need for recovery has been demonstrated to be a strong predictor of ill health, the findings suggest that enhancing sleep quality in nurses working irregular shifts may lead to a lower need for recovery, which may in turn lead to better health and less risk for burnout and sickness absence. Therefore, it is important to assess in future research whether sleep quality in nurses working irregular shifts can be improved by either optimizing irregular shifts schedules or by using certain sleep hygiene strategies.

# Strategies and lifestyle behaviors that nurses working irregular night shifts use to improve sleep quality: A qualitative interview study among good and bad sleepers

**Mr. Uthman Albakri<sup>1,2</sup>**, Mr. Nick Smeets<sup>3</sup>, Prof. Jmert Kant<sup>4</sup>, Associate Professor Ree Meertens<sup>1</sup>

<sup>1</sup>Department of Health Promotion, NUTRIM School of Nutrition and Translational Research in Metabolism, and Care and Public Health Research Institute (CAPHRI), Maastricht University, Maastricht, Netherlands,

<sup>2</sup>Department of Public Health, Faculty of Applied Medical Sciences, Albaha University, Albaha, Saudi Arabia,

<sup>3</sup>Maastricht University Medical Center (MUMC+), department Human Resources, Maastricht, Netherlands,

<sup>4</sup>Department of Epidemiology, Care and Public Health Research Institute (CAPHRI), Maastricht University, Maastricht, Netherlands

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** To assess the sleep strategies and lifestyle behaviors that nurses working irregular night shifts use to improve their sleep quality, and to compare the strategies of good and poor sleepers to determine whether the differences between the two groups could provide insights into possible good strategies.

**Methods:** A qualitative interview study was performed. Thirty-four nurses working irregular night shifts participated; 17 were classified as good sleepers and 17 as poor sleepers based on the Sleep-Wake Experience List. Data were collected through semi-structured, face-to-face interviews, using a guide of open questions regarding strategies/lifestyle behaviors around the night-shift set and for switching to a normal sleep rhythm after the night-shift set. The interviews were recorded, transcribed, translated, and analyzed by two researchers using thematic analysis and NVivo v. 12.

**Results:** Both groups described similar and different strategies that help them work and sleep well during and after night shifts. However, good sleepers mentioned a greater number of strategies and seemed to have thought about them more than poor sleepers. The most common strategies were having a clear structure, being organized—especially regarding sleeping time—maintaining a daily routine, and adjusting the sleep environment.

**Conclusion:** First, this is the first study that uses semi-structured interviews to explore sleep strategies among nurses working irregular night shifts who are good and poor sleepers. Second, the study findings indicate that good sleepers have a clear, consistent plan for the night shift period. Third, having a clear structure, being organized, maintaining a daily routine, and adjusting the sleep environment are often part of such a plan. To promote good quality sleep among nurses working irregular night shifts, they could be stimulated to develop such plans, therein considering their individual characteristics. Future interventions and research should help identify and encourage nurses to experiment with strategies/behaviors to find out what works best for them.

# Sex differences and family determinants in children's time use throughout the day

**Dr. Daniela Rodrigues**<sup>1,2</sup>, Prof. Aida Isabel Tavares<sup>3,4</sup>, Prof. Aristides Machado-Rodrigues<sup>1,5</sup>, Assistant Professor Augusta Gama<sup>1,6</sup>, Assistant Professor Helena Nogueira<sup>1,7</sup>, Assistant Professor Maria-Raquel Silva<sup>1,8</sup>, Associate Professor Cristina Padez<sup>1,2</sup>

<sup>1</sup>University of Coimbra, CIAS – Research Centre for Anthropology and Health, Coimbra, Portugal, <sup>2</sup>University of Coimbra, DCV – Department of Life Sciences, Coimbra, Portugal, <sup>3</sup>CEISUC - Centre for Health Studies and Research, University of Coimbra, Coimbra, Portugal, <sup>4</sup>ISEG, UL - Lisbon School of Economics and Management, University of Lisbon, Lisbon, Portugal, <sup>5</sup>High School of Education, Polytechnic Institute of Viseu, Viseu, Portugal, <sup>6</sup>Department of Animal Biology, Faculty of Sciences of the University of Lisbon, Lisbon, Portugal, <sup>7</sup>Faculty of Letters, University of Coimbra, Coimbra, Portugal, <sup>8</sup>Faculty of Health Sciences, University Fernando Pessoa, Porto, Portugal

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** More studies should adopt a combine approach to modifiable lifestyle behaviors because of their potential synergistic effects on health. This study will 1) determine differences in children's time allocation, considering sex and period of the week, and 2) identify family determinants associated with children's time use.

**Methods:** In 2016/2017, we pooled cross-sectional questionnaire data from 3-10-year-old Portuguese children (n=8472). Using a standardized questionnaire, parents reported children's time use in different behaviors - sleep, study, screen media, indoor and outdoor play, and commute to and from school - as well as children's participation in sports, and family socioeconomic characteristics (e.g., siblings, type of family, and degree of urbanization). Correlations between time use indicators were performed and pairwise correlations were calculated. Multiple linear regressions were performed. First, using screen time as dependent variable (independent variables: indoor play, outdoor play, school commute, study time, sleep duration; child characteristics were used as control variables). Second, using children's time use indicators as dependent variables (independent variables: family characteristics).

**Results:** Time-use correlation between activities was similar between boys and girls. Overall, boys accumulated more screen-time and spent more time in outdoor activities, but less in indoor plays in comparison with girls. Moreover, the time spent in different activities was correlated, particularly during the weekdays. However, the interaction between screen-time and outdoor play, indoor play, study-time and school commuting time was weak. Relevant effect on the time spent using screen media devices came from the sleep duration (more sleep=less screen). Also, children who practiced an organized sport, spent less time on screen, especially on weekends. Lastly, the time devoted for each task or activity was determined by a set of family sociodemographic factors such as urbanization and parental employment.

**Conclusions:** Identifying time spent in multiple activities that differ by sex (and associated determinants) is critical for the development of activity promotion strategies, and may help to inform evidence-based policies designed to increase physical activity and decrease sedentary behavior in young children.

# A cross-country ecological momentary assessment of joint association between outdoor and social contexts on movement behaviors

Dr. Chih-Hsiang Yang<sup>1</sup>, Dr. Shang-Ti Chen<sup>3</sup>, Mr. Abhishek Aggarwal<sup>1</sup>, **Dr. Christine Pellegrini**, Dr. Mengya Xia<sup>2</sup>

<sup>1</sup>University of South Carolina, Columbia, USA, <sup>2</sup>University of Alabama, Tuscaloosa, USA, <sup>3</sup>National Dong Hwa University, Hualien, Taiwan

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** The ecological momentary assessment (EMA) has been used to identify the impact of social and environmental contexts on movement behaviors in various populations. However, few EMA studies focused on the interface of multiple contexts in promoting physical activity (e.g., outdoor and not alone as a joint context). This study combined two EMA studies collected among college students in US and Taiwan (TW) to fill this research gap.

**Methods:** The two EMA studies were designed to understand the psychosocial and environmental determinants of daily movement behaviors in college students. Participants in each country responded to 6 EMA surveys for 7 (US) or 14 (TW) days during waking time using an app. For each survey, they reported if they were sitting, standing, or moving, staying outdoors or indoors, and alone or with someone else.

**Results:** A total of 6,072 EMA surveys from 279 participants (US=118; TW=161) were included in the analysis. Findings suggested that, compared to staying indoors and alone, participants were more likely to report movements with higher energy expenditure if they were outdoors and not alone ( $t= 24.75$ ,  $p<.001$ ), indoor and not alone ( $t= 4.31$ ,  $p<.01$ ), or outdoor and not alone ( $t= 28.74$ ,  $p<.001$ ). They were more likely to report moving than sitting if they were staying outdoors, regardless of being alone or not ( $ts= 21.86$  and  $27.04$ ,  $p<.001$ ). These results were consistent between the US and Taiwanese college students. However, US students were more likely to report movement behaviors with higher energy expenditure and moving than sitting at any EMA survey ( $ps<.001$ ). The models adjusted for participants' sex, age, and BMI.

**Conclusions:** This cross-country EMA study identified identical phenomena that outdoor context and the presence of other people are jointly associated with more movements at a given time. The outdoor context tends to be relatively more important than being alone or not in promoting physical activity. The current study dichotomizes both the outdoor and social contexts into four simple but independent momentary contexts. Future EMA studies are encouraged to apply various items to capture and study the diversity of our social and environmental contexts for promoting active lifestyles.

# Identity-based adolescent health interventions: A systematic review

**Miss Sarah Jenner<sup>1,2</sup>**, Dr. Jana Kreppner<sup>1</sup>, Dr. Kerry Fox<sup>3</sup>, Prof. Mary Barker<sup>1,2</sup>

<sup>1</sup>University of Southampton, Southampton, United Kingdom, <sup>2</sup>Medical Research Council Lifecourse Epidemiology Centre, Southampton, United Kingdom, <sup>3</sup>University of Brighton, Brighton, United Kingdom

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** This review sought to evaluate health interventions aimed at adolescents that used theories of identity in the design of their behaviour change strategies. It aimed to investigate which theories have been used and how, as well as which intervention strategies have been most successful and why.

**Methods:** Six databases (PsycINFO, MEDLINE, Web of Science, EMBASE, CINAHL, and ERIC) were searched and results were screened by title, abstract and full text using defined inclusion and exclusion criteria. Data extraction and quality assessment were conducted by two reviewers for all studies and results were summarised in a narrative synthesis.

**Results:** A total of 26 studies from 20 papers were included in the review. Most interventions were based on self-affirmation theory (n = 15) and used a simple self-affirmation manipulation to strengthen aspects of a participant's identity that were highly valued by them before presenting them with health risk or health promotion materials. Other identity theories/concepts used included role identity, implicit drinking identity and deviance regulation theory. Studies addressed a range of different health behaviours including diet, physical activity, alcohol use and smoking. Most studies (n = 16) were unsuccessful in achieving statistically significant changes to health behaviours.

**Conclusions:** Using psychological theories that are pertinent to adolescent development, such as identity theories, as a basis for intervention design is a step in the right direction. However, the low success rates found by this review highlight the importance of taking adolescent values into consideration. Health is not a priority for adolescents, so interventions need to find other ways to support adolescents to make changes that fit into their lives and matter to them. For example, several studies included in this review aimed to reduce alcohol consumption in undergraduate students. Alcohol consumption is an accepted social norm within this group and is tied to important social events and relationships. The 'student drinker' identity is also highly prevalent. Therefore, reducing alcohol consumption is not something that is valued by most students. If interventions can strengthen healthy identities that are highly valued by adolescents they may have more success in supporting them to make healthier choices.

# Barriers and facilitators for implementing a 'lifestyle is medicine' model of care in hospitalized care: a qualitative study

**Ms. Marlinde L. van Dijk**<sup>1,2,3</sup>, Dr. Joyce Vrijssen<sup>4</sup>, Dr. Inge van den Akker-Scheek<sup>4</sup>, Prof. Martine de Bruijne<sup>1,3</sup>, Prof. Willem van Mechelen<sup>1,2</sup>, Dr. Judith Jelsma<sup>1,2,3</sup>

<sup>1</sup>Amsterdam UMC location Vrije Universiteit Amsterdam, Department of Public and Occupational Health, Amsterdam, Netherlands, <sup>2</sup>Amsterdam Public Health research institute, Health Behaviors & Chronic Diseases, Amsterdam, Netherlands, <sup>3</sup>Amsterdam Public Health research institute, Quality of Care, Amsterdam, Netherlands, <sup>4</sup>University of Groningen, University Medical Centre Groningen, Department of Orthopaedics, Groningen, Netherlands

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** In the Dutch healthcare system, advice on lifestyle-related behaviour in consultation with a healthcare professional is hindered by limited time, insufficient motivational skills and insufficient knowledge on referral options. We propose a new care pathway in which lifestyle medicine related care is organized through a separated lifestyle front office (LFO) in the hospital in collaboration with community-based lifestyle initiatives. The aim was to identify barriers and facilitators for implementing a LFO in a hospital, and identify matching implementation strategies.

**Methods:** Semi-structured interviews were held with healthcare professionals (i.e. physicians (assistant), dieticians, physiotherapist, (specialized) nurses) from different departments (n=33) and with patients (n=27) under treatment in the hospital who had either a BMI of  $25 \geq \text{kg/m}^2$  or who was a current smoker. Topics included experience with (i.e. providing or receiving) lifestyle-related care, and views, needs and preferences regarding design and implementation of an LFO in the hospital. An inductive thematic content analysis was conducted to identify barriers and facilitators. Barriers were matched to evidence-based implementation strategies with the CFIR-ERIC Implementation Strategy Matching Tool, resulting in an implementation plan that indicated strategies in three time-related phases: 1) preparation; 2) launch; 3) continuation.

**Results:** Barriers and facilitators were clustered according different organizational stages of the identified care pathway and patient journey: 1) Referral to the LFO (i.e. healthcare professional characteristics, health care professional motivation, patient motivation, resources); 2) Appointment at the LFO (i.e. fragmented care, lifestyle broker characteristics, time, case load, resources, perceived effectiveness); 3) Referral to community-based lifestyle initiatives (i.e. quality monitoring, patient motivation, patient behaviour, reimbursement structures, location); 4) Communication between patients and healthcare professionals (i.e. feedback, stakeholder characteristics, digital resources). Implementation strategies included identifying champions dedicated to supporting and marketing implementation of the LFO, recurrent training for professionals, and building a stakeholder network.

**Conclusion:** Insights from the current study are based on a relatively large and diverse stakeholder group and provide important insight for implementation of an LFO in the hospital. Future research should provide information on the effect of implementation strategies on actual implementation of an LFO in the hospital and if adaptations are necessary.

# Effects of Home-based Exergaming on Preschool Children's Cognition, Sedentary Behavior, and Physical Activity: A Randomized Crossover Trial

**Dr. Nan Zeng**, Dr. Jung Eun Lee, Dr. Zan Gao

<sup>1</sup>University of New Mexico Health Sciences Center, Albuquerque, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Exergaming's potential to promote young children's cognition and health remains largely unknown. We conducted a randomized crossover trial to evaluate the preliminary effects of a home-based educational exergaming program (LeapTV™) versus usual practice on preschool children's executive function, sedentary behavior, and physical activity (PA).

**Methods:** A total of 34 preschool children (17 girls, Mage = 4.72±0.73 years; BMI-z = 0.39±1.08) were recruited. Participants were randomized to either exergaming condition (30 minutes/day, 5 days/week) or usual practice condition for 12 weeks, followed by a 1-week washout period (week 13) and a second 12-week crossover phase. Executive function was assessed by the Dimensional Change Card Sort (DCCS) test; sedentary behavior, light PA, and moderate-to-vigorous PA (MVPA) were assessed via ActiGraph GT3X+ accelerometers. All participants underwent identical assessments at baseline, week 13, and week 26.

**Results:** Compared with usual practice, exergaming intervention increased children's executive function by 1.9 DCCS unit (95% confidence interval [95% CI], -0.34 to 4.04; d = 0.22); decreased sedentary time by 22.1 minutes (95% CI, -25.22 to 18.98; d = 0.29); decreased light PA by 9.56 minutes (95% CI, -7.09 to -12.02; d = 0.22); and increased MVPA by 4.05 minutes (95% CI, 2.35 to 5.74; d = 0.20), respectively.

**Conclusion:** This study demonstrates the implementation of a home-based educational exergaming intervention would promote meaningful improvements in preschool children's executive function and PA behaviors. Despite the promising findings, such intervention merits larger trials to maximize and confirm the potentials of LeapTV™.

# Customer Discovery for Scale Up: Enhancing the Acceptability and Scalability of the Building Healthy Families Program

Dr. Gwenndolyn Porter<sup>1</sup>, Dr. Todd Bartee<sup>2</sup>, **Ms. Caitlin Golden**<sup>1</sup>, Prof. Paul Estabrooks<sup>3</sup>, Prof. Jennie Hill<sup>3</sup>, Dr. Kate Heelan<sup>2</sup>

<sup>1</sup>University Of Nebraska Medical Center, Omaha, USA, <sup>2</sup>University of Nebraska at Kearney, Kearney, USA,

<sup>3</sup>University of Utah, Salt Lake City, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Customer discovery, an entrepreneurial and iterative process to understand the context and needs of potential adoption agencies, may be an innovative strategy to improve broader dissemination of evidence-based interventions. This presentation will describe the customer discovery process for Building Healthy Families (BHF) an evidence-based, family healthy weight program designed to be delivered in rural areas by trained community implementation teams.

**Methods:** The customer discovery process was completed as part of a SPeeding Research-tested INTerventions (SPRINT) training supported by the U.S. Centers for Disease Control and Prevention. Customer discovery interviews (n=47) were conducted with people that could be potential resource users, economic buyers, and BHF adoption influencers to capture multiple contextual and needs-based factors related to adopting new evidence-based interventions. Qualitative analyses were completed in an iterative fashion as each interview was completed.

**Results:** While BHF was designed to be flexible in the type of implementation organization due to different resources being available in different rural communities, a focus on rural health departments provided the most consistently supportive context for intervention adoption. These health departments prioritize childhood obesity but lack resources to implement effective programming. Several intervention funding approaches were also identified that included (1) program grants from local and national foundations, (2) local value-based care hospital systems and (3) regional employer groups. Payment plans recommended included licensing fees and tiered payments based on level of implementation support (e.g., recruitment support, implementation consultation) at the organizational level and tiered fees at the participant level based on family ability to pay. Marketing a range of BHF outcomes (e.g., weight change, constructive family time, social & emotional support) and the use of a not-for-profit business model were also recommended during the customer discovery process to increase the likelihood of BHF scale up and sustainability.

**Conclusions:** Engaging in customer discovery was an important exercise to better understand the intended audience and the factors that could assist or hinder future scale up. These findings provide practical directions for BHF commercialization that will increase the likelihood of program adoption, implementation, and sustainment while also allowing the program to be low or no cost to eligible families.

# The Feasibility of a Remotely-Delivered Physical and Food Literacy Program for Youth with Intellectual Disabilities (ID)

**Dr. Carol Curtin**<sup>1</sup>, Dr. Heidi Stanish<sup>2</sup>, Dr. Aviva Must<sup>3</sup>, Mr. Patrick Cullen<sup>1</sup>, Ms. Katherine Rancaño<sup>2</sup>, Ms. Monica Forquer<sup>4</sup>, Ms. Kristin Schreck<sup>5</sup>, Dr. April Bowling<sup>6</sup>, Mr. Chris Irish<sup>5</sup>, Ms. Nicole Askenazy<sup>7</sup>, Ms. Xiaoya Wei<sup>7</sup>, Dr. Linda Bandini<sup>1,7</sup>

<sup>1</sup>E.K. Shriver Center, UMass Chan Medical School, Worcester, USA, <sup>2</sup>University of Massachusetts - Boston, Boston, USA, <sup>3</sup>Tufts University School of Medicine, Boston, USA, <sup>4</sup>Consultant, Washington, DC, USA, <sup>5</sup>Consultant, Boston, USA, <sup>6</sup>Merrimack College, North Andover, USA, <sup>7</sup>Boston University - Sargent College of Health & Rehabilitation Sciences, Boston, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Youth with ID have low fitness and physical activity levels and poor diet quality. Physical literacy (PL) and food literacy (FL) are hypothesized to underlie the healthy physical activity and eating habits. PL comprises motivation, confidence, and physical competence for physical activity engagement. FL entails the capacity to learn about food and nutrition and make healthy choices. We developed and piloted a PL/FL program for youth with ID ages 12-16 yrs. Originally designed for in-person programming, the pandemic required significant redesign for remote delivery.

**Methods:** Six youth (4 male, 2 female) participated in remote sessions weekly (2 separate groups of 3 youth each) over 12 weeks. An ID-trained fitness instructor led 30-minute sports skills sessions focused on ball and locomotor skills using equipment sent to the home (balls, low hurdles, paddles). A registered dietitian and 2 nutrition students led 30-minute nutrition education sessions on food group identification, making healthy choices, snack preparation, and taste testing. Families received tablets to access Zoom™, food preparation equipment, food lists, and pre-paid credit cards for food purchases.

**Results:** Attendance was 88%; all participants completed the program. Protocol fidelity was 91%. Youth satisfaction data revealed that 5/6 liked the sport sessions “a lot”; 1 liked them “a little bit”. Two liked the nutrition sessions “a lot”, 3 liked them “a little”, and 1 did not like them. Five youth felt the sessions were “just right”; 1 indicated they were “too hard”. Parent satisfaction data indicated that 5/6 were satisfied overall. Four parents indicated their teen enjoyed the sport sessions; 5 indicated their teen enjoyed the nutrition sessions. Three felt the program increased their teen’s interest in physical activity/sports; 5 indicated the program motivated their teen to eat healthy foods. However, only 2 parents felt they had adequate space for the sport sessions.

**Conclusions:** This small pilot suggests that a PL/FL program for youth with ID is feasible and acceptable. Effective interventions that promote positive health behaviors in youth with ID are needed. PL/FL interventions for the ID population warrant further research, including evaluating in-person, remote, and hybrid formats.

# What types of brief vigorous intermittent physical activity could workplace interventions try as ‘exercise snacks’? A scoping review

**Dr. Josephine Chau<sup>1</sup>**, Dr. Juliana Oliveira<sup>2</sup>, Ms. Putu Novi Arfirsta Dharmayani<sup>1</sup>, Dr. Steve Gilbert<sup>2</sup>, Ms. Taryn Jones<sup>1</sup>, Prof. Emmanuel Stamatakis<sup>3,4</sup>, Prof. Andrew Philp<sup>3,4</sup>, Prof. Anne Tiedemann<sup>2</sup>, Prof. Janaki Amin<sup>1</sup>  
<sup>1</sup>Department of Health Sciences, Macquarie University, Sydney, Australia, <sup>2</sup>Institute for Musculoskeletal Health, University of Sydney and Sydney Local Health District, Sydney, Australia, <sup>3</sup>Sydney School of Health Sciences, Faculty of Medicine and Health, University of Sydney, Sydney, Australia, <sup>4</sup>Charles Perkins Centre University of Sydney, Sydney, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To identify types of vigorous intermittent physical activity that are feasible to implement as ‘exercise snacks’ in workplace interventions.

**Methods:** We conducted a scoping review to examine the peer reviewed literature on interventions involving brief bouts of vigorous intermittent physical activity. We searched five databases for articles reporting on experimental and quasi-experimental studies that involved brief bouts of vigorous-intensity physical activity (e.g., high intensity interval training, HIIT) with physical and/or mental health outcomes in adults published up to March 2022. We extracted and synthesised data on characteristics of the intervention (types of activities, duration, frequency), participants, settings and outcomes.

**Results:** We identified 82 relevant articles (54% RCT, 24% cross-over, 12% randomised pre-post). Half the studies were conducted in a laboratory or clinical setting, 11% were school-based, 7% in mixed settings, 25% did not report the setting, and none were in workplaces. Studies involved participants who self-identified as sedentary/inactive (40%), were overweight/obese (29%), or had chronic conditions (30%). The most common type of activity performed in brief vigorous bouts was cycling, followed by running or sprinting, and walking. Nearly one fifth of studies involved interventions with mixed vigorous activities such as running plus football, game-based activities, and circuit training (e.g., squats, push ups, jumping jacks). Only 2 studies gave participants free choice of the activities they would like to do at high intensity in intermittent intervals. Intervention duration, composition and frequency varied from one session on a cycle ergometer (4X4-min exercise + 4X3-min rest) to 20-minute circuit training with drills and games twice per week for three months, to 16-minute HIIT sessions of self-selected activities twice per week for five years. Most studies measured outcomes related to cardiometabolic health, while few examined effects on mental health.

**Conclusion:** Translating evidence of the benefits of vigorous intermittent physical activity into workplaces requires more attention. Most studies in this scoping review were based in laboratory or clinical settings. The feasibility and acceptability of engaging in vigorous intermittent bursts of cycling and sprinting and other activities in workplace settings require further investigation with end-users in formative research before testing in larger trials.

# Neighborhood environment and physical activity in girls: findings from the LEGACY Girls Study

**Dr. Rebecca Kehm**<sup>1</sup>, Dr. Esther John<sup>2</sup>, Dr. Mary Daly<sup>3</sup>, Dr. Theresa Keegan<sup>4</sup>, Dr. Julia Knight<sup>5</sup>, Dr. Jasmine McDonald<sup>1</sup>, Dr. Caren Frost<sup>6</sup>, Dr. Danielle Hanna<sup>5</sup>, Dr. Angela Bradbury<sup>7</sup>, Dr. Sandra Buys<sup>6</sup>, Dr. Irene Andrulis<sup>5</sup>, Dr. Mary Beth Terry<sup>1</sup>

<sup>1</sup>Columbia University, New York, USA, <sup>2</sup>Stanford University, Stanford, USA, <sup>3</sup>Fox Chase Cancer Center, Philadelphia, USA, <sup>4</sup>University of California, Davis, Davis, USA, <sup>5</sup>Lunenfeld-Tanenbaum Research Institute, Toronto, Canada, <sup>6</sup>University of Utah, Salt Lake City, USA, <sup>7</sup>University of Pennsylvania, Philadelphia, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The built environment affects physical activity in adults; less is known about whether the neighborhood environment, as reported by parents, is associated with childhood physical activity.

**Methods:** We conducted a cross-sectional analysis using questionnaire data from the LEGACY Girls Study, a North American cohort of 1,068 girls, primarily aged 6-13 years at enrollment (2011-2013). Guardians (97% mothers) were asked by questionnaire if they 1="strongly disagreed" to 4="strongly agreed" that their neighborhood had: shops within walking distance, transit stops within walking distance, sidewalks on most streets, four-way intersections, high traffic, high crime, many recreational facilities, many physically active residents, and many interesting things to look at while walking (data available for 964 girls). Girls, aged ≥10 years, were asked these same questions (n=560). We used log-binomial regression models adjusted for age, race/ethnicity, study center, and maternal education to estimate relative risks (RRs) and 95% confidence intervals (CIs) for each neighborhood characteristic in association with being physically inactive (no report of free play, riding a bike, etc.) while at home in the past week. We used the weighted kappa statistic to evaluate mother-daughter inter-rater agreement .

**Results:** Forty-two percent of girls were physically inactive while at home in the past week. Girls in high crime and high traffic neighborhoods, as reported by guardians, had 26% (RR=1.26, 95% CI=1.07-1.48) and 37% (RR=1.37, 95% 1.13-1.65), respectively, higher risk of being physical inactive compared with girls in low crime/traffic neighborhoods. Girls, aged ≥10 years, who reported living in a neighborhood without many physically active residents had a 53% (RR=1.53, 95% CI=1.01-2.32) higher risk of being physically inactive compared with girls in neighborhoods with many physically active residents. Mother-daughter agreement on neighborhood characteristics was fair to moderate, with weighted kappa statistics ranging from 0.19 (many physically active residents) to 0.60 (sidewalks on most streets).

**Conclusions:** These findings support the need for policies and programs focused on the built environment for physical activity promotion in youth, especially given that we have previously found an association between childhood physical inactivity and early puberty in girls, a risk factor for breast cancer and other health outcomes.

# Cooking Self-Efficacy and Nutrition Knowledge Predict Diet Quality in College Students

**Ms. Emma Watras<sup>1</sup>**, Ms. Kayla Parsons<sup>1</sup>, Ms. Leigh Neptune<sup>1</sup>, Ms. Amelia Sullivan<sup>1</sup>, Ms. Caitlyn Winn<sup>1</sup>, Dr. Jade McNamara<sup>1</sup>

<sup>1</sup>University of Maine, Orono, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** College is a time when many young adults learn independence and self-management. College students often report eating processed foods which may be due to a lack of cooking knowledge (CK), nutrition knowledge (NK), and cooking self-efficacy (CSE), leading to poor overall diet quality (DQ). This study aimed to assess if greater CK, NK, and CSE, predicted DQ in college students.

**Methods:** A cross-sectional convenience sample of undergraduates completed an online survey assessing health behaviors. DQ was measured using the Short Healthy Eating Index (sHEI), assessing adherence to the 2015-2020 Dietary Guidelines for Americans. Scores range from 0-100, with higher scores indicating healthier DQ. CK, NK, and CSE were measured using the Food Preparation Knowledge and Confidence Survey, scores range from 1-5, with higher scores indicating better knowledge and self-efficacy. A Pearson correlation examined the directionality of relationships among variables. A linear regression determined whether CK, NK, and CSE predict DQ.

**Results:** Students (N=851) were on average 19.7 ( $\pm 1.6$ ) years old, primarily White (90.7%), female (63.8%), and underclassmen (58.6%). 38.3% of students perceived their NK as poor or fair and 26.9% perceived their CK as poor or fair. The mean CSE score was 3.9. The mean sHEI score was 47.9. CSE ( $r=.263$ ,  $p<.001$ ), NK ( $r=.345$ ,  $p<.001$ ), and CK ( $r=.261$ ,  $p<.001$ ) were positively correlated with DQ. The overall regression model was significant,  $R^2 = 0.14$ ,  $F(3, 757) = 39.3$ ,  $p<0.001$ . CSE ( $\beta=1.89$ ,  $p=.009$ ) and NK significantly predicted DQ ( $\beta=2.61$ ,  $p<.001$ ). CK did not predict DQ.

**Conclusions:** CSE and NK positively predicted DQ, highlighting the need to implement college-aimed initiatives incorporating nutrition and cooking education to improve overall DQ in college students. Providing students with comprehensive nutrition and cooking education can support positive behavior change, improve overall DQ, and reduce risk for developing chronic disease in adulthood.

# Study protocol for the Screen Free Time with Friends Feasibility Trial

**Miss Sarah Overgaard Sørensen**<sup>1</sup>, Dr. Anne Kær Gejl<sup>1</sup>, Miss Teresa Victoria Høy<sup>2</sup>, Dr. Peter Lund Kristensen<sup>1</sup>, Dr. Mette Toftager<sup>3</sup>, Mr. Arne Gårn<sup>4</sup>, Prof. Anders Grøntved<sup>1</sup>, Dr. Kristen Traberg Larsen<sup>1</sup>

<sup>1</sup>Research Unit for Exercise Epidemiology, Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark, <sup>2</sup>National Institute of Public Health, University of Southern Denmark, Copenhagen, Denmark, <sup>3</sup>Research Unit for Active Living, Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark, <sup>4</sup>Steno Diabetes Center Odense, Odense University Hospital, Odense, Denmark

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Children are spending an increasing amount of time alone with screens, which seems to affect both their physical and mental health. Furthermore, the field lacks feasible and effective interventions conducted in a natural setting. The Screen Free Time with Friends Feasibility Trial will be conducted to test the feasibility, including acceptability and compliance, to an intervention aiming to reduce screen media use and promote time physically with friends during leisure time in 10-11-year-old children.

**Methods:** A non-randomized single group feasibility trial will be conducted from February to October 2023 including approximately 200 children (aged 10-11 years) and 200 parents (at least one per child) from three different schools recruited from three different municipalities in Denmark (ClinicalTrials.gov ID: NCT05480085). The Screen Free Time with Friends intervention is a multicomponent intervention targeting families, afterschool clubs and local communities and has been developed based on a thorough development process following the Medical Research Council UK framework for developing and evaluating complex interventions. The implementation approach will allow the intervention to vary across different local communities yet maintaining the integrity of the core components of the intervention. Feasibility and acceptability of the intervention will be assessed during the intervention using process evaluation inspired by the RE-AIM framework including focus groups interviews with parents, afterschool club personnel and local stakeholders. Participation, recruitment, retention rate and compliance to the outcome measurements (objectively measured physical activity, screen time, screen media addiction, wellbeing, social relations, leisure time activities, sociodemographic background) will be investigated and presented.

**Conclusion:** The trial will investigate the feasibility including acceptability and compliance with regards to the intervention and the planned outcome measurements. This feasibility study will ensure the final essential refinements before the intervention program will be implemented in a large randomized controlled trial investigating the effect of the intervention.

# Comparing direct and indirect assessments of fidelity in a family healthy weight program

**Ms. Caitlin Golden**<sup>1</sup>, Prof. Jennie Hill<sup>2</sup>, Dr. Kate Heelan<sup>3</sup>, Dr. Gwenndolyn Porter<sup>1</sup>, Mrs. Emiliane Pereira<sup>1</sup>, Dr. Todd Bartee<sup>3</sup>, Mrs. Ali Malmkar<sup>3</sup>, Dr. Tzeyu Michaud<sup>1</sup>, Dr. Bryce Abbey<sup>3</sup>, Prof. Paul Estabrooks<sup>2</sup>

<sup>1</sup>University of Nebraska Medical Center, Omaha, USA, <sup>2</sup>University of Utah, Salt Lake City, USA, <sup>3</sup>University of Nebraska Kearney, Kearney, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Fidelity assessment is essential to dissemination and implementation science. Fidelity can be measured through direct, independent observer, assessment which is rigorous and expensive and/or indirect, implementer, assessment. Understanding the utility of indirect assessment is important to determine its potential to provide valid fidelity information in large trials or where implementation of interventions covers a broad geographic area. This study compared direct and indirect measures of fidelity from a 12-week family healthy weight program, Building Healthy Families (BHF), across 7 rural US communities.

**Methods:** Trained observers completed weekly direct assessments in each community while community implementation teams (CITs) provided weekly indirect assessments immediately following the completion of each session. Direct assessment measured key components on a 3-point scale (0=did not cover, 1=inconsistently covered, 2=completely covered), indirect assessment used a 10-point scale (1= did not achieve objective to 10= completely achieved objective). Correlations between direct and indirect assessments for each fidelity component (i.e., nutrition and physical activity (PA) content, self-regulation support, and family engagement) were completed within and across communities. Descriptive statistics were also completed.

**Results:** Direct and indirect fidelity assessments were significantly correlated for PA content ( $r=0.92$ ), nutrition content ( $r=0.37$ ), and family engagement ( $r=0.41$ ), but not for self-regulation ( $r=0.05$ ). The rank order of the fidelity assessments differed between direct (highest to lowest=nutrition, PA, self-regulation, family engagement) and indirect (highest to lowest=family engagement, PA, nutrition, and self-regulation). While not powered to examine significant differences in direct-indirect assessment correlations by community, there were variations in these relationships across communities.

**Conclusions:** Correlations between direct and indirect fidelity assessments may indicate that (1) the measures assessed different aspects of fidelity, (2) an existence of social desirability in indirect assessment, or (3) different perceptions between trained independent observers and implementers trained to deliver BHF rather than to assess fidelity--or some combination of these factors. Determining the relationship between direct/indirect assessments to participant outcomes will provide additional information on the utility of each method and determine which factors are most relevant to the development and implementation of fidelity assessments that are efficient and allow for rapid monitoring and feedback.

# Reliability of the digital physical fitness test digimot

**Dr. Anke Hanssen-Doose<sup>1</sup>**, Mr. Max Pauli<sup>1</sup>, Dr. Claudia Niessner<sup>2</sup>, Prof. Annette Worth<sup>1</sup>

<sup>1</sup>University of Education, Karlsruhe, Germany, <sup>2</sup>Karlsruhe Institute of Technology, Karlsruhe, Germany

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Monitoring of physical fitness (PF) in children and youth is important because PF is a summative indicator of health. There exist different ways of monitoring the PF levels in younger populations. The digital measurement of PF within a video meeting seems to be cost-effective and has the potential for wide-reach. However, there is almost no evidence how reliable this kind of measurement is. Therefore, the aim of this study was to assess the reliability of a new digital instrument.

**Methods:** We developed the *digimot* test on the basis of four tasks of the MoMo test profile (Worth, et al. 2015). The original test profile is validated, discussed with experts and frequently used within a population-based monitoring in Germany (MoMo study). Within the new *digimot* test, PF was assessed by means of these four tasks: 'Jumping-sideways', 'Sit-ups', 'Push-ups', 'Stand and reach'. The validation sample (n=47, aged 8-12 yrs, n<sub>♂</sub>=28, n<sub>♀</sub>=19) participated in two different test settings: 'digital' in a Zoom meeting at their homes and 'in presence' in test rooms. Both measurements - 'digital' and 'in presence' - were researcher-assessed by exactly the same trained researcher. Statistical significance was set at  $p < 0.05$ . Descriptive and inferential statistical analyses (t and sign tests, Spearman and Pearson correlations) were performed using SPSS. The reliabilities were estimated on the basis of mean comparisons in combination with the degrees of correlations.

**Results:** The results revealed a satisfactory reliability of 'Jumping-sideways' (no difference,  $r=0.66$ ,  $p < 0.001$ ), a very good reliability of 'Sit-ups' (no difference,  $r=0.70$ ,  $p < 0.001$ ), a not satisfactory reliability of 'Push-ups' (no difference,  $r=0.41$ ,  $p=0.005$ ) and a very good reliability of 'Stand and reach' (no difference,  $r=0.88$ ,  $p < 0.001$ ).

**Conclusions:** The study provides support that the *digimot* test is a reliable alternative to 'in presence' tests. Three of four tasks turned out to be sufficiently reliable. To enhance the reliability of 'Push-ups', motivational aspects should be proved. Additional research is needed which aims to the integration of a task for the endurance performance.

# Cluster randomised controlled trial to determine the impact of an activity enabling uniform on primary school student's fitness and physical activity

**Ms. Nicole McCarthy<sup>1,2,3</sup>**, Dr. Alix Hall<sup>1,2,3</sup>, Prof. Luke Wolfenden<sup>1,2,3</sup>, Dr. Emma Pollock<sup>2,3</sup>, Dr. Nicole Nathan<sup>1,2,3</sup>

<sup>1</sup>University of Newcastle, Newcastle, Australia, <sup>2</sup>Hunter New England Health, Newcastle, Australia, <sup>3</sup>Hunter Medical Research Institute, Newcastle, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** An emerging barrier to student physical activity at school, particularly among girls are traditional uniforms that may be impractical for participating in physical activity (e.g. dresses, skirts and black leather shoes). Modifying the school uniform to be sports uniform everyday may be a simple intervention to improve student's physical activity (PA). The aim of this study was to assess the impact of an activity enabling uniform on primary schools students' cardiovascular fitness and PA across the school day.

**Methods:** A cluster randomised controlled trial was undertaken in 13 primary schools in New South Wales, Australia with students in grade 4,5 or 6. Schools were randomised to either an activity friendly uniform intervention, whereby students wore their sports uniform every day of the school week, or to a usual practice control. Physical fitness was measured using the shuttle run test and PA was measured in steps and counts per minute using wrist worn accelerometers for 5 school days. Linear mixed models will be used to compare student fitness and PA (across the segmented school day) between the intervention and control groups at follow-up, controlling for baseline. All analyses will follow intention to treat principles, with missing data addressed using multiple imputation. To reduce bias and ensure adequate power no preliminary data will be analysed prior to final data collection, which is due for completion in December 2022.

**Results:** Results of the study will report overall difference in physical fitness levels and step count between intervention and control schools at follow-up. 13 schools have completed baseline data, there were 684 consenting students of which 602 had valid shuttle run data and 620 had valid accelerometer data.

**Conclusion:** Given the many challenges faced when implementing, at scale, school PA interventions this study is aiming to support a school uniform policy change as a simple means of improving student PA; one that does not require significant resource to build the capacity of schools and their staff to support implementation. It also has the ability to support other school PA programs by having students ready to engage in PA at any time of the week, especially for girls.

# Associations between cancer and cardiovascular disease diagnosis history and physical activity in Korean adults

**Dr. Ki-Yong An<sup>1</sup>**, Miss Fernanda Arthuso<sup>1</sup>, Mr. Spencer Allen<sup>1</sup>, Miss Stephanie Ntoukas<sup>1</sup>, Prof. Kerry Courneya<sup>1</sup>

<sup>1</sup>University of Alberta, Edmonton, Canada

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Cardiovascular disease (CVD) and cancer (CAN) are the leading causes of death in many countries worldwide. Although physical activity provides many health benefits, patients with CAN or CVD experience many barriers to physical activity. Understanding the physical activity levels in patients with CAN and CVD is important to improve their physical activity levels. The primary purpose of this study was to examine independent and combined associations of a CAN and/or CVD diagnosis with physical activity in Korean adults.

**Methods:** The current study is a cross-sectional design. A total of 32,655 adults, who completed the self-reported assessments of CAN and CVD diagnosis, and physical activity from the Korea National Health and Nutrition Examination Survey between 2015 and 2019, were included. Participants were asked to report their diagnosis of different types of CAN and CVD, and were divided into four groups depending on CAN and CVD diagnosis. Physical activities were measured using the Korean version of the Global Physical Activity Questionnaire. Chi-square analyses and analysis of variance were used to identify the differences in demographic, medical, and physical activity variables among the four diagnosis groups. Analysis of covariance and multinomial logistic regression were used to compare physical activity levels among the four diagnosis groups after adjusting for covariates. Factorial ANCOVA was used to examine the associations of time since diagnosis and time between diagnosis of CAN and/or CVD with physical activities.

**Results:** In adjusted model, participants diagnosed with CAN only participated in more leisure time physical activity compared to those diagnosed with neither disease ( $p=0.045$ ) and CVD only ( $p=0.024$ ), more walking compared to those diagnosed with neither disease ( $p=0.002$ ), CVD only ( $p<0.001$ ), and both ( $p=0.015$ ) diseases, and more strength exercise than those diagnosed with neither ( $p=0.009$ ) and both diseases ( $p=0.001$ ).

**Conclusions:** Although Physical activity levels in Korean adults are insufficient regardless of CAN and/or CVD diagnosis, people diagnosed with CAN only participated in more physical activity than those diagnosed with neither, both diseases, and CVD only. Different strategies may be required for each diagnosis group to improve their physical activity levels.

# Carbon footprint of diets among K-12 students in the USA

**Miss Andrea Barney**<sup>1</sup>, Associate Prof. Lori Spruance<sup>1</sup>, Dr. Amelia Willits-Smith<sup>2</sup>, Dr. Diego Rose<sup>2</sup>

<sup>1</sup>Brigham Young University, Provo, USA, <sup>2</sup>Tulane University, New Orleans, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Greenhouse gas emissions (GHGE) from food production and diet choice contribute to climate change. Little is known about how the food choices of school-aged children and youth may contribute to this problem. The study's purpose was to calculate dietary GHGE, or "dietary carbon footprints," of US K-12 students, and examine its relationship with diet quality.

**Methods:** The study sample dietary recalls (N=2,400 students) came from the 2014-2015 US Department of Agriculture (USDA) School Nutrition and Meal Cost Study (SNMCS). The SNMCS collected demographic information, usual participation in the National School Lunch Program (NSLP) and School Breakfast Program (SBP), and a 24-hour dietary recall from a nationally representative sample of K-12 students. The USDA processed the 24-hour dietary recalls to produce nutrient intakes and Healthy Eating Index (HEI) scores for all respondents. Dietary GHGE were calculated by linking items from the SNMCS 24-hour dietary recalls to dataFRIENDS (database of Food Recall Impacts on the Environment for Nutrition and Dietary Studies), which includes the GHGE (kg CO<sub>2</sub>-equivalents) per 100g of each USDA food code. Dietary GHGE were ordered from low to high and categorized into quintiles. Dietary quality, measured by HEI scores, was compared between the students in the lowest-GHGE (Q1, n=549) and highest-GHGE (Q5, n=549) groups using t-tests. Analyses also compared Q1 and Q5 for usual school meal participation.

**Results:** The average dietary GHGE of the sample was 5.13 kg CO<sub>2</sub>-equivalents per person per day. Students in Q1 consumed higher amounts of dietary fiber, plant protein, and significantly lower ( $p < 0.05$ ) amounts of sodium and saturated fat. Students in Q1 had significantly higher HEI scores (mean = 62.40, SE=0.91) compared to students in Q5 (mean=29.19, SE=0.64) ( $p=0.004$ ). Q5 students were more likely to be usual participants of the NSLP ( $p=0.04$ ) and SBP ( $p=0.03$ ) compared to Q1 students.

**Conclusion:** Dietary carbon footprints of students were inversely correlated with overall diet quality, but the relationship of carbon footprint to individual nutrients was mixed. These results can inform dietary guidance seeking to modify food behaviors in order to reduce dietary GHGE. Opportunities exist to modify school meals to reduce GHGE among participants.

# Physical activity and inactivity during youth sport and dance: A systematic review and meta-analysis

**Prof. Gregory KOLT<sup>1</sup>**, Ms. Bethany Perkins<sup>1</sup>, Associate Prof. Emma George<sup>1</sup>, Dr. Justin Guagliano<sup>1</sup>

<sup>1</sup>Western Sydney University, Sydney, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The aims of this study were to identify the percentage of time youth spend in moderate-to-vigorous physical activity (MVPA) and inactivity during organised sport or dance, and to identify the associated contextual factors that impact on time spent in these behaviours.

**Methods:** A systematic review and meta-analysis were conducted. Included studies sampled youth aged  $\leq 18$  years currently participating in organised youth sport or dance. Studies had a quantitative study design and baseline measure of time spent in MVPA or inactivity during a youth sport or dance session. Five electronic databases were searched: Scopus, SPORTDiscus, PubMed, Web of Science, and PsycINFO, with forward searching in Google Scholar to identify eligible articles that had cited the included studies. Meta-analysis was conducted to estimate the pooled mean percent time spent in MVPA/inactivity using random-effects models. Analyses were conducted using Stata Version 17.

**Results:** From an initial pool of 7,518 nonduplicate records, 31 articles from 30 studies met the inclusion criteria. Most studies were conducted in the US ( $n = 16$ ) and used accelerometry ( $n = 27$ ) as the primary physical activity measure. Only 7 studies targeted youth dance. Meta-analysis revealed that the mean (95% CI) time spent in MVPA during organised sport was 38.2% (33.8, 42.5) and mean time spent inactive was 29.7% (22.7, 36.7). Most studies explored contextual factors during practices only. There were several contextual factors that appeared to influence MVPA, including task contexts (e.g., warm-up, gameplay, free play), demand contexts (i.e., contexts that foster participation and inclusion), and coach contexts (e.g., coaches' MVPA during practice). Some task contexts (e.g., instruction, fitness) and demand contexts (i.e., contexts that foster exclusion like elimination games) also appeared to influence inactivity.

**Conclusions:** The findings indicate that in organised youth sport and dance there is potential to increase time in MVPA, particularly during practices. Sport and dance are likely one of the widest reaching out-of-school settings for physical activity. In many countries, most youth participate in at least one sport annually, so optimising the setting for MVPA could have substantial public health impact.

# Nutrition-related information on Instagram: A content analysis of posts by popular Australian accounts

**Ms. Emily Denniss<sup>1</sup>**, Dr. Rebecca Lindberg<sup>1</sup>, Prof. Sarah McNaughton<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition, School of Exercise and Nutrition Sciences, Deakin University, Melbourne, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Social media can influence individuals toward both healthy and unhealthy eating behaviours and has become a popular source of food and nutrition information. Nutrition is one of the most discussed health topics on Instagram, however, little is known about the content of nutrition-related posts by popular accounts. Therefore, the aim of this study was to examine the content of nutrition-related posts by popular Australian Instagram accounts using a machine learning approach.

**Methods:** Australian Instagram accounts that primarily posted about nutrition, with over 100,000 followers were identified. All posts from a 12-month period, excluding stories, were extracted and screened to identify posts containing information about nutrition. Text-based captions of included posts were uploaded to Leximancer, a content analysis software that uses machine learning to identify key concepts and themes in textual data. Instagram posts from each theme were read by the authors to develop an agreed upon interpretation and select illustrative quotes.

**Results:** A total of 10,964 Instagram posts from 61 Instagram accounts were included in the final sample. The mean engagement (number of likes plus number of comments) for included posts was 1,854 and mean number of followers was 279,505. Five overarching themes were identified. In decreasing order of magnitude, the themes were: 1) recipes; 2) eating practices; 3) body goals; 4) food literacy and 5) cooking and eating at home. Information about the benefits of healthy eating and how to prepare healthy meals occurred frequently throughout the Instagram posts. Additionally, the marketing of supplements and online programs for meal plans and weight loss occurred throughout posts under each theme.

**Conclusions:** The popularity of social media content about recipes and healthy eating indicate that social media may be a useful setting for wide-reaching nutrition promotion campaigns. Nutrition-related content about “body goals” and weight loss may contribute to restrained and disordered eating. There is a large amount of marketing claims about supplements and online nutrition programs present on Instagram. Future research should examine the accuracy of nutrition information on Instagram, and how consumers use social media to inform their eating behaviours.

# The Sleep and Activity Database for the Early Years (SADEY) project: International collaboration and data pooling to understand young children's 24-hour movement behaviours.

Associate Prof. Dylan Cliff<sup>1</sup>, **Dr. Devan Antczak<sup>1</sup>**, Dr. Byron Kemp<sup>1</sup>, Associate Professor Catherine Draper<sup>2</sup>, Prof. Timothy Olds<sup>3</sup>, Dr. Rute Santos<sup>4</sup>, Dr. Diego Augusto Santos Silva<sup>5</sup>, Prof. Mark Tremblay<sup>6</sup>, Dr. Esther Van Sluijs<sup>7</sup>, Dr. Ian Janssen<sup>8</sup>

<sup>1</sup>University of Wollongong, Wollongong, Australia, <sup>2</sup>University of the Witwatersrand, Johannesburg, South Africa, <sup>3</sup>University of South Australia, Adelaide, Australia, <sup>4</sup>University of Porto, Porto, Portugal, <sup>5</sup>Federal University of Santa Catarina, Florianópolis, Brazil, <sup>6</sup>Children's Hospital of Eastern Ontario Research Institute, Ontario, Canada, <sup>7</sup>University of Cambridge, Cambridge, United Kingdom, <sup>8</sup>Queen's University, Kingston, Canada

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Canada, Australia, the World Health Organization and other countries have released 24-hour movement guidelines for the early years which integrate physical activity, sedentary behaviour, and sleep, focusing more holistically on supporting children to achieve a healthy 24-hour day. The guideline development process, however, highlighted the dearth of quality evidence, particularly from large-scale studies. The Sleep and Activity Database for the Early Years (SADEY) project will assemble a large, pooled database of 24-hour movement behaviours, their determinants and health indicators in young children (birth to 5.99 years), to advance knowledge in these areas. This presentation will describe the SADEY methods and preliminary sample.

**Methods:** Researchers are being identified who have and are willing to share medium- to large-scale datasets (>100 children) of device-measured (waist-worn ActiGraph accelerometers) physical activity and sedentary behaviour, and parent-reported or device-measured sleep. Led by the co-ordinating centre at the University of Wollongong and supported by the International Children's Accelerometry Database (ICAD), SADEY is pooling these studies using R and Microsoft SQL Server to create a harmonised database of young children's 24-hour movement behaviours, health and developmental indicators, and determinants. Data contributors and external researchers can apply to access and analyse data via a virtual (off-premises) computer system.

**Results:** To date, 11 researchers from 7 countries have expressed interest in collaborating by contributing data from 12 studies. Ethics clearance and data sharing agreements have been secured for many of these studies and the SADEY 1.0 database will be assembled by early 2023. Data collection and harmonisation processes and descriptive findings will be presented.

**Conclusion:** SADEY will be used to address questions of global importance to public health policy and practice, for example - *How much does the mix of movement behaviours across the 24-hour day impact healthy development?*, *What is the optimal mix of these behaviours?*, and; *What factors can be targeted to support young children in achieving the optimal mix of 24-hour movement behaviours?* Additionally, SADEY seeks to develop and disseminate protocols, and develop capacity, on how to objectively assess movement behaviours, and seeks partnerships with stakeholders that promote knowledge translation on movement behaviours.

# Outdoor gym resistance training workouts delivered via mHealth: Process evaluation from the *ecofit* effectiveness trial

**Dr. Anna Jansson**<sup>1,2</sup>, Prof. David Lubans<sup>1,2</sup>, Prof. Mitch Duncan<sup>2,3</sup>, Mr. Jordan Smith<sup>1,2</sup>, Prof. Adrian Bauman<sup>4</sup>, Prof. John Attia<sup>3</sup>, Prof. Ronald Plotnikoff<sup>1,2</sup>

<sup>1</sup>Centre for Active Living and Learning, University of Newcastle, Newcastle, Australia, <sup>2</sup>Active Living Research Program, Hunter Medical Research Institute, Newcastle, Australia, <sup>3</sup>School of Medicine and Public Health, University of Newcastle, Newcastle, Australia, <sup>4</sup>School of Public Health, University of Sydney, Sydney, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** This study describes the process evaluation of (i) the *ecofit* workouts delivered via the smartphone app, (ii) the characteristics, use and perceptions of outdoor gyms, and (iii) factors influencing selection of outdoor gym locations, included in the *ecofit* effectiveness trial. The trial aimed to determine the effects of an innovative multicomponent physical activity intervention promoting resistance and aerobic-based physical activity using mHealth, outdoor gyms, and social support.

**Methods:** We evaluated the '*ecofit*' intervention using a two-arm cluster randomised controlled trial from September 2019 to March 2022 in two regional municipalities of New South Wales, Australia. We recruited a sample of 245 participants (72% female, mean age 53.4 years [SD=13.9]) who were randomised to the *ecofit* intervention ( $n=122$ ) or waitlist control ( $n=123$ ) group. The intervention group received access to a smartphone app, which included standardised workouts tailored to 12 outdoor gym locations. Process evaluation data were collected using surveys ( $n=69$ ), user data through the *ecofit* app and qualitative interviews at the 3-month time-point. Data were analysed using descriptive statistics and presented as means (standard deviations [SD]) or counts (percentages) as appropriate. Qualitative data were analysed using Nvivo 11 software.

**Results:** The outdoor gyms ( $N=12$ ) in this study varied in the number of pieces of installed equipment (min=3, max=19). Most locations (75%) included 'trail-based' equipment. Of the total number of logged workouts ( $n=1,447$ ), 53% were park-based (i.e., 47% were 'Home Challenges'). Participants logged workouts in an average of 3 (SD = 2.3) different outdoor gym locations. Proximity to outdoor gym facilities (mean=5.5, SD=1.1; 1='not at all', 6='completely') appeared to be the most important factor influencing the choice of facility to work-out. Almost all (90%) participants self-reported that the scenery was pleasant and 74% indicated that the quality of the outdoor gym equipment was good, at the location they used the most. Regarding the qualitative interviews, participants generally expressed positive views about the outdoor gyms and preferred those with more varied equipment.

**Conclusion:** This study demonstrated that locations with a variety of equipment and proximity of outdoor gym facilities were important factors to promote outdoor gym use.

# Associations between Health-Related Fitness Measures and General Health in Newly Diagnosed Breast Cancer Patients from the AMBER Cohort Study

**Mr. Spencer Allen<sup>1</sup>**, Dr. Ki-Yong An<sup>1</sup>, Miss Fernanda Arthuso<sup>1</sup>, Dr. Gorden Bell<sup>1</sup>, Dr. Andria Morielli<sup>2</sup>, Dr. Jessica McNeil<sup>3</sup>, Mr. Qinggang Wang<sup>2</sup>, Miss Stephanie Ntoukas<sup>1</sup>, Dr. Margaret McNeely<sup>1</sup>, Prof. Jeff Vallance<sup>4</sup>, Dr. Nicole Culos-Reed<sup>5</sup>, Dr. Karen Kopciuk<sup>2</sup>, Miss Myriam Fillion<sup>1</sup>, Dr. Lin Yang<sup>2,5</sup>, Dr. Charles Matthews<sup>6</sup>, Miss Leanne Dickau<sup>2</sup>, Dr. John Mackey<sup>1</sup>, Dr. Christine Friedenreich<sup>2,5</sup>, Prof. Kerry Courneya<sup>1</sup>

<sup>1</sup>University of Alberta, Edmonton, Canada, <sup>2</sup>Alberta Health Services, Calgary, Canada, <sup>3</sup>University of North Carolina at Greensboro, North Carolina, USA, <sup>4</sup>Athabasca University, Athabasca, Canada, <sup>5</sup>University of Calgary, Calgary, Canada, <sup>6</sup>US National Cancer Institute, Rockville, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** The diagnosis and treatment of breast cancer is associated with substantial stress and uncertainty that may threaten quality of life (QoL) in newly diagnosed breast cancer patients. Examining the correlates of QoL in newly diagnosed breast cancer patients may identify important intervention targets to improve QoL and better prepare patients for treatment. The present study aimed to examine the associations between a comprehensive set of high-quality health-related fitness (HRF) measures and the general health component of QoL in a large sample of newly diagnosed breast cancer patients.

**Methods:** Newly diagnosed breast cancer patients were recruited between 2012-2019 in Edmonton and Calgary, Canada as part of the Alberta Moving Beyond Breast Cancer (AMBER) Cohort Study. All participants (N=1,458) had early-stage disease and completed baseline HRF and QoL assessments within 90 days of diagnosis. HRF assessments included measures of cardiorespiratory fitness (VO<sub>2peak</sub> treadmill test), muscular fitness (upper and lower body strength and endurance tests), and body composition (dual x-ray absorptiometry). The general health component of the SF-36 was used to assess QoL among participants. Binary logistic regression was used to examine the associations between HRF and general health (dichotomized into poor/fair versus good/very good/excellent). Univariate and multivariate models were adjusted for key demographic, medical and behavioural covariates.

**Results:** Significant adjusted univariate associations were observed between general health and relative VO<sub>2peak</sub> (p=0.013), absolute VO<sub>2peak</sub> (p=0.021), relative upper body endurance (p=0.05), relative handgrip strength (p<0.001), body mass index (p=0.029), lean mass percentage (p=0.011), body fat percentage (p=0.05) and lean/fat ratio (p=0.009). However, in multivariate models, only relative handgrip strength emerged as significant. In particular, the least fit group was 3.7 times more likely to report poor/fair general health compared to the most fit group (OR=3.67, 95% CI=1.85-7.28).

**Conclusion:** Muscular strength, measured by relative handgrip strength, was the only component of HRF to emerge as independently associated with general health in newly diagnosed breast cancer survivors. Future studies aiming to mitigate the effects of a cancer diagnosis on QoL in breast cancer patients may benefit from the inclusion of an exercise intervention targeting muscular strength.

# Early childhood obesity prevention interventions – are we reaching the right populations to address this health equity problem?

**Dr. Anna Lene Seidler**<sup>1</sup>, Ms. Kylie Hunter<sup>1</sup>, Mr. Mason Aberoumand<sup>1</sup>, Dr. Jonathan Williams<sup>1</sup>, Prof. Rebecca Golley<sup>2</sup>, Dr. Sol Libesman<sup>1</sup>, Ms. Angie Barba<sup>1</sup>, Prof. Lousie Baur<sup>3</sup>, Dr. Talia Palacios<sup>1</sup>, Dr. Nipun Shrestha<sup>1</sup>, Dr. Alison Macchi<sup>4</sup>, Associate Professor Shonna Yin<sup>5</sup>, Dr. Brittany Johnson<sup>2</sup>

<sup>1</sup>University of Sydney, NHMRC Clinical Trials Centre, Sydney, Australia, <sup>2</sup>Caring Futures Institute, Flinders University, Adelaide, Australia, <sup>3</sup>Sydney Medical School, Sydney, Australia, <sup>4</sup>Department of Dietetics and Nutrition, Robert Stempel College of Public Health & Social Work, Florida International University, Florida, USA, <sup>5</sup>Departments of Pediatrics and Population Health, New York University Grossman School of Medicine, New York, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Childhood obesity is a major health equity problem. Despite substantial efforts, rates of childhood obesity remain concerning, and inequalities are widening. Childhood obesity is more prevalent in underserved populations, necessitating targeted interventions. We aimed to analyse the landscape of current early childhood obesity prevention trials and to understand whether and how priority populations have been targeted and reached.

**Methods:** We completed systematic searches of five databases (e.g. Medline, EMBASE) and trial registries for all planned, ongoing and completed randomised controlled trials evaluating behavioural early childhood obesity prevention interventions. Eligible trialists were invited to join the TOPCHILD Collaboration and share their individual participant data and unpublished intervention materials. We analysed trial location, target populations, intervention reach and key intervention elements.

**Results:** 48 trials with >50,000 children have joined TOPCHILD. Interventions varied in content (i.e. addressing nutrition, physical activity and/or sleep), delivery features and effectiveness. We identified trials across all continents in 15 countries; the majority (n=44) were from high-income countries, albeit 5 trials were from middle-income countries (Belarus, Brazil, Guatemala, China). Most trials targeted universal populations (n=34), and results were frequently not stratified by priority population. Thirteen trials targeted specific priority populations, including lower socio-economic background populations (n=7) and specific cultural backgrounds (n=6). Trials reported challenges in reaching priority populations. For instance, some recruited in geographical low socio-economic areas but mainly reached the higher-socioeconomic position populations within these areas. Trials that were embedded in pre-existing services to target participants within a priority population group reported higher reach. One trial found that lower health literacy was associated with lower intervention effectiveness, highlighting the importance of health literacy considerations when designing interventions.

**Conclusion:** We mapped whether early obesity prevention interventions targeted and reached priority populations. We found low numbers of interventions specifically targeting priority populations or conducted in low- and middle-income countries. Based on our findings, we derived key recommendations for future interventions and policy to address the major health equity burden of childhood obesity, including more targeted interventions, stratifying reporting by priority population, appropriate health literacy considerations and selecting targeted behaviour change techniques (e.g. social support).

# Exercise adherence trajectory during chemotherapy treatment in patients with breast cancer- Results from the Phys-Can study

**Dr. Anna Henriksson**<sup>1</sup>, Associate Professor Andreas Stenling<sup>2, 6</sup>, Dr. Anne-sophie Mazzoni<sup>1</sup>, Dr. Katarina Sjövall<sup>3</sup>, Prof. Susanne Börjeson<sup>4</sup>, Dr. Laurien Buffart<sup>5</sup>, Dr. Christopher Bean<sup>1,7</sup>, Prof. Sveinung Berntsen<sup>1,6</sup>, Associate Prof. Ingrid Demmelmaier<sup>1</sup>, Prof. Karin Nordin<sup>1</sup>

<sup>1</sup>Uppsala university, Uppsala, Sweden, <sup>2</sup>Umeå university, Umeå, Sweden, <sup>3</sup>Kristianstad university, Kristianstad, Sweden, <sup>4</sup>Linköping university, Linköping, Sweden, <sup>5</sup>Radboud University Medical Center, Nijmegen, Netherlands, <sup>6</sup>University of Agder, Kristiansand, Norway, <sup>7</sup>University of Adelaide, Adelaide, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** This study will provide a detailed description and explore potential predictors of exercise adherence (percentage of performed exercise volume/prescribed exercise volume) to a combined resistance and endurance training intervention during chemotherapy treatment for patients with breast cancer (BRCA).

**Methods:** The Phys-Can is a multicentre 6-month exercise trial conducted in Sweden (in Linköping, Lund and Uppsala). Participants were randomized to one of four conditions: high (HI) or low-moderate (LMI) intensity exercise groups, with or without behaviour change support. Randomized women receiving neo- or adjuvant chemotherapy in 21-day cycles for six cycles without treatment delays and with available resistance (n=143) and endurance (n=148) data will be included in the planned analyses. Adherence for endurance and resistance training will be analyzed in multilevel regression analyses due to the hierarchical nature of the data (i.e., observations at each time point were nested within participants). Predictors to be included in the analyses: chemotherapy treatment dose, randomized exercise intensity (HI vs LMI), baseline aerobic fitness, baseline physical activity, baseline BMI, and baseline co-morbidity.

**Results:** A preliminary descriptive analysis of participants without chemotherapy treatment delays shows the mean (SD) exercise volume for resistance (n=143) training across the entire chemotherapy treatment period was 68 % (18) for HI and 65 % (11) for LMI. The mean (SD) exercise volume for endurance training (n=148) was 54 % (16) for HI and 62% (11) for LMI. The mean volume per week varied throughout the cycles (i.e., lower levels in the weeks after the chemotherapy cycle) and decreased for each cycle. The total mean (SD) for the first and last cycle of resistance training 94% (9) and 55% (5) respectively, and for endurance training 72% (2) and 47% (15) respectively.

**Conclusions:** Preliminary descriptive analysis shows variation of exercise adherence throughout the chemotherapy treatment trajectory, but also a trend of lower levels at the end of the chemotherapy treatment period compared to the beginning of treatment. These patterns will be described further by plotting adherence for each chemotherapy week and predictors for adherence will be explored. This knowledge will contribute to optimising exercise programming for patients receiving chemotherapy against BRCA.

# Assessing the implementation of obesity prevention practices in Early Childhood Education and Care setting in New South Wales, Australia: a cross-sectional study.

**Ms. Ana Renda**<sup>1,2,3,4</sup>, Dr. Alice Grady<sup>1,2,4,5</sup>, Dr. Kathryn Reilly<sup>1,2,4,5</sup>, Associate Professor Serene Yoong<sup>4,5,6</sup>, Dr. Rebecca Hodder<sup>1,2,4,5</sup>

<sup>1</sup>University of Newcastle, Newcastle, Australia, <sup>2</sup>Hunter Medical Research Institute, Newcastle, Australia, <sup>3</sup>Sydney Local Health District, NSW Health, Sydney, Australia, <sup>4</sup>National Centre of Implementation Science, Newcastle, Australia, <sup>5</sup>Hunter New England Local Health District, Newcastle, Australia, <sup>6</sup>Global Obesity Centre, Institute for Health Transformation, Deakin University, Geelong, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** The aim of this study was to assess the prevalence of implementation of obesity prevention policies, practices, and programmes in Early Childhood Education and Care (ECEC) services in New South Wales (NSW), Australia.

**Methods:** A cross-sectional study was conducted using a randomly selected sample of 1,026 centre-based ECECs in NSW. A 50-item survey measured the implementation of 7 evidence-based healthy eating (HE) and 8 evidence-based physical activity (PA) policies and practices. Service demographic characteristics were also assessed. Participating services were randomly allocated to receive items related to either HE (267 services) or PA (234 services). Surveys were conducted between October 2021 and June 2022, taking 30 minutes to complete. Descriptive statistics were used to report prevalence of implementation.

**Results:** Of 1026 ECEC services, a total of 501 (50% consent rate) completed the survey and were included in the analysis. Of the participating services, 81.4% were long daycares and 18.3% were preschools, 76.8% were in major cities and 61% were located in a low socio-economic area.

In services that prepare food, 91.89% of menu planners/cooks use nutrition guidelines to plan their menus. For all services, 29.59% reported that more than half of their educators participated in professional development or training which promotes HE for children. Outside mealtimes, almost half (48.32%) of services reported undertaking planned HE education lessons at least weekly.

On average, 3-6-year-olds are provided with 331.79 minutes (SD=173.70) of child-initiated free-play per day, and 109.57 minutes (SD=92.12) of structured, educator-led PA per day. Most (82.76%) services reported providing daily activities to intentionally teach and develop fundamental movement skills for children. Only 19.83% of services reported that more than half of their educators participated in training promoting PA for children, and only 13.79% offered PA education (workshops or meetings) to all parents/families.

**Conclusions:** Findings of this study indicate the prevalence of implementation of evidence-based HE and PA policies and practices to be variable across NSW, Australia. Several evidence-practice gap were identified, particularly HE and PA training for educators and the provision of PA education for all families per sector recommendations. Efforts to support implementation of these practices is required.

# Barriers and facilitators to dissemination of obesity prevention research: a mixed methods systematic review.

**Ms. Ana Renda**<sup>1,2,3,4</sup>, Dr. Heidi Turon<sup>1,2,4,5</sup>, Dr. Alice Grady<sup>1,2,4,5</sup>, Associate Professor Serene Yoong<sup>2,5,6</sup>, Dr. Kathryn Reilly<sup>1,2,4,5</sup>, Dr. Rebecca Hodder<sup>1,2,4,5</sup>

<sup>1</sup>School of Medicine and Public Health, University of Newcastle, Newcastle, Australia, <sup>2</sup>National Centre of Implementation Science, Hunter New England Population Health, Newcastle, Australia, <sup>3</sup>Sydney Local Health District, Population Health, Sydney, Australia, <sup>4</sup>Hunter Medical Research Institute, Newcastle, Australia, <sup>5</sup>Hunter New England Local Health District, Population Health, Newcastle, Australia, <sup>6</sup>Global Obesity Centre, Institute for Health Transformation, Deakin University, Geelong, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To synthesise the barriers and facilitators to the dissemination of research related to the prevention of non-communicable diseases (NCD) to end-users of public health research.

**Methods:** A mixed methods systematic review, was conducted following the JBI convergent integrated approach. A search of 3 electronic databases was undertaken to identify studies published between Jan 2000 - May 2021 together with grey literature searches. We included quantitative, qualitative and mixed methods studies investigating factors influencing the dissemination of NCD research. Quantitative evidence was extracted, then converted into 'qualitized' data and categorised into themes based on the Framework for Knowledge Translation (FKT) which include: the user group, the issue, the research, the researcher-user relationship and dissemination strategies.

**Results:** The initial database search yielded 27,192 articles. After removal of duplicates, we screened 20,343 titles and abstracts, and retrieved 643 articles. Following full-text review, we included 11 qualitative, 1 quantitative and 4 mixed-methods studies, conducted in 9 different countries and on physical activity (n=6), nutrition (n=1), healthy body weight (n=1), and obesity prevention (n=1). Factors affecting dissemination were categorised across all 5 themes of the FKT. Barriers related to 'the user group' were inadequate timing and perceived low value of disseminated guidelines, and facilitators being end-users' interest and support in health and inclusion of stakeholders in dissemination process. Regarding 'the issue', perceived difficulties in linking research to policy hindered dissemination and an organisation (audience) prioritises that health facilitated dissemination. For 'the research', a reported barrier was lack of compatibility of content of guidelines and organisation goals (audience) and a facilitator was guidelines being evidence-based. Barriers regarding 'the researcher-user relationship' were the researcher and practitioners' different priorities and a facilitator was the mutual benefits for members of partnership. Regarding 'dissemination strategies', barriers were unclear target audiences and lack of communication skills, with facilitators being endorsement by recognised organisations or professionals and disseminating research findings through existing channels.

**Conclusion:** This review identified the key barriers and facilitators that can be targeted to improve the dissemination of research related to NCD and their risk factors including nutrition, physical activity and obesity prevention.

# The role of nature as a resource for student's health in the university setting

**Mrs. Pia Laemmert<sup>1</sup>**, Mr. Philipp Laemmert<sup>1</sup>, Prof. Susanne Tittlbach<sup>1</sup>

<sup>1</sup>University of Bayreuth, Bayreuth, Germany

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Around 26% of students are affected by a mental disorder during their study. Various demands in the university context like performance requirements contribute to this constitution. Based on salutogenetic approaches, resources must be identified to be able to cope with these demands. Different theoretical approaches show that nature can be one of those. The aim of the study is to examine (a) the role of nature as a resource for students, and (b) the pathways through which contact with nature relates to health involving physical activity, social cohesion and stress reduction. Regarding to the social-ecological model personal and environmental determinants will be included.

**Methods:** The study follows a mixed-methods design. First data collection is a quantitative standardized questionnaire, designed as full-scaled survey at the University of Bayreuth. 2.751 students (58% f, 42% ma, age range 18-66 years, response rate 22%) took part. Second data collection will take place as qualitative interviews, mid-2023 to go into more detail on the results of the quantitative survey. The focus will be on the perception of nature as a resource, i.e., which motives lead to the use of nature and which personal and environmental determinants influence the nature-health-relation.

**Results:** Students rate their mental health status (mean 3.15 on a five points Likertscale) worse than their physical (mean 2.56) and general health status (mean 2.38). Regarding to the student's behavior, they spend an average of 5.5 h/week, spread over 4 days a week, in natural environments. Nature is important to students for relaxation (mean 1.38 on a four points Likertscale), quality of life (mean 1.36) and as setting for physical activity (mean 1.65). First analyses of variance suggest that nature users (from 2 to 7 days/week) benefit significantly compared to non-nature users (never up to 1 day /week). Further statistical analyses to examine associations regarding to student's health (behavior) will follow.

**Conclusions:** First results show that the mental health of students is a serious issue. Nature can be a resource for coping with demands in the university setting. A special consideration on personal and environmental determinants which affect student's nature contact is necessary.

# Communicating Physical Activity to Adolescents: what works? A scoping review

**Miss Caera Grady**<sup>1</sup>, Dr. Enrique García Bengoechea<sup>1, 2</sup>, Dr. Kwok Ng<sup>1,3,4</sup>, Dr. Elaine Murtagh<sup>1</sup>, Prof. Catherine Woods<sup>1</sup>

<sup>1</sup>Physical Activity for Health Research Centre, Physical Education and Sport Science, Health Research Institute, University of Limerick, Limerick, Ireland, <sup>2</sup>Sport Ireland, Dublin, Ireland, <sup>3</sup>University of Eastern Finland, Joensuu, Finland, <sup>4</sup>University of Turku, Rauma, Finland

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Adolescents are among the most inactive population group worldwide. Researchers have called for an effective communication strategy for physical activity (PA) but to date this has been largely unexplored among adolescents. This scoping review aims to explore the content, context and mode of delivery for communicating PA messages with adolescents.

**Methods:** The protocol for this review was published in HRB Open research. It followed a systematic scoping review methodology guided by the Levac et al scoping review framework and PRISMA-ScR guidelines. Five databases were searched using the following key search terms 'physical activity', 'adolescents' and 'communication'. Sources included databases and citations of extracted articles were checked from the year 1995 onwards. A proportion (10%) of articles were double screened at both screening stages until a high level of agreement was achieved (i.e.  $\geq 75\%$ ), the remaining articles were screened by CG. This review is currently in the data extraction phase which is expected to be complete in January 2023. Results will be synthesised narratively and descriptively and reported as recurring themes.

**Results:** The search revealed 16,943 articles, of which 4,480 were duplicates. A further 12,008 were removed after title and abstract screening. A total of 459 full texts were assessed for eligibility of which 98 studies were included in the review. Initial analysis has identified the following themes: mechanisms for effective communication, ideal PA communicators, ideal setting for PA communication, additional considerations for adolescents needs.

**Conclusion:** A previous review of the PA messaging literature in the general population highlighted that messaging requirements differ across the lifespan e.g. adolescents are not concerned by the health related benefits of PA. However, this paper provides a more comprehensive overview of adolescents needs and wants for PA messaging. These findings have potential to facilitate the development of an effective communication strategy that outlines best practices for communicating PA messages to adolescents, which would be applicable for practice and policy.

# Pupils' experiences of physical activity and wearable technologies within primary school

**Ms. Georgina Wort**<sup>1</sup>, Dr. Gareth Wiltshire<sup>2</sup>, Dr. Oliver Peacock<sup>1</sup>, Dr. Simon Sebire<sup>3</sup>, Prof. Dylan Thompson<sup>1</sup>

<sup>1</sup>University of Bath, Bath, United Kingdom, <sup>2</sup>Loughborough University, Loughborough University, United Kingdom, <sup>3</sup>University of Bristol, Bristol, United Kingdom

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Children are insufficiently active, with vast inequalities which disadvantage girls and those from lower socio-economic backgrounds. It is acknowledged that researchers should move towards bottom-up approaches, understanding the perspectives and knowledge of individuals at the centre of research. Children's voices are often excluded from issues which directly impact them, with perceptions that they lack the capability for meaningful discussions. However, children are likely to provide valuable insights and their perspectives should contribute to intervention development. To understand primary school pupils' views and experiences of physical activity and wearable technologies within schools.

**Methods:** Semi-structured focus groups (N= 9) were conducted with 41 Year 5 and 6 pupils (19 girls, 22 boys) from across 6 primary schools based in the South-West of England. Information sheets and consent forms were sent home to pupils' parents/carers, and those who received consent participated in focus groups. Focus groups were recorded, transcribed, and the data was analysed using a reflective thematic approach.

**Results:** Pupils highlighted that academic learning was often a barrier to physical activity, as well as acknowledging the influence of the playground space and equipment. Social factors, particularly friendships and the influence of teachers, was recognised as contributing to their engagement, or lack of, in certain activities. Conversations took place regarding physical activity gender differences and included girls stating they had experienced exclusion, particularly in football, as well as gender stereotyping which was a barrier to their engagement. Individuals' competence and confidence, which included feelings of embarrassment, could prevent children from engaging, particularly the least active. Finally, autonomy was important for children, who valued choice and variety. When discussing wearable technologies children reported that they liked monitoring their steps. However, they highlighted that less sporty children were not as likely to own a device. Pupils acknowledged that technologies could often lead to competition, which may be less enjoyable for less active children.

**Conclusion:** Pupils contributed valuable knowledge and experiences. The findings from this study can contribute to a more detailed understanding of pupils' perspectives on physical activity and wearable technologies in primary schools, which can be used to inform intervention design.

# Changes in self-reported physical activity engagement across retirement transition among retirees from different occupational backgrounds

**Mr. Miika Tuominen**<sup>1,2</sup>, Associate Professor Tuija Leskinen<sup>1,2</sup>, Prof. Sari Stenholm<sup>1,2</sup>

<sup>1</sup>Department of Public Health, University of Turku and Turku University Hospital, Turku, Finland, <sup>2</sup>Centre for Population Health Research, University of Turku and Turku University Hospital, Turku, Finland

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Retirement is a common life transition associated with changes in physical activity engagement. The impact of retirement on physical activity appears to vary across socioeconomic positions which may serve to increase socioeconomic disparities in physical activity, and consequently health, in older age. However, further longitudinal studies focused specifically on retirement transition period are needed. The purpose of the current study was to examine changes in self-reported physical activity engagement across retirement transition among retirees from different occupational backgrounds.

**Methods:** Public sector workers (n=3541) from the Finnish Retirement and Aging cohort study were followed annually approximately 6 months before and after retirement transition. Occupational background was categorized based on the International Standard Classification of Occupations: High (classes 1-2), Middle (classes 3-4), Low (classes 5-9). The amount and intensity of weekly leisure-time or commuting related physical activity was assessed annually with a four-item questionnaire and expressed as METh/week. Binary variables were created for physical inactivity (<14METh/week) and participation in vigorous physical activity (yes/no). Differences in changes across retirement transition by occupational backgrounds were estimated using linear and logistic regressions with generalized estimating equations while adjusting for gender, age and self-reported health.

**Results:** Physical activity increased during retirement transition, although the increases were smallest among participants with low occupational background (High: 2.87 METh/week, 95% CI 1.78–3.97; Middle: 2.67, 1.58–3.77; Low: 1.12, 0.04–2.19; time\*occupation, p=0.049). The participants with high (OR 0.72, 95% CI 0.62–0.82) and middle (OR 0.81, 0.70–0.93) occupational background were less likely to be physically inactive after retirement transition when compared to before retirement, while no changes were observed among participants with low occupational background (OR 0.94, 0.82–1.07; time\*occupation p=0.022). In addition, participants with low occupational background were less likely to participate in vigorous physical activity after retirement transition (OR 0.85, 0.75–0.96), whereas no changes were observed among participants with high (OR 1.05, 0.93–1.18) or middle occupational background (OR 1.04, 0.92–1.19, time\*occupation p=0.026).

**Conclusion:** Retirement transition increases disparities in physical activity engagement across occupational backgrounds with the least favorable changes observed among participants with low occupational background.

# Does Exercise Modality Matter Affectively? Contrasting Type and Sequence of Moderate-Intensity Continuous Training versus High-Intensity Interval Training in a Randomized Within-Subject Study

**Mrs. Katja Dierkes**<sup>1</sup>, Ms. Inka Rösel<sup>1</sup>, Prof. Katrin E. Giel<sup>1</sup>, Prof. Ansgar Thiel<sup>1</sup>, Prof. Gorden Sudeck<sup>1</sup>

<sup>1</sup>University of Tübingen, Tübingen, Germany

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Affective determinants of exercise behavior are receiving increasing attention in research on health promotion and prevention. To date, however, little is known about changes in affective exercise determinants during multi-week training programs in insufficiently active individuals. This applies in particular to the currently discussed advantages and disadvantages of moderate-intensity continuous training (MICT) compared with high-intensity interval training (HIIT) with regard to the affective experience of these two training types, which is important for exercise adherence. Therefore, referring to the Affect and Health Behavior Framework (AHBF), this within-subject study investigated changes in affective exercise determinants as a function of training type and sequence consisting of MICT and HIIT.

**Methods:** Forty insufficiently active healthy adults ( $M_{age} = 27 \pm 6$  years; 72% women) underwent two 6-week training periods in a randomized sequence (MICT–HIIT vs. HIIT–MICT) within 15 weeks. Pre-post questionnaires and in-situ measurements, during and after a standardized vigorous-intensity continuous exercise session (VICE), were used to assess affective attitude, intrinsic motivation, in-task affective valence, and post-exercise enjoyment. These four affect-related constructs were collected before, between, and after the two training periods. For each of the four affect-related constructs, we separately fitted a mixed model for repeated measures including the fixed effects training type (MICT vs. HIIT), training period (period 1 vs. 2), and sequence (MICT–HIIT vs. HIIT–MICT) according to a 2x2 cross-over design. We set the significance level of  $\alpha = .0125$  to adjust for multiple testing using the Bonferroni correction.

**Results:** Mixed models revealed a significant effect for training sequence ( $p = .011$ ) – but not for training type ( $p = .045$ ) – on changes in in-task affective valence in favor of the MICT–HIIT sequence. Moreover, no significant training type or sequence effects were found for the constructs of reflective processing examined following the AFBH framework: exercise enjoyment, affective attitude, and intrinsic motivation.

**Conclusions:** Based on our results, individual-based training recommendations should consider the effects of variety and training sequence to develop tailored interventions that lead to more positive affective experiences – in particular during exercise – and thus to the maintenance of exercise behavior in previously inactive individuals.

# Factors that Predict Interest in Participation in Nutrition Interventions among Audiences with Low Incomes during COVID-19

Dr. Elena Serrano, **Ms. Rachel Liebe**, Dr. Sarah Misyak  
<sup>1</sup>Virginia Family Nutrition Program, Virginia Tech, Blacksburg, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** To explore factors that predict interest in participating in nutrition interventions for individuals with low incomes in the United States (US).

**Study Design, Setting, and Participants:** A cross-sectional online survey using Qualtrics panels was conducted in March and April of 2020 with adults 18 years and older who lived in Virginia, US, and were eligible for the US federal nutrition assistance program, Supplemental Nutrition Assistance Program (SNAP). SNAP provides monetary benefits to eligible individuals to supplement their food budget with the goal of eliminating food insecurity.

**Methods:** Survey questions included the following: socio-demographic information, including SNAP participation; food resource management skills and physical activity levels adapted from the Expanded Food and Nutrition Education Program (EFNEP) validated questionnaire for adults; number of days of poor mental health from the Centers for Disease Control and Prevention Health-Related Quality of Life questionnaire; and interest in nutrition interventions (designed by the survey development team). Frequencies and means were computed for each measure. Pearson chi-square analyses were utilized to predict different socio-demographic factors (age, gender, education, income, race, ethnicity, and SNAP participation) and food resource management skills and interest in nutrition interventions. All analyses were conducted using IBM SPSS Statistics for Windows (Released 2021, Version 28.0. Armonk, NY: IBM Corp.).

**Results:** A total of 1,309 (93.0%) participants completed all of the questions of interest for this specific study. Age, race, and participation in SNAP within the past 12 months were the only demographic variables found to be significantly associated with interest in nutrition interventions ( $p < .05$ ). A higher proportion of respondents who expressed interest in nutrition interventions indicated overall higher mean frequencies of planning meals before shopping, shopping with a grocery list, and poor mental health days ( $p < .05$ ).

**Conclusions:** The findings help characterize individuals with interest in nutrition interventions designed for audiences with low-incomes and can be used to help inform and tailor recruitment strategies, as well as potential intervention content.

# Smartphone- & Wearable-based Activity Trackers–Determinants of Engagement: Study Design and Instrument Development

**Ms. Chen-Chia Pan<sup>1,2,3</sup>**, Prof. Benjamin Schüz<sup>1,3</sup>, Dr. Kathrin Günther<sup>2</sup>, Prof. Wolfgang Ahrens<sup>1,2,4</sup>

<sup>1</sup>Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany, <sup>2</sup>Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, <sup>3</sup>Institute for Public Health and Nursing Research, University of Bremen, Bremen, Germany, <sup>4</sup>Institute of Statistics, Faculty of Mathematics and Computer Science, University of Bremen, Bremen, Germany

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Smartphones and wearable devices with activity-tracking functions offer great opportunities to support health behavior change. They can deliver evidence-based behavior change techniques and provide just-in-time adaptive interventions for physical activity. However, there is a dearth of epidemiological research on consumer usage patterns in the real world and the determinants of long-term engagement. We aim to investigate the distribution, patterns, and determinants of engagement with activity trackers in Germany.

**Methods:** A web-based survey assessing the experience of and attitudes toward activity trackers was developed for a sub-study embedded in the German National Cohort (NAKO), called "Smartphone- & Wearable-based Activity Trackers–Determinants of Engagement" (SWEAT-DE). The questionnaire addresses ownership, types of devices, usage patterns of activity trackers, and determinants of usage based on the Capability, Opportunity, Motivation, Behavior (COM-B) model. Face validity and content validity of the questionnaire were assessed qualitatively by an expert group. The test-retest reliability is planned with a one-week interval in between among university students. The correlation coefficient of continuous variables and Cohen's kappa for categorical variables will be calculated between the test and retest. Each study center will sequentially distribute the questionnaire via email to at least 2000 participants per study center.

**Results:** The project is ongoing in the data collection process of test-retest, and the official questionnaire distribution to NAKO participants is planned for the beginning of 2023. This study will present: 1) the prevalence of owning and using consumer activity trackers and their distribution in the German National Cohort study; 2) the degree of engagement and usage patterns and their population characteristics; 3) the individual-level behavioral constructs of activity tracker users vs. non-users and long-term engaged users vs. discontinued users.

**Conclusions:** The study results will provide insights into the user characteristics, usage patterns, and determinants of uptake and engagement with activity trackers. Moreover, they have significant implications for understanding how to increase long-term engagement with activity trackers using modifiable factors like capability, opportunity, and motivation. These findings will be of interest to developers and researchers in designing digital behavior change interventions for physical activity using a smartphone- or wearable-based activity tracker.

# Design and baseline results of the SoFiT study: a randomized controlled intervention to study the effect of a personalized lifestyle program on cancer-related fatigue in colorectal cancer survivors

Mrs. Judith de Vries-ten Have<sup>1</sup>, Mr. Koen Manusama<sup>1</sup>, Miss Auke Verkaar<sup>1</sup>, Prof. Ellen Kampman<sup>1</sup>, Dr. Laura Winkens<sup>2</sup>, **Associate Professor Renate Winkels<sup>1</sup>**

<sup>1</sup>Division of Human Nutrition and Health, Nutrition and Disease Chair Group, Wageningen University and Research, Wageningen, Netherlands, <sup>2</sup>Consumption and Healthy Lifestyles Chair Group, Wageningen University and Research, Wageningen, Netherlands

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Many colorectal cancer survivors (CRC) experience long-term side effects of treatment, with cancer-related fatigue (CRF) listed as the most reported and severe problem. Observational studies among CRC survivors suggest an association between a healthy lifestyle and decreased risk of CRF; intervention studies are sparse. Importantly, there are no interventions that recruited only CRC survivors experiencing fatigue. We designed the SoFiT-study to assess the effect of a personalized 6-month lifestyle intervention compared with usual care on CRF.

**Methods:** The SoFiT-study is an ongoing parallel randomized controlled trial aiming to recruit 184 participants. Eligible are persons who experience CRF and who completed treatment for stage I-III CRC between six months and five years ago. Participants randomized to the intervention group receive personalized coaching from a lifestyle coach for 6 months to increase adherence to the lifestyle recommendations of the World Cancer Research Fund regarding adopting healthy dietary behaviours, maintaining a healthy weight, and increasing physical activity. The intervention is personalized to the current level of adherence to WCRF recommendations of the participant, and to the preference of the participant; additionally, it is personalized by applying behavioural change techniques tailored to the specific behavioural determinants of the participant. Participants randomized to the usual care group receive two lifestyle coaching sessions after completion of the 6 months measurements. The primary endpoint is the difference in change in CRF between intervention and usual care group from baseline to 6 months assessed by the Functional Assessment of Chronic Illness Therapy (FACIT)-Fatigue Scale. Secondary, differential changes in skeletal muscle echo-intensity, gut microbiota composition, health-related quality of life, physical performance, and sleep quality and duration are assessed. Primary outcome data are expected the last quarter of 2023.

**Results:** Recruitment is ongoing, n=92 participants were recruited so far (Dec 2022). Baseline data on the level of CRF, on adherence to the WCRF lifestyle recommendations and on behavioral determinants will be presented, together with further details on the design of the intervention.

**Conclusions:** The SoFiT trial will show whether adopting a healthier lifestyle can reduce CRF. Adopting healthy lifestyle behaviours may also contribute to better health-related quality of life.

# A systematic scoping review of accelerometer-measured physical activity datasets that include markers of cardiometabolic health: The Global Physical Activity Dataset (GPAD) catalogue

Mr. Jonah Thomas<sup>1</sup>, Prof. Amanda Daley<sup>1</sup>, Dr. Dale Esliger<sup>1</sup>, Dr. Victoria Kettle<sup>1</sup>, Mrs. April Coombes<sup>2</sup>, Prof. Emmanuel Stamatakis<sup>3</sup>, **Dr. James Sanders<sup>1</sup>**

<sup>1</sup>Loughborough University, Loughborough, United Kingdom, <sup>2</sup>University of Birmingham, Birmingham, United Kingdom, <sup>3</sup>University of Sydney, Sydney, Australia

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Many research study datasets have been collected to answer questions about the relationship between accelerometer-measured physical activity and cardiometabolic health. This scoping review aimed to map the available datasets across the world which have collected accelerometer-measured physical activity and markers of cardiometabolic health. This data was then used to develop of a publicly available resource, named the Global Physical Activity Dataset catalogue (GPAD) to house the identified datasets, to facilitate future research studies on questions related to physical activity and cardiometabolic health.

**Methods:** Databases, trial registries and grey literature (inception until 09/2022) were systematically searched to identify studies that have collected data on physical activity and cardiometabolic health outcomes. Inclusion criteria were; datasets must have included accelerometer-measured physical activity in adults aged  $\geq 18$  years, a sample size  $>400$  participants (unless recruited participants in a lower middle-income country where a sample size threshold was 100), utilised an observational, longitudinal or trial based study design and collected at least one cardiometabolic health marker (unless only body mass was measured). Two reviewers independently screened the search results to identify eligible studies and the characteristics of each dataset were extracted.

**Results:** A total of 16,720 study reports were identified and after screening, 319 were eligible, with 124 unique datasets in these study reports meeting the review inclusion criteria. Datasets were found in 49 countries, with the most developed in Europe ( $n=54$ ) and the least in Africa and Oceania ( $n=4$  and  $n=3$  respectively). The most common accelerometer was the waist-worn ActiGraph. Body mass was the most frequently measured cardiometabolic health marker in datasets (121/124 datasets), followed by blood pressure (83/124 datasets). The number of participants in the included datasets ranged from 120 to 103,712. Once the review processes had been completed the GPAD catalogue was developed(<https://lboro-climb.shinyapps.io/gpad/>).

**Conclusion:** This review identified datasets from around the world that have collected potentially harmonisable accelerometer-measured physical activity and cardiometabolic health markers. The GPAD catalogue is an online open-source resource which will enable easier identification of potentially harmonisable datasets, to answer important health research questions

# Measuring Resilience and Mental Health as Moderated by Daily Habits of Senior Military College Students.

**Ms. Tara Grogan<sup>1</sup>**, Ms. Jacie Harlow<sup>1</sup>, Dr. Rachele Pojednic, corresponding<sup>1</sup>, Dr. Kylie Blodgett<sup>1</sup>

<sup>1</sup>Norwich University, Northfield, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** To examine associations between resilience and positive or negative mental health in undergraduate students at a senior military college, and to further explore how sleep, diet, and physical activity moderates that relationship.

**Methods:** This cross-sectional study administered the National College Health Assessment version 3 (NCHA III) survey at the beginning of the fall semester to first year undergraduate students. Three distinct lifestyles were assessed, Reserve Officer Training Corps (ROTC), Corp of Cadets (CORPS) and Civilian (CIV). The NCHA III included Connor Davidson Resiliency (CDRISC 2), Diener Flourishing Score (DIENER), Kessler 6 Non-Specific Psychological Distress Score (K6), UCLA Loneliness Scale (UCLA), Suicide Behavior Questionnaire – Revised (SBQR), a sleep score (SLEEP), PRIME screen (DIET), and International Physical Activity Questionnaire (IPAQ). Data were analyzed by SPSS software version 28 using Pearson correlation and multiple linear regression.

**Results:** Seventy-seven (n=77) students responded (age: 18.50±1.20 years; gender: n=47 male, n=27 female, and n=3 non-binary). LIFESTYLE reported: ROTC (n=25), CORPS (n=18), and CIV (n=34). When LIFESTYLE was combined, the means and standard deviations of each scale included CD-RISC 25.64 ±1.84, DIENER 41.54± 10.22, K6 9.16± 6.42, UCLA 5.80± 1.80 and SBQR 5.54± 3.48. There was a positive correlation between CD-RISC2 and DIENER (r=0.414, p<0.001). There were negative correlations between CD-RISC2 and K6 (r=-0.454, p<0.001), UCLA (r=-0.394, p<0.001), and SBQR (r=-0.233, p=0.046). When separated by LIFESTYLE, there was a negative correlation between K6 and Total Moderate activity within ROTC (r=0.419, p=0.041) and CORPS (r=0.541, p=0.025). Multiple linear regression models examined the effect of CDRISC2, DIET, IPAQ, SLEEP, and LIFESTYLE on DIENER (r<sup>2</sup>=0.128, p=0.123), K6 (r<sup>2</sup>=0.204, p=.013), UCLA (r<sup>2</sup>=0.186 p=0.023), and SBQR (r<sup>2</sup>=0.097, p=0.253). DIET, IPAQ, SLEEP and LIFESTYLE were not significant in any model.

**Conclusions:** Based on the results of this study, there was a positive correlation between resilience and flourishing in first year undergraduate students, regardless of lifestyle, and an inverse relationship between resilience and loneliness, emotional distress, and suicide behavior. There was no effect of sleep, diet, or physical activity on these relationships cross-sectionally, although longitudinal assessment is necessary to better understand how health behaviors relate to resilience and mental health.

# Is the adherence to the food practices recommended by the 2014 Brazilian Food Guide associated with a healthier diet?

**Ms. Kamila Gabe**<sup>2,3</sup>, Dr. Caroline dos Santos Costa<sup>1,2</sup>, Dr. Francine Silva dos Santos<sup>1,2</sup>, Ms. Thays Nascimento Souza<sup>2,3</sup>, Prof. Patricia Constante Jaime<sup>1,2</sup>

<sup>1</sup>Department of Nutrition, School of Public Health, University of São Paulo, São Paulo, Brazil, <sup>2</sup>Center for Epidemiological Research in Nutrition and Health, Department of Nutrition, School of Public Health, University of São Paulo, São Paulo, Brazil, <sup>3</sup>Postgraduate Program in Nutrition in Public Health, School of Public Health, University of São Paulo, São Paulo, Brazil

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The 2014 Brazilian Food Guide (BFG)'s messages are mostly qualitative and based on food practices and behaviors, such as meal planning, cooking, and eating modes. This study investigates if the adherence to these food practices is aligned with a healthier diet according to the BFG's recommendations for food intake based on the level of food processing.

**Methods:** A cross-sectional analysis was conducted using a quota-based subsample of adults from the NutriNet-Brasil Cohort. The participants completed the Food Practices Brasil Scale (FPBr), a validated 24-items scale which accesses four dimensions of healthy food practices encompassed by the BFG: planning, domestic organization, eating modes, and food choices. Each item has four possible frequency-based answers; the sum of them generates a score ranging from 0 to 72. Web-based 24h-recalls (up to three per person) were used for calculating the usual percentage of energy intake (%energy) of ten food groups, divided into three categories: 'eating more' (plant-based fresh/minimally processed foods, fruits, vegetables, whole grains, legumes, and nuts); 'limit' (processed foods, red meat, and table sugar); and 'avoiding' (ultra-processed foods). The association between quartiles of the FPBr-score and food groups' %energy was analysed through crude and adjusted linear regression models; the results were expressed in terms of geometric means.

**Results:** The participants (n=2052) were 39.8 (sd=13.5) years old on average. Most of them were women (52.6%), had completed up to high school (69.1%), and self-declared as white (56.7%). Adjusted means for the %energy of plant-based fresh/minimally processed foods were 27.4% (95%CI 26.7-28.2) and 37.9% (95%CI 36.9-38.6) among those classified in the first and fourth quartiles of the FPBr-score, respectively. Conversely, these percentages were 16.4% (95%CI 15.8-17.0) against 14.8% (95%CI 14.1-15.4) for processed foods and 26.3% (95%CI 25.6-27.0) against 17.1% (95%CI 16.3-17.8) for ultra-processed foods. Except for red meat, all the other food groups were also associated with the FPBr-score in the expected direction.

**Conclusions:** In general, healthier food practices were aligned with a healthier diet. These results support the use of messages based on practices and behaviors in Food-Based Dietary Guidelines and reinforce the importance of policies that enable people to adopt them.

# Accessibility, Quality, and Selection of Nutritious Foods Differ by Food Security Status in Virginia

Dr. Elena Serrano, Dr. Sarah Misyak, **Ms. Rachel Liebe**

<sup>1</sup>Virginia Family Nutrition Program, Virginia Tech, Blacksburg, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Individuals experiencing food insecurity are at an elevated risk for several adverse physical and mental health outcomes. Contributors to food insecurity are multi-factorial and include individual and community-level factors, including access to nutritious foods. This study aimed to explore differences in the accessibility, quality, and selection of fresh produce and low-fat foods in a person's neighborhood by food security status.

**Methods:** A cross-sectional survey was administered to English-speaking adults living in the state of Virginia from February to July 2022. The survey included demographic information and previously validated measures of household food security status (USDA Economic Research Service) and healthful food access (NEMS). Food security status was categorized as high (HFS), marginal (MFS), low (LFS), or very low (VLFS). Results were analyzed using descriptive statistics and chi-squared tests were used to explore differences in access by food security status. Cohen's  $w$  effect sizes were also calculated. The threshold for significance was set *a priori* at 0.05 and a Bonferroni correction was applied ( $p < 0.007$ ).

**Results:** Of the 2,018 respondents, 25.2% experienced HFS, 14.9% MFS, 20.0% LFS, and 39.9% VLFS. There were medium effects of food security status on produce accessibility, quality, and selection ( $w = 0.32, 0.30, 0.33$ , respectively;  $p < 0.001$ ). Nearly half (49.0%) of HFS respondents strongly agreed that produce was easy to access in their neighborhood compared to 17.7% of people experiencing VLFS. More VLFS respondents strongly disagreed that produce was easy to access (13.0%), high quality (8.8%), and abundant (11.5%) in their neighborhood compared to HFS respondents (5.1%, 3.5%, and 4.7%, respectively). There were medium effects of food security status on low-fat food accessibility and quality ( $w = 0.31, 0.32$  respectively;  $p < 0.001$ ). Respondents experiencing VLFS disagreed or strongly disagreed that low-fat foods were accessible and high quality (27.7% and 25.6% respectively). There was a small effect of food security status on low-fat food selection ( $w = 0.29$ ;  $p < 0.001$ ).

**Conclusions:** Respondents experiencing food insecurity reported lower perceived access to produce and low-fat foods in their neighborhoods than respondents experiencing food security. Strategies to improve neighborhood access to healthful foods for people experiencing food insecurity are needed to help mitigate existing disparities in health outcomes.

# Swiss pre-school children' s type and level of physical activity during open gym programs

**Miss Bianca Schmidli<sup>1</sup>**, Prof. Claudio Renato Nigg<sup>1</sup>, Dr. Simon Endes<sup>2</sup>, Mrs. Sonja D. Stoffel Kerr<sup>3</sup>

<sup>1</sup>Department of Health Science, Institute of Sport Science, University of Bern, Bern, Switzerland, <sup>2</sup>Ecoplan AG, Bern, Switzerland, <sup>3</sup>Gesundheitsförderung Schweiz, Bern, Switzerland

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Physical activity (PA) access is an issue especially during winter and for people with lower socioeconomic status. In Switzerland, open gym programs with opportunities for PA activities (movement landscapes) are offered for preschoolers and their parents for free or for nominal price during winter time. The aim of the study was to evaluate whether children are physically active during these open gym programs and which types of movement they perform.

**Methods:** Preschoolers (2-5 years old) from 8 sites of two Swiss activity programs (MiniMove & Ä Halle wo's fägt) were randomly selected to participate as part of a larger program evaluation. All children were observed using the System for Observing Play and Leisure Activity in Youth (SOPLAY). Additionally, 5-8 children per gym were observed with the System for Observing Children's Activity and Relationships during Play (SOCARP) over 12 minutes per child. Simultaneously to SOCARP, the children wore an ActiGraph accelerometer on their right hip.

**Results:** According to SOPLAY, 56% (SD=0.2) of children (N=1633) attending the open gym program engaged in moderate to vigorous (MV)PA. According to SOCARP (N=45), children engaged in MVPA 61% of the observed 12 (SD=0.16) minutes. Accelerometry data (N=45) confirmed that 56% (SD=0.16) of the recorded time was spent in MVPA. Movement types observed were: climbing (21%), on a swing (14%), climbing and jumping on the gymnastic box (12%), and on the slide (12%). The intensity of PA in those areas varied from 62% MVPA (slide), 60% MVPA (climbing), 55% MVPA (gymnastic box), to 31% MVPA (swing).

**Conclusions:** The overall intensity of PA in the Swiss Winter open gym programs is relatively high (>50% MVPA) as indicated both by observation and accelerometry. A large variety of movement types are promoted including endurance and strength activities; however, intensity does vary within the different activities. The lowest intensity is observed at the swing, which may be due to children sitting, being pushed from their parents. This notwithstanding, open gym programs can contribute to a higher level of MVPA and help potentially underserved populations to meet the PA recommendations of WHO (2020).

# Using mixed-methods social network research to grow and sustain complex community-based health programmes in low- and middle-income countries: Benefits, limitations, and potential solutions.

**Ms. Nina Abrahams<sup>1,2</sup>**, Prof. Charlie Foster<sup>1</sup>, Prof. Estelle Victoria Lambert<sup>2</sup>, Dr. Zoi Toumpakari<sup>1</sup>, Associate Professor Frederick Marais<sup>3</sup>

<sup>1</sup>Centre for Exercise, Nutrition and Health Sciences, School for Policy Studies, Faculty of Social Sciences and Law, University of Bristol, Bristol, United Kingdom, <sup>2</sup>Health through Physical Activity Lifestyle and Sport Research Centre, Division of Physiological Sciences, Department of Human Biology, Faculty of Health Sciences, University of Cape Town, Cape Town, South Africa, <sup>3</sup>Healthy Lifestyle Services, Public Health, Somerset County Council, United Kingdom

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The impact of community-based programmes to prevent and manage non-communicable diseases may be limited unless they can be scaled up and sustained. Social network analysis – the measurement of the structural relationships between individuals or organisations – may serve as an important tool to better understand the potential role of social networks in scaling up and sustaining complex community-based physical activity and nutrition programmes.

**Methods:** This was a mixed-methods study using a complex, South African healthy lifestyles initiative as a case study (Western Cape on Wellness, WoW!). This programme is made up of a core team, over 60 partner organisations, and over 700 community champions. The first phase was a network survey. Sixty-seven network partners were asked about their relationships along five themes: centralisation, quality of relationships, cliques, leaders, and shared goals. Network relationships and visualisations were determined using UCINET and NetDraw software. Semi-structured interviews were then conducted with fourteen purposively sampled network stakeholders, representing the WoW! team, partners, and champions. Interview transcripts were analysed with the help of NVivo using Framework Approach.

**Results:** Results revealed a centralised network around the WoW! team, other possible network leaders, overall unclear role differentiation, and low rural representation. Despite testing the survey process, there was still a fairly low response rate (39%) which brings into question the practicality of collecting social network survey data from these complex settings. Interviewees supported the survey findings and provided contextual understanding of the network, such as how centralisation affected them. However, participants indicated that while some aspects of the research are useful, such as the visual outputs, most of the analyses did not provide enough information for them to take action in the network. Participants suggested the use of a “live mapping” tool that can provide the visual benefits of social network analysis while taking into account the data collection capabilities and information needed to measure, monitor, and act in complex community networks.

**Conclusions:** This research contributes to the development of practical network analysis tools in improving the scale-up and sustainability of complex community programmes, particularly in low-income settings where it may be needed most.

# Perceived environmental factors affecting recreational walking behavior among socioeconomically disadvantaged adults

**Mrs. Suzannah D'hooghe**<sup>1,2,3</sup>, Ms. Yasemin Inac<sup>1,2,3</sup>, Prof. Benedicte Deforche<sup>3</sup>, Prof. Delfien Van Dyck<sup>3</sup>, Dr. Stefanie Vandevijvere<sup>1</sup>, Dr. Karin De Ridder<sup>1</sup>, Prof. Nico van de Weghe<sup>3</sup>, Prof. Sarah Dury<sup>2</sup>

<sup>1</sup>Sciensano, Brussels, Belgium, <sup>2</sup>Vrije Universiteit Brussel, Brussels, Belgium, <sup>3</sup>Ghent University, Ghent, Belgium

Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Socioeconomically disadvantaged (SED) adults are found to be less active during leisure time in comparison with higher socioeconomic groups. Recreational walking (RW) is an important type of leisure time physical activity which is considered budget-free and without specific skills or equipment. Local environmental factors affecting RW behavior are particularly important for SED adults who are more dependent on their direct environment. Limited papers studied the role of the perceived local environment in peri-urban areas on RW, especially among SED adults. The following research questions will be answered: (1) Which perceived environmental factors play a role in RW among SED adults? (2) Which actions can be identified by SED adults to promote RW?

**Methods:** Purposeful convenience sampling was used to recruit 38 SED adults (25-65 y/o) in two peri-urban municipalities in Belgium. Walk-along interviews (n=38) have been performed in the participants' neighborhood to identify local environmental factors affecting RW. 20 participants joined a focus group (n=4) afterwards to categorize the identified environmental factors in the different environmental types (physical, sociocultural, political and economic) of the ANGELO framework, and to identify local actions to promote RW. The interviews and focus groups were transcribed ad verbatim. MaxQDA was used for thematic content analysis.

**Results:** The participants added the information environment (dissemination, retrieving and understanding of information) to the ANGELO framework, as they felt it was lacking. Furthermore, the availability of well-maintained walking surfaces, toilets, street lighting and seating options (physical environment), but also social support, dog-ownership, stigmatization, social isolation (sociocultural environment) and affordability (direct and indirect links – economic environment) are identified important environmental factors in RW among SED adults. The identified political and economic factors are intertwined with the other environmental factors. Improving communication and knowledge transfer, stimulation of physical, sociocultural, and economic accessibility, and promotion of physical and social safety are identified most important action points for the local government to facilitate RW.

**Conclusion:** Different environmental types interact and are embedded in each other. A broad comprehension of the various dimensions of the local environment are necessary to understand the mechanisms affecting RW among SED adults.

# The Feasibility and Acceptability of an Online CPD Programme to Enhance PE Teachers' Knowledge of Muscular Fitness Activity

**Mr. Ash Cox**<sup>1</sup>, Dr. Robert Noonan<sup>2</sup>, Prof. Stuart Fairclough<sup>1</sup>

<sup>1</sup>Edge Hill University, Ormskirk, United Kingdom, <sup>2</sup>University of Bolton, Bolton, United Kingdom

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Muscular fitness (MF) activity provides a range of health benefits, including improvements in metabolic function, bone health, and mental health. MF activity seldom features within Physical Education (PE) curricula due to perceived barriers among some PE teachers. These barriers typically centre around confidence, time and a perceived lack of facilities. The aims of this study were to (1) assess if an online continued professional development (CPD) course can increase PE teacher knowledge of MF activity (2) assess the feasibility of an online CPD course to enhance PE teacher knowledge and competence of MF activity, and (3) assess the acceptability of the content and design of an online CPD course.

**Methods:** A user-centred approach to the development of an online CPD platform was undertaken with five secondary school PE teachers across three meetings to inform CPD content and design. Once the CPD course was developed, UK secondary school PE teachers were invited to enrol, and 119 teachers expressed an interest in taking part. A pre-course quantitative quiz was included to assess knowledge and understanding of the concepts covered. The quizzes were completed by 44 enrolled teachers and a wait-list control group (n=21). Upon CPD completion, teachers provided feedback which was analysed qualitatively.

**Results:** Pre-and-post CPD knowledge quiz data were available from 65 participants (55.4% male). The median knowledge quiz change score was significantly higher in the CPD group than in the wait-list control group ( $U=37, z=-5.96, p<0.01$ ). Qualitative data analysis provided three primary themes reflecting factors associated with the acceptability and feasibility of the course: (1) practical application, (2) support and resources, and (3) knowledge and confidence. A further 19 secondary themes provided further context and were conceptualised using pen profiles.

**Conclusions:** Improvements in PE teachers' MF activity knowledge and practice were observed following completion of a user-centred CPD programme. The online platform was beneficial to overcoming the limitations of face-to-face CPD, such as time and financial constraints. Further, the CPD content was beneficial and appropriate to their teachers' practice. Future work is required to establish links between teachers' learning following CPD, the translation into PE practice and student MF outcomes.

# Implementation of the TEACH e-Learning course on physical activity and sedentary behaviour for pre- and in-service early childhood educators: A pilot study

**Dr. Trish Tucker**<sup>1</sup>, Dr. Brianne Bruijns<sup>1</sup>, Dr. Leigh Vanderloo<sup>1</sup>, Dr. Andrew Johnson<sup>1</sup>, Dr. Kristi Adamo<sup>2</sup>, Dr. Shauna Burke, Dr. Valerie Carson<sup>3</sup>, Dr. Rachel Heydon<sup>1</sup>, Dr. Jennifer Irwin<sup>1</sup>, Dr. Patti Jean Naylor<sup>4</sup>, Dr. Brian Timmons<sup>5</sup>

<sup>1</sup>University of Western Ontario, London, Canada, <sup>2</sup>University of Ottawa, Ottawa, Canada, <sup>3</sup>University of Alberta, Edmonton, Canada, <sup>4</sup>University of Victoria, Victoria, Canada, <sup>5</sup>McMaster University, Hamilton, Canada

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Childcare interventions targeting physical activity and sedentary behaviour often employ in-person training to supplement early childhood educators' (ECEs) knowledge and self-efficacy to provide physically active programming to children in care. However, this approach is resource-intensive, and limits reach to ECEs. The purpose of the Training pre-service EARly CHildhood educators in physical activity (TEACH) pilot study was to examine the implementation (e.g., fidelity, feasibility, acceptability) of an e-Learning course targeting physical activity and sedentary behaviours among a sample of pre-service (i.e., post-secondary students) and in-service (i.e., practicing) ECEs in Canada.

**Methods:** A pre-/post-pilot study design was used, and implementation outcomes were assessed cross-sectionally at post-intervention. Pre-service ECEs were purposefully recruited from Canadian colleges ( $n = 3$ ) and in-service ECEs were recruited via social media. Following the e-Learning course, a process evaluation survey ( $n = 32$  pre-service and 121 in-service ECEs) and interviews ( $n = 3$  pre-service and 8 in-service ECEs) were conducted to explore ECEs' perspectives on the e-Learning course. Intervention fidelity was assessed using e-Learning course metrics pulled from the web platform. Descriptive statistics were calculated for quantitative data, while thematic analysis was conducted for qualitative data.

**Results:** Moderate-to-high fidelity to the TEACH study e-Learning course was displayed by pre-service (68%) and in-service (63%) ECEs. The course was reported to be highly acceptable, compatible, effective, feasible, and appropriate in complexity; however, some ECEs noted technical difficulties with the e-Learning platform and a longer than anticipated course duration as challenges. ECEs reported especially enjoying content on outdoor play (87.5% and 91.7%) and risky play (84.4% and 88.4%) among pre- and in-service ECEs, respectively.

**Conclusions:** The TEACH e-Learning course was feasible to implement and well received among both pre-service and in-service ECEs. Findings demonstrate the value of e-Learning for professional development interventions for ECEs. Modifications to the TEACH e-Learning course, based on participants' feedback, will be used to make improvements to improve scalability of this training.

# Neighbourhood greenness moderates the association between physical activity and geriatric relevant health outcomes: An analysis of the CLSA

**Mx. Andrew Putman<sup>1</sup>**, Ms. Irmina Klicnik<sup>1</sup>, Prof. Shilpa Dogra (Corresponding Author)<sup>1</sup>

<sup>1</sup>University of Ontario Institute of Technology, Oshawa, Canada

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** The purpose of this analysis was to evaluate the relationship between physical activity levels of older adults and geriatric relevant health outcomes, and to determine whether neighbourhood characteristics alter this association.

**Methods:** Data from the Canadian Longitudinal Study on Aging (CLSA) were used to assess geriatric relevant outcomes of physical impairment, medication use, severity of daily pain, and depressive symptoms. Data from the Canadian Active Living Environments (Can-ALE) and the Normalized Difference Vegetative Index (NDVI) were used to determine neighbourhood walkability and greenness, respectively. The analytic sample included adults who were 65 years or older at baseline (n=16,735, age=73±5.6, 50% female).

**Results:** Adjusted odds ratios and 95% confidence intervals for the base relationships were calculated using proportional odds logistic regression (physical impairment, pain, medication use), and linear regression (depressive symptoms). Moderation effects of environmental factors were assessed using greenness and walkability. The base relationships showed protective associations between each additional hour per week of total physical activity and physical impairment (OR=0.95, p<.001), daily pain severity (OR=0.98, p<.001), medication use (OR=0.98, p<.001), and depressive symptoms (OR=0.95, p<.001). Additive effects were seen when greenness was added to physical impairment (p=.04), daily pain severity (p<.01), and depressive symptoms (p=.01) but no moderation was seen with walkability. Sex differences were observed in that greenness moderation was found in severity of daily pain in males but not in females.

**Conclusions:** Neighbourhood greenness shows a moderation effect on the protective associations between physical activity and geriatric relevant health outcomes in a sample of over 15,000 Canadian seniors. Future research investigating geriatric relevant health outcomes and physical activity should consider neighbourhood greenness as a potential moderator.

# Prevalent Dietary Patterns in U.S. Food-Insecure Cancer Survivors are Associated with Mortality: NHANES 1999-2018

**Mr. Christian Maino Vieytes<sup>1</sup>**, Dr. Ruoqing Zhu<sup>2,3</sup>, Dr. Francesca Gany<sup>4</sup>, Ms. Brenda Koester<sup>5</sup>, Dr. Anna Arthur<sup>6</sup>

<sup>1</sup>Division of Nutritional Sciences, the University of Illinois at Urbana-Champaign, Champaign, USA,

<sup>2</sup>Department of Statistics, the University of Illinois at Urbana-Champaign, Champaign, USA, <sup>3</sup>Carl R. Woese Institute for Genomic Biology, the University of Illinois at Urbana-Champaign, Champaign, USA, <sup>4</sup>Memorial Sloan Kettering Cancer Center, New York, USA, <sup>5</sup>Family Resiliency Center, Department of Human Development and Family Studies, Champaign, USA, <sup>6</sup>Department of Dietetics and Nutrition, the University of Kansas Medical Center, Kansas City, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Food insecurity (FI) is a public health issue of concern and a sociodemographic factor that drives health inequities and affected approximately 13.5% of U.S. households in 2020. Using penalized logistic regression as a novel methodology, we previously characterized the major prevalent dietary patterns in the U.S. food-insecure cancer survivor population [1]. The goal of the present analysis was to evaluate how those characterized patterns related to mortality, a critical prognostic outcome in cancer survivors.

**Methods:** This analysis employed data from the National Health and Nutrition Examination Survey (NHANES, 1999-2018) and public-use linked mortality files from the National Center for Health Statistics (NCHS). We used penalized logistic regression (logit), with binary outcomes for FI and FI risk factors, and principal components analysis (PCA) to extract dietary patterns as previously described [1]. We computed index scores and fit covariate-adjusted Cox-Proportional Hazards models to evaluate the relationship between adherence to these diet indices and the risks of all-cause and cancer-specific mortality within 2,495 eligible cancer survivors.

**Results:** We extracted four patterns using penalized logit and named them according to the outcome variable used in each model (FI, Age, SNAP, Household Size). Two patterns were extracted with PCA and were named the Modified Western and Prudent patterns due to their interpretations. In the survival analysis, we found significant positive associations between adherence to the FI pattern (HR: 1.23, 95% CI: 1.05-1.44), the SNAP pattern (HR: 2.20, 95% CI: 1.45-3.36), and the risk of all-cause mortality. There was an inverse association between the Modified Western pattern (HR: 0.54, 95% CI: 0.35-0.83) and all-cause mortality.

**Conclusions:** Major dietary patterns prevalent in the food-insecure cancer survivor population deleteriously impacted survival in the U.S. cancer survivor population. Given the extant health disparities food insecure cancer survivors face, these results highlight a potential area for targeted interventions and policies to mitigate those disparities.

# Assessing Physical Literacy Knowledge, Attitudes and Behaviours in Early Childhood Educators: Face and Content Validity Study

**Dr. Lynne Lafave**<sup>1,2</sup>, Dr. Nadine Van Wyk<sup>1</sup>, **Dr. Mark Lafave**<sup>1</sup>

<sup>1</sup>Mount Royal University, Calgary, Canada, <sup>2</sup>University of Calgary, Calgary, Canada

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Physical literacy is a complex construct that encompasses “the motivation, confidence, physical competence, and knowledge and understanding to value and engage in physical activity for life.” Early childhood educators (ECEs) play a critical role in shaping young children’s relationship with movement and physical activity that influence their physical literacy journey. There is a paucity of measurement tools that assess the motivation, knowledge, and confidence aspects of physical literacy. The purpose of this study was to develop and assess the face and content validity of an online survey tool to assess physical literacy constructs for ECEs in both a professional teaching context and their own personal context.

**Methods:** An environmental scan of the literature guided the physical literacy knowledge, attitudes and behaviours (PL-KABQ) item creation. Face validity and content validity were evaluated by two physical literacy experts and one early childhood educator expert. Content validity was quantified by the content validity index. Readability was measured with the Flesch-Kincaid Reading Level with a grade 8 reading level target. Feasibility was assessed by completion time measured in minutes. A cross-sectional design was used to test internal consistency of the PL-KABQ items by calculating Cronbach's alpha.

**Results:** A 25-item survey (7 knowledge items) was created to collectively represent a holistic metric of knowledge, attitudes, and behaviours related to physical literacy. The readability score was initially grade 15, but after five revisions the final readability score was grade 8.8. Cronbach’s alpha was determined to be 0.87 indicative a strong unifying and underlying construct. The median survey completion time was 8 minutes.

**Conclusion:** A novel physical literacy assessment tool for knowledge, attitude, and behaviour domains was developed for a special population of early childhood educators. The current study is the first step in the process to validate this tool. The results indicate a strong Cronbach’s alpha level, which paves the way to continue the development with intra-rater reliability. Future research will begin to use this tool as a baseline measure for PL knowledge, attitudes and behaviours of ECEs so that we can measure the impact of continuing competence education for working practitioners.

# Factors that influence firefighters' food choices at the fire station

**Mr. Thomas Sire<sup>1</sup>**, Prof. Louis Laurencelle<sup>1</sup>, Prof. Noémie Carbonneau<sup>1</sup>, Prof. Julie Houle<sup>1</sup>, Prof. François Trudeau<sup>1</sup>, Prof. Philippe Gendron<sup>1</sup>

<sup>1</sup>Université du Québec à Trois-Rivières, Trois-Rivières, Canada

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** A low-quality diet increases the risk of cardiovascular diseases and, consequently, the risk of on-duty cardiac events among firefighters. Qualitative studies have provided a picture of the barriers to healthy eating at the fire station. However, to our knowledge, factors that may influence firefighters' food choices while on duty have never been quantitatively investigated. Therefore, the purpose of this study was to identify factors that may influence firefighters' food choices at the fire station.

**Methods:** An online questionnaire (Qualtrics, Provo, UT, USA) was sent to full-time and part-time firefighters in Québec. The survey consisted of two main sections: the assessment of diet (ratio of servings of good and poor foods for cardiovascular health) and the examination of social (Social Support for Healthy Eating Questionnaire), environmental (Perceived Food Environment Questionnaire in a French-Canadian population), occupational and individual (Regulation of Eating Behavior Scale) factors that may influence firefighters' diet at work. Correlational analyses via Kendall's tau-b coefficient were used to test the relationships between these variables.

**Results:** Ninety-three (93) firefighters (91 males and 2 females, age:  $37.6 \pm 11.5$  years, years of experience as firefighter:  $14.0 \pm 9.8$  years) responded to the questionnaire. Co-workers' social support for healthy eating showed a positive correlation with food quality ( $t = 0.171$ ,  $p = 0.01$ ). Conversely, the number of co-workers at the fire station was negatively correlated with food quality ( $t = -0.149$ ,  $p = 0.04$ ) and positively correlated with frequency of fast food meals ( $t = 0.153$ ,  $p = 0.04$ ). Frequency of the latter is also positively associated with the perceived fast food availability around the fire station ( $t = 0.171$ ,  $p = 0.03$ ). Nutritional literacy varies inversely with fast food frequency ( $t = -0.162$ ,  $p = 0.05$ ). Finally, frequency of meals cut by emergency calls was positively associated with diet quality ( $t = 0.224$ ,  $p = 0.01$ ).

**Conclusions:** Social support, number of teammates, perceived food environment and nutritional literacy seem to influence the quality of food at the fire station. This exploratory study will support further intervention studies aimed at improving firefighters' food choices.

# Pre-pandemic Sleep and Activity Behaviors and Associated Change in Depressive Symptoms during the COVID-19 Pandemic

**Ms. Mikael Anne Greenwood-Hickman<sup>1</sup>**, Dr. Laura Harrington<sup>1</sup>, Dr. Lily Shapiro<sup>1</sup>, Dr. Andrea LaCroix<sup>3</sup>, Dr. Susan M. McCurry<sup>2</sup>, Dr. Pamela Shaw<sup>1</sup>, Dr. Dori Rosenberg<sup>1</sup>

<sup>1</sup>Kaiser Permanente Washington Health Research Institute, Seattle, USA, <sup>2</sup>University of Washington, Seattle, USA, <sup>3</sup>University of California, San Diego, La Jolla, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Changes in sleep and physical activity and worsened depressive symptoms were observed in older adult populations during early stages of the COVID-19 pandemic. Quantifying these changes as the pandemic progressed and understanding behavioral predictors of increases in depressive symptoms following major stressor events like the pandemic onset could inform future intervention and public health responses.

**Methods:** We used data from older adults in the Adult Changes in Thought study collected at pre-pandemic study visits (2016-February 2020) and a one-time survey approximately 1 year into the pandemic period (April-July 2021) to characterize activity and sleep behaviors (daily total sitting; TV and computer time; days/week briskly walking; sleep disturbance) and depressive symptoms (N=896). We subtracted pre-pandemic Center for Epidemiological Studies-Depression (CES-D) 10-item scale scores from pandemic scores to calculate CES-D change. We used paired t-tests to compare levels of pre- and during-pandemic behaviors and used multivariable linear regression to explore potential pre-pandemic predictors of CES-D change score, adjusted for demographics, time between measurements, body mass index, retirement status, difficulty with activities of daily living and pre-pandemic CES-D, social support, and fatigue scores.

**Results:** Mean age pre-pandemic was 77.2 (SD=6.6), with 3.0 years between measurements on average. Participants (89% White, 58% female, 83% retired, mean 17 years education) reported significantly more TV (3.0 vs. 2.6 hours) and computer (2.3 vs. 1.9 hours) time, fewer days briskly walking (0.7 vs. 1.6 days/week), more sleep disturbance (53.4 vs. 46.7 PROMIS t-score), and higher depressive symptoms (5.2 vs. 3.7 CES-D; 20.8% vs. 9.7% CES-D score  $\geq 10$ ) in pandemic vs. pre-pandemic comparisons ( $p < 0.0001$ ). Higher pre-pandemic sleep disturbance and computer time were associated with larger increases in CES-D ( $B = 0.07$  [0.03, 0.11] and  $B = 0.20$  [0.01, 0.38], respectively) and higher fatigue was associated with larger decreases in CES-D ( $B = -0.08$  [-0.10, -0.06]). No associations with pre-pandemic total sitting, TV, or brisk walking time were observed.

**Conclusions:** Findings suggest prior better sleep quality and less sedentary computer time may be associated with less worsening in depressive symptoms from stressor events, like pandemics, but that physical activity and TV time may not. Future research on these relationships with objective measures is warranted.

# Examining Exercise Motivation and Physical Activity Patterns Among Users and Non-Users of Wrist-Worn Wearable Activity Trackers

**Ms. Rebecca Coulter<sup>1</sup>**, Dr. Sam Liu<sup>1</sup>, Dr. Kayla Nuss<sup>2</sup>

<sup>1</sup>University of Victoria, Victoria, Canada, <sup>2</sup>Klein Buendel Institute, Denver, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Physical activity (PA) is crucial for good health, however, meeting the Canadian PA guidelines (>150 minutes of weekly moderate-to-vigorous PA) remains a challenge. Wrist-worn wearable activity trackers (WATs) have quickly grown in popularity and these devices are often marketed as a potential tool to improve PA. However, it is unclear whether owning a WAT increases adherence to PA guidelines and if differences in exercise motivation and WAT use are associated with MVPA. The objectives of this study were to 1) identify the proportion of individuals meeting PA guidelines among WAT users compared to non-users, and 2) examine whether exercise motivation, WAT use and demographic characteristics predict MVPA.

**Methods:** Canadian adults aged 18+ years were recruited (February – November 2022) to participate in this cross-sectional study. Participants completed an online questionnaire that measured exercise motivation (BREQ-3), WAT use (i.e., current user vs non-user) and demographic information (i.e., age, sex, employment status). Chi-squared test was used to determine differences in the proportion of WAT users and non-users meeting PA guidelines. Multiple linear regression was used to examine associations of exercise motivation, participant demographic characteristics and WAT status on MVPA.

**Results:** 551 participants were included in the study (WAT users, n = 388; Non-users, n = 163; 66% Female). A higher proportion of WAT-users met MVPA guidelines (79.4%) compared to non-users (62.6%;  $\chi^2 = 17.02$ ,  $p < .001$ ). Our regression showed that both intrinsic motivation ( $\beta = 61.2 \pm 23.6$ ,  $p < .01$ ) and integrated regulation ( $\beta = 92.8 \pm 21.8$ ,  $p < .001$ ) were significantly associated with greater minutes of weekly MVPA after controlling for age, sex, and employment status. Using a WAT was associated with a 34-minute increase in weekly MVPA, however the association was not significant ( $p = .21$ ).

**Conclusions:** Results from this study contribute to our understanding of associations between WATs with PA. While a greater proportion of WAT users adhere to guidelines, integrated regulation and intrinsic motivation for exercise remain the strongest predictors of MVPA regardless of WAT status. More research should employ longitudinal designs to further understand the impact of WATs on motivation for exercise over time.

# Understanding Food Insecurity at Residential Liberal Arts Colleges: Roles of Campus Dining Options and Cooking Habits

**Dr. Emily Heying<sup>1</sup>**, Dr. Jonathan Nash<sup>1</sup>

<sup>1</sup>College of Saint Benedict/Saint John's University, Saint Joseph, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Food insecurity exists among college students, but the reasons why students lack access to food can vary greatly. Many students at residential liberal arts colleges rely on campus dining options for meals. More research investigating how food insecurity manifests at these institutions is needed to design effective campus-wide interventions that students are willing to utilize. The goal of this research was to determine if there were relationships between campus dining participation and collaboration, cooking habits, dietary habits, perceived stress, and food security status.

**Methods:** Participants (n = 532) were undergraduate students at two residential liberal-arts institutions in rural environments. Participants completed an online survey at the beginning and end of the semester. The surveys contained questions about demographics, cooking habits, campus dining participation, meal plans, the perceived stress scale (PSS), and food security status (six-item US Household Food Security Survey Module). Chi-square analyses were used to determine relationships between food security status and other variables.

**Results:** 41% (n = 322) of participants experienced food insecurity within the previous 30 days of survey completion. Perceived stress and number of meals cooked in a residence per week was significantly higher in food insecure participants ( $p < 0.001$ ,  $p = 0.05$ , respectively). Enrollment in the "continuous" meal plan, which provided unlimited access to campus cafeterias, was associated with higher food security than participants on meal plans with a set number of meals per semester or having no meal plan ( $p < 0.001$ ). Students willing to donate a meal punch or campus dining dollars to another student were more likely to be food secure ( $p < 0.001$ ). Daily servings of fruit and vegetable intake did not vary by food security status.

**Conclusions:** Perceived stress, cooking more frequently, and enrollment in smaller meal plans or no meal plan was associated with food insecurity. All three of these factors may be interrelated -- for example, students on smaller meal plans may need to cook more frequently. Better understanding of the association between food insecurity and barriers to accessing campus dining environments or cooking while in college is crucial for creating sustainable interventions.

# Implementation Models and Frameworks Used to Guide Community-Based Physical Activity Programs for Children: A Scoping Review

**Mrs. Emma Ostermeier**<sup>1</sup>, Associate Prof. Shauna Burke<sup>1,2</sup>, Dr. Jason Gilliland<sup>1,2,3</sup>, Dr. Trish Tucker<sup>1,2,3</sup>

<sup>1</sup>Western University, London, Canada, <sup>2</sup>Children's Health Research Institute, London, Canada, <sup>3</sup>Lawson Health Research Institute, London, Canada

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** This scoping review explores the implementation models and frameworks used to develop, explore, and/or evaluate community-based physical activity programs for children. The foundational components of the implementation models and frameworks and practical application in real-world settings are also described. The findings provide context into the strategies used previously by researchers and program developers to support the implementation of physical activity programs at a community level.

**Methods:** The methodological framework developed by Arksey and O'Malley (2005) and the updated recommendations from Levac, Colquhoun and O'Brien (2010) were used to search, identify, and summarize applicable studies. This review also met the requirements in the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Scoping Reviews Checklist (PRISMA-ScR). A detailed search of six databases and three academic journals was conducted. The search string included a variety of terms related to physical activity, children, implementation science, and community-based programs. To be eligible for inclusion, the articles had to be peer-reviewed and had to use an implementation model or framework to guide the development, exploration, and/or evaluation of a community-based physical activity intervention for children ages 5 to 12 years. Information about the article, the program, and the implementation model/framework were extracted and summarized.

**Results:** The search retrieved 42,202 articles, of which 27 met the inclusion criteria. Of the identified models and frameworks, eleven guided program development, one explored the barriers and facilitators for program implementation, and two evaluated implementation and physical activity outcomes. Tailoring, situational analysis, and element identification were common components among the identified models and frameworks.

**Conclusions:** As program implementation can affect the success of physical activity initiatives, researchers and program developers should consider using implementation models and frameworks to guide their community-based programs. The included articles were all published in the last ten years, demonstrating the use of implementation models and frameworks in community-based physical activity initiatives is still in its infancy and requires further exploration. Further research examining the application of new and existing implementation models and frameworks in developing, exploring and evaluating community-level programs is warranted.

# Social Engagement during a Sedentary Time Reduction Intervention in Assisted Living

**Ms. Irmína Klicnik**, Dr. Jennifer Copeland, Dr. Shilpa Dogra

<sup>1</sup>Ontario Tech University, Oshawa, Canada

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** To determine whether a sedentary time reduction intervention conducted with older adults residing in an assisted living setting would lead to changes in social engagement.

**Methods:** A pre-post intervention, mixed-methods design was used. Data were collected at the beginning and end of a 12-week intervention aimed at increasing standing breaks and reducing sedentary time in three assisted living facilities across Canada (Alberta, Ontario, New Brunswick). Environmental cues such as posters, table cards, and floor stickers were implemented to encourage standing breaks. Participants (n=43, 80.6% female) were given the Keele Assessment of Participation Questionnaire (KAP) before and after the 12-week intervention to assess their social participation across 7 domains. Participants were also invited to focus group discussions after the conclusion of the intervention to gather more insight into the effects of the intervention. Focus groups were transcribed verbatim, and thematic analysis was performed.

**Results:** Analysis of the KAP indicated no statistical changes in participation across any domain from pre-intervention to post-intervention. Several key themes emerged from thematic content analysis of focus group discussions, including sense of belonging, enjoyment, and staff interaction. Across all three provinces, participants endorsed the importance of social interaction and participation, but were clear that their personal choice to participate was of utmost importance. In one facility, residents initially stated that intervention did not increase their social participation, but later acknowledged the sense of belonging they gained from participating in the program. Some residents also suggested that despite the presence of the environmental cues, there are some institutional barriers within the residence which preclude social participation.

**Conclusion:** In conclusion, a sedentary time reduction intervention may not significantly affect social engagement across all older adults. The lack of significance may be due to the highly social nature of congregate living in assisted living facilities where older adults eat their meals together in a dining room, and are able to participate in several recreation activities planned by staff. Enjoyment related to the sedentary time reduction intervention indicates that social engagement may be critical for reducing sitting time among older residents in assisted living.

# Associations of Neighbourhood Greenness and Walkability with Social Participation among Older Canadians: An Analysis of the CLSA

**Ms. Irmna Klicnik**, Mx. Andrew Putman, Dr. Shilpa Dogra

<sup>1</sup>Ontario Tech University, Oshawa, Canada

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** To explore associations of neighborhood characteristics (greenness and walkability), physical activity, and social participation at two time periods.

**Methods:** This is a population-based prospective cohort study of cross-sectional baseline data from the Canadian Longitudinal Study on Aging (CLSA), with a follow-up period at 3 years. The CLSA is a nationally representative, stratified random sample of Canadian men and women, aged 45-85 years at baseline (2011-2015, n=51388). Data on different aspects of social participation (e.g., positive social interaction, and desire to participate in more activity) *at follow-up* were used as outcomes. The CLSA baseline database was linked with the Canadian Active Living Environments, a measure of walkability, and Normalized Difference Vegetation Index, a measure of greenness. Physical activity was measured using the Physical Activity Scale for Elderly. Walkability, greenness, and total physical activity from baseline were used as exposure variables.

**Results:** The primary associations of interest and assessment of interactions will be analyzed using linear and ordinal logistic regression modeling with the models being adjusted for age, sex, education, and household income. The analytic sample consists of 50.0% females (n=16,735, age 72.9±5.6 years). At follow-up, 33.4% (n=5,637) participants reported desiring more social interactions and 34.7% (n=5,811) participants scored the maximum possible value (100) on the Medical Outcomes Study measure of positive social interactions. We will examine the relationships between older Canadians' neighbourhood environment, total physical activity, and social participation to gain a better understanding of how these factors influence one another and provide insight into the design of age-friendly environments.

**Conclusion:** The goal of this study is to inform future work on how external factors such as the natural and built environments can facilitate or hinder social participation among older adults.

# Preliminary effects of a carbohydrate-restricted, high-fat diet in head and neck cancer patients undergoing radiotherapy: A pilot randomized controlled trial

**Ms. Hania Taha (corresponding author)**<sup>1,2</sup>, Assistant Professor Hannah Holscher<sup>1</sup>, Dr. Fadi Atrash<sup>2</sup>, Dr. Alexander Slade<sup>3</sup>, Associate Professor Yuan-Xiang Pan<sup>1</sup>, Dr. Salem Billan<sup>2</sup>, Assistant Professor Anna Arthur (corresponding author)<sup>1,4</sup>

<sup>1</sup>University of Illinois at Urbana-Champaign, Champaign, USA, <sup>2</sup>Augusta Victoria Hospital, East Jerusalem, Palestine, State of, <sup>3</sup>Stony Brook University School of Medicine, Stony Brook, USA, <sup>4</sup>University of Kansas Medical Center, Kansas City, USA

**Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Our previous observational studies showed that a self-reported diet of < 50% carbohydrates and ≥ 23% unsaturated fats is associated with positive outcomes in head and neck cancer (HNC) patients. The purpose of this single-blinded randomized controlled trial (RCT) is to test the preliminary effects of implementing a carbohydrate-restricted, high-fat (CRHF) diet in HNC patients undergoing definitive radiotherapy (RT).

**Methods:** From January 2020 to August 2021, thirteen newly-diagnosed HNC patients that planned to receive RT at Augusta Victoria Hospital in Palestine, were enrolled and randomized to one of two arms—a CRHF arm (N=6) who received ~30% carbohydrates, ~45% fats, and ~25% proteins or a standard diet (SD) arm (N=7). Three meals per day were provided to all participants for 2-weeks before RT and 6-7 weeks during RT, with adequate calories estimated for weight maintenance. The per-protocol analysis included (N=4) participants in the CRHF arm and (N=5) participants in the SD arm. Outcomes were nutritional status (assessed by patient-generated subjective global assessment (PG-SGA)), body composition (assessed by fat-mass (FM) and lean body mass (LBM)), nutrition impact symptoms (NIS), and tumor progression, and were assessed at baseline, 2-weeks (before RT), and 1.5-2 months post-RT.

**Results:** Both arms showed improvements in PG-SGA score at 2-weeks. Post RT, a non-significant, but greater percent weight loss was observed in the CRHF arm compared to the SD arm. Conversely, the CRHF arm maintained more LBM and lost more FM than the SD arm. The most common NIS were taste deterioration and pain for the CRHF arm, and dry mouth, early satiety, fatigue, pain, and loss of appetite for the SD arm. There was one recurrence in the CRHF arm and one mortality in the SD arm.

**Conclusion:** This pilot RCT shows that dietary intervention may improve the PG-SGA score before RT. There were fewer NIS observed in the CRHF arm. The CRHF had greater FM loss but better LBM maintenance than the SD arm. These preliminary results can be used to develop a larger sample size, with more statistical power to test the efficacy of implementing a CRHF diet on HNC outcomes.

# Exploring factors associated with sedentary behaviour pre, during, and post covid-related restrictions in UK university students: A pooled cross-sectional analysis

**Mr. Matthew Savage**<sup>1</sup>, Dr. Ruth James<sup>1</sup>, Dr. Philip Hennis<sup>1</sup>, Dr. Daniele Magistro<sup>1</sup>, Dr. Kirsty Hunter<sup>1</sup>, Dr. James Donaldson<sup>1</sup>, Dr. Laura Healy<sup>1</sup>

<sup>1</sup>Nottingham Trent University, Nottingham, United Kingdom

Chaired Poster Session, June 14, 2023, 5:30 PM - 6:45 PM

**SIG - Primary Choice:** J. Young Adults

**Purpose:** University students undertake prolonged periods of habitual sedentary behaviour which can adversely affect future health. This issue was exacerbated further by the onset of restrictions to freedom of movement due to the COVID-19 pandemic in March 2020. However, in July 2021 the UK government reopened all sectors of the economy and limits on social contact were largely abolished, leading to a contextual shift towards pre-pandemic societal norms. Despite this, little is known about how sedentary behaviour in university students has been influenced since the removal of covid-related restrictions. The aim of this study is therefore to explore correlates of sedentary behaviour across four academic years from October 2019 (pre-pandemic) to October 2022 (15-months following the removal of covid-related restrictions) in UK university students.

**Methods:** This study used an online self-report survey to obtain sociodemographic information and to quantify levels of mental wellbeing (MWB), perceived stress (PS), moderate to vigorous physical activity (MVPA), body mass index (BMI), and sedentary behaviour (SB) in four cohorts of university students from prior to the pandemic (October 2019) to 15-months following the removal of COVID-related restrictions (October 2022) in UK university students ( $n=7,100$ ). A pooled cross-sectional analysis was used to explore the relationships between sedentary behaviour and other lifestyle factors over time.

**Results:** The regression model was statistically significant ( $R^2 = .27$ ,  $F(1, 7) = 382.21$ ,  $P < .001$ ). MWB and MVPA were positively related to SB ( $P < .001$  &  $P = 0.01$ ) whereas PS and BMI were negatively related to SB ( $P < .001$ ). Compared to 2019, SB was higher in 2020 and 2022 ( $P < .001$ ) but was not different in 2021 ( $P = 0.03$ ).

**Conclusion:** These findings demonstrate that behavioural and psychological correlates of sedentary behaviour remain constant across four years despite substantial changes in sedentary behaviour due to the COVID-19 pandemic. Importantly, the implementation of COVID related restrictions led to an increase in sedentary behaviour beyond pre-pandemic levels that still remains despite a contextual shift towards pre-pandemic society. As such, universities and policy makers should make a concerted effort to explore methods of reducing sedentary behaviour to develop an environment in which students' health can thrive.

# ORAL PRESENTATIONS

## Examining associations between mothers' and fathers' food skills and children's diet quality: A Structural Equation Modelling approach

**Mr. Amar Laila**<sup>1</sup>, Dr. Maude Perreault<sup>2</sup>, Mr. Adam Sadowski<sup>1</sup>, Dr. Scott Maitland<sup>1</sup>, Dr. David Ma<sup>1</sup>, Dr. Jess Haines<sup>1</sup>

<sup>1</sup>University of Guelph, Guelph, Canada, <sup>2</sup>Université de Montréal, Montréal, Canada

**O.1.01 - How parents and carers behaviors are linked to children behaviors and health, UKK - Main Hall (Level 6), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Parents have substantial influence on young children's dietary intake. Parental food skills may be associated with the healthfulness of food provided in the home, which could influence children's diet quality. However, a paucity of research has examined the association between parental food skills and children's diet quality or compared how this association may differ between mothers and fathers.

**Methods:** A Structural Equation Modelling (SEM) approach was used to build a measurement model representing food skills of mothers ( $n = 202$ ) and fathers ( $n = 116$ ) participating in the Guelph Family Health Study, a randomized trial of an obesity-prevention intervention among Canadian families ( $n = 169$ ) with children aged 1.5-5 years. Measurement invariance followed by latent mean analysis was conducted between mothers and fathers, separately. Structural regression analysis was then conducted to assess the association between parental food skills and child diet quality (assessed via the parent-reported Healthy Eating Index) and whether this association was mediated by parent-reported healthfulness of dinner.

**Results:** Results indicated partial scalar invariance between mothers and fathers. Latent mean analyses showed that fathers' ability to plan meals and adjust recipes was significantly lower than mothers ( $M = -0.16$ ,  $p = 0.04$ ). Structural regression showed that the ability to plan meals and adjust recipes among fathers was associated with healthfulness of dinner ( $\beta = 0.59$ ,  $p = 0.009$ ). However, neither mothers' nor fathers' food skills were associated with parent-reported children's Healthy Eating Index.

**Conclusions:** These results highlight the utility of an SEM approach and the importance of including fathers to understand how parental food skills are associated with food provision.

# Carer perspectives on overweight, obesity and dental caries in early childhood to inform a feeding behaviour intervention: findings from a systematic qualitative review

**Ms. Heilok Cheng**<sup>1,3</sup>, Prof. Louise Baur<sup>1,3</sup>, Associate Professor Amit Arora<sup>2</sup>, Prof. Elizabeth Denney-Wilson<sup>1,3</sup>  
<sup>1</sup>The University of Sydney, Sydney, Australia, <sup>2</sup>Western Sydney University, Sydney, Australia, <sup>3</sup>The Centre of Research Excellence in Translating Early Prevention of Obesity in Childhood, Sydney, Australia

**O.1.01 - How parents and carers behaviors are linked to children behaviors and health, UKK - Main Hall (Level 6), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Overweight, obesity and early childhood caries (ECC) share overlapping etiologies through bottle and formula feeding. Feeding behaviours, which include feeding to settle crying; overfeeding, via feeding until bottle emptying and exceeding infant satiety; and the addition of cariogenic carbohydrate foods to bottles, can cause overnutrition and continual exposure of teeth to sugar. Carer beliefs may be barriers to uptake of best-practice feeding messages. Creating targeted messages on best-practice formula and bottle feeding, and bottle transition to cups, may be more effective and engaging. This systematic qualitative review aimed to identify carer perspectives on overweight, obesity and ECC in infants and young children.

**Methods:** Databases CINAHL, Medline and EMBASE, were searched in August 2021, for original qualitative research, involving caregivers of infants and children aged 0-6 years, diagnosed with, or at increased risk of, child overweight, obesity or ECC. Studies were coded in NVivo, informed by the COM-B framework. Themes were generated inductively using thematic analysis. Critical appraisal was undertaken using the CASP Qualitative Checklist.

**Results:** 92 studies were identified: 49 on overweight/obesity, 43 on ECC. All studies, except one with Photovoice, used focus groups and interviews. Themes focused on how caregivers: perceived children's wellness; identified unhealthy weight or teeth; and felt resourced for supporting children's healthy weight and teeth. Beliefs that may be barriers to behaviour change include: large body size, good feeding and activity as better indicators of weight and health, instead of growth charts; baby teeth being unimportant, compared to adult teeth; obesogenic and cariogenic foods as supporting dietary diversity; and the role of food in discipline and responding to perceived hunger and satiety signals. CASP appraisal indicated, in general, high quality research conduct; however, 67 studies did not report on researcher reflexivity and/or potential researcher bias in research conduct.

**Conclusion:** Findings indicate caregivers prioritise wellness and value health promotion, but may only respond reactively once adverse symptoms of overweight/obesity or ECC occur. Understanding how caregivers value weight, dental health and feeding can help tailor intervention strategies. Using behaviour change theory, this can address priorities for child health and support uptake of obesity and ECC prevention messages.

# Latent profiles of eating behaviours in childhood and their association with temperament, parenting and food insecurity

**Dr. Abigail Pickard<sup>1</sup>**, Dr. Helen Croker<sup>5</sup>, Prof. Claire Farrow<sup>1</sup>, Dr. Moritz Herle<sup>4</sup>, Prof. Emma Haycraft<sup>3</sup>, Dr. Alice Kinninmonth<sup>2</sup>, Associate Professor Clare Llewellyn<sup>2</sup>, Prof. Jacqueline Blissett<sup>1</sup>  
<sup>1</sup>Aston University, Birmingham, United Kingdom, <sup>2</sup>University College London, London, United Kingdom, <sup>3</sup>Loughborough University, Loughborough, United Kingdom, <sup>4</sup>King's College London, London, United Kingdom, <sup>5</sup>World Cancer Research Fund International, London, United Kingdom

**O.1.01 - How parents and carers behaviors are linked to children behaviors and health, UKK - Main Hall (Level 6), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Previous research has evidenced that from infancy onward, genetic influences on weight are partly mediated by appetite avidity, expressed as food approach behaviours. The primary aim of this research was to identify a comprehensive eating behaviour profile reflecting high food approach (avid eating) in children between 3-5 years. The secondary aim was to understand how factors such as child temperament, the experience of food insecurity, or parental feeding practices, may vary in that profile.

**Methods:** An online survey was conducted with 995 parents/carers living in England and Wales. Participants reported on their child's eating behaviour using the Child Eating Behaviour Questionnaire (CEBQ), as well as completing measures of child temperament (VSF-CBQ), household food security (HFSS) and parental feeding practices (CFPQ). Latent Profile Analysis (LPA) was carried out to identify distinct eating profiles amongst the children (36-72 months, mean age = 48.8 months, 52% female).

**Results:** Four eating profiles emerged from the sample of children: (a) *avid eating*, (b) *fussy eating*, (c) *happy eating*, and (d) *typical eating*. *Avid eating* (21.9% of children) was characterised by higher levels of food responsiveness, enjoyment of food, and emotional over-eating in combination with lower satiety responsiveness, slowness in eating, and food fussiness. Children in the *avid eating* profile were recipients of parental feeding practices linked with increased risk of adiposity in later childhood, namely food use for emotional regulation and food restriction for weight control. Children with an *avid eating* profile were reported to be more surgent and experienced greater food insecurity than all other eating profiles.

**Conclusions:** This work provides novel evidence that avid eating is a distinct, multi-dimensional and emotionally charged eating profile observable in children as young as 3 years old and which is systematically related to more surgent child temperament and more non-nutritive parental feeding practices such as restriction and the use of food for emotion regulation. The results demonstrate the importance of tailoring preventative and intervention methods to both the child's environment and temperament to promote healthier eating habits.

# Parental feeding practices and appetite in toddlerhood and early childhood: a discordant twin analysis of the Gemini cohort

**Dr. Alice Kininmonth<sup>1</sup>**, Dr. Moritz Herle<sup>2</sup>, Miss Kristiane Tommerup<sup>1</sup>, Prof. Emma Haycraft<sup>3</sup>, Dr. Claire Farrow<sup>4</sup>, Dr. Helen Croker<sup>5</sup>, Dr. Abigail Pickard<sup>4</sup>, Dr. Katie Edwards<sup>4</sup>, Prof. Jacqueline Blissett<sup>4</sup>, Dr. Clare Llewellyn<sup>1</sup>

<sup>1</sup>University College London, London, United Kingdom, <sup>2</sup>Kings College London, London, United Kingdom,

<sup>3</sup>Loughborough University, Loughborough, United Kingdom, <sup>4</sup>Aston University, Birmingham, United Kingdom,

<sup>5</sup>World Cancer Research Fund, London, United Kingdom

**O.1.01 - How parents and carers behaviors are linked to children behaviors and health, UKK - Main Hall (Level 6), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** To test the hypothesis that parents develop their feeding practices partly in response to their child's individual appetite, using a discordant twin design. We hypothesised that parents would use more nonresponsive feeding practices such as restriction, emotional feeding and instrumental feeding with their twin who expresses a more avid appetite (e.g., more food responsive and less satiety responsive) and parents will use more pressuring feeding practices with their twin who expresses a less avid appetite (e.g., less food responsive, more satiety responsive, fussier eating).

**Methods:** Participants were from the Gemini study, a longitudinal cohort of twins born in England and Wales in 2007. Psychometric measures of parental feeding practices (PFPs) and child appetite were completed by parents when their twins were 15-months and 5-years. We identified twins who were discordant for PFPs (n=14-357) and used Paired Samples T-tests to explore the direction and magnitude of differences in appetite between twin pairs.

**Results:** As hypothesised, parents used more pressure with twins expressing less food responsiveness, lower enjoyment of food, lower emotional overeating, higher satiety responsiveness, slower eating speed, and greater fussiness at 15-months and 5-years (p-values<0.001; d=0.28-0.95). Parents used more instrumental feeding with twins expressing lower food enjoyment, higher satiety responsiveness, slower eating speed, and greater fussiness at 15-months and 5-years (p-values<0.05; d=0.25-0.65). Parents exerted greater restriction on twins who expressed a more avid appetite, characterised by greater food responsiveness, higher food enjoyment, lower satiety responsiveness, quicker eating speed, less fussiness – at 15-months and 5-years (all p-values<0.05; d=0.29-0.89). Parents also used more emotional feeding and exerted more control over meals/snacks with their twin who expressed a more avid appetite, but findings were not consistent across timepoints. No differences in appetite were observed for twins who were encouraged to eat healthy foods to differing extents.

**Conclusion:** Parents who fed their twins differently appear to be, in part, responding to differences in appetite expressed by their children. These findings could be used to guide the development of an intervention to provide support for parents around appropriate ways to feed their children to support the development of healthy eating behaviours.

# The Relationship between Neighborhood Environment and Children's Physical Activity and the Mediating Role of Parental Perception of Child Friendliness

**Ms. Xiaoli Gong#1<sup>1</sup>**, Assistant Professor Pauline E.W. van den Berg#2<sup>1</sup>, Prof. Theo A. Arentze#3<sup>1</sup>

<sup>1</sup>Eindhoven University of Technology (TU/e), Eindhoven, Netherlands

**O.1.01 - How parents and carers behaviors are linked to children behaviors and health, UKK - Main Hall (Level 6), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** During the last decades, the level of children's physical activity is in decline. To develop effective interventions for children, insight in the correlates of physical activity and the possible mediating factors is necessary. Besides, parents are important gatekeepers and decision references for their children's physical activity. Some studies have considered parental perceived safety, while parental perceptions of child friendliness on neighborhoods as a whole have been ignored. Furthermore, we consider children's physical activity in more detail by differentiating into three types: active travel, organized sports and outdoor play. Therefore, this study aimed to examine the potential mediating effect of parental perception of child friendliness on the associations between household, physical and social environment characteristics and children's three types of physical activities: active travel, organized sports and outdoor play.

**Methods:** In order to study these relationships, survey data were collected using a large national sample of parents with children (7–12 years old) in the Netherlands. Geographic Information System (GIS) was used to objectively measure the physical environment variables of the neighborhood of each participant, and enriched with data from Dutch Central Bureau of Statistics (CBS). A TwoStep cluster analysis was conducted to identify the natural groupings of respondents' living neighborhood environment based on physical environment variables. Structural equation modelling (SEM) was used to test the mediating role of parental perception of child friendliness on the relationships between household, physical and social environment characteristics and children's three types of physical activities.

**Results:** The paper will present the results of the TwoStep cluster analysis and structural equation modelling (SEM). The results will show different groups of physical environments based on the TwoStep cluster analysis, what characteristics influence parental perception of child friendliness and children's three types of physical activities, and whether parental perception of child friendliness has a mediating role between household, environment characteristics and children's physical activity.

**Conclusion:** These insights can be used by policy makers from different sectors to create more child-friendly neighborhoods, which in turn will improve children's physical activity, health and wellbeing.

# Prospective associations of parent feeding behaviors with early childhood appetitive traits

**Dr. Tonja Nansel<sup>1</sup>**, Dr. Leah Lipsky<sup>1</sup>, Dr. Kyle Burger<sup>2</sup>, Dr. Jenna Cummings<sup>1</sup>, Dr. Myles Faith<sup>3</sup>

<sup>1</sup>National Institute of Child Health and Human Development, Bethesda, USA, <sup>2</sup>University of North Carolina Chapel Hill, Chapel Hill, USA, <sup>3</sup>University at Buffalo - SUNY, Buffalo, USA

**O.1.01 - How parents and carers behaviors are linked to children behaviors and health, UKK - Main Hall (Level 6), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Child appetitive traits, eating styles that reflect responsiveness to external influences and internal hunger and satiety signals, are associated with eating behaviors and susceptibility to excess weight gain. However, little is known about early life influences on child appetitive traits. This study investigated relations of early life maternal feeding behaviors with child appetitive traits at age 3.5 years.

**Methods:** Participants of the Pregnancy Eating Attributes Study (PEAS) and follow-up Sprouts study were enrolled in early pregnancy and followed prospectively. This analysis includes data collected from baseline through child age 3.5-years (n=160). Child appetitive traits at age 3.5 years were measured using the Child Eating Behavior Questionnaire. Maternal feeding to soothe was assessed with the Food to Soothe Questionnaire at child age 3, 6, and 12 months. Maternal permissive feeding was assessed with the Infant Feeding Style Questionnaire at child age 2 years. Multiple linear regressions estimated relations of maternal feeding behaviors with child appetitive traits (food responsiveness, satiety responsiveness, enjoyment of food, emotional overeating, emotional undereating, desire to drink, slowness in eating, food fussiness) at age 3.5 years, controlling for maternal age, education, family income-poverty ratio, and breastfeeding duration.

**Results:** Maternal feeding to soothe at 6 and 12 months was positively associated with permissive feeding at 2 years ( $r=0.39$  and  $0.37$ , respectively,  $p<0.001$ ). Greater maternal feeding to soothe at 12 months was associated with greater child emotional overeating ( $\beta=0.21\pm0.06$ ,  $p=0.002$ ), emotional undereating ( $\beta=0.49\pm0.10$ ,  $p<0.001$ ), and desire to drink ( $\beta=0.25\pm0.11$ ,  $p=0.03$ ); more permissive feeding at 2 years was associated with greater child emotional undereating ( $\beta=0.35\pm0.14$ ,  $p=0.02$ ) and desire to drink ( $\beta=0.36\pm0.15$ ,  $p=0.03$ ) at 3.5 years. Maternal feeding behaviors were not significantly associated with other appetitive traits.

**Conclusions:** Associations of emotional eating with parent feeding behaviors is consistent with previous literature suggesting a stronger environmental influence on emotional eating, while the absence of associations with food responsiveness and satiety responsiveness are consistent with a relatively stronger genetic influence on these traits.

# Associations between area deprivation and changes in the digital food environment during the COVID-19 pandemic: longitudinal analysis of three online food delivery platforms

**Ms. Alexandra Kalbus**<sup>1</sup>, Prof. Andrea Ballatore<sup>2</sup>, Dr. Laura Cornelsen<sup>1</sup>, Mr. Robert Greener<sup>1</sup>, Prof. Steven Cummins<sup>1</sup>

<sup>1</sup>London School of Hygiene & Tropical Medicine, London, United Kingdom, <sup>2</sup>King's College London, London, United Kingdom

**O.1.02 - Evidence-based approaches for the promotion of healthy foods, UKK - Level 6 Foyer, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Foods prepared away from home are typically energy-dense and nutrient-poor and contribute to health inequalities relating to overweight and obesity. The COVID-19 pandemic has changed the way people interact with the out-of-home food environment, accelerating the transition to use of online food delivery services. It is unknown if these changes affect households equally or exacerbate social and spatial inequalities in exposure to unhealthy food environments. In this study we explore whether neighbourhood deprivation is associated with (1) greater exposure to online food delivery services, and (2) changes in access to these services during the COVID-19 pandemic.

**Methods:** Data on food outlets delivering to 661 postcode districts in Greater London and the North of England were obtained for April 2020 and May 2021 from three online delivery platforms. Using machine learning, food outlet data were merged and cross-platform and duplicates were removed. Relationships between area deprivation and change in the total number of delivering outlets over time were assessed using a multilevel regression model. Linear regression was used to model absolute and relative change in the count of outlets during the pandemic. Models were adjusted for area and demographic characteristics.

**Results:** The median number of food outlets delivering to postcode districts increased by 132% between 2020 and 2021. The association between area deprivation and the overall exposure to online food delivery services was moderated by region, with evidence of a positive relationship between number of outlets and deprivation in the North of England, but a negative relationship in London. There was no association between area deprivation and growth of online food delivery services.

**Conclusions:** While inequalities in the exposure to online food delivery services exist, these have not been exacerbated during the COVID-19 pandemic. Findings suggest that the direction and magnitude of associations between neighbourhood deprivation and exposure to the digital food environment vary geographically. Hence, policies targeting the digital food environment may need to consider this heterogeneity and tailor to the local context.

# Revising a home food inventory scale to increase utility and assess sodium and ultraprocessed foods

**Dr. Leslie Lytle<sup>1</sup>**, Dr. Melissa Laska<sup>1</sup>, Ms. Sarah Friend<sup>1</sup>, Dr. Mary Hearst<sup>1</sup>, Mr. Nicholas Marka<sup>1</sup>, Dr. Jayne Fulkerson<sup>1</sup>

<sup>1</sup>University of Minnesota, Minneapolis, USA

**O.1.02 - Evidence-based approaches for the promotion of healthy foods, UKK - Level 6 Foyer, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The Home Food Inventory (HFI) is a validated tool assessing the obesogenicity and healthfulness of foods available in the home (Fulkerson et al, 2008). To expand the tool's utility, methodological research is underway to shorten the tool, evaluate its ability to rank home food environments by the presence of high sodium and ultraprocessed foods, and assess construct validity with comparisons to dietary intake.

**Methods:** A scale reduction approach recommended by Stanton et al (2002) was employed using a secondary data set that included dietary recall data from children (ages 7-12 years), food frequency data from parents, and data on home food availability using the HFI (n=342). Elimination of specific foods within an HFI food category (such as a dairy or protein category) was determined by evaluating the frequency of each item identified across homes and by comparing the association of each food item with nutrient intake. The creation of scores to rank homes on the presence of high sodium and ultraprocessed foods (using the Nova system) occurred by aggregating HFI food items based on sodium content or identification as an ultraprocessed food; those scores were then evaluated for associations with dietary sodium and energy intake to assess construct validity.

**Results:** Using Stanton's approach, the number of food items in the revised HFI was reduced by 23%. A total of 63 high sodium food items (sodium above 5% of daily values) were aggregated to form an HFI high sodium score; the Spearman correlation between the HFI sodium score and sodium intake based on dietary intake data from children and parents was 0.176 and 0.187 ( $p < 0.001$ ), respectively. A total of 86 food items were aggregated to form an ultraprocessed score; the Spearman correlation between the score and child and parent energy intake was 0.15 and 0.16 ( $p < 0.001$ ), respectively.

**Conclusions:** Creating valid tools to assess environmental contributions to disease risk is important from an epidemiologic as well as an intervention evaluation perspective. Enhanced utility of such tools will be demonstrated by reducing the time required to complete the tools and by increasing the tool's ability to assess multiple chronic-disease related risk factors.

# Examining differences in children and adolescents' exposure to food and beverage marketing in Canada by sociodemographic characteristics: findings from the International Food Policy Study Youth survey, 2020

Dr. Rachel Acton<sup>1,2</sup>, Ms. Mariangela Bagnato<sup>3</sup>, Ms. Lauren Remedios<sup>3</sup>, Dr. Monique Potvin Kent<sup>3</sup>, **Dr. Lana Vanderlee**<sup>4</sup>, Mrs. Christine M White<sup>1</sup>, Dr. David Hammond<sup>1</sup>

<sup>1</sup>University of Waterloo, Waterloo, Canada, <sup>2</sup>Health Canada, Ottawa, Canada, <sup>3</sup>University of Ottawa, Ottawa, Canada, <sup>4</sup>Université Laval, Québec, Canada

**O.1.02 - Evidence-based approaches for the promotion of healthy foods, UKK - Level 6 Foyer, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Marketing is a known determinant of dietary intake among youth, and many countries, including Canada, are considering regulations to restrict food and beverage marketing to children. However, little evidence is available outside of the US on how marketing exposure differs across sociodemographic subgroups. This study aimed to investigate potential associations between sociodemographic characteristics and exposure to food and beverage marketing in Canada among children and adolescents.

**Methods:** Data were from the 2020 International Food Policy Study Youth survey. Participants (n=3,780) in Canada aged 10-17 years self-reported exposure to food and beverage marketing across different food categories, settings, and marketing techniques. Logistic regression models tested relationships between sociodemographic characteristics (age, sex, ethnicity, income adequacy) and measures of marketing exposure.

**Results:** The results identified meaningful differences in marketing exposure among youth of different age, sex, ethnicity and income adequacy groups in Canada. Among other differences identified, 13-17 year-olds were more likely than 10-12 year-olds to report seeing unhealthy food marketing online in the last 30 days (41% vs 31%, OR 1.61, p<0.001). Girls were more likely than boys to see such marketing online (40% vs 35%, OR 1.21, p=0.009) and in retail settings (33% vs 26%, OR 1.40, p<0.001), while boys were more likely to see unhealthy food and beverage marketing in video games (15% vs 10%, OR 1.59, p<0.001). Minority ethnicities, including Indigenous youth, tended to report higher exposure to unhealthy food and beverage marketing than White respondents, with the exception of East/Southeast Asian respondents, who tended to report lower exposure than White youth. Similarly, respondents with lower income adequacy generally reported higher exposure than those with higher income adequacy.

**Conclusions:** This study highlights important differences in marketing exposure among youth of different sociodemographic groups in Canada, including greater exposure to marketing among those most disadvantaged. In particular, this is the first study to examine food and beverage marketing among Indigenous children and adolescents in Canada, who reported significantly greater exposure to unhealthy food and beverage marketing than White youth. The results emphasize the essential need to consider food marketing across equity groups when developing restrictions on marketing to kids.

# Assessing the prevalence and nutritional quality of Canadian packaged food and beverage products that would be required to display a FOP symbol using Food Label Information and Price (FLIP) 2020 data

**Ms. Jennifer Lee<sup>1</sup>**, Dr. Christine Mulligan<sup>1</sup>, Ms. Nadia Flexner<sup>1</sup>, Ms. Hayun Jeong<sup>1</sup>, Dr. Mavra Ahmed<sup>1</sup>, Dr. Guanlan Hu<sup>1</sup>, Dr. Mary L'Abbe<sup>1</sup>

<sup>1</sup>University of Toronto, Toronto, Canada

**O.1.02 - Evidence-based approaches for the promotion of healthy foods, UKK - Level 6 Foyer, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** In July 2022, Canada finalized its front-of-pack (FOP) labelling regulations that mandate pre-packaged foods meeting and/or exceeding thresholds for nutrients-of-concern (i.e., saturated fat, sugars, sodium) display a 'high-in' FOP nutrition symbol. However, limited research on its potential impact on the food supply system is available. Therefore, the objective was to examine the prevalence and nutritional quality of Canadian packaged food and beverage products that would be required to display a FOP symbol.

**Methods:** Using a nationally representative, branded food composition database, Food Label Information and Price (FLIP) 2020, packaged food and beverage products (n=20,458 products with unique universal product code) were assessed and categorized according to FOP labelling regulations. The prevalence of foods that would display a FOP symbol, and their nutritional quality, determined by the Food Standards Australia New Zealand (FSANZ) nutrient profiling model was evaluated overall and by food category.

**Results:** According to Canadian FOP labelling regulations, approximately 55% of products (n=11,406) would display a FOP symbol, with the majority of products displaying a FOP symbol for 1 nutrient (n=7,623; 67%). The categories with the highest proportion of foods that would display a FOP symbol were Soups (94%), Dessert Toppings (91%), and Desserts (86%). Overall, products that would display a FOP symbol had higher FSANZ scores (i.e., were 'less healthy') than products that would not display a FOP symbol (means±SD: 10.0±8.9 vs. 4.1±11.5). Although most food categories showed a similar trend, Dairy products & alternatives (6.2±8.7 vs. 13.5±14.1) and Oils and fats (22.2±8.6 vs. 17.9±4.4) showed an opposite trend, where products that would display a FOP symbol showed lower FSANZ scores (i.e., were 'more healthy') than those that would not display a FOP symbol.

**Conclusions:** With a high prevalence of foods that would display a FOP symbol according to Canada's FOP labelling regulations, the regulations have the potential to help consumers identify "less healthy" products and for manufacturers to reformulate products to avoid displaying a FOP symbol. Thus, a comprehensive monitoring and evaluation plan is needed to examine pre-post implementation of the regulations in 2026; and these data can serve as a baseline for such an analysis.

# Food reformulation before the implementation of the front-of-package nutrition labeling in Brazil

**Dr. Ana Clara Duran**<sup>1,2</sup>, Ms. Mariana Fagundes Grilo<sup>3</sup>, Mr. Thiago A Pastorelli Rodrigues<sup>4</sup>, Associate Professor Paula Carvalho Pereda<sup>2,4</sup>

<sup>1</sup>Center for Food Studies and Research, University of Campinas, Campinas, Brazil, <sup>2</sup>Center for Epidemiological Studies in Nutrition and Health, University of Sao Paulo, São Paulo, Brazil, <sup>3</sup>Milken Institute School of Public Health, George Washington University, Washington, DC, USA, <sup>4</sup>Department of Economics, School of Business, Accounting and Economics, University of Sao Paulo, São Paulo, Brazil

**O.1.02 - Evidence-based approaches for the promotion of healthy foods, UKK - Level 6 Foyer, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To assess changes in the content of total sugars, sodium, saturated fat, non-sugar sweeteners (NSS) and food additives of 'cosmetic use' (CFA) in foods and beverages sold in Brazil over a 11-year period prior to the implementation of front-of-package nutrition labeling (FOPNL).

**Methods:** We used data from the "Global New Products Database (Mintel-GNPD)". We created a panel with all processed and ultra-processed foods according to NOVA launched in the Brazilian food supply between 2010 and 2021 with at least one reported change in food composition (nutrients and/or ingredient list) by pairing unique barcodes and product inclusion and reformulation dates (126,441 observations and 6,021 unique products). Outcome variables included energy, saturated fat, sodium, and the presence of total sugars, NSS, and CFA. The latter were identified using detailed description of CFA found in ultra-processed foods. We searched products' ingredients list for the presence of sugars, NSS, and CFA. We ran year- and product-fixed effect log-linear models. For additives 'of cosmetic use' we ran Poisson models with similar specifications. We then explored heterogeneity across food categories.

**Results:** Findings from our fitted models show significant increases in energy and sodium contents in 2021 as compared with 2010, but not in saturated fat. While we found smaller changes in the prevalence of foods and beverages with total sugars (ranging from 77% to 80%), the presence of NSS grew from 12% to 28%. The number of CFA/products had a 15% upward increase from 2015 to 2021. The energy content of candies and salty snacks had the largest increases, while dairy beverages the sharpest decrease. The number of CFA/product soared in dairy and non-dairy sweetened beverages, ready-to-eat meals, and snacks. Finally, CFA changes were followed by greater increases in the energy content of foods in 2019-21 as compared with earlier periods.

**Conclusions:** Foods and beverages have undergone significant reformulation in the 10 years prior to the implementation of FOPNL, with important heterogeneity across nutrients, total sugars, NSS and other food additives of 'cosmetic use', and food categories. Monitoring food reformulation will be key to address an unintended worsening of the healthfulness of the food supply.

# Characterizing the Dollar Store Food Environment to Inform New Legislation in Baltimore City

**Ms. Samantha Sundermeir<sup>1</sup>**, Dr. Joel Gittelsohn<sup>1</sup>, Ms. Lisa Poirier<sup>1</sup>, Ms. Emma Lewis<sup>1</sup>, Ms. Sydney Santos<sup>1</sup>  
<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA

**O.1.02 - Evidence-based approaches for the promotion of healthy foods, UKK - Level 6 Foyer, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Over the past decade, Dollar Stores (DS) have become ubiquitous retailers in low-income urban settings. There are over 34,000 DS in the U.S., with proliferation largely occurring in under-resourced majority Black urban neighborhoods where low food access is prevalent. The City of Baltimore has focused recent efforts on understanding and mitigating the impact of DS on health and local retailers and therefore enlisted our research team to characterize the DS food environment and develop informed recommendations for new policies to be considered by City Council.

**Methods:** Direct observations will be used to collect data on the in-store food environment at all 55 DS located in Baltimore City using a modified version of the Nutrition Environment Measures Survey in Stores (NEMS-S). Healthy food availability index (HFAI) scores will be calculated according to NEMS-S scoring protocol.

**Results:** Results from in-store observations will help to characterize the DS food environment including food availability, pricing, and quality. Findings will also include data on acceptance of food assistance program benefits, the presence of in-store shopping promotions, and general store characteristics (cleanliness, staffing, layout). Based on initial store visits, ultra-processed foods (e.g., frozen pizza, hot dogs, ice cream, snacks, and soda) are ubiquitous, while fruit and vegetable options are scarce. Most stores accept Supplemental Nutrition Assistance Program benefits, but not Special Supplemental Nutrition Program for Women, Infants and Children benefits. We anticipate having policy recommendations to share by June 2023, including the City Council's receptiveness to them.

**Conclusion:** This ongoing work is timely as Baltimore City is currently interested in developing and implementing new DS legislation. Findings may support future scale-up of similar work in other food retail settings, particularly among vulnerable communities where healthy food access is a challenge and local retailers face business threats from larger national brand stores.

# A mediation analysis on the relationship between adolescents' migrant background and their body mass index

**O.1.03 - Latest findings on socio-economic inequalities, UKK - Hall B (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Obesity and its risk factors often show a socioeconomic gradient. However, it is essential to understand which health behaviours and correlates explain such disparities. In particular, there is little information about which mediators explain the higher weight often found in adolescents with a migrant background. The objective of this study was to assess the potential mediating role of several adolescents' and parental health behaviours and factors in the association between the origin of the parents and adolescents' body mass index (BMI).

**Methods:** Data were obtained from 24 secondary schools enrolled in the SI! Program for Secondary Schools trial in Spain. Participants were measured at approximately 12 (n=925; ~50% girls), and followed up at 14 (n=781), and 16 (n=876) years of age. Parental data on diet, smoking, physical activity and BMI and adolescent's dietary data were obtained via questionnaires. Adolescents' physical activity, sedentary and sleep parameters were measured by 7-day accelerometer. Age- and sex-adjusted z-scores were calculated using validated cut-off points for BMI at each assessment. A migrant background was assumed if at least one parent/caregiver was born outside Spain. Potential mediators were explored via MacKinnon's product-of-coefficients test in single mediation models and a final multiple mediation model, including all previous significant mediators.

**Results:** Significant mediators in the multiple mediation models explained 48.5%, 7.7% and 45.8% of the association between migrant background and adolescents' BMI z-scores at 12, 14, and 16 years of age, respectively. The most relevant single mediator at all time-points was maternal BMI (44.7%, 39.0% and 32.9%, respectively), followed by the number of meals at 12 and 16 years of age (16.2% and 19.9%), and sleep duration at 12 years of age (9.2%). Significant suppression effects were found for the consumption of sugar-rich foods at all time-points, reducing the total percentage explained in the models.

**Conclusions:** A higher maternal BMI was consistently found to be the most important mediator explaining the higher weight in adolescents with a migrant background. Obesity prevention strategies should address not only adolescents but also their family unit, with special attention to vulnerable groups.

# Facilitating Children's Club-Organized Sports Participation: Person–Environment Misfits Experienced by Parents from Low-Income Families

**Dr. Lonneke Van Leeuwen**, Dr. Anne Annink, Dr. Kirsten Visser, Dr. Marielle Jambroes

<sup>1</sup>Public Health Department, Julius Center For Health Sciences And Primary Care, University Medical Center Utrecht, Utrecht, Netherlands, <sup>2</sup>Utrecht University School of GovernanceUtrecht School of Governance, Utrecht University, Utrecht, Netherlands, <sup>3</sup>Department of Human Geography and Spatial Planning, Faculty of Geosciences, Utrecht University, Utrecht, Netherlands, <sup>4</sup>Public Health Department, Julius Center For Health Sciences And Primary Care, University Medical Center Utrecht, Utrecht, Netherlands

**O.1.03 - Latest findings on socio-economic inequalities, UKK - Hall B (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Despite the many benefits of club-organized sports participation for children, studies have shown that sports participation is lower among children from low-income families than among children from middle- or high-income families. Adopting a socioecological perspective, the aim of our study was to identify and describe experiences of person–environment (PE) misfits in relation to parental facilitation of children's sports participation.

**Methods:** We conducted 24 interviews with parents from low-income families. The interviews were structured around three sets of questions, probing for: 1) positive and negative thoughts or beliefs about sports for children and organizing children's sports participation, 2) experienced or expected constraining and facilitating factors while/for facilitating children's sports participation, and 3) suggestions for parent-targeted solutions to help increase sports participation among children from low-income families. The analysis of the interview transcripts was aimed at discovering experiences of misfits and parental strategies to reduce misfits or deal with misfits. Then, individual and environmental attributes involved in each misfit were coded.

**Results:** PE misfits were found in multiple behaviors related to the facilitation of children's sports participation: financing sports participation; planning and investing time; transporting children; acquiring, processing, and providing information; and arranging support. Across these PE misfits, influential attributes were found on the individual level (e.g., skills) as well as within the social, policy, physical, and information environment. In response to PE misfits experienced, parents deployed multiple strategies to reduce these PE misfits, aimed at enhancing either themselves (e.g., increasing financial capacities) or their environments (e.g., arranging social support). These results provide an insight into experienced PE misfits that took the form of multiple specific behaviors which parents found difficult while facilitating their children's sports participation. Furthermore, the results provide insight into the environmental and individual attributes that were involved in these PE misfits, and into how parents modified themselves or their environments in order to make their environments more supportive.

**Conclusions:** The study contributes to future research on individual and environmental influences on parental facilitation of their children's sports participation, as well as on the development of multilevel interventions aimed at increasing sports participation among children from low-income families.

# Understanding young people's participation in a health-promotion intervention in schools located in socially advantaged and disadvantaged areas in Sweden

**Dr. Lisette Farias Vera**<sup>1</sup>, Dr. Gisela Nyberg<sup>1,2</sup>, Dr. Björg Helgadóttir<sup>1,2</sup>, Dr. Susanne Andermo<sup>1,2</sup>

<sup>1</sup>Karolinska Institutet, Stockholm, Sweden, <sup>2</sup>The Swedish School of Sport and Health Sciences, Stockholm, Sweden

**O.1.03 - Latest findings on socio-economic inequalities, UKK - Hall B (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Adolescents face many challenges, including increasing academic expectations and physical, cognitive, and emotional changes. These are influenced by socioeconomic determinants, leading to health inequalities. This study explores how young people in grade eight (14-15 years old) experience their participation in a health-promotion in socially advantaged and disadvantaged areas in Sweden.

**Methods:** The intervention (n=193) was conducted in six schools (four control and two intervention) and lasted one-school year. The intervention was teacher-led and consisted of three 60-minute sessions per week: varied physical activities, homework support, and walks while listening to audiobooks. A qualitative design with ethnographic fieldwork, participant observations, and focus groups in two intervention schools was used to evaluate how participants experienced the intervention. A total of 27 students (18 boys and 9 girls) were purposely recruited to focus groups and 23 participant observations were conducted over 8 months. A content analysis was conducted.

**Conclusions:** "Having fun with others" illustrates how having teachers leading activities allowed participants to have fun, look forward to the activities, and share experiences with others. "Being too busy with other organized activities" describes how both groups enjoyed the physical activities and walks, but some experienced having too much to do after school, which coincided with those attending the school located in the advantaged area. Most participants from the disadvantaged area described having little to do at home and preferred to participate in the activities instead of sitting at home with their mobile phones. "Catching up with studies" exemplifies how both groups were motivated by homework support and walks listening to audiobooks but used this time differently depending on how busy they were after school; most of those attending the school in the advantaged area used that time to do their homework and listen to books, while most participants in the disadvantaged area preferred to study at home.

**Conclusions:** Access and use of time dedicated to physical activity, walks with audiobooks, and homework support were influenced by socioeconomic factors. This study showed that it is crucial to support young people's participation by focusing on availability and support, especially in schools located in disadvantaged areas.

# The obesogenic system in deprived urban neighbourhoods in the Netherlands: an expert-based system map through Group Model Building.

**Ms. Fleur ter Ellen<sup>1</sup>**, Dr. Joost Oude Groeniger<sup>1</sup>, Dr. Karen Oude Hengel<sup>1,2</sup>, Dr. Luc Hagedaars<sup>2</sup>, Prof. Karien Stronks<sup>2</sup>, Prof. Frank van Lenthe<sup>1</sup>

<sup>1</sup>Department of Public Health, Erasmus MC University Medical Center, Rotterdam, Netherlands, <sup>2</sup>Department of Public Health, Academic Medical Center, University of Amsterdam, Amsterdam, Netherlands, <sup>3</sup>Department of Work Health Technology, Netherlands Organisation for Applied Scientific Research TNO, Leiden, Netherlands

**O.1.03 - Latest findings on socio-economic inequalities, UKK - Hall B (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Over the past decades, the prevalence of obesity among adults has increased tremendously, especially in deprived urban neighbourhoods. Obesity prevention policies often address a single cause, resulting in individual-level actions. However, it is the complex dynamics between individuals and their living environment that must be understood to inform obesity prevention strategies. Drawing on insights and methodologies from system science, our study investigates obesity as an undesirable consequence of the dynamics of the underlying system. Therefore, we developed a system map to understand how the dynamics in the obesogenic system in deprived urban neighbourhoods have led to the rise of obesity over the past 30 years in the Netherlands.

**Methods:** We conducted a participatory workshop process called Group Model Building (GMB). During three GMB sessions, thirteen researchers with expertise in obesity and/or health inequalities qualitatively modelled the obesogenic system by developing a 'Causal Loop Diagram' (CLD). A CLD is a system dynamics tool visualising the connectedness of variables and the feedback and dynamics present in the system. Using system-based analyses, the core modelling team interpreted the overarching system paradigm and subsystems goals.

**Results:** Four subsystems were generated in the GMB sessions: the system of the food environment, the system of the built environment, the socio-cultural system, and the socioeconomic system. The overarching CLD provides a visual representation of the interacting subsystems, consisting of interconnected variables and multiple feedback loops. The CLD shows us that in the deprived urban neighbourhoods, changes in the living environment and societal development over the past 30 years (e.g., increased availability of unhealthy foods, digitization of social security, increased screen time, changes in social norms) amplified obesity risk factors at the individual level (e.g., unhealthy dietary intake, chronic stress, sleeping problems and sedentary behaviour).

**Conclusions:** This study developed a CLD that visualises the dynamics in deprived urban neighbourhoods in the Netherlands that result in an increased prevalence of obesity. These insights allow for a better understanding of the dynamics driving obesity at the population level and can be used to identify leverage points for effective obesity prevention strategies that disrupt the obesogenic system.

# Predicting vegetable and fruit consumption in distinct socioeconomic groups using machine learning models

**Ms. Mélina Côté<sup>1,2</sup>**, Ms. Catherine Laramée<sup>1,2</sup>, Ms. Annie Lapointe<sup>1,2</sup>, Prof. Simone Lemieux<sup>1,2</sup>, Dr. Sophie Desroches<sup>1,2</sup>, Mrs. Ariane Bélanger-Gravel<sup>1,3</sup>, Prof. Benoît Lamarche<sup>1,2</sup>

<sup>1</sup>Centre Nutrition, Santé et Société (NUTRISS), Institut sur la nutrition et les aliments fonctionnels (INAF), Université Laval, Québec, Canada, <sup>2</sup>École de nutrition, Faculté des sciences de l'agriculture et de l'alimentation, Université Laval, Québec, Canada, <sup>3</sup>Département d'information et de communication, Faculté des lettres et des sciences humaines, Université Laval, Québec, Canada

**O.1.03 - Latest findings on socio-economic inequalities, UKK - Hall B (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Recruiting vulnerable populations represents a considerable challenge in public health research. Developing and validating predictive models of nutrition-related outcomes using data from broader population samples for use in hard-to-reach low socioeconomic groups would be valuable. This study aimed to assess the applicability in different socioeconomic subgroups of a machine learning (ML) model developed to predict adequate vegetable and fruit consumption (VFC) in a general population.

**Methods:** Data from a large array of variables (96) potentially associated with dietary habits in a sample of 2836 adults (86% women) from the NutriQuébec project were used. Adequate VFC ( $\geq 5$  servings/d) was measured by averaging data from two to three web-based 24-h dietary recalls and used as the outcome to predict. The sample was randomly divided into training (60%), testing (20%) and validation (20%) sets. The training set (general population) was used to develop a Random Forest (RF) classification algorithm to predict adequate VFC. The prediction performance of the model was evaluated in the testing set (general population) using the accuracy score (proportion of correct predictions). The validation set was divided into low (household income  $< 50\,000$  \$CAN/y,  $n=130$ ), middle ( $50\,000$  \$CAN to  $< 100\,000$  \$CAN/y,  $n=204$ ) and high ( $\geq 100\,000$  \$CAN/y,  $n=230$ ) income groups. The accuracy of the model was then evaluated in each income subgroup. The analysis was repeated by dividing the validation set into low (high school or less), middle (pre-university or certificate), and high (bachelor or higher) education groups.

**Results:** The model developed in the training set predicted adequate VFC with an accuracy of 0.60 (95%CI:0.56-0.64) in the testing set. The model predicted adequate VFC in low, middle and high income subgroups with accuracies of 0.65 (95%CI:0.60-0.70), 0.65 (95%CI:0.62-0.68) and 0.55 (95%CI:0.52-0.58), respectively. Relatively similar results were obtained in the education subgroups.

**Conclusion:** The RF model predicted adequate VFC in the low income subgroup with similar accuracy as in the total population, in which the model was developed and tested. These results suggest that ML models predicting a nutrition-related outcome in a general population can be used to predict a similar outcome in harder-to-reach socioeconomic groups.

# Intersectional, cross-level correlates of physical activity guidelines among 131,717 Korean adults: Korean Community Health Survey 2021

**Mr. Heejun Lim<sup>1</sup>**, Dr. Eun-Young Lee<sup>1</sup>

<sup>1</sup>Queen's University, Kingston, Canada

O.1.03 - Latest findings on socio-economic inequalities, UKK - Hall B (Level 3), June 15, 2023, 2:15 PM - 3:45 PM

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** To examine intersectional, cross-level correlates (i.e., intersections of individual-[gender, education, employment, monthly income, physical limitations] and community-[community satisfaction]level variables) of adhering to the World Health Organization (WHO)'s physical activity (PA) guidelines (guidelines thereafter) among Korean adults aged 24-64 years.

**Methods:** Self-reported, nation-wide, cross-sectional data from Korean Community Health Survey 2021 (N=229,242) was used. Participants were categorized into adhering/not adhering to the guidelines (either  $\geq 150$ -300 minutes moderate-intensity aerobic PA or  $\geq 75$ -150 minutes vigorous-intensity aerobic). Multilevel logistic regressions with interactions were performed.

**Results:** Of 131,717 (*Mean*=44.89yrs, women=50.7%), overall adherence to the guidelines was 32.8% (women=26.7% vs men=38.7%,  $p < 0.001$ ). All social identities that reflect privilege at the individual level (being male, educated, employed, high income, no physical limitations) and community trust, social network, and public transportation at the community level (being satisfied) were statistically significant with adhering to the guidelines compared to their respective counterparts (being female, less educated, not employed, low income, physical limitations, and dissatisfied with community trust, social network, and public transportation). Two statistically significant intersectional, cross-level, 3-way interactions were analyzed for further stratification (SexXEducationXSocial network; SexXEmploymentXSocial network). Compared to groups that reflect disadvantages (i.e., being women, less educated [or not employed], and dissatisfied with social network), both women and men were more likely to adhere to the guidelines regardless of their education (or employment) and satisfaction with social network. Among women, when women were satisfied with social network, being less educated (OR=1.25, 95%CI=1.16-1.34) or employed (OR=1.67, 95%CI=1.50-1.85) is more conducive to adhering to the guidelines compared to being more educated (OR=1.22, 95%CI=1.11-1.34) or not employed (OR=1.25, 95%CI=1.16-1.34). Among men, when education or employment is equal, being satisfied with social network (Male+<University+Satisfied: OR=1.41, 95%CI=1.27-1.85; Male+ $\geq$ University+Satisfied: OR=1.70, 95%CI=1.50-1.92; Male+Not employed+Satisfied: OR=1.41, 95%CI=1.27-1.58; Male+Employed+Satisfied: OR=2.38, 95%CI=2.12-2.68) is more supportive of adherence to the guidelines compared to being dissatisfied with social network (Male+<University+Dissatisfied: OR=1.39, 95%CI=1.26-1.53; Male+ $\geq$ University+Dissatisfied: OR=1.65, 95%CI=1.47-1.85; Male+Not employed+Dissatisfied: OR=1.39, 95%CI=1.26-1.53; Male+Employed+Dissatisfied: OR=1.95, 95%CI=1.73-2.19).

**Conclusions:** Individual-level variables compounded with community-level variables were associated with adhering to the guidelines. Identifying marginalized groups with intersectionality theoretical framework is important for promoting equitable PA interventions among Korean adults.

# Validity of raw accelerometry data from consumer wearable devices to predict activity intensity in children.

**Dr. R Glenn Weaver<sup>1</sup>**, Mr. James White<sup>1</sup>, Ms. Olivia Finnegan<sup>1</sup>, Miss Xuanxuan Zhu<sup>1</sup>, Dr. Sarah Burkart<sup>1</sup>, Dr. Michael Beets<sup>1</sup>, Dr. David Brown III<sup>1</sup>, Dr. Russell Pate<sup>1</sup>, Dr. Massimiliano de Zambotti<sup>2</sup>, Dr. Gregory Welk<sup>3</sup>, Dr. Srihari Nelakuditi<sup>1</sup>, Dr. Rahul Ghosal<sup>1</sup>, Dr. Yuan Wang<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>, Dr. Elizabeth Adams<sup>1</sup>, Dr. Layton Reesor-Oyer<sup>1</sup>, Dr. Christopher Pfladderer<sup>1</sup>, Mr. Roddrick Dugger<sup>1</sup>, Ms. Meghan Bastyr<sup>1</sup>, Ms. Lauren Von Klingraeff<sup>1</sup>, Ms. Hannah Parker<sup>1</sup>

**O.1.04 - Improving measurement of movement behaviour in children, UKK - Hall C (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Consumer wearables often include accelerometers, an important marker of activity intensity. Given the widespread adoption of consumer wearables, accessing their accelerometry data may provide an accurate, reproducible, open-access, and device-agnostic method for classifying activity intensity. This study examined the validity of physical activity intensity estimates based on the raw accelerometry data from consumer wearables compared to indirect calorimetry in children.

**Methods:** Seventy-five 5–12-year-old apparently healthy children (58% male, 63% White) participated in a simulated, free-living, 60-minute protocol (12 activities for 5 minutes each) with activity intensities from sedentary to vigorous (e.g., seated watching a video, standing writing on a board, walking, playing tag). Children wore two wrist-placed consumer wearables (Apple Watch Series 7 and Garmin Vivoactive 4), a wrist-placed research-grade accelerometer (Actigraph GT9X), and a portable indirect calorimeter (Cosmed K5), concurrently. Criterion activity intensity from the K5 was calculated based on metabolic equivalent (MET) thresholds (i.e.,  $V_{O2}$  per kg per minute divided by resting  $V_{O2}$  per kg per minute) of <1.49 METs=sedentary, 1.50-2.99 METs=light, 3.00-5.99 METs=moderate, 6.00-max=vigorous. Activity intensities for the consumer wearables and Actigraph raw accelerometer data were based on Euclidian Norm Minus One thresholds of 0.0-35.5mg=sedentary, 35.6-201.3mg=light, 201.4-706.9mg=moderate, and >707.0mg=vigorous. Epoch-by-epoch agreement and mean absolute error (MAE) between accelerometry-derived (i.e., proxy) and K5-derived activity intensities (i.e., criterion) were used to evaluate validity.

**Results:** Accelerometry data was accessible for 73 and 72 of the 75 participants for the Apple and Garmin, respectively. Epoch-by-epoch agreement with the K5 showed that Actigraph, Apple, and Garmin correctly classified time sedentary 77%, 97%, 86%; light 60%, 55%, 57%; moderate 74%, 71%, 72%, and vigorous 50%, 50%, 67% of the time, respectively. MAE was 1.7, 1.5, and 1.8 minutes for sedentary; 1.7, 2.0, and 2.0 for light; 0.6, 0.7, 0.7 for moderate, and 0.4, 0.6, and 0.6 for vigorous for ActiGraph, Apple, and Garmin, respectively.

**Conclusions:** Raw accelerometry data from wrist-placed consumer wearables in this study performed comparable to a wrist-placed research-grade accelerometry device when classifying activity intensity. The findings herein highlight the potential of accurate, reproducible, open-access, and device-agnostic methods of quantifying physical activity intensity.

# Calibration of raw accelerometry and heart rate from consumer wearable devices during sleep in children

**Ms. Olivia Finnegan<sup>1</sup>**, Dr. R. Glenn Weaver<sup>1</sup>, Mr. James White<sup>1</sup>, Ms. Xuanxuan Zhu<sup>1</sup>, Dr. Sarah Burkart<sup>1</sup>, Dr. Michael Beets<sup>1</sup>, Dr. Trey Brown<sup>2</sup>, Dr. Russell Pate<sup>1</sup>, Dr. Massimiliano de Zambotti<sup>3</sup>, Dr. Greg Welk<sup>4</sup>, Dr. Srihari Nelakuditi<sup>1</sup>, Dr. Rahul Ghosal<sup>1</sup>, Dr. Yuan Wang<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>, Dr. Elizabeth Adams<sup>1</sup>, Dr. Layton Reesor-Oyer<sup>1</sup>, Dr. Christopher D. Pfledderer<sup>1</sup>, Mr. Roddrick Dugger<sup>1</sup>, Ms. Meghan Bastyr<sup>1</sup>, Ms. Hannah Parker<sup>1</sup>, Ms. Lauren von Klinggraeff<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA, <sup>2</sup>University of South Carolina School of Medicine, Columbia, USA, <sup>3</sup>SRI International, Menlo Park, USA, <sup>4</sup>Iowa State University, Ames, USA

**O.1.04 - Improving measurement of movement behaviour in children, UKK - Hall C (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Consumer wearables have the capacity to measure motion via 3-axes accelerometry and heart rate (HR) via photoplethysmography measurement, which is the main information currently used by research-grade devices to classify sleep/wake patterns. The objective of this study was to examine the accuracy of HR and raw accelerometry collected via two popular consumer wearables (Garmin Vivoactive 4S, Apple Watch series 7) compared to a criterion measure of HR (3-lead ECG) and accelerometry (wrist-placed ActiGraph GT9X) during sleep and across sleep stage in children.

**Methods:** 38 children (M=8.5 years, SD=2.4, 42% black, 61% male) underwent overnight laboratory-based polysomnography (PSG), including a 3-lead ECG, while concurrently wearing an ActiGraph accelerometer, an Apple watch, and a Garmin device on their non-dominant wrist. Euclidean norm minus one (ENMO) and mean amplitude deviation (MAD) were calculated from the raw accelerometry data for each device. HR in beats per minute was calculated from the 3-lead ECG and collected from the consumer wearable devices. Lin's concordance correlation coefficient (LCCC) and mean absolute error (MAE) were calculated to assess agreement between the consumer wearables and research-grade devices overall and in each sleep stage.

**Results:** The LCCC for HR from Apple and Garmin compared to the criterion indicated a high level of agreement (0.976, 0.942, respectively) with no substantial variation across sleep stages. For accelerometry, LCCC indicated a weaker agreement between Apple and Garmin accelerometry data and the criterion: ENMO (0.89, 0.71, respectively) and MAD (0.91, 0.66, respectively). LCCC for the accelerometry variables varied by sleep stage, with stronger agreement between the consumer wearables and the criterion during N1 and N2 sleep stages than in N3 and REM stages of sleep. For Apple, MAE of ENMO was 0.01, MAD was 0.002 and HR was 1.66. For Garmin, MAE for ENMO was 0.02, MAD was 0.005 and HR was 2.54.

**Conclusions:** Research and clinical application of consumer wearable technology is largely limited by the black-box (proprietary) nature of the algorithms used for sleep classification. This study suggests the possibility of using raw data from consumer wearables to ultimately enable the development of device-agnostic open-source algorithms to detect sleep in children.

# Calibration of raw accelerometry and heart rate data from consumer wearable devices during simulated free-living activities in children

**Mr. James W. White III<sup>1</sup>**, Dr. R. Glenn Weaver<sup>1</sup>, Ms. Olivia Finnegan<sup>1</sup>, Miss Xuanxuan Zhu<sup>1</sup>, Mr. Nick Tindall<sup>1</sup>, Ms. Hannah Parker<sup>1</sup>, Dr. Sarah Burkart<sup>1</sup>, Dr. Michael W. Adams<sup>1</sup>, Dr. Layton Reesor-Oyer<sup>1</sup>, Dr. Christopher D. Pfledderer<sup>1</sup>, Ms. Meghan Bastyr<sup>1</sup>, Ms. Lauren Von Klinggraeff<sup>1</sup>  
<sup>1</sup>University of South Carolina, Columbia, USA, <sup>2</sup>Iowa State University, Ames, USA, <sup>3</sup>SRI International, Menlo Park, USA, <sup>4</sup>Prisma Health, Columbia, USA

**O.1.04 - Improving measurement of movement behaviour in children, UKK - Hall C (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Consumer wearables (e.g., Apple watch, Garmin) incorporate accelerometry to assess movement and photoplethysmography to capture heart rate (HR). The raw movement and HR data from consumer wearables has been overlooked in device-reference comparisons that have focused on processed metrics like steps and calories. The aim of this study was to examine the accuracy of consumer wearables' raw accelerometry and HR data compared to research-grade monitors in children across simulated free-living activities.

**Methods:** Seventy children (5-12yrs, 57% male, 71% White) participated in a 60-minute protocol consisting of 5-minute activities completed at varying intensities (e.g., seated, watching a video, walking, and playing tag). Children wore two consumer wearables (Apple Watch Series 7 and Garmin Vivoactive 4S) and a research-grade accelerometer (ActiGraph GT9X) on their non-dominant wrist, and a chest-placed, research-grade HR monitor (Actiheart 5, ECG), concurrently. Mean absolute error (MAE) was calculated for consumer wearables compared to the ActiGraph for the following metrics: vector magnitude (VM), Euclidean Norm Minus One (ENMO), and Mean Amplitude Deviation (MAD) (i.e., milligravity-mg). MAE was calculated for HR (i.e., beats per minute-bpm) for consumer wearables compared to Actiheart. Lin's Concordance Correlation Coefficient (CCC) was calculated to assess agreement between consumer wearables and research-grade indicators of HR and movement.

**Results:** MAE values for accelerometry were VM 215.2mg and 221.1mg; ENMO 214.1mg and 219.3mg; MAD 34.3mg and 51.8mg for Apple and Garmin, respectively. MAE values for Apple and Garmin HR were 3.5bpm and 11.5bpm, respectively. Raw accelerometry from Apple and Garmin indicated strong concordance with raw accelerometry from ActiGraph in terms of VM (CCC=0.90 and CCC=0.92), ENMO (CCC=0.90 and CCC=0.92), and MAD (CCC=0.96 and CCC=0.91), respectively. Apple HR indicated strong concordance (CCC=0.96), while Garmin HR exhibited moderate concordance (CCC=0.71).

**Conclusions:** The raw accelerometry data from consumer wearables were comparable to raw accelerometry estimates from ActiGraph. While HR estimates from Apple and Garmin were comparable to Actiheart, Apple HR estimates outperformed Garmin's based on MAE and concordance. Results suggest that the underlying accelerometry and HR data from consumer wearables are comparable to research-grade monitors. Open-source algorithms could use these metrics for estimating physical activity energy expenditure in children.

# Reciprocal effects between affect and physical activity: A systematic review and continuous-time meta-analysis of intensive longitudinal studies

**Dr. GERALYN RUISSSEN**<sup>1</sup>, Associate Professor Eli Puterman<sup>2</sup>, Dr. Rebecca Kuiper<sup>3</sup>, Dr. Genevieve Dunton<sup>4</sup>, Dr. Ryan Rhodes<sup>5</sup>, Dr. Mark Beauchamp<sup>2</sup>

<sup>1</sup>University of Alberta, Edmonton, Canada, <sup>2</sup>University of British Columbia, Vancouver, Canada, <sup>3</sup>Utrecht University, Utrecht, Netherlands, <sup>4</sup>University of Southern California, Los Angeles, USA, <sup>5</sup>University of Victoria, Victoria, Canada

**O.1.04 - Improving measurement of movement behaviour in children, UKK - Hall C (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Despite research using intensive longitudinal methods examining the reciprocal relationships between affect and physical activity in daily life, efforts to quantitatively synthesize the accumulated empirical evidence remains a challenge due to differences in the time intervals when affect and physical activity are measured. The purpose of this study was to quantify the *presence* and *temporal specificity* of reciprocal relationships between (positive and negative) affect and physical activity measured in naturalistic settings.

**Methods:** In this preregistered meta-analysis (PROSPERO CRD42020180035; <https://osf.io/wkhhb2/>), we synthesized evidence for within-person reciprocal relationships between affect and physical activity using 17 effect sizes from 13 primary studies using nine unique datasets ( $N_{total} = 45,677$  observations across 624 participants), accounting for between-person differences in effects and variation in time intervals in primary studies by using a novel random-intercept continuous-time meta-analysis (RI-CTmeta). RI-CTmeta averages the transformed standardized lagged relationships for one or more targeted time intervals ( $\Delta t^*$ ), which for the present study was  $\Delta t^* = 1.5$  hrs.

**Results:** Results indicated that people engaged in more physical activity after ( $\Delta t^* = 1.5$  hrs) they experienced higher than usual positive affect ( $\phi = 0.04$ , 95% CI [0.01, 0.07]); however, they did not significantly deviate from their average physical activity levels after they experienced lower than usual negative affect ( $\phi = -0.02$ , 95% CI [-0.05, 0.01]). Conversely, when people engaged in more physical activity than usual, they experienced subsequent ( $\Delta t^* = 1.5$  hrs) reductions in negative affect ( $\phi = -0.01$ , 95% CI [-0.02, -0.002]). However, when engaged in more physical activity than usual, participants did not subsequently deviate from their average positive affect levels ( $\phi = 0.01$ , 95% CI [-0.01, 0.02]). The size of the observed effects (in both directions) between positive and negative affect and physical activity varied continuously over time, with the maxima/minima of these continuous functions observed about 2.5 hrs preceding and following a physical activity bout.

**Conclusions:** The results provide mixed support for a reciprocal relationship between affective states and physical activity, which varied as a function of the time-interval under consideration. Medium-term (i.e., 2-3 hrs) timescales appear to be most sensitive to detecting these reciprocal relationships and, therefore, should be examined in future research.

# Peer similarity in objectively assessed physical activity during physical education class

**Dr. Katherine Arlinghaus<sup>1</sup>**, Dr. Tyler Prochnow<sup>2</sup>

<sup>1</sup>University of Minnesota School of Public Health, Minneapolis, USA, <sup>2</sup>Texas A&M University Department of Health Behavior, College Station, USA

**O.1.04 - Improving measurement of movement behaviour in children, UKK - Hall C (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Physical activity engagement among adolescents is significantly impacted by peer influence. Physical education (PE) class provides an opportunity for physical activity and social interaction. Yet, how adolescent physical activity is shaped by social connections during PE class is not well understood. This study examined how physical activity during PE class was related to peer physical activity in the class.

**Methods:** During the first and last weeks of a semester-long PE class in a Houston, Texas public charter school, adolescents ( $n=156$ ,  $13.51 \pm 1.45$  years old, 52.6% female, 85.3% Hispanic) nominated up to three female and three male students they felt closest to in PE. Each day of PE, adolescents wore Polar Heart Rate monitors and were given a goal number of minutes to be in moderate-vigorous physical activity (MVPA; defined as  $\geq 65\%$  of age-estimated maximum heart rate). The mean percentage of MVPA goal minutes achieved during the semester was calculated. Linear network autocorrelation models were used to determine significant associations between MVPA, gender, grade, body mass index z-score, and the MVPA of the students they felt closest to in PE. Separate models were conducted for the start and end of semester. Separable temporal exponential random graph modeling was used to examine how MVPA during class impacted the odds of social connections forming over the course of the semester.

**Results:** Adolescent MVPA was significantly associated with the MVPA of the students they felt closest to at the end of the semester ( $B=0.04$ ,  $p<.01$ ); however, this effect was not significant at the start of the semester ( $B=0.01$ ,  $p=.29$ ). Students with higher MVPA during class were significantly more likely to gain new incoming connections throughout the semester ( $PE=0.007$ ,  $p<.03$ ).

**Conclusions:** Findings indicate the presence of social influence on adolescents' MVPA during PE. Additionally, longitudinal results suggest a popularity effect for high MVPA during PE. These results imply that the opportunities for MVPA provided during PE class may be a mechanism for youth to establish social connections, making PE important for both adolescent social and physical health. Network interventions such as opinion leader training or segmentation to reinforce norms may be appropriate.

# Utilising accelerometry and machine learning to assess children's fundamental movement skills

**Prof. Scott Duncan**<sup>1</sup>, Dr. Tom Stewart<sup>1</sup>, Prof. Kelly Macintosh<sup>2</sup>, Dr. Phil Hill<sup>2</sup>, Prof. Lisa Barnett<sup>3</sup>, Prof. Michael Duncan<sup>4</sup>, Dr. Charlotte Jelleyman<sup>1</sup>, Dr. Wesley O'Brien<sup>5</sup>, Dr. Justin Richards<sup>6</sup>, Mr. Alex Swain<sup>2</sup>, Prof. Melitta McNarry<sup>2</sup>

<sup>1</sup>Auckland University of Technology, Auckland, New Zealand, <sup>2</sup>Swansea University, Swansea, United Kingdom, <sup>3</sup>Deakin University, Melbourne, Australia, <sup>4</sup>Coventry University, Coventry, United Kingdom,

<sup>5</sup>University College Cork, Cork, Ireland, <sup>6</sup>Victoria University of Wellington, Wellington, New Zealand

**O.1.04 - Improving measurement of movement behaviour in children, UKK - Hall C (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Fundamental movement skills (FMS) are foundational movements that become the 'building blocks' to more advanced movement skills and leading an active lifestyle. Despite the importance of FMS, practitioners have relied on direct observation scoring methods, which integrates a subjective element and requires significant human resource and expertise. The aim of this study was to determine the accuracy of an automated measure of FMS competency using wearable accelerometers.

**Methods:** Fourteen school-aged children (8-16 years) wore seven accelerometers (ActiGraph GT9X), sampling at 100 Hz, positioned on both wrists, knees and ankles, and the torso. Participants completed five skills from the Test of Gross Motor Development Third Edition (overhand throw, one-handed strike, kick, hop, slide). Each skill was video recorded and FMS competency scores (range: 1–10) were subsequently manually determined by two fully-trained researchers. The raw accelerometer data were then segmented into individual actions and signal features were extracted and used as input variables to a machine learning model (random forest) to predict the FMS competency score. The importance of each variable was determined using the gini index.

**Results:** Preliminary results showed the random forest model was able to correctly assign the competency score to overhand throws 75.8% of the time. The two most important signal features for predicting overhand throw competency were from the gyroscope sensor (correlation between y- and z-axes, and skewness of the z-axis). The total acceleration in the y-axis was the third most important feature. Complete results for all skills will be presented at the conference.

**Conclusion:** Preliminary results for the overhand throw skill show promise for automating the measurement of FMS competency and highlight the importance of using the gyroscope sensor in addition to the accelerometer. Such a system would greatly enhance our ability to understand the true associations between FMS and health-related outcomes, quickly identify at-risk individuals, and accurately quantify the long-term effects of physical literacy interventions.

# From 'Kids in Action!' to 'Chic@s en Acción!': Transferring a Dutch youth participatory action research to the Spanish context

**Dr. Teatske Altenburg**<sup>1</sup>, Ms. Laura Belmon<sup>1</sup>, Dr. Pilar De Miguel-Etayo<sup>2, 3</sup>, Prof. Luis A Moreno<sup>2, 3</sup>, Other - on Behalf of the GrowH! Consortium<sup>4</sup>

<sup>1</sup>Amsterdam UMC, Vrije Universiteit Amsterdam, Department of Public and Occupational Health, Amsterdam Public Health research institute, Amsterdam, Netherlands, <sup>2</sup>Growth, Exercise, Nutrition and Development (GENUD) Research Group, University of Zaragoza, Instituto Agroalimentario de Aragón (IA2), Instituto de Investigación Sanitaria de Aragón (IIS Aragón), Zaragoza, Spain, <sup>3</sup>CIBEROBN, (Physiopathology of Obesity and Nutrition CB15/00043), Institute of Health Carlos III (ISCIII), Madrid, Spain, <sup>4</sup>Department Prevention and Evaluation, Leibniz Institute for Prevention Research and Epidemiology – BIPS, Bremen, Germany

**O.1.05 - What have we learned recently on participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** In the 'Kids in Action!' study (2016-2019), youth participatory action research (YPAR) was combined with Intervention Mapping to develop, implement and evaluate actions aimed at promoting healthy energy balance-related behaviors together with 9-12-year-old children from a deprived neighborhood in Amsterdam, the Netherlands. This study aims to evaluate the feasibility, acceptability and potential impact of transferring this YPAR approach to Zaragoza, Spain, and the potential for wider uptake.

**Methods:** First, the Dutch Kids in Action! practical protocol was adapted to 'Chic@s en Acción!', based on the latest insights from similar projects and the local context. Subsequently, in so called 'action teams' children conducted peer-research to assess the needs of same-aged children in their neighborhood, in terms of health behaviors and aspects in their environment contributing to their health behaviors. In the action phase, the action teams will co-create, co-implement and co-evaluate actions aimed at improving their health behaviors. The process of implementing Chic@s en Acción! will be evaluated on feasibility, acceptability and potential impact using (focus group) interviews with participating children and other involved stakeholders.

**Results:** Adaptations included integrating systems science elements (e.g. causal loop diagrams), applying a different recruitment strategy (e.g. by Aragón's Public Health and Education Department) and including a smaller age range (i.e. 9-11-year-olds). Three action teams were established (since November 2021), including children from two schools in a deprived neighborhood in Zaragoza and an academic researcher. The action teams showed that being alone at home, using screens and unhealthy family behaviors are barriers for children's healthy behaviors. The action phase will start in November 2022. Results of this phase will be presented at the conference. First evaluations of Chic@s en Acción! showed that this approach is feasible and acceptable for the children participating in the action teams.

**Conclusion:** This study provides insight in the adaptations that are necessary for the transfer and wider uptake of the participatory 'Kids in Action' approach. Additionally, the study will demonstrate differences and similarities in children's needs in terms of factors influencing their health behaviors and co-created actions to promote their health behaviors.

# Perceptions of how Social Determinants of Health Interact to Influence Children's Health and Disparities in Seven Communities across the United States

**O.1.05 - What have we learned recently on participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Community groups such as coalitions can create the conditions for whole-of-community change through advocacy, partnerships, pooling resources, and other approaches. The purpose of this study is to describe how coalition committees perceive the complex systems that influence several nutrition-related trends in their communities. Learning what is salient to community groups provides insight to researchers and professionals seeking to partner with these groups.

**Methods:** Ninety-five participants from seven coalition committees located across the United States (US) participated in a Stakeholder-Driven Community Diffusion theory-informed study from 2018 – 2022. The intervention employed Community-based System Dynamics methods to create maps of the systems that each committee perceive to influence community-specific trends of interest. Content analysis was conducted on the systems maps using both deductive and inductive coding. Each map was double coded. Themes and accompanying system structures are reported.

**Results:** Initial results show that participants perceive interactions and interdependencies across a variety of social determinants of health. While each coalition committee started the process by considering the factors that influence and are influenced by nutrition-related trends such as food insecurity or healthy weights in childhood, every group included factors representing multiple types of social determinants of health in their maps, including education, neighborhood environments, and healthcare. System structures showing trade-offs between cost of housing and other basic needs were present in most maps, as were connections between healthy food access, mental health, and healthcare costs. Every group modeled facets of health inequities during the process, though details of which and how groups are affected varied between the communities.

**Conclusions:** Social and structural determinants of health were salient to the coalition committees, and they clearly linked those determinants to health behaviors and outcomes. The systems maps qualitatively show how some health disparities are perpetuated over time. Common themes across geographically dispersed groups suggest opportunities for national policy and systems change. Common system structures could be used as seed models to start conversations about health inequities and opportunities for intervention in other communities.

# Developing community-based partnership research to prevent type 2 diabetes among schoolchildren and students in Indigenous communities: a realist synthesis

**Assistant Professor Dave Bergeron<sup>1,2</sup>**, Associate Professor Maman Joyce Dogba<sup>1</sup>, Associate Professor Marie-Claude Tremblay<sup>1</sup>

<sup>1</sup>Université du Québec à Rimouski, Rimouski, Canada, <sup>2</sup>Université Laval, Québec, Canada

**O.1.05 - What have we learned recently on participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** To improve the prevention of type 2 diabetes (T2D) in Indigenous communities, the mobilization of Indigenous stakeholders is necessary for the development of new interventions that meet their needs. Community-based participatory research (CBPR) is recognized as essential for the development of these new interventions because it allows for deeper and more comprehensive transformation of interventions, policies, communities and institutions. As CBPR is used in various social and cultural contexts to develop interventions for the prevention of T2D in Indigenous communities, it is important to identify the different underlying elements that may influence its development in Indigenous communities. The objectives of this research are to: 1) understand the underlying elements involved in CBPRs with Indigenous communities to prevent T2D in schoolchildren and students and 2) validate a program theory explaining how and under which circumstances CBPRs in Indigenous communities to prevent T2D in schoolchildren and students produce their outcomes.

**Methods:** A realist synthesis was conducted. In the first step, an initial program theory was developed and validated with the members of an Indigenous Patient Circle. Next, five databases were searched (CINAHL, PsycINFO, MEDLINE, SCOPUS and Public Health Database). Articles were considered if they: described a CBPR with Indigenous community(ies), focused on T2D prevention among schoolchildren and students, and were published in English, French or Spanish. Selected articles were analyzed using a directed content analysis approach with NVivo 12, which helped to refine the initial program theory.

**Results:** Twenty-five articles from five CBPRs were included. Among the elements present in the refined program theory, the presence of positive experiences of Indigenous partners in previous research, the development of relationships between Indigenous partners and researchers, and the respect and sensitivity of researchers to the history and perspective of Indigenous partners would contribute to the perception of a sense of equality with researchers among Indigenous partners and promote the participation of Indigenous community members in CBPRs.

**Conclusion:** This research could support the development of CBPRs with Indigenous communities that are more in line with local practices and thus support the development of T2D prevention interventions that are more deeply rooted in Indigenous knowledge.

# Children's COOPeration Denmark (Child-COOP) feasibility study: a participatory system dynamics approach targeting childhood health in a small Danish community

**Dr. Knud Ryom<sup>1</sup>, Dr. Helene Kirkegaard<sup>2</sup>**, Prof. Steven Allender<sup>3</sup>, Mrs. Christina Breddam<sup>4</sup>, Prof. Helle Terkildsen Maindal<sup>1,5</sup>, Dr. Jane Nautrup Østergaard<sup>2</sup>

<sup>4</sup>Randers Municipality, Randers, Denmark, <sup>5</sup>Steno Diabetes Center Copenhagen, Copenhagen, Denmark

**O.1.05 - What have we learned recently on participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Improving childhood health and well-being are complex due to the multi-level determinants and considered a wicked problem. System-based participatory approaches have shown promising potential to solve such complex problems. However, limited evidence exists using such methods in a Danish context. To determine the feasibility and acceptability of a system-based participatory approach targeting children's health and well-being in a Danish community with low socio-economic status.

**Methods:** This study evaluate the system-based participatory approach, by feasibility testing the approach using qualitative and quantitative methods. The approach is based on Group Model Building (GMB), a participatory system dynamics method, which has been used to engage the community, create consensus of the drivers of childhood health, identify local opportunities and develop context specific actions. The feasibility testing are based on a process evaluation, using interviews with stakeholders and tracking the implementation of actions through Rippled effects. Interview were collected six months after the GMB process and Rippled effects were assessed a year after first meeting of the GMB.

**Results:** Preliminary findings suggested that the feasibility of conducting a full-scale evaluation was confirmed for intervention acceptability, GMB process, implementation, capacity building and adherence. However, difficulties to organize within the local community and participating municipality were identified. Furthermore, communication efforts on the results from the project was found to be important in both the local community and municipality. Implementation of context specific actions is ongoing, Rippled effects of these will be presented.

**Conclusion:** The potential of this participatory system dynamics approach includes opportunities for community engagement and local capacity building and the feasibility suggests that an upscaling of the intervention for effectiveness testing is feasible.

# Reducing and breaking up sedentary behaviour at school among adolescents using a participatory approach

**Ms. Veerle Van Oeckel**<sup>1</sup>, Prof. Benedicte Deforche<sup>1,2</sup>, Ms. Janneke de Boer<sup>1</sup>, Ms. Lea Delfmann<sup>1</sup>, Prof. Maïté Verloigne<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Vrije Universiteit Brussel, Brussels, Belgium

**O.1.05 - What have we learned recently on participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Adolescents spend the majority of the day sedentary, especially sitting in class at school and while making homework. As high levels of sedentary time are associated with adverse physical and mental health effects, effective interventions are needed. To improve effectiveness, literature recommends a participatory approach in which adolescents are actively involved in the choice and development of intervention strategies. This study aimed to evaluate the effectiveness and process of a participatory developed intervention targeting adolescents' sedentary behaviour at school and while making homework.

**Methods:** We conducted a clustered controlled trial in Flanders, Belgium, including 1 control school and 1 intervention school, each with 3 participating classes from Grade 7 or 8. The intervention was developed from November '21 to March '22 in close collaboration with pupils and teachers. The 6-week intervention included a.o. posters, movement breaks and standing desks. At pre- and post-test (March '22 and May-June '22), sedentary time and prolonged sedentary time were measured using an Axivity AX3 accelerometer and a questionnaire. The questionnaire also measured psychosocial determinants of (prolonged) sedentary time. Accelerometer and questionnaire data are being analysed in R using multilevel generalised linear models. Questionnaires and focus groups among pupils and teachers were used to evaluate the process of intervention implementation. Questionnaire data will be analysed using descriptive statistics. Focus group data will be analysed in NVivo using qualitative content analysis.

**Results:** 99 pupils (13.38±0.70 yr, 55.1% boys) participated in the study. Preliminary analyses of questionnaire data showed that the intervention was effective to reduce sedentary time, but not to increase the number of breaks in sedentary time, in class. No effects were found on (prolonged) sedentary time while making homework. The intervention was delivered as intended and was received by the majority of the pupils. In general, pupils and teachers liked the project and appreciated that the project was developed by pupils and teachers from their school.

**Conclusion:** Preliminary findings indicate that the intervention was effective to reduce sedentary time in the classroom. Furthermore, the intervention was implemented and received well. Therefore, a participatory approach can be promising to change adolescents' health behaviour.

# Culturally grounded health promotion with the Kanien'kehá:ka community of Kahnawà:ke

**Miss Hariata Tai Rakena**, Associate Professor Lee Schaefer

<sup>1</sup>Johns Hopkins University, Baltimore, USA, <sup>2</sup>University of Saskatchewan, Saskatoon, Canada

**O.1.05 - What have we learned recently on participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Despite increasing calls to develop culturally grounded health promotion initiatives in partnership with Indigenous communities, evidence of this research approach is limited. In the First Nations community of Kahnawà:ke, the need to increase Kanien'kehá:ka cultural content, connection to land, spiritual aspects of wellbeing, and multigenerational interaction in community health promotion initiatives was highlighted. The purpose of this study was to gain an understanding of culturally meaningful elements involved in an Indigenous approach to holistic health, specific to the community of Kahnawà:ke. This exploration then informed the development of physical activity health resource recommendations.

**Methods:** This indigenist community-based participatory research utilized an instrumental case study design, driven by three research propositions: (a) the influence of Kahnawà:ke's natural environment on culture; (b) culturally driven physical activity as a vehicle for cultural practice; (c) community voice is strengthened via co-design. Two data collection methods were used; a contextual description of the case study setting, and unstructured knowledge holder conversations. Analysis drew on categorical aggregation and direct interpretation techniques.

**Results:** The findings situate the significance of Kahnawà:ke's name, translating to "on the river"; a place-based epistemology that underpins socio-political factors that simultaneously undermine and support the community's cultural continuation and wellbeing. The philosophical findings of the study present the importance of land, language, and culture as primary; and identity, belonging and wellbeing as secondary.

**Conclusion:** The practical study findings propose three pragmatic recommendations: (a) tools to introduce cultural traditions; (b) a practical experience of cultural traditions; (c) a discussion model. This research contributes toward Indigenous health promotion initiatives in physical activity and health curriculum, and offers insight into the expression of indigeneity, which is specific to place, nuanced, multidimensional, and ever evolving.

# Multivariate Physical Activity Association Patterns for Fundamental Motor Skills and Physical Fitness in Preschool Children

**Miss Elisabeth Straume Haugland<sup>1</sup>**, Dr. Ada Kristine Ofrim Nilsen<sup>1</sup>, Dr. Katrine Nyvoll Aadland<sup>1</sup>, Prof. Anthony David Okely<sup>1,2</sup>, Prof. Eivind Aadland<sup>1</sup>

<sup>1</sup>Western Norway University of Applied Sciences, Sogndal, Norway, <sup>2</sup>Early Start and School of Health and Society, University of Wollongong, Wollongong, Australia

**O.1.06 - How is early childcare education linked to child health? UKK - K1 (+K2) (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Physical activity (PA) is essential for children's development of fundamental motor skills (FMS) and physical fitness (FIT). However, there is limited evidence regarding which intensities that are strongest associated with FMS and FIT in young children. As many children have suboptimal FMS and FIT, early childhood has been highlighted as an important phase for optimizing PA levels, and such, possibly improve FMS and FIT. The Active Learning Norwegian Preschool(er)s (ACTNOW) cluster-randomized controlled trial sought to explore effects of a 7-month professional development intervention, co-created with preschool staff targeting preschoolers PA opportunities, and providing them the necessary competency to deliver the PA-intervention consisting of four core components to the children (moderate-to-vigorous PA, motor-challenging PA, cognitively engaging PA, and physically active learning) in their respective preschools. Using baseline data and a novel analytic approach, the aim of the present study was to determine the cross-sectional multivariate PA intensity signatures associated with FMS and FIT in children aged 3-5 years.

**Methods:** A total of 952 preschoolers (mean age 4.3 yr, 51% boys) were included from the ACTNOW-sample. Included participants provided valid data on PA (ActiGraph GT3X+), body mass index, socioeconomic status, and at least one FMS or FIT outcome during 2019-2020. FMS was evaluated by a process-oriented test battery (9 items) across three domains: locomotor skills, object control skills, and balance skills. FIT was assessed through three tests including speed-agility, handgrip, and standing long jump. We performed multivariate pattern analyses consisting of 17 PA intensity variables from the vertical axis, ranging from 0-99 to  $\geq 15000$  counts per minute.

**Results:** All outcomes were significantly associated with the PA intensity spectrum (explained variance for locomotor skills: 7.82%; object control skills: 4.97%; balance skills: 1.63%; speed agility: 5.78%; standing long jump: 9.31%; handgrip strength: 2.89%). Associations were strongest for PA intensities in the moderate and vigorous range. The results also showed that associations were significant across subgroups (sex and age).

**Conclusion:** Our findings show that the PA intensity spectrum is associated with both FMS and FIT in early childhood and that PA-promotion from an early age may benefit child development.

# Parents of preschoolers use multiple strategies to feed their children: Findings from an observational video study of parent-preschooler dyads

**Dr. Katie Loth**<sup>1</sup>, Ms. Ziyu Ji<sup>2</sup>, Dr. Nidhi Kohli<sup>3</sup>, Dr. Jennifer Fisher<sup>4</sup>, Dr. Jayne Fulkerson<sup>5</sup>

<sup>1</sup>Department of Family Medicine and Community Health, University of Minnesota Medical School, Minneapolis, USA, <sup>2</sup>Division of Biostatistics, School of Public Health, University of Minnesota, Minneapolis, USA,

<sup>3</sup>Department of Educational Psychology, University of Minnesota, Minneapolis, USA, <sup>4</sup>Department of Social and Behavioral Sciences, College of Public Health, Temple University, Philadelphia, USA, <sup>5</sup>School of Nursing, University of Minnesota, Minneapolis, USA

**O.1.06 - How is early childcare education linked to child health? UKK - K1 (+K2) (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Parents influence their children's eating through a broad range of food parenting practices, or goal-directed actions that parents engage to guide their child's eating behaviors. While experts agree that parent-child feeding relationships are bidirectional, most studies on food parenting practices to date have been cross-sectional, limiting our understanding of this bi-directional relationship. Guided by a current conceptual framework of food parenting, developed by Vaughn and colleagues, the current observational study aimed to: 1) characterize the broad range of food parenting practices used by parents of preschoolers during shared mealtimes at home, including differences by child gender, and 2) describe child responses to specific food parenting practices.

**Methods:** Forty parent-child dyads participated by completing a survey and video-recording two in-home shared meals. Meals were coded using an in-depth, bi-directional behavioral coding protocol that coded the occurrence of 11 distinct food parenting practices (e.g. indirect/direct commands, praise, bribes) and eight child responses (e.g., eat, refuse, cry/whine); the coding protocol was developed based on existing literature.

**Results:** Results revealed that parents engaged in a broad range of food parenting practices with their preschooler at meals. On average, parents used 10.51 (SD 7.83; Range 0-30) food parenting practices per mealtime. Use of *indirect* and *direct commands* to eat were the two most common practices used; these food parenting practices were used by 97.5% (n=39) and 87.5% (n=35) of parents at recorded meals, respectively. No one specific feeding practice consistently yielded compliance or refusal from the child; instead child responses were most often mixed (i.e., compliance followed by refusal, or refusal followed by compliance). However, use of *praise to prompt eating* was the food parenting practice that most often resulted in child compliance; 80.8% of children "only complied" following parent's use of praise as a prompt to eat.

**Conclusion:** Findings from this study deepen our understanding of the types and frequency of food parenting practices used by parents of preschoolers during meals eaten at home and illuminate child responses to specific food parenting practices. These observations set the stage for future observational studies seeking to more deeply understand the bi-directional relationship between parents and children at mealtimes.

# The Impact of Non-Parental Childcare on Preschool-Aged Children's Sleep Duration

**Ms. Hannah Parker<sup>1</sup>**, Dr. Sarah Burkart<sup>1</sup>, Dr. Layton Reesor-Oyer<sup>1</sup>, Ms. Michal T. Smith<sup>1</sup>, Ms. Lauren von Klinggraeff<sup>1</sup>, Mr. Roddrick Dugger<sup>1</sup>, Mr. James W. White III<sup>1</sup>, Ms. Olivia Finnegan<sup>1</sup>, Ms. Meghan Bastyr<sup>1</sup>, Dr. Christopher D. Pfledderer<sup>1</sup>, Dr. Elizabeth L. Adams<sup>1</sup>, Dr. R. Glenn Weaver<sup>1</sup>, Dr. Michael W. Beets<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**O.1.06 - How is early childcare education linked to child health? UKK - K1 (+K2) (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Adequate sleep duration is linked with positive health outcomes in children. Identifying day-level contextual factors that influence children's sleep duration can pinpoint potential targets for improving children's sleep. Daycare, a form of daily structure, is a contextual factor that may be related to sleep for preschool-aged children by supporting consistent bedtimes and waketimes. The purpose of this study was to examine if attending daycare on a given day was associated with sleep duration that same night.

**Methods:** Children (N=74, 4.7±0.9 yrs, 48.3% female, 63.2% White) were instructed to wear an Axivity AX3 accelerometer on their dominant wrist 24 hours/day for 14 days to measure sleep duration. Data were processed with GGIR (v2.6-4) and wear-time was a-priori defined as ≥16 hours/day. Caregivers reported the number of hours their child attended daycare each day. Linear mixed-effects models predicted day-level sleep duration from hours spent in daycare. We included child age, sex, household income and accelerometer wear-time as covariates. Weekends were excluded from analysis.

**Results:** Children wore accelerometers for an average of 9.3±1.2 (range = 1-11) days and children attended 3.4 days of daycare per week on average. Children spent an average of 5.0±2.9 hours/day in daycare and had an average of 6.6±2.8 hours of sleep/night. Mixed models indicated that for every additional hour children spent in daycare above their own average daycare time, children had 2.2 hours (95%CI = -2.7, 7.0) more sleep that night. Compared to children who attend less hours of daycare on average, children who attend more hours of daycare had less sleep on average (B = -1.5 hours; 95%CI = -12.7, 9.7).

**Conclusion:** On days when children spend more time in daycare than usual, they do not sleep significantly more that night. Similarly, children who spend more time in daycare on average, do not sleep more than compared to children who spend less time in daycare. Ultimately, more research is needed to understand other possible day-level factors that influence sleep duration in preschool-aged children.

# Policy, System, and Environmental Interventions Addressing Physical Activity in Early Childhood Education Settings: A Systematic Review

**Dr. Cody Neshteruk<sup>1</sup>**, Dr. Sarah Burkart<sup>2</sup>, Dr. Emily Flanagan<sup>3</sup>, Dr. Courtney Luecking<sup>4</sup>, Dr. Emily Melnick<sup>5</sup>, Dr. Chelsea Kracht<sup>3</sup>

<sup>1</sup>Duke University School of Medicine, Durham, USA, <sup>2</sup>University of South Carolina, Columbia, USA,

<sup>3</sup>Pennington Biomedical Research Center, Baton Rouge, USA, <sup>4</sup>University of Kentucky, Lexington, USA,

<sup>5</sup>Arizona State University, Phoenix, USA

**O.1.06 - How is early childcare education linked to child health?, UKK - K1 (+K2) (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Early childhood education (ECE) settings play a critical role in promoting children's physical activity. Policy, systems, and environment (PSE) approaches can facilitate physical activity in priority populations (i.e., racial/ethnic minorities, low resource groups) at the population-level. The purpose of this review was to 1) characterize the inclusion of priority populations within ECE physical activity interventions containing PSE approaches and 2) identify effective ECE interventions within these populations.

**Methods:** We systematically searched seven databases (January 2000-February 2022) for ECE-based interventions focusing on children (0-6 years) that utilized at least one PSE approach. Eligible studies included a physical activity (i.e., total physical activity) or related outcome (i.e., gross motor skills or physical activity environment) and population characteristics. Information related to the study population, recruitment strategy, intervention, outcomes, and main findings were extracted. Methodological quality was assessed using the Downs and Black Checklist. Central tendencies were used to describe study characteristics and a narrative synthesis was used to compare studies with effective outcomes.

**Results:** Forty-seven studies, representing 44 unique interventions were identified. Most studies were stand-alone ECE interventions (24/44, 55%) or an ECE intervention with a parent component (13/44, 30%). Half of studies included one PSE approach (22/44, 50%) and a fourth included three or more approaches (12/44, 27%). Physical environment changes [e.g., adding play equipment, modifying space (26/44, 59%)] and system level changes [e.g., integration of physical activity into routines or schedule changes, (22/50 50%)] were the most common PSE approaches. For Aim 1, almost half of studies were conducted in predominantly priority populations (20/44, 45%). Studies were primarily rated as good (51%) or fair (38%) methodological quality. For Aim 2, just ten studies demonstrated effectiveness at improving physical activity outcomes in priority populations, mostly improving the physical activity environment (6/10). Interventions were heterogeneous, containing a range of PSE approaches (1-4) and varied in length (15 weeks to 2 years).

**Conclusions:** Few ECE physical activity interventions containing PSE approaches were tested in priority populations. Even fewer were effective in improving physical activity outcomes. There are clear opportunities to target priority populations by incorporating PSE approaches in ECE physical activity interventions.

# Associations between 24-hour movement behaviours and executive functions in preschool children: A compositional analysis

Associate Prof. Dylan Cliff<sup>1</sup>, Dr. Zhiguang Zhang<sup>2</sup>, Associate Professor Steven Howard<sup>1</sup>, Dr. Jade Burley<sup>1</sup>, **Dr. Devan Antczak**<sup>1</sup>, Prof. Timothy Olds<sup>3</sup>, Dr. Dot Dumuid<sup>3</sup>

<sup>1</sup>University of Wollongong, Wollongong, Australia, <sup>2</sup>Beijing Normal University, Beijing, China, <sup>3</sup>University of South Australia, Adelaide, Australia

**O.1.06 - How is early childcare education linked to child health?, UKK - K1 (+K2) (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** The movement behaviours (MB) of sleep, sedentary behaviour (SED), light (LPA) and moderate-to-vigorous physical activity (MVPA) form a finite composition over the 24-hour day. Previous studies investigating associations between MB and cognitive development in preschool children have used traditional analyses which don't account for the compositional nature of MB data. The aim of this study is to investigate compositional associations between MB and executive functions in preschool children.

**Methods:** Participants were 270 children (age =  $4.2 \pm 0.7$ y) from the Preschool Activity, Technology, Health, Adiposity, Behaviour and Cognition (PATH-ABC) study. MVPA, LPA and SED were measured using accelerometry (hip-mounted ActiGraph for 3-7 days) and sleep duration was parent-reported. Executive functions, including phonological and visual-spatial working memory (WM), inhibition and shifting, were assessed using the validated Early Years Toolbox. A single outcome developed using factor analysis to combine executive function domains was also used. Cross-sectional associations between MB and executive functions were examined using isometric log-ratio predictors in linear mixed models, adjusted for clustering, child age and sex, parental education, and children's level of television/program viewing and electronic/game app use. Differences in executive functions were estimated for the reallocation of time between MB.

**Results:** The MB composition was significantly associated with executive function ( $p=0.004$ ), and visual-spatial ( $p=0.019$ ) and phonological WM ( $p=0.003$ ). Relative to the remaining behaviours: MVPA was positively associated with executive function ( $\beta=0.50$ ,  $p=0.008$ ) and phonological WM ( $\beta=0.42$ ,  $p=0.029$ ); LPA was negatively associated with executive function ( $\beta= -0.83$ ,  $p=0.016$ ) and visual-spatial WM ( $\beta= -0.95$ ,  $p= 0.034$ ); SED was positively associated with executive function ( $\beta= -0.85$ ,  $p=0.001$ ), visual-spatial ( $\beta=0.97$ ,  $p=0.002$ ) and phonological WM ( $\beta=0.90$ ,  $p=0.001$ ), and; sleep was negatively associated with phonological WM ( $\beta= -0.70$ ,  $p=0.016$ ).

**Conclusions:** The MB composition was associated with executive function in preschool children, and increasing daily time in MVPA and SED, and decreasing LPA may support their executive function development.

# The association between children's outdoor play, activity intensity and spatial location at child care centres in Vancouver, BC

**Ms. Rachel Ramsden<sup>1,2,3</sup>**, Dr. Mariana Brussoni<sup>1,2,3</sup>

<sup>1</sup>University Of British Columbia, Vancouver, Canada, <sup>2</sup>British Columbia Children's Hospital Research Institute, Vancouver, Canada, <sup>3</sup>Human Early Learning Partnership, Vancouver, Canada

**O.1.06 - How is early childcare education linked to child health?, UKK - K1 (+K2) (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Children are more active when they are outside than indoors (Gray et al., 2015). Participation in outdoor play benefits children's physical development, spatial awareness, motor skills and physical activity level (Santer et al., 2007; Thomas & Harding, 2011; Tremblay et al., 2015). To enhance children's outdoor play, it is important to understand outdoor environments that support the early years (0-6 years). This study aims to understand the association between outdoor play behavior, activity intensity and outdoor play affordances at child care centres in Vancouver, Canada.

**Methods:** Data from 8 child care centres in the PROMoting Early Childhood Outside (PRO-ECO) study were used. A total of 130 children aged 2.5 – 6 years attending participating child care centres were recruited to participate in this study. The expanded *Tool for Observing Play Outdoors (TOPO)* (Loebach & Cox, 2020) and the *Children's Activity Rating Scale (CARS)* (Puhl et al., 1990) were mobilized using observational behavior mapping to measure children's observed outdoor play and activity intensity in relation to physical spatial location during designated outdoor play times at child care (Cox et al., 2018). Descriptive maps outlining the frequency of play behavior and activity level for each child care centre were produced. Multivariable logistic regression, adjusting for covariates, was used to assess the relationship between children's physical activity intensity and play behavior.

**Results:** A total of 1,733 play observations were collected in this cross-sectional study. Of these, 18.5% (321) involved moderate or fast movement activity intensity. Children had increased odds of participating in moderate and fast activity intensities when participating in physical outdoor play behaviours (OR: 3.61, 95% CI: 2.20:5.91), including gross motor, vestibular and rough-and-tumble play. Children exhibited higher activity intensities on pathways (e.g. trike paths), play structures (e.g. slides and climbing walls) and fence lines.

**Conclusions:** This study suggests that children's activity intensity is influenced by outdoor play behavior. In addition, outdoor affordances and spatial location are important predictors of children's activity intensity and play behavior. The results of this study will have implications for the planning and design of outdoor child care spaces to support outdoor play at increased activity intensities.

# Understanding older people's engagement with online yoga classes: a realist analysis

**Dr. Abby Haynes<sup>1,2</sup>**, Dr. Heidi Gilchrist<sup>2,1</sup>, Dr. Juliana S Oliveira<sup>1,2</sup>, Prof. Catherine Sherrington<sup>1,2</sup>, Prof. Anne Tiedemann<sup>1,2</sup>

<sup>1</sup>Institute for Musculoskeletal Health, The University of Sydney and Sydney Local Health District, Sydney, Australia, <sup>2</sup>School of Public Health, The University of Sydney, Sydney, Australia

**O.1.07 - Physical function and ageing - from prevention to intervention, UKK - K3+4 (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** The Successful AGEing (SAGE) RCT is testing an innovative 40-week yoga-based exercise program aimed at healthy ageing and fall prevention in 700 people aged 60+. Following COVID-19 restrictions, face-to-face classes moved online so some participants attended a hybrid program, while others attended classes entirely online. Our evaluation aimed to explain high adherence rates across all classes and positive feedback regarding improved physical function and mental wellbeing.

**Methods:** We conducted a two-stage realist process evaluation that developed and tested program theories. Initial theories about participants' engagement with the hybrid yoga program were generated via discussion with the research partners (comprising trial leaders and the yoga instructors). Data was collected via purposively sampled interviews and focus groups with participants (n=33) and yoga instructors (n=4), observations of classes, review of feedback forms (n=46) and routine trial data. Analysis involved coding deductively to the initial program theories, and inductively as we identified potential new/revised theories. Workshops with research partners reviewed unfolding analyses. A second stage of evaluation tested the program theories with participants in entirely online classes.

**Results:** Findings indicate that SAGE works well for most participants—regardless of the delivery mode—due to the quality of yoga instruction, program structure and inherent yoga characteristics. Gains in transitioning online included greater convenience, and uptake by those who find face-to-face classes too exposing. Losses included perceptions of less effective observation/correction by yoga instructors. Unsuitable home environments and pain create barriers for some. Yoga instructors developed strategies for maximising observation/correction, social connection, rapport and adaption to home constraints in teleyoga. Technology support was initially required by some participants and instructors. We identified 16 likely mechanisms configured within six program theories: 1. It's worth the effort, 2. In expert hands, 3. A communal experience, 4. Finding yoga within reach, 5. Building yoga habits and 6. Yoga's special properties.

**Conclusions:** Online delivery of SAGE retains much of the value of the well-received face-to-face program for most participants, and increases value and reach for some. This indicates that teleyoga can provide engaging, accessible and scalable yoga-based healthy ageing and fall prevention programs.

# The Effectiveness of a Computer-Tailored Web-Based Physical Activity Intervention Using Fitbit Activity Trackers in Older Adults (Active for Life): Randomized Controlled Trial

**Dr. Stephanie Alley**<sup>1</sup>, Associate Professor Jannique van Uffelen<sup>2</sup>, Dr. Stephanie Schoeppe<sup>1</sup>, Prof. Lynne Parkinson<sup>3</sup>, Dr. Susan Hunt<sup>1</sup>, Ms. Deborah Power<sup>1</sup>, Ms. Natasha Waterman<sup>1</sup>, Ms. Courtney Waterman<sup>1</sup>, Dr. Quyen To<sup>1</sup>, Prof. Mitch Duncan<sup>3</sup>, Prof. Anthony Schneiders<sup>1</sup>, Prof. Corneel Vandalanotte<sup>1</sup>

<sup>1</sup>Central Queensland University, Rockhampton, Australia, <sup>2</sup>KU Leuven, Leuven, Belgium, <sup>3</sup>The University of Newcastle, Callaghan, Australia

**O.1.07 - Physical function and ageing - from prevention to intervention, UKK - K3+4 (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Preliminary evidence suggests that web-based interventions with computer-tailored advice and Fitbit activity trackers may be well suited for older adults. The aim of this study was to examine the effectiveness of Active for Life, a 12-week web-based physical activity intervention with 6 web-based modules of computer-tailored advice to increase physical activity in older Australians.

**Methods:** A total of 243 participants were randomly assigned to tailoring + Fitbit (n=78, 32.1%), tailoring only (n=96, 39.5%), and wait-list control (n=69, 28.4%). The computer-tailored advice was based on either participants' Fitbit data (tailoring + Fitbit participants) or self-reported physical activity (tailoring-only participants). The main outcome was change in wrist-worn accelerometer (ActiGraph GT9X)–measured moderate to vigorous physical activity (MVPA) from baseline to post-intervention (week 12). Generalized linear mixed model analyses were conducted with a  $\gamma$  distribution and log link to compare MVPA over time within each trial arm and between each of the trial arms.

**Results:** At post-intervention (week 12) study attrition was 28% (22/78) in the Fitbit + tailoring group, 39% (37/96) in the tailoring only group and 27% (18/69) in the wait-list control group. The overall time by group interaction for MVPA was borderline significant ( $p=.05$ ). There were no significant within-group changes for MVPA over time in the tailoring + Fitbit group (+3%, 95% CI –24% to 40%) or the tailoring-only group (–4%, 95% CI –24% to 30%); however, a significant decline was seen in the control group (–35%, 95% CI –52% to –11%). The tailoring + Fitbit group participants increased their MVPA significantly more than those in the control group (59%, 95% CI 6%-138%). However, no between group differences for MVPA changes over time were seen between the tailoring + Fitbit group and the tailoring only group (8%, 95% CI -27% to 59%) or between the tailoring only group and the control group (48%, 95% CI -1% to 20%).

**Conclusions:** A computer-tailored physical activity intervention with Fitbit integration resulted in improved MVPA outcomes in comparison with a control group in older adults.

# Leading the Way Together: A Cluster Randomised Controlled Trial of the 5R Shared Leadership Program in Older Adult Walking Groups

Prof. Katrien Fransen<sup>1</sup>, Prof. Tegan Cruwys<sup>2</sup>, Prof. Catherine Haslam<sup>3</sup>, Prof. Seghers Jan<sup>1</sup>, Dr. Julie Vanderlinden<sup>1</sup>, Prof. van Uffelen Jannique<sup>1</sup>, Mrs. Elvire Verbaander<sup>1</sup>, Prof. Iserbyt Peter<sup>1</sup>, **Prof. Filip Boen<sup>1</sup>**  
<sup>1</sup>KU Leuven, Leuven, Belgium, <sup>2</sup>The Australian National University, Canberra, Australia, <sup>3</sup>The University of Queensland, Brisbane, Australia

**O.1.07 - Physical function and ageing - from prevention to intervention, UKK - K3+4 (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** With a rapidly ageing society, healthy ageing has become a key challenge for older adults. Engagement in physical activity, and particularly walking, is a key strategy that contributes to healthy ageing. The present study aimed to evaluate the efficacy of a group walking program for older adults that incorporates the 5R Shared Leadership Program (5R<sup>S</sup>), compared to a regular group walking program, based on the social identity approach. By implementing a structure of shared leadership and strengthening peer leaders' identity leadership, 5R<sup>S</sup> has been associated with greater performance and well-being in other contexts.

**Methods:** Our cluster randomised controlled trial included 19 walking groups (i.e., the clusters;  $N = 503$ ;  $M_{age} = 69.23$  years,  $SD = 6.68$ ), in which older adults participated in a 12-week structured group walking program. Nine of these walking groups ( $n = 304$ ) were randomly assigned to the intervention condition and received additionally the 5R<sup>S</sup> program.

**Results:** Results revealed that 5R<sup>S</sup> was successful in strengthening the identity leadership qualities of the appointed peer leaders. Moreover, multilevel regressions showed that 5R<sup>S</sup> succeeded in increasing group cohesion and walking activity to a greater extent than a regular group walking program, while participants' group identification and well-being increased to a similar extent in both conditions. Using structural equation modelling, we found that group identification mediated the impact of peer leaders' identity leadership on group cohesion and well-being, but not walking activity.

**Conclusion:** We can conclude that by harnessing the capacity of the group and its peer leaders, 5R<sup>S</sup> constitutes a promising intervention to engage older adults in physical activity.

# Psychological and behavioural predictors of perceived ADL disability in older adults

**Miss Nicola Camp<sup>1</sup>**, Dr. Kirsty Hunter<sup>1</sup>, Dr. Daniele Magistro<sup>1</sup>

<sup>1</sup>Nottingham Trent University, Nottingham, United Kingdom

**O.1.07 - Physical function and ageing - from prevention to intervention, UKK - K3+4 (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** The way that older adults perceive their ability to function in various activities of daily living (ADLs) can influence their ability to live independently within a community. The underlying factors which influence this perception are unclear, however there are suggested links between several psychological and behavioural variables such as health perception, self-efficacy, depressive symptoms, and activity level. The purpose of this study was to identify the influences between perception of health, fear of falling (FoF), general self-efficacy (GSE), depressive symptoms (DS), physical activity level (PA), sedentary behaviour (SB), and perceived ADL disability.

**Methods:** A cross-sectional study design used an online survey consisting of several validated measures related to health perception, self-efficacy, fear of falling, depressive symptoms, physical activity/sedentary behaviour, and perceived ADL disability. This was distributed via email to local charity groups (e.g., U3A, AgeUK) and social media (e.g., Twitter, Facebook) with the aim of recruiting older adults. Data was analysed using a Pearson Bivariate Correlation analysis to describe the relationships between all variables. Following this, an structural equation modelling (SEM) PATH analysis was conducted to further understand the connections between each variable. To assess the fit of the model, the following criteria were used: Chi-squared statistic ( $p > 0.05$ ), normed chi-squared ( $\chi^2/df < 3$ ), Goodness-of-Fit index (GFI  $> 0.9$ ), Normed-Fit index (NFI  $> 0.9$ ), Comparative-Fit index (CFI  $> 0.9$ ) and Root Mean Square Error of Approximation (RMSEA  $< 0.05$ ).

**Results:** 473 participants completed the online survey (152 males, 321 females; mean  $\pm$  SD age  $69 \pm 7$  years). Pearson correlation analysis showed significant moderate-strong relationships between all variables ( $p < 0.05$ ). SEM path analysis model showed an excellent fit when all participants were included:  $\chi^2 = .67$  ( $p = .88$ ),  $\chi^2(3) = .22$ , GFI = .99, NFI = .99, CFI = .99, RMSEA = .01. There were significant interactions between PA and sedentary behaviour ( $b = 0.37$ ,  $p < 0.001$ ), as well as PA and depressive symptoms ( $b = -0.25$ ,  $p < 0.001$ ). SB was significantly predicted by DS ( $b = 0.33$ ,  $p < 0.001$ ), FoF ( $b = 0.10$ ,  $p < 0.05$ ) and GSE ( $b = -0.36$ ,  $p < 0.001$ ). Perceived ADL disability showed no significant interactions with being physically active, however there was a positive interaction with sedentary behaviour ( $b = 0.18$ ,  $p < 0.001$ ).

**Conclusion:** This model demonstrates the importance of psychological variables in the prediction of activity level and/or sedentary behaviour in UK community-dwelling older adults, as well as how these behaviours may predict perceived ADL disability.

# Trajectories of physical activity from mid to old age in women: 21 years of data from the Australian Longitudinal Study on Women's Health

**Dr. Yuta Nemoto<sup>1,2,3</sup>**, Prof. Wendy Brown<sup>1</sup>, Prof. Gita Mishra<sup>1</sup>, Dr. Gregore Mielke<sup>1</sup>

<sup>1</sup>The University of Queensland, Brisbane, Australia, <sup>2</sup>Tokyo Medical University, Tokyo, Japan, <sup>3</sup>Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan

**O.1.07 - Physical function and ageing - from prevention to intervention, UKK - K3+4 (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Women's physical activity levels vary during the life course. However, evidence of physical activity trajectories among mid-aged women is scarce. In this study, we analyzed 21 years of data from women born in 1946–51 to: 1) identify trajectories of physical activity in the transition from mid- to early old-age; 2) investigate the predictors of different trajectories of physical activity.

**Methods:** This study used data from the 1946–51 cohort of the Australian Longitudinal Study on Women's Health (N = 10,371). Mailed surveys from 1998 (Survey 2: age 47–52) to 2019 (Survey 9: age 68–73) at 3-year intervals were used to collect data on leisure-time physical activity, sociodemographic factors (country of birth, area of residence, educational attainment, marital status, economic status, working duration, number of births), health conditions (menopause status, BMI, physical function), and health behaviors (smoking, alcohol status). Physical activity was calculated as MET.minutes/week. Group-based trajectory modeling was conducted to identify physical activity trajectories from age 47-52 to 68-73. Multinomial logistic regression models were used to examine the predictors of physical activity trajectories.

**Results:** Five physical activity trajectories were identified: Low (13.3%), Moderate (50.4%), Moderate-increasing (22.2%), High (6.6%), and High-declining (7.7%). The High-declining trajectory showed significant physical activity decline from age 47–52 (median: 2647.3 MET.minutes/week) to age 68–73 (median: 799.2 MET.minutes/week). In comparisons between the High and High decline trajectories, living in outer regions, using hormone replacement therapy or oral contraceptives, peri-menopause, overweight and obese, and increased BMI between Surveys 2 and 5 were associated with higher odds of the High-declining trajectory. In contrast, high educational attainment, high economic status, more hours in paid work, never given birth, high physical function, and decreased BMI from Survey 2 to 5 were associated with lower odds of the High-declining trajectory.

**Conclusions:** There were five unique trajectories of physical activity from mid to old age. In addition to well-known determinants of physical activity, menopause status, number of births, and weight gain were associated with a declining trajectory. Menopausal women with children were more likely to gain weight. These results could inform the development of targeted physical activity interventions for menopausal women with children.

# Preventing decline in physical functioning in older age: The "whole picture" from the UK REACT trial

Prof. Afroditi Stathi<sup>1</sup>, **Prof. Colin Greaves<sup>1</sup>**, Prof. Jack Guralnik<sup>3</sup>, Prof. W Jack Rejeski<sup>4</sup>, Mx. The REACT Research Group<sup>2</sup>, Dr. Janet Withall<sup>1</sup>, Prof. Janice Thompson<sup>1</sup>, Prof. Gordon Taylor<sup>5</sup>, Prof. Heidi Johansen-Berg<sup>8</sup>, Prof. James Bilzon<sup>7</sup>, Prof. Selena Gray<sup>10</sup>, Dr. Rosina Cross<sup>5</sup>, Dr. Max Western<sup>7</sup>, Dr. Jolanne de Koning<sup>7</sup>, Dr. Peter Ladlow<sup>11</sup>, Dr. Jessica Bollen<sup>5</sup>, Dr. Sarah Moorlock<sup>1</sup>, Prof. Melvyn Hillsdon<sup>5</sup>, Prof. Ken Fox<sup>6</sup>, Dr. Tristan Snowsill<sup>5</sup>, Dr. Antonieta Medina-Lara<sup>5</sup>, Prof. Colin Green<sup>5</sup>

<sup>1</sup>University of Birmingham, Birmingham, United Kingdom, <sup>2</sup>Universities of Exeter, Bath, Bristol, Loughborough, Oxford, various, United Kingdom, <sup>3</sup>University of Maryland, Baltimore, USA, <sup>4</sup>Wake Forest University, Winston-Salem, USA, <sup>5</sup>University of Exeter, Exeter, United Kingdom, <sup>6</sup>University of Bristol, Bristol, United Kingdom, <sup>7</sup>University of Bath, Bath, United Kingdom, <sup>8</sup>University of Oxford, Oxford, United Kingdom, <sup>9</sup>Loughborough University, Loughborough, United Kingdom, <sup>10</sup>University of West of England, Bristol, United Kingdom, <sup>11</sup>Defence Medical Rehabilitation Centre (DMRC), Loughborough, United Kingdom

**O.1.07 - Physical function and ageing - from prevention to intervention, UKK - K3+4 (Level 3), June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Mobility limitation in older age reduces quality of life, generates substantial health and social care costs, and increases mortality. The REtirement in ACTION (REACT) trial aimed to establish whether or not a community-based active ageing intervention could prevent decline in physical functioning in older adults at risk of developing mobility limitation.

**Methods:** Physically frail or pre-frail older adults (age $\geq$ 65; Short Physical Performance Battery (SPPB) score 4–9) were recruited into a two-arm, multi-centre randomised controlled trial, with parallel process and health economic evaluations. Participants were randomly assigned to receive brief healthy ageing advice or a 12-month, group-based, multimodal exercise and behavioural maintenance programme delivered in community centres. The primary outcome was lower limb physical function (SPPB score) at 24 months. The process evaluation included multistakeholder qualitative research and intervention fidelity assessment designed to evaluate a pre-specified logic model.

**Results:** 777 participants (mean age 77.6; 66% female) were randomised and primary outcome data at 24 months were provided by 628 (80.8%) participants. At 24-month follow-up, SPPB scores there was a significant and clinically meaningful difference favouring the intervention arm compared with controls (adjusted mean difference 0.49, 95%CI: 0.06 to 0.92). Self-reported muscle-strengthening activity (but not accelerometer-measured physical activity) significantly increased in the intervention arm compared with controls. Of those who started the intervention (16.1% did not engage), mean session attendance was 67.7%. Session attendance was associated with positive changes in exercise competence, relatedness and enjoyment and perceived physical, social and mental well-being benefits (but not changes in autonomy). Fidelity analysis revealed considerable scope for improving the delivery of the behavioural maintenance support sessions. The intervention was cost-effective compared with control, saving £103 per participant, with a quality-adjusted life-year gain of 0.04 (95%CI: 0.006 to 0.074) within the 2-year trial window.

**Conclusion:** A 1-year multimodal exercise and behaviour-maintenance intervention prevented decline in physical functioning in at-risk older adults over 24-months, whilst saving money for health services. The process evaluation identified ways to further increase programme effectiveness. Overall, the results indicate that the decline in physical functioning in older age is modifiable using affordable, targeted interventions like REACT.

# Barriers and Facilitators to Scaling Healthy Eating and Active Living Policy, Systems, and Environmental Interventions to More Rural Communities in Louisiana

Ms. Nila Pradhananga<sup>1</sup>, Dr. Laura Balis<sup>2</sup>, Dr. Denise Holston<sup>1</sup>, Dr. Melissa Cater<sup>3</sup>, Dr. Bailey Houghtaling<sup>1, 4, 5</sup>

<sup>1</sup>School of Nutrition and Food Sciences, Louisiana State University (LSU) & LSU Agricultural Center, Baton Rouge, USA, <sup>2</sup>Pacific Institute for Research and Evaluation, Louisville, USA, <sup>3</sup>Agricultural and Extension Education and Evaluation, Louisiana State University (LSU) & LSU Agricultural Center, Baton Rouge, USA, <sup>4</sup>Department of Human Nutrition, Foods, and Exercise, Virginia Tech, Blacksburg, USA, <sup>5</sup>Gretchen Swanson Center for Nutrition, Omaha, USA

**O.1.08 - Scaling up interventions in community and health care settings, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Louisiana Cooperative Extension Services (LCES) is part of a national network of practitioners in the United States charged with bridging innovations to local communities. The purpose of this study was to identify barriers and facilitators to LCES delivery of healthy eating and active living policy, systems, and environmental (PSE) interventions in rural Louisiana communities to inform scaling.

**Methods:** A qualitative research design was used. Semi-structured focus group discussions with LCES Family and Consumer Science practitioners (n=40 participants), following the updated 2022 Consolidated Framework for Implementation Research (2022 CFIR), were conducted in 2022 at each of five regional LCES trainings. LCES has identified PSE interventions as a priority area, although they have not been fully adopted across rural Louisiana. Focus group discussions were audio recorded and transcribed verbatim. The constant comparison method and a deductive coding approach following the 2022 CFIR was used, including *Inner Setting* (LCES organization), *Outer Setting* (rural communities), *Innovation* (healthy eating and active living PSE interventions), and *Individuals* (implementation actors/partners). Barrier or facilitator were also used as codes. Analysis was iterative: two researchers independently coded transcripts using a qualitative analysis software and met to discuss discrepancies; after initial coding, two researchers reviewed all codes for coding agreement and re-coded when appropriate based on consensus.

**Results:** LCES practitioners described more barriers (n=210) than facilitators (n=100). The most prominent barriers were at the *Inner Setting*, specifically communication streams, inconsistent access to knowledge and information, limited available resources, and issues with organizational culture. In addition, barriers in the *Outer Setting* were also prominent, such as challenges with community partnerships and the rural community context. *Individual* barriers mainly included limited time, knowledge, and skills to fully prioritize rural PSE interventions. These barriers were coupled with *Innovation* barriers, regarding the complexity of rural PSE interventions for healthy eating and active living. LCES practitioners also described multiple facilitators at these levels aiding in delivery of rural PSE interventions for healthy eating and active living.

**Conclusions:** Barriers should be matched to implementation strategies that are needed to support ongoing rural PSE interventions and to ensure successful scaling to more rural communities in Louisiana.

# Health-promoting and health-constraining environmental features and physical activity and sedentary behaviour in adolescence: a geospatial cross-sectional study

**Dr Matthew Hobbs<sup>1</sup>**, Dr. Tom Stewart<sup>2</sup>, Dr. Lukas Marek<sup>1</sup>, Prof. Scott Duncan<sup>2</sup>, Associate Professor Malcolm Campbell<sup>1</sup>, Prof. Simon Kingham<sup>1</sup>

<sup>1</sup>University of Canterbury, Christchurch, New Zealand, <sup>2</sup>Auckland University of Technology, Auckland, New Zealand

**O.1.08 - Scaling up interventions in community and health care settings, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Adolescence is a key period of the life course characterised by physiological, mental and social change and the built environment may influence adolescent physical activity and sedentary behaviour. This study first examines the extent of access to both health-promoting (i.e. parks) and health-constraining (i.e. fast-food outlets) environmental features. Second, it investigates associations between environmental exposure to such features and physical activity, sedentary behaviour, and travel behaviours.

**Methods:** Data were sourced from the Built Environment in Adolescent New Zealanders (BEANZ) study (n=194) an eight-site cross-sectional study comprising a robust sample of adolescents. Access to environmental features was based on the New Zealand Healthy Location Index (HLI); a nationwide composite measure of access to five health-promoting (i.e. physical activity facilities) and five health-constraining (i.e. fast-food outlets) features. We combined the HLI, a multidimensional environmental measure with accelerometry and global positioning system data to define access to the environment. Linear mixed models evaluated the association between different levels of access to health-promoting and health-constraining environments, and each physical activity and transportation outcome variable while considering the multistage sampling design (students nested within schools).

**Results:** Adolescents spent most of their time in very close proximity to a range of both health-promoting and health-constraining features. Several associations were detected between time spent in areas with the best access to health-promoting features and reduced sedentary time and less travel by motor vehicle. For instance, for every 1% increase in time in areas with the lowest access to health-promoting environments, sedentary time increased by 1.6 minutes, vehicular travel increased by 0.47 minutes, and light intensity activity increased by 0.41 minutes.

**Conclusions:** This study addresses an important gap in our current understanding of environmental exposure and access by integrating GPS and accelerometry data. We respond to calls to move beyond static definitions of place, to more dynamic metrics combining GPS and accelerometry as well as multidimensional environmental metrics. Our findings add to a growing body of robust evidence which posits that the decreases typically seen during adolescence in physical activity and increases in sedentary behaviour may be partly due to the environments where they spend their time.

# Influence of policy on the effective and sustainable delivery of exercise referral schemes: a retrospective analysis (1990-2020).

**Prof. Emily Oliver<sup>1</sup>**, Dr. Caroline Dodd-Reynolds<sup>2</sup>

<sup>1</sup>Newcastle University, Newcastle, United Kingdom, <sup>2</sup>Durham University, Durham, United Kingdom

**O.1.08 - Scaling up interventions in community and health care settings, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Exercise referral schemes involve the delivery of structured physical activity support to those with, or at risk of, poorer health. National policy guidance and approaches differ, and delivery environments have changed substantially since exercise referral's emergence. Previous work highlights ambiguity in national guidelines and varying local practices (Oliver et al., 2016); however, beyond this there has been little examination of how policy contexts can influence schemes. Where this has been explored in single schemes (e.g., Henderson et al., 2018), operational cultures have been identified as critical determinants of sustainability. Here, we redress this imbalance to examine factors that have driven, undermined, or supported effective and sustainable exercise referral practices. We integrate policy, political and behavioural sciences to explore how and why schemes, and the people working within them, have changed over the past 30 years.

**Methods:** A retrospective naturalistic design was adopted. Schemes were purposively selected for variety in terms of governance (e.g., nationally-governed schemes, local authority led, charity led), with participants (e.g., commissioners, delivery and managerial staff) recruited using snowball and purposive sampling methods. Qualitative and visual data were generated using semi-structured interviews, adapting life-history methodologies (such as storyboarding, life history diagrams e.g., Söderström, 2020) to triangulate scheme histories.

**Results:** Analysis of data is ongoing. A three-stage approach is being applied, using: (i) narrative policy analysis to 'story' changes in the policy landscape, (ii) Hood's (1986) taxonomy to identify influential policy tools (e.g., the role of funding "treasure" and governance "authority"), and (iii) Archer's (2020) morphogenetic framework to analyse how agency, culture and structure within schemes are influenced.

**Conclusion:** Findings will inform recommendations for the development of sustainable physical activity referral systems that can effectively target health inequalities. Implications will have broad interest for policymakers, practitioners, and researchers working in community-based provision (e.g., social prescribing systems) and physical activity promotion. This high-level longitudinal analysis offers additional learning from its methodological innovation (adapting life-history methods to scheme entities) and the integration of multiple disciplinary perspectives.

# Equipping the future generation of teachers to promote optimal academic outcomes through physical activity: TransformUs Higher Ed

**Dr. Natalie Lander**<sup>1</sup>, Dr. Emiliano Mazzoli<sup>1</sup>, Prof. Amanda Telford<sup>2</sup>, Dr. Kate Ridely<sup>3</sup>

<sup>1</sup>Deakin University, Melbourne, Australia, <sup>2</sup>RMIT University, Melbourne, Australia, <sup>3</sup>Flinders University, Adelaide, Australia

**O.1.08 - Scaling up interventions in community and health care settings, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** *TransformUs Higher Ed* equips future teachers with pedagogies, strategies and concepts to promote academic outcomes through physical activity for the students they go on to teach. More than 1200 undergraduate teachers from one Australian university have participated, thus far. A limitation is the lack of understanding around implementation and effectiveness at a population-level. Therefore, the aim of this research was to expand the program across two universities and investigate the effect of the program on undergraduate teachers' teaching confidence and competence, and their willingness to deliver active pedagogies in current and future teaching, in comparison to a control university group.

**Methods:** Pre/post surveys with pre-service teachers ( $n = 580$ ) and post-program interviews with lecturers ( $n = 12$ ) were conducted. The implementation and evaluation were guided by RE-AIM. Surveys were analysed via linear mixed models, checklists via descriptive analysis and a framework approach was used for the interview data.

**Results:** Significant improvements were observed in undergraduate teachers' confidence and competence, as well as their willingness to implement physically active pedagogic strategies following the intervention, in comparison to the control. Three key themes spanning multiple dimensions informed recommendations for program scalability: "co-design", "embedded in practice" and "evidence of impact".

**Conclusions:** This research provided important knowledge for improving evidence-based practice within organisations and systems. *TransformUs Higher Ed* has the potential to advance the teaching capability of teachers, and transform the learning experience of all primary school students.

# What happens to school healthy eating and physical activity programs when implementation support stops?

**Dr. Nicole Nathan**<sup>1,2,3</sup>, Dr. Alix Hall<sup>1,2,3</sup>, Mr. Adam Shoesmith<sup>1,2,3</sup>, Prof. Luke Wolfenden<sup>1,2,3</sup>

<sup>1</sup>The University of Newcastle, Newcastle, Australia, <sup>2</sup>Hunter New England Population Health, Newcastle, Australia, <sup>3</sup>National Centre of Implementation Science, Newcastle, Australia

**O.1.08 - Scaling up interventions in community and health care settings, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Governments have invested billions in the implementation, at scale, of chronic disease prevention (CDP) interventions in schools. However <20% of public health interventions are sustained once implementation support is removed. Of those that do sustain it is unknown if this is related to the characteristics of the CDP itself, the strategies used to support their initial implementation or both. We will present a series of case studies from >15yrs of school-based research (of both success and failures) to explore the contexts and circumstances where CDP interventions have continued or ceased in schools once implementation support has stopped. Example of these case studies include:

## **Methods and Results:**

Example 1: *Crunch&Sip* is a school-based program where teachers provide a time in class for children to eat a piece of fruit and/or vegetables that they have brought from home. The program was first introduced in 2006 and achieved a high level of implementation across a large population of schools in Australia (approx. 80%) following an initial 11-15 month implementation period. During initial implementation schools received training, program resources, incentives, follow-up support, and implementation feedback from external health promotion unit. 10yr longitudinal data from a population wide monitoring survey found the program continued to be implemented in >90% of schools that had initially implemented it.

Example 2: A 12-month multi-strategy intervention was undertaken to support NSW schools' implementation of a mandatory physical activity policy. Implementation support included: identifying and training school champions, on-going support, provision of resources, principals mandated change and action planning. Overall 400 teachers provided primary outcome data. Immediately following the intervention, intervention teachers recorded a greater increase in weekly minutes of physical activity than control teachers by approximately 44.2 min (95% CI 32.8 to 55.7;  $p<0.001$ ). However at longer term follow-up the effect size had significantly dropped 27.1 min (95% CI 15.5 to 38.6;  $p\leq 0.001$ ).

**Conclusions:** Policy makers, practitioners and researchers will, through case study analysis, identify characteristics of interventions, contexts and initial implementation support strategies that influence CDP to sustain or are at risk of failing.

# Patient and Physician Engagement in a Produce Prescription Program at a Federally Qualified Health Center

**Associate Professor Kelly Ylitalo**<sup>1</sup>, Ms. Wendy Cox<sup>2</sup>, Ms. Braden Popelsky<sup>1</sup>, Ms. Reanna Clavon<sup>1</sup>, Dr. Kathryn Janda<sup>1</sup>, Dr. Matt Rafalski<sup>2</sup>, Dr. John Gill<sup>2</sup>, Ms. Katie Walter<sup>3</sup>, Dr. Burritt Hess<sup>2</sup>

<sup>1</sup>Baylor University, Waco, USA, <sup>2</sup>Waco Family Medicine, Waco, USA, <sup>3</sup>World Hunger Relief, Waco, USA

**O.1.08 - Scaling up interventions in community and health care settings, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The “Food as Medicine” movement encourages public health and medical professionals to recognize the role of diet in health and embrace solutions to improve healthy eating and food access. This study describes patient and physician engagement with a Produce Prescription (PRx) program to improve access to fresh vegetables in a health care setting.

**Methods:** The PRx program (2017-2021) was a partnership between a multi-site Federally Qualified Health Center, a sustainable farm, and an academic institution in central Texas. During biannual harvest seasons, patients redeemed “prescriptions” for initial produce boxes and subsequent “refills.” Baseline cross-sectional surveys on food insecurity, measured using the United States Household Food Security Module, were embedded in electronic medical records. Refill surveys assessed satisfaction and confidence. Electronic surveys to prescribing physicians assessed program knowledge, expectations, and motivations for prescriptions to potential participants. Frequencies and proportions were used to describe programmatic data, patient food insecurity, patient satisfaction, and physician feedback.

**Results:** Across 8 biannual harvest seasons and 9,986 produce boxes, 8,046 patients received prescriptions, 6,227 patients redeemed prescriptions for  $\geq 1$  box, and 720 patients redeemed for  $\geq 2$  boxes. Initial prescription redemption rates ranged from 64.5-82.7% across all seasons; refill rates ranged from 6.8-16.7%. Among participants, 70.8% sometimes or often worried food would run out, 66.7% sometimes or often ran out of food, and 71.7% sometimes or often could not afford balanced meals. Among those with refills, there was very high satisfaction with food quality (95.8%), variety (97.2%), and 94.2% were confident preparing meals from produce. Among physicians (n=22), 100% self-reported knowing enough about PRx to make patient recommendations and 100% believed PRx had potential benefit for patients. Common motivating factors for writing PRx prescriptions were chronic conditions (77%), obesity (73%), low socioeconomic status (64%), and food insecurity (59%).

**Conclusions:** The PRx program created cross-sector capacity to deliver a perishable food program within a multi-site health care system. PRx participants reported high levels of food insecurity and high levels of satisfaction with produce. Incorporating “Food as Medicine” initiatives and food insecurity screening in low-income health care settings may help patients and physicians prioritize nutrition and food access.

# Systems approaches to scaling up in public health: A systematic review and narrative synthesis of evidence

Dr. Harriet Koorts<sup>1</sup>, Dr. Jiani Ma<sup>1</sup>, Dr. Christopher Swain<sup>2</sup>, **Prof. Harry Rutter**<sup>3</sup>, Prof. Jo Salmon<sup>1</sup>, Dr. Kristy Bolton<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Sciences, Deakin University, Geelong, Australia, <sup>2</sup>Cancer Epidemiology Division, Cancer Council Victoria, Melbourne, Australia,

<sup>3</sup>Department of Social and Policy Sciences, University of Bath, Bath, United Kingdom

**O.1.08 - Scaling up interventions in community and health care settings, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Despite many global public health successes at scale, efficacious interventions seldomly achieve system-wide integration for population-level impact. Scaling up health interventions is complex, and we know little about the *how* of scaling up. For example, how to support researchers, policymakers, and practitioners to operationalise systems thinking approaches when scaling up in research and in practice. This presentation will describe systematic review findings that sought to explore how systems approaches have been used in scaling up public health interventions.

**Methods:** The review follows the PRISMA guidelines and is registered with PROSPERO. Seven electronic databases were searched for studies published during 2016-2021. Eligible studies involved interventions targeting at least one of the four chronic disease risk factors (e.g., physical inactivity, smoking, alcohol consumption, diet/obesity) and were conducted in a real-world setting or an evaluation of a previously scaled intervention. A narrative synthesis approach was used to interpret how systems approaches were operationalised in the scale-up process and/or evaluate scale-up outcomes.

**Results:** Twenty-one studies were eligible. Studies were categorised as (i) high, (ii) moderate, and (iii) low use of systems approach in scaling up. Five studies (classified as '*high* use of systems approach') planned and implemented the scale-up with an explicit focus on relations between system elements and using system changes to drive impact at scale. Seven studies (classified as '*moderate* use of systems approach') considered the systems elements impacting the scale-up process or outcome but were not embedded from the outset as to what is required to achieve system-level changes. Eight studies (classified as '*low* use of systems approach') were designed to work at multiple levels among multiple agencies by default in an intervention setting, although the complexity of the system and the relationsd between the system elements were not articulated.

**Conclusions:** The use of systems approaches in scale-up is still in its infancy. Systems approaches to guide scale-up processes, or to inform evaluation design, were rarely explicitly described in studies. When systems approaches were described, they were usually brief or lacked theoretical explanations. Increased guidance is needed on how to operationalise and communicate the use of systems approaches in practice.

# Barriers and facilitators to online grocery shopping among Supplemental Nutrition Assistance Program (SNAP) Participants: A Mixed Method Study

**Dr. Alison Gustafson**<sup>1</sup>, Ms. Emily DeWitt<sup>1</sup>, Ms. Rachel Gillespie<sup>1</sup>, Dr. Elizabeth Anderson Steeves<sup>2</sup>

<sup>1</sup>University of Kentucky, Lexington, USA, <sup>2</sup>Gretchen Swanson Nutrition Center, Knoxville, USA

**O.1.09 - Multi-source data collection using e- & m-Health methodologies, towards improved mental and physical health, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** The Supplemental Nutrition Assistance Program (SNAP) Online Purchasing Pilot (OPP) allows households to use their SNAP Electronic Benefit Transfer (EBT) to purchase groceries online from authorized retailers across the United States (US). There have been efforts to expand online shopping options for SNAP recipients, yet few SNAP shoppers use their EBT benefits online. An online shopping intervention was developed and tested to improve online shopping practices and purchase of fruits and vegetables.

**Methods:** This mixed methods study examined impact of a pilot effectiveness study across three arms: 1) brick and mortar shopping “BM”; 2) online shopping with no behavioral intervention components “O”; and 3) online shopping + place-based text message and behavioral support for online shopping “O+I” [SNAP benefits (total sample, n=129, n=40 SNAP recipients and n=89 non-SNAP recipients)]. We also conducted qualitative structured interviews with SNAP participants who were part of arm 2 or 3 of the intervention (n=26). Descriptive statistics and t-tests assessed quantitative findings, and conventional content analysis was used to identify qualitative themes. Quantitative and qualitative results were layered and interpreted collectively.

**Results:** Survey results found no differences in perceptions of online grocery shopping between SNAP and non-SNAP recipients (p-values ranged from 0.2-1.0), and that 97% of SNAP recipients surveyed agreed that they felt comfortable using their SNAP benefits online. For those who used their EBT card online in “O+I” spent more on fruits and vegetables compared to those who didn’t use their EBT card online in “O+I” (\$12.89 vs. \$7.98, p=.02).

Five qualitative themes were identified and provided valuable context to the quantitative survey results. Themes included: challenges to online shopping, benefits to online shopping, online shopping using SNAP benefits, financial factors, and future use of online shopping.

**Conclusions:** Using SNAP/EBT online seems to present few unique barriers and assists with purchasing more fruits and vegetables with tailored assistance through text messages and behavioral nudges. The results of this study can be used to inform policy and programmatic actions to make online grocery shopping more appealing to SNAP recipients and reduce barriers to entry in the US.

# Impact of a web-based physical activity intervention on depression, anxiety, stress and quality of life

**Prof. Corneel Vandelanotte**<sup>1</sup>, Prof. Mitch Duncan<sup>2</sup>, Prof. Ron Plotnikoff<sup>2</sup>, Dr. Amanda Rebar<sup>1</sup>, Dr. Stephanie Alley<sup>1</sup>, Dr. Stephanie Schoeppe<sup>1</sup>, Dr. Quyen To<sup>1</sup>, Prof. Kerry W Mummery<sup>3</sup>, Associate Professor Camille Short<sup>4</sup>  
<sup>1</sup>Central Queensland University, Rockhampton, Australia, <sup>2</sup>University of Newcastle, Newcastle, Australia, <sup>3</sup>University of Alberta, Alberta, Canada, <sup>4</sup>University of Melbourne, Melbourne, Australia

**O.1.09 - Multi-source data collection using e- & m-Health methodologies, towards improved mental and physical health, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Regular engagement in physical activity is associated with improved mental health. However, few studies have investigated the impact of web-based physical activity interventions on mental health outcomes. Those studies that did examine this had small sample sizes and only used self-report measures for physical activity. Therefore, this study examined the impact of a web-based personally tailored physical activity intervention on depression, anxiety, stress and quality of life using both self-reported and device-based measures in a fully powered sample.

**Methods:** A total of 501 Australian adults were randomised into either a control group or a pooled intervention condition who received a 3-month physical activity intervention delivered via personalised webbased videos or personalised website-text. Previously, this intervention has demonstrated to improve self-reported physical activity (Active Australia Survey), but not device-measured (GT3X-Actigraph accelerometer) physical activity. At baseline, 3- and 9-months, depression, anxiety and stress were assessed using the DASS21, and quality of life was assessed using the SF-12V2. General linear mixed models examined differences between groups over time.

**Results:** Most participants (>80%) reported normal levels of depression, anxiety or stress. Relative to baseline levels, significant reductions of depression, anxiety, stress and the SF12 mental health component were observed in the pooled intervention group at 3 and 9 months. Relative to the control group, significant reductions were observed in the pooled intervention group for depression and stress (3-months only) and anxiety (3- and 9-months), but not quality of life.

**Conclusion:** A web-based intervention that was not effective in improving device-measured physical activity, but that was effective to improve self-reported physical activity, did have a positive impact on depression, anxiety, stress and mental quality of life. To our knowledge our study is the first to examine mental health outcomes in a trial that assessed physical activity changes in response to a web-based intervention both using devices and a self-reported questionnaire. However, these findings need to be confirmed in future studies.

# Provision of social support is associated with 3-month weight loss in the mobile Lifestyle Intervention for Food and Exercise (mLIFE) study

**Dr. Gabrielle Turner-McGrievy<sup>1</sup>**, Dr. Courtney Monroe<sup>1</sup>, Dr. Carolina Delgado-Diaz<sup>1</sup>, Dr. Kelli DuBois<sup>1</sup>, Ms. Halide Aydin<sup>1</sup>, Dr. Sara Wilcox<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**O.1.09 - Multi-source data collection using e- & m-Health methodologies, towards improved mental and physical health, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** To examine baseline characteristics of the mobile Lifestyle Intervention for Food and Exercise (mLIFE) study participants as well as the relationship between social support activities and 3-month weight loss in cohort 1.

**Methods:** Adults with overweight/obesity were recruited to participate in a one-year remotely delivered intervention (two total cohorts) and could live anywhere in the U.S. The intervention is delivered through the mLIFE app and includes podcasts, tips of the day, diet and physical activity (FitBit) self-monitoring, and objective tracking of weight (FitBit Aria scale). Social support-related activities in the app include requesting and responding to support, providing a “thumbs up” to other participants when they complete a self-monitoring or intervention activity, and reaching out to participants who haven’t logged on in the past 24 hours. Participants are randomized to the mLIFE+points group (receive up to 8 points a day for completing different social support activities) or the mLIFE group (participants can do the same social support activities but do not see their points). Among participants with 3-month weight data (data combined across group assignment), linear regression was conducted to examine the relationship between total number of social support activities (points earned) and 3-month % weight loss, adjusting for age, race, and sex. We hypothesized that the total number of social support activities (e.g., total points) would be significantly associated with weight loss.

**Results:** Participants (n=106, mean age 49.3±11.8 y, 93% female, mean BMI 33.6±5.5 kg/m<sup>2</sup>) were recruited for cohort 1 (76 participants had objective weight data and 102 participants had points data). Participants were from 29 different U.S. states. Participants earned a mean of 214.9±137.5 points for social support activities (out of 672 possible points in 12 weeks) and lost a mean of -3.5±3.8% body weight. Results of the linear regression indicated that number of points earned significantly predicted % weight loss ( $R^2=0.17$ ,  $F(4,74) = 3.60$ ,  $p=0.01$ ), such that for every 100 social support activities, participants lost -0.5% of their body weight ( $B = -0.005$ ,  $p=0.014$ ).

**Conclusions:** Providing social support was associated with weight loss at 3 months. Future work will examine the one-year outcomes among the complete sample.

# Ecological momentary assessment of leisure-time physical activity and active transport: preliminary findings from the Continuous Observations of Behavioural Risk Factors in Asia (COBRA) study

**Dr. Sarah Edney<sup>1</sup>**, Assistant Professor Chuen Seng Tan<sup>1</sup>, Prof. Rob Van Dam<sup>1,2</sup>, Dr. Falk Müller-Riemenschneider<sup>1,3</sup>

<sup>1</sup>National University of Singapore, Singapore, Singapore, <sup>2</sup>The George Washington University, Washington DC, USA, <sup>3</sup>Charité-Universitätsmedizin Berlin, Berlin, Germany

**O.1.09 - Multi-source data collection using e- & m-Health methodologies, towards improved mental and physical health, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** The Continuous Observations of Behavioural Risk Factors in Asia (COBRA) study aims to understand how health behaviours are shaped by interactions between people and their environments. The purpose of this study was to describe patterns of leisure-time physical activity and active transport as reported via ecological momentary assessments (EMA).

**Methods:** Participants were sent 6 EMA surveys per day between 8am and 9.30pm for 9 days. Each EMA asked about engagement in leisure-time physical activity or active transport since the previous EMA survey. Participants responded to 87.0% of all EMA surveys (15,883/18,252 surveys), and each took 1.5 minutes (standard deviation [SD] 2.6) to complete. For the current study, EMA responses were collapsed to the day-level (i.e., 9 days per participant) and are analysed descriptively.

**Results:** Participants (N=338) were mostly female (63.6%) with a mean age of 41.3 years (SD 13.7) and mean BMI of 23.4kg/m<sup>2</sup> (SD 4.2), 63.6% female), who provided a total of 3018 person-days of EMA monitoring (out of 3042 days, 99.2%). Participants reported engaging in leisure-time physical activity or active transport on 27.6% (832/3018) and 28.2% (850/3018) of days, respectively. On average, participants reported engaging in leisure-time physical activity on 2.5 (SD 2.4) days per week, and active transport on 2.5 (SD 2.0) days per week. Over 70% of participants reported 1 or more days of leisure-time physical activity (71.9%: 243/338) or active transport (73.4%: 248/338). Approximately one-fifth of participants reported 5 or more days of leisure-time physical activity (19.2%: 65/338) or active transport (22.8%: 77/338). Across the week, the proportion of participants who reported leisure-time physical activity (30.8%) or active transport (30.1%) on the weekend was higher as compared to weekdays (leisure-time physical activity: 26.1%; active transport: 27.2%). Further analysis, including linkage to accelerometer data, will be available within the coming months.

**Conclusion:** Gaining a comprehensive understanding of patterns of physical activity is essential to aid the design of public health interventions. Our next steps are to: (1) examine the social and physical context of physical activity as reported via EMA, and (2) investigate day-level associations between physical activity and social and physical environment contextual factors.

# Understanding participation in an online diabetes prevention programme. A mixed methods study

**Ms. clair Haseldine**<sup>1</sup>, Prof. Patricia M Kearney<sup>1,2</sup>, Dr. Grainne O'Donoghue<sup>3</sup>, Dr. Fiona Riordan<sup>1</sup>, Dr. Claire Kerins<sup>1</sup>, Ms. Margaret Humphreys<sup>2</sup>, Ms. Liz Kirby<sup>2</sup>, Dr. Sheena McHugh<sup>1</sup>

<sup>1</sup>University College Cork, Cork, Ireland, <sup>2</sup>Health Service Executive, Cork, Ireland, <sup>3</sup>University College Dublin, Dublin, Ireland

**O.1.09 - Multi-source data collection using e- & m-Health methodologies, towards improved mental and physical health, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Diabetes prevention programmes (DPPs) prevent diabetes in those at high risk. Yet, many people at high risk are not referred or do not participate in DPPs. Digital DPPs (e.g., online or mobile) provide new ways to reach participants, however there is limited research on factors that affect participation in such programmes. To gain an understanding of factors influencing participation in digital diabetes prevention programmes

**Methods:** This study uses an explanatory sequential mixed methods design. Quantitative administrative data (e.g., age, gender, and reasons for declining) were collected by educators on all those invited to a national online DPP in Ireland between June 2021 and September 2022. A bespoke questionnaire (adapted from the English-DPP evaluation) was administered to attenders to examine factors affecting participation. Data was analysed descriptively. Focus group discussions and interviews were conducted with programme attenders and educators and are being analysed using framework analysis with the Theoretical Domains Framework.

**Results:** Of 158 people at risk invited to attend the online DPP, 73 accepted (46%). Of those, 39 (53%) were male and average age was 60 years. Overall, 85 (54%) declined with 26 (31%) decliners citing technology as the main barrier to participation. Remote interviews and focus groups were conducted with 13 attenders and 8 educators. Initial qualitative analysis suggests fear of developing diabetes motivated many to participate and having family members or knowing someone with diabetes positively influenced participation. Family and educator support helped facilitate online participation. Joining an online group was perceived as less daunting than joining an in person group, with some participants feeling they could be more open online which may have also positively influenced participation. Support of the group facilitated retention to the programme.

**Conclusion:** While the online format was considered convenient by both educators and attenders, simultaneously, difficulty with technology was the most commonly cited reason not to participate. Study findings can be used to inform tailored implementation strategies for other digital DPPs internationally and may be useful for other health interventions that were forced to adapt to online delivery due to Covid 19.

# Do holistic mHealth interventions have the potential to promote healthy ageing? A systematic review and meta-analysis

**Ms. Shenglin Zheng**<sup>1</sup>, Dr. Sarah Edney<sup>1</sup>, Mr. Chin Hao Goh<sup>2</sup>, Dr Jacqueline Mair<sup>1,3</sup>, Oscar Castro<sup>3</sup>, Associate Professor Bee Choo Tai<sup>1,2</sup>, Dr. Alicia Salamanca-Sanabria<sup>3</sup>, Associate Professor Tobias Kowatsch<sup>4,5,6</sup>, Prof. Rob M van Dam<sup>1,7</sup>, Associate Professor Falk Müller-Riemenschneider<sup>1,2,8</sup>

<sup>1</sup>Saw Swee Hock School of Public Health, National University of Singapore and National University Health System, Singapore, Singapore, <sup>2</sup>Yong Loo Lin School of Medicine, National University of Singapore and National University Health System, Singapore, Singapore, <sup>3</sup>Future Health Technologies, Singapore-ETH Centre, Campus for Research Excellence And Technological Enterprise (CREATE), Singapore, Singapore, <sup>4</sup>Institute for Implementation Science in Health Care, University of Zürich, Zürich, Switzerland, <sup>5</sup>School of Medicine, University of St. Gallen, St. Gallen, Switzerland, <sup>6</sup>Centre for Digital Health Interventions Department of Management, Technology and Economics ETH Zürich, Zürich, Switzerland, <sup>7</sup>Departments of Exercise and Nutrition Sciences and Epidemiology, Milken Institute School of Public Health, The George Washington University, Washington, USA, <sup>8</sup>Digital Health Centre, Berlin Institute of Health, Charité University Medical Centre Berlin, Berlin, Germany

**O.1.09 - Multi-source data collection using e- & m-Health methodologies, towards improved mental and physical health, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Good physical and mental health are essential for healthy ageing. Holistic mobile health (mHealth) interventions - integrating content targeting physical activity, diet, and mental health - could support healthy ageing and be scaled up to the population level. This review is the first to provide an overview of holistic mHealth interventions and address their effects on related behavioural and health outcomes in adults.

**Methods:** MEDLINE via PubMed, Embase, Cochrane Library, PsycINFO, Scopus, China National Knowledge Infrastructure, and Google Scholar (first 200 records) were searched in April 2022. Eligible studies were randomised controlled trials (RCTs) and non-randomized studies of interventions (NRSIs) if they (i) targeted a general adult population ( $\geq 18$  years old), (ii) included combined content on physical activity, diet, and mental health, and (iii) were delivered via mHealth technologies. Searches returned 4,292 unique records that were screened for eligibility. Narrative synthesis and meta-analysis were conducted. The most frequently reported outcome measures from four outcome domains (weight, physical activity, diet, and mental health) in RCTs were pooled using random-effects meta-analysis.

**Results:** Twenty-eight studies (reported in 37 articles) with 5,094 participants (63.4% female, mean age 39.8 years (SD=12.5)) were included; 21 of the 28 were RCTs, and 7 NRSIs. Most were conducted in high-income countries. Apps, text messages, and websites were the top three mHealth technologies employed. Notably, 54% of the studies adopted a mixed channel, using a combination of apps, wearables, text messages, and websites. Meta-analysis results showed that participation in a holistic mHealth intervention led to significant reductions in weight (9 RCTs, 839 participants, mean difference -1.62 kg, 95% CI -2.74 to -0.50). Reductions in stress levels were observed but did not reach statistical significance (5 RCTs, 353 participants, standardised mean difference -0.21, 95% CI -0.42 to 0.004). There were no significant pooled intervention effects for self-reported moderate-to-vigorous intensity physical activity or diet quality.

**Conclusions:** Holistic mHealth interventions may aid weight loss among general adult populations. However, such effects were small and measured directly after interventions with moderate to high risk of biases. Further high-quality research is needed focusing on middle- or low-income countries and investigating long-term effects.

# Parent-related correlates of 24-hour movement behaviors in 0- to 4-year-old children: the My Little Moves Project

**Dr. Jessica Gubbels<sup>1</sup>**, Dr. Sanne Veldman<sup>2</sup>, Mr. Jelle Arts<sup>2</sup>, Prof. Arnoud Verhoeff<sup>3, 4</sup>, Prof. Mai Chin A Paw<sup>2</sup>, Dr. Teatske Altenburg<sup>2</sup>

<sup>1</sup>Maastricht University, dep. of Health Promotion, NUTRIM School of Nutrition and Translational Research in Metabolism, Maastricht, Netherlands, <sup>2</sup>Amsterdam Public Health Research Institute, Amsterdam UMC, Vrije Universiteit Amsterdam, dep. of Public and Occupational Health, Amsterdam, Netherlands, <sup>3</sup>Public Health Service Amsterdam, Sarphati Amsterdam, Amsterdam, Netherlands, <sup>4</sup>University of Amsterdam, dep. of Sociology, Amsterdam, Netherlands

**O.2.10 - Movement behaviors and health in children and families, UKK - Main Hall (Level 6), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Early childhood is a period of rapid development and habit formation. Parents play a crucial role in shaping their young children's behavior. Current research shows mixed findings regarding which parental factors influence young children's 24-hour movement behaviors (physical activity, sedentary behavior including screen time, and sleep). Therefore, this study aims to examine parent-related correlates of 24-hour movement behaviors in 0- to 4-year-old children living in the Netherlands.

**Methods:** This presentation includes baseline data of the My Little Moves project from the Netherlands, a longitudinal observational study with a follow up duration of 18 months. Participants are recruited through the Amsterdam Sarphati Cohort, which includes detailed information on children's development collected through Youth Health Care services, as well as other channels (e.g., childcare centers). A total of 200 children will be recruited for the sub study on correlates of 24-hour movement behaviors. Data on 24-hour movement behaviors is being collected using a proxy-report app for parents: the My Little Moves App, specifically developed for this project. Data on potential parent-related determinants is being collected through questionnaires for parents. Multivariate linear regression analyses will be used to examine the associations between parental factors and children's 24-hour movement behaviors, adjusted for other covariates (including child factors and other environmental factors).

**Results:** Associations between parent-related factors and children's 24-hour movement behaviors will be discussed. Examined parent-related data include parental 24-hour movement behaviors (based on the International Physical Activity Questionnaire and Wisconsin Sleep Questionnaire), relevant parenting practices (including the Preschooler Physical Activity Parenting Practices questionnaire and screen time parenting) and parental background characteristics (including age, gender, socio-economic status).

**Conclusions:** The findings of the study will advance our current understanding of correlates of young children's 24-hour movement behaviors, thereby providing valuable input for the development of interventions stimulating young children's healthy 24-hour movement behaviors through their parents.

# The 24-hour movement behaviour profiles and cardiometabolic outcomes in 8-year-old children.

**Dr. Anna Fogel<sup>1</sup>**, Ms. Natarajan Padmapriya<sup>2</sup>, Ms. Claire Marie Jie Lin Goh<sup>3</sup>, Dr. Jonathan Bernard<sup>4</sup>, Dr. Lynette Lynette Pei Chi Shek<sup>1, 5</sup>, Prof. Yap Seng Chong<sup>1, 2</sup>, Prof. Kok Hian Tan<sup>6</sup>, Associate Professor Shiao-Yng Chan<sup>1</sup>, Prof. Fabian Yap<sup>6</sup>, Prof. Keith M. <sup>1</sup>Singapore Institute for Clinical Sciences, Singapore, Singapore, <sup>2</sup>Department of Obstetrics & Gynaecology and Human Potential Translational Research Programme, Yong Loo Lin School of Medicine, National University of Singapore, Singapore, Singapore, <sup>3</sup>Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore, <sup>4</sup>Université de Paris, Centre for Research in Epidemiology and Statistics (CRESS), Inserm, Inrae, F-75004, Paris, France, <sup>5</sup>Department of Paediatrics, Yong Loo Lin School of Medicine, National University of Singapore, Singapore, Singapore, <sup>6</sup>KK Women's and Children's Hospital, Singapore, Singapore, <sup>7</sup>Medical Research Council Lifecourse Epidemiology Unit, University of Southampton, Southampton, United Kingdom, <sup>8</sup>Department of Paediatrics, Yong Loo Lin School of Medicine, National University of Singapore, Singapore, Singapore

**O.2.10 - Movement behaviors and health in children and families, UKK - Main Hall (Level 6), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** New physical activity guidelines for children address all movement behaviours (MB) throughout the day. We have identified 24-hour MB profiles in children from the Growing Up in Singapore Towards healthy Outcomes (GUSTO) cohort. The purpose of this study was to investigate the associations between 24-hour MB profiles with cardiometabolic indicators in 8-year-old children.

**Methods:** Cardiometabolic indicators and 24-hour MB measures were collected at age 8 years (n=614). Wrist accelerometers were worn for 7 consecutive days to derive information on light, moderate and vigorous physical activity, inactivity and night sleep. Four profiles emerged in latent profile analysis: “Rabbits” (very high moderate and vigorous physical activity, low inactivity and average sleep), “Chimpanzees” (high moderate physical activity, low inactivity and average sleep), “Pandas” (low physical activity, high inactivity and high night sleep) and “Owls” (low physical activity, high inactivity and low night sleep). Anthropometrics, skinfold thickness, abdominal circumference (AC), QMR measures of fat and lean mass, blood pressure, fatty liver index (FLI) and metabolic biomarkers were used to derive BMI z-score, sum of skinfolds (SS) and metabolic risk score (MRS). Multivariable linear regression was performed to investigate the associations, adjusting for confounders.

**Results:** The profile of “Chimpanzees” was the most prevalent; time spent in each behaviour was closest to the mean and this profile was therefore used as a reference to compare the estimates of other profiles. The largest differences were observed with children with the “Panda” profile. “Pandas”, compared to “Chimpanzees”, had higher BMI z-scores (mean difference: 0.29 [0.03, 0.55]), higher SS (5.41 [2.21, 8.62] mm), higher AC [2.01 [0.49, 3.53] cm), higher body fat % (2.11 [0.41, 3.81]), lesser lean body mass % (-2.62 [-4.71, -0.53]), higher MRS (0.62 [0.11, 1.12] units) and higher FLI (1.65 [0.40, 2.90]). Overall, “Rabbits” had better and “Owls” had worse outcomes compared to “Chimpanzees”, though these differences were not significant (p>0.05). We will further analyse these associations longitudinally (pending).

**Conclusions:** High inactivity combined with low physical activity seems to be the most detrimental to cardiometabolic health, even in the presence of longer night sleep (“Pandas”).

# Natural blue spaces are associated with Australian preschool children's movement behaviours.

**Ms. Phoebe George**<sup>1,2</sup>, Dr. Kevin Murray<sup>2</sup>, Prof. Stewart Trost<sup>3</sup>, Associate Professor Hayley Christian<sup>1,2</sup>

<sup>1</sup>Telethon Kids Institute, Perth, Australia, <sup>2</sup>School of Population and Global Health, The University of Western Australia, Perth, Australia, <sup>3</sup>School of Human Movement and Nutrition Sciences, University of Queensland, Brisbane, Australia

**O.2.10 - Movement behaviors and health in children and families, UKK - Main Hall (Level 6), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Natural outdoor environments such as blue spaces (oceans, rivers, lakes and swamps) are important physical activity settings. It is unclear if natural blue spaces promote physical activity in very young preschool aged children. We examined associations between the amount and type of blue space, proximity to the beach and pre-schooler's device measured movement behaviours.

**Methods:** Accelerometer data from 1,073 preschool children in the PLAYCE baseline study were processed into movement behaviours using a machine learned physical activity classification algorithm specifically developed for children under five (Ahmadi et al. 2020). Geographic Information Systems were used to identify total percentage neighbourhood blue space and the components of blue space (ocean, riverways and lakes and swamps) for 1600m and 5000m buffer areas around children's home residence. Distance to the closest beach, patrolled beach and dog beach were also calculated. Multiple linear regression analyses were used, adjusting for age, and parent education. Results were stratified by sex.

**Results:** Riverways were associated with preschool boy's walking ( $\beta = 1.2$  seconds/day,  $p \leq 0.028$ ) in a 5000m buffer area, and the 1600m ( $\beta = 1.8$  seconds/day,  $p \leq 0.002$ ) and 5000m ( $\beta = 1.2$  seconds/day,  $p \leq 0.020$ ) in preschool girls. In the 5000m buffer area riverways were negatively associated with preschool girls' light activities and games ( $\beta = -6.0$  seconds/day,  $p \leq 0.004$ ) and the percentage of lake and swamp were negatively associated with preschool girls walking ( $\beta = -1.2$  seconds/day,  $p \leq 0.004$ ).

Amongst preschool boys who owned a dog, greater distance to the dog beach was positively correlated with sedentary time ( $\beta = 76$  seconds/day,  $p \leq 0.013$ ) in the 5000m buffer area.

There were no significant associations between total blue space in, or distance to closest or patrolled beach and pre-schooler movement behaviours.

**Conclusions:** These findings suggest that greater amounts of neighbourhood blue space as well as a variety of blue space type has the potential to support positive movement behaviours (less sedentary time and higher amounts of physical activity such as walking) in young children. These findings could be used to inform urban planning and highlight the need for greater protection of natural environments as key health promoting settings for all ages.

# The prospective associations of 24-hour movement behaviours with executive function and academic achievement among school-aged children in Singapore

**Ms. Padmapriya Natarajan**<sup>1,2</sup>, Dr. Jonathan Y. Bernard<sup>3</sup>, Ms. Sarah Yi Xuan Tan<sup>1</sup>, Ms. Claire Marie Jie Lin Goh<sup>1</sup>, Prof. Lynette Pei Chi Shek<sup>4,5,6</sup>, Prof. Yap Seng Chong<sup>2,4</sup>, Prof. Kok Hian Tan<sup>7,8</sup>, Associate Professor Shiao-Yng Chan<sup>2,4</sup>, Prof. Kok Peng Fabian Yap<sup>7,8,9</sup>, Prof. Keith M. **O.2.10 - Movement behaviors and health in children and families, UKK - Main Hall (Level 6), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Physical activity (PA), sedentary behaviour/inactivity (SB) and sleep are collectively referred to as 24h movement behaviours (24h-MB). We aimed to investigate the prospective associations of 24h-MBs with executive function and academic achievement in school-aged children.

**Methods:** Children in the Growing Up in Singapore Towards healthy Outcomes (GUSTO) cohort were asked to wear an accelerometer (Actigraph-GT3x+) on their wrist for seven consecutive days to measure 24h-MB at ages 5.5 and 8 years. The NEuroPSYchology test (NEPSY-II) and the Wechsler Individual Achievement Test (WIAT-III) were used to assess executive function (inhibition errors, switching error, repetition and recall) and academic achievement (numerical operations, spelling and oral-reading -fluency and -accuracy), at ages 8.5 and 9 years, respectively. Latent variables were generated based on executive function and academic achievement measures using confirmatory factor analysis. Compositional data analyses using isometric-logratio (ilr) coordinates and compositional isotemporal substitution were performed to investigate the associations of 24h-MB with outcomes, adjusting for sex, ethnicity, maternal age and education, and BMI of children at ages 5 or 8 years.

**Results:** In total, 432 children were included in the analysis. No associations were observed between composition of 24h-MB and executive function. However, relative to light-intensity PA (LPA), inactivity and sleep, higher moderate-to-vigorous PA (MVPA) was associated with lower academic achievement [For each unit increase in  $MVPA_{(ilr1)}$  at age 5.5 years, the mean difference in academic achievement (95% confidence interval): -0.367 (-0.726, -0.009) z-score; and for  $MVPA_{(ilr1)}$  at age 8 years: -0.282 (-0.616, 0.052) z-score]. The substitution model showed that reallocation of 5 to 60 min/day from MVPA to sleep was associated with increased academic achievement, but the expected decrease in academic achievement was modest for the reallocations of the same amount of time from sleep to MVPA. The estimated changes in the outcomes were not statistically significant for remaining pairs of reallocations.

**Conclusion:** In our study, the composition of 24h-MB was not associated with executive function. Higher MVPA, relative to LPA, inactivity and sleep, was associated with lower academic achievement. Further investigation on domain-specific activities is warranted to better understand relationships between 24h-MBs and executive function and academic achievements.

# The Associations Between Movement Behaviours and Insomnia Symptoms Among Preschoolers – Results from the SUNRISE Finland Pilot Study

**Dr. Elina Engberg**<sup>1,2</sup>, Prof. Jari Lahti<sup>2</sup>, Ms. Hanna Paasio<sup>1</sup>, Prof. Anthony Okely<sup>3</sup>, Prof. Eva Roos<sup>1,2</sup>, Dr. Marja Leppänen<sup>1,2</sup>

<sup>1</sup>Folkhälsan Research Center, Helsinki, Finland, <sup>2</sup>University of Helsinki, Helsinki, Finland, <sup>3</sup>University of Wollongong, Wollongong, Australia

**O.2.10 - Movement behaviors and health in children and families, UKK - Main Hall (Level 6), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Previous studies have reported associations of less physical activity (PA) and more sedentary (SED) and screen time with unfavourable sleep outcomes among children and adolescents. However, little is known about the relationship between movement behaviours and insomnia symptoms of young children. We examined whether PA, SED, sleep duration, or screen time associate with insomnia symptoms among 3- to 4-year-old children.

**Methods:** Fifty-eight children (mean age  $4\pm0.5$  years, 52% girls) participated in the cross-sectional SUNRISE Finland Pilot Study in 2022. Waist-worn ActiGraph accelerometers measured children's SED and different intensities of PA. Parents (85% mothers) of 49 children reported screen time (use of any electronic screen device or watching television, movies or videos while sitting or lying down), restrained sitting, and sleep duration (including naps) in 24 hours, and completed the Pediatric Insomnia Severity Index (PISI). PISI includes dimensions of Sleep Onset Problems (SOP) and Sleep Maintenance Problems (SMP), with higher scores indicating more symptoms. We used Spearman's partial correlation to examine associations between movement behaviours and PISI, and Mann Whitney U test to compare PISI between children who met and did not meet the WHO movement behaviour guidelines (total and moderate- to vigorous-intensity PA [MVPA], screen time, sleep duration, and restrained sitting).

**Results:** MVPA (crude  $r_s=-0.30$ ,  $p=0.035$ ) and VPA (crude  $r_s=-0.30$   $p=0.038$ ) associated negatively with SOP, but not after adjustments. Screen time associated with SOP after adjusting for age, sex, parent education, and household income (crude  $r_s=0.49$ ,  $p<0.001$ ; adjusted  $r_s=0.48$   $p<0.001$ ). In addition, children (50%) who met the screen time guideline ( $\leq 1$  h/24 h) had lower SOP compared to those who did not meet the guideline (mean  $2.2\pm1.9$  vs.  $4.2\pm2.8$ ,  $p=0.005$ ). SED and sleep duration, or meeting the other movement behaviour guidelines did not associate with PISI, but children (31%) who met all movement behaviour guidelines had a lower SOP compared to others ( $2.1\pm2.1$  vs.  $3.7\pm2.6$ ,  $p=0.024$ ).

**Conclusions:** Results from this pilot study indicate that less sedentary screen time and meeting all movement behaviour guidelines were associated with less sleep onset problems among preschoolers. These results need to be verified in a larger sample from the SUNRISE Main Study.

# Longitudinal changes in children's 24-hour activity compositions over two school years

**Mr. Aaron Miatke (corresponding author)<sup>1,2</sup>**, Prof. Tim Olds<sup>1,2</sup>, Prof. Carol Maher<sup>1</sup>, Dr. Francois Frayssse<sup>1</sup>, Dr. Dot Dumuid<sup>1,2</sup>

<sup>1</sup>University of South Australia, Adelaide, Australia, <sup>2</sup>Murdoch Children's Research Institute, Melbourne , Australia

**O.2.10 - Movement behaviors and health in children and families, UKK - Main Hall (Level 6), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The summer school holiday period has been proposed as a key time of year where negative health outcomes may develop in children due to reduced physical activity (PA) and increased sedentary behaviour (SB). The aim of this study was to examine longitudinal changes in 24-h activity compositions during the in-school and summer school holiday periods in a sample of Australian children.

**Methods:** Participants (n=343; 9.4 ± 0.3 years and in Grade 4 at enrolment) were children enrolled in the longitudinal Life on Holidays study (LoH). 24-h activity compositions were measured at the start and end of each school year for two years, and once during the interposed summer holiday period, using (1) accelerometry (time spent in sleep, SB, light PA, moderate-to-vigorous PA (MVPA)) and (2) use of time recall (time spent in 8 activity domains). Compositional multi-level multivariate linear models were used to estimate changes in 24-h activity compositions across timepoints while accounting for nesting of observations within participant, within school. Interaction effects for sex, age, puberty, weight status, socio-economic position (SEP) were tested. Model-based estimates were plotted to show activity trajectories across the two years.

**Results:** Children's activity composition differed across time points (p<0.001). Generally, over the two years, SB increased while MVPA and sleep decreased. Activity composition during summer holidays was significantly different to activity composition at every school timepoint. Using accelerometer data children accrued significantly less MVPA (range: -23; -14 min/day) and more SB (range: 15; 42 min/day) during holidays vs. in-school timepoints (sleep and LPA generally not significant). Using use-of-time recall data children accrued significantly less physical activity (range: -50; -16 min/day) and school-related activity (range: -174; -105 min/day); and more screen time (range: 37; 119 min/day), self-care (range: 20; 40 min/day), and domestic/social activities (range: 27; 33 min/day) during holidays vs in-school timepoints.

**Conclusions:** Children accrue less MVPA and more SB during the summer school holiday period. Summer holidays may be a key intervention point to reduce the burden of disease related to physical inactivity.

# The impact of the world's first regulatory intervention on child digital game time, homework time, and out-of-campus learning in China: a natural experiment evaluation of the ENERGISE study

**Dr. Bai Li**<sup>1</sup>, Dr. Selene Valerino Perea<sup>1</sup>, Prof. Charlie Foster<sup>1</sup>, Prof. Keith Syrett<sup>4</sup>, Dr. Weiwen Zhou<sup>2</sup>, Prof. Yihong Xie<sup>3</sup>, Dr. Zouyan He<sup>3</sup>, Prof. Yunfeng Zou<sup>3</sup>, Prof. Frank de Vocht<sup>5</sup>

<sup>1</sup>School for Policy Studies, University of Bristol, Bristol, United Kingdom, <sup>2</sup>Guangxi Centre for Diseases Control and Prevention, Nanning, China, <sup>3</sup>Guangxi Medical University, Nanning, China, <sup>4</sup>Law School, University of Bristol, Bristol, United Kingdom, <sup>5</sup>Bristol Medical School, University of Bristol, Bristol, United Kingdom

**O.2.11 - Policies for healthy environments in children and youth, UKK - Level 6 Foyer, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** In 2021, the Chinese government introduced nationwide regulations to restrict the time that children (7-18 years) should spend on digital games, homework, and out-of-campus learning, to improve child health and wellbeing. This was the world's first regulatory intervention on child sedentary behaviour (SB). The impact of this intervention could have important research and policy implications globally. We evaluated the effect of this regulatory intervention on child SB.

**Methods:** With a pre-post natural experiment design, we used surveillance data collected by the Guangxi Autonomous Region authority from 9 to 18 years students, before (wave 1) and after (wave 2) the introduction of the regulatory intervention, for repeated analyses (n=7,054) and repeated cross-sectional analyses (n=99,947). The regionally representative data were collected using a multi-stage random sampling from 31 counties. Pre-post differences were analysed for self-reported total SB time and key SB outcomes (e.g. homework time, out-of-campus learning time, screen viewing time and electronic device use time), using multilevel models adjusted for relevant covariates. We also explored subgroup differences by sex, stage of education, residency, and baseline weight status.

**Results:** At wave 2, students reduced their total daily SB time by 13.8% (95% CI: -15.9 to -11.7%, approximately 46 minutes less) on average and spent significantly less time on homework (and were 2.8 times more likely to meet the standards set by the regulation, 95% CI: 2.47-1.14) and out-of-campus learning. Students also reduced their screen-viewing time by 6.4% (95%CI: -9.6 to -3.3%, approximately 10 minutes less), and were 20% more likely to meet international daily screen time recommendations (95% CI: 1.1 to 1.3). The reduction in homework and screen-viewing time was larger in secondary school students ( $p < 0.0001$  for interaction) than in primary school students. We did not find an intervention effect on other outcomes. Population-level (repeated cross-sectional) analyses showed similar findings as the longitudinal (repeated) analyses.

**Conclusions:** The regulatory intervention has been effective in reducing total SB time among Chinese children and adolescents, mainly through reducing time spent on homework, out-of-campus learning and screen viewing. Similar but culturally appropriate regulatory interventions could be considered by policy makers in other countries.

# International school-related sedentary behaviour recommendations for children and youth

Associate Prof. Travis Saunders<sup>1</sup>, **Dr. Nicholas Oliver Corey Kuzik**<sup>2</sup>, Prof. Mark Tremblay

<sup>1</sup>University of Prince Edward Island, Charlottetown, Canada, <sup>2</sup>Children's Hospital of Eastern Ontario Research Institute, Ottawa, Canada

**O.2.11 - Policies for healthy environments in children and youth, UKK - Level 6 Foyer, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Existing sedentary behaviour guidelines for children and youth target overall sedentary behaviour and recreational screen time, without any specific recommendations regarding school-related sedentary behaviours (i.e., sedentary behaviours performed during the school day, or within the influence of school). This presentation will describe the recent development of international evidence-based recommendations for school-related sedentary behaviours for children and youth.

**Methods:** A panel of international experts was convened by the Sedentary Behaviour Research Network (SBRN) in November 2020 to guide the development of these recommendations for children and youth aged ~5–18 years. The recommendations were informed by 1) age-relevant existing sedentary behaviour guidelines, 2) published research on the relationship between overall sedentary behaviour and health, 3) a de novo systematic review on the relationship between school-related sedentary behaviours and health and/or academic outcomes, and 4) a de novo environmental scan of the grey literature to identify existing recommendations for school-related sedentary behaviours.

Draft recommendations were presented to the Expert Panel in June 2021. Following thorough discussion and modifications, updated recommendations were distributed for stakeholder feedback from July 9–26. Feedback was received from 148 stakeholders across 23 countries, leading to additional updates to the recommendations. Following further rounds of discussion and updates with the Expert Panel in August and September 2021, consensus was achieved on the final recommendations, which were released on April 5, 2022.

**Results:** A healthy day includes breaking up extended periods of sedentary behaviour and incorporating different types of movement into homework whenever possible, while limiting sedentary homework. School-related screen time should be meaningful, mentally or physically active, and serve a specific pedagogical purpose that enhances learning. Replacing sedentary learning activities with movement-based learning activities, and replacing screen-based learning activities with non-screen-based learning activities, can further support students' health and wellbeing.

**Conclusions:** These recommendations present the first evidence-based recommendations for school-related sedentary behaviours for children and youth. These recommendations will support the work of parents, caregivers, educators, school system administrators, policy makers, researchers and healthcare providers interested in promoting student health and academic success.

# Preschool children's physical activity in the home, childcare and neighbourhood environment: A latent profile analysis using device-based measures.

**Ms. Pulan Bai**<sup>1,2</sup>, Dr. Jasper Schipperijn<sup>3</sup>, Dr. Michael Rosenberg<sup>4</sup>, Dr. Hayley Christian<sup>1,2</sup>

<sup>1</sup>School of Population and Global Health, The University of Western Australia, Perth, Australia, <sup>2</sup>Telethon Kids Institute, The University of Western Australia, Perth, Australia, <sup>3</sup>Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark, <sup>4</sup>School of Human Sciences (Exercise and Sport Science), The University of Western Australia, Perth, Australia

**O.2.11 - Policies for healthy environments in children and youth, UKK - Level 6 Foyer, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** There is a significant evidence gap around using 'location-specific' physical activity data to explore the characteristics of physical environment domains where preschool children are physically active. A latent profile analysis approach using device-based physical activity location data can address this evidence gap by classifying preschool children into subgroups based on where they accumulate physical activity. We explored profiles of preschool children based on which environmental domains they accumulate moderate to vigorous physical activity (MVPA), and investigated the underlying characteristics of the physical environmental features within each profile.

**Methods:** A GIS map layer of the Perth and Peel region (Western Australia) was imported from OpenStreetMap into ArcGIS Pro for analysis. Combined 7-day accelerometer and Global Positioning System (GPS) data from 115 preschool children aged 2 to 5 years old was analysed in ArcGIS Pro to identify where preschool children accumulated MVPA within five environmental domains: 1) home, 2) childcare, 3) <500m from home, 4) 500-1600m from home, and 5) >1600m from home. Latent profile analysis was performed with the five environmental domain specific mean minutes of MVPA as outcome variables. Independent t-tests were performed to explore if there were any significant differences between profiles in terms of the physical environmental characteristics of each domain.

**Results:** Three profiles were identified: "Home bodies" (n=41), "Active except close to home" (n=61), and "Active except in local neighbourhood" (n=13). Compared to other profiles, "Home bodies" had less parks and playgrounds within their 500-1600m neighbourhood and the "Active except in local neighbourhood" profile had fewer sports and recreation centres within the <500m neighbourhood (both  $P<0.05$ ). The "Active except close to home" profile had less school grounds within the <500m neighbourhood, but more parks and playgrounds and sport and recreation centres in their 500-1600m neighbourhood compared to the other two profiles (all  $P<0.05$ ).

**Conclusions:** Findings suggest preschool children's MVPA profiles are reflections of their physical environmental opportunities. Future policy and planning should consider that local access to parks and playgrounds, school grounds and sport and recreation centres is important for supporting young children to be physically active.

# National school food standards in secondary schools in England: how well do schools comply and how does this influence students' dietary intake?

**Dr. Miranda Pallan<sup>1</sup>**, Dr. Marie Murphy<sup>1</sup>, Dr. Breanna Morrison<sup>1</sup>, Dr. Alice Sitch<sup>1,2</sup>, Prof. Peymane Adab<sup>1</sup>  
<sup>1</sup>University of Birmingham, Birmingham, United Kingdom, <sup>2</sup>National Institute for Health Research Biomedical Research Centre, Birmingham, United Kingdom

**O.2.11 - Policies for healthy environments in children and youth, UKK - Level 6 Foyer, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** School food standards (SFS) in England are in place to promote healthy eating in school students. They are a legal requirement for state-funded schools. In secondary schools, there has been little evaluation of compliance with the standards and their influence on student dietary intake. In the FUEL study, we aimed to evaluate SFS compliance in secondary schools and explore associations between compliance-level and students' dietary intakes.

**Methods:** We conducted a cross-sectional study with 36 state-funded secondary schools and 2,273 students aged 11-15 years in the Midlands, UK. We assessed SFS compliance through review of school food menus and observations of foods and drinks offered in the school canteens. We grouped standards according to whether they were aiming to increase dietary variety or aiming to restrict the provision of high fat, sugar and salt (HFSS) foods/drinks, and assessed compliance with these standards. We assessed student dietary intakes on two separate occasions using an online 24-hour dietary recall measure (Intake24) and estimated intakes of energy, free sugar, fat, fibre, fruit and vegetables, sugar-sweetened drinks, confectionery and HFSS items during school lunch, the school day, and 24 hours. Using multilevel models and controlling for student and school characteristics, we explored the association between school SFS compliance-level and student dietary intakes.

**Results:** Overall, schools were compliant with 64% of SFS. Standards with the lowest compliance were those restricting HFSS foods/drinks. Compliance with SFS aiming to increase dietary variety was associated with marginally lower lunchtime energy intake ( $B=-2.14\text{kcal}$ ; 95% CI:  $-3.88\text{kcal}$ ,  $-0.41\text{kcal}$ ) and fat intake ( $B=-0.12\text{g}$ ; 95% CI:  $-0.19\text{g}$ ,  $-0.04\text{g}$ ), but higher lunchtime percent energy from free sugars ( $B=0.14\%$ ; 95% CI:  $0.06\%$ ,  $0.22\%$ ). School compliance with SFS aiming to restrict HFSS items was associated with marginally higher 24-hour free sugar intake ( $B=0.29\text{g}$ ; 95% CI:  $0.03\text{g}$ ,  $0.56\text{g}$ ) and confectionery item intake (IRR:  $1.01$ ; 95% CI:  $1.00-1.01$ ).

**Conclusions:** Secondary schools do not fully comply with the national SFS and there is no evidence that compliance-level is associated with improved student nutritional intake. Adaptation of the current SFS may be needed to more positively influence nutritional intake in secondary school students.

# Parent Perceptions of Universal School Meals During the COVID-19 Pandemic in Two U.S. States

**Dr. Leah Chapman<sup>1,8</sup>**, Dr. Deborah Olarte<sup>1</sup>, Dr. Wendi Gosliner<sup>2</sup>, Dr. Lorrene Ritchie<sup>2</sup>, Dr. Marlene Schwartz<sup>3</sup>, Dr. Michele Polacsek<sup>4</sup>, Dr. Christina Hecht<sup>2</sup>, Mr. Kenneth Hecht<sup>2</sup>, Dr. Lindsey Turner<sup>5</sup>, Dr. Anisha Patel<sup>6</sup>, Ms. Margaret Read<sup>7</sup>, Ms. Tara Daly<sup>1</sup>, Dr. Juliana Cohen<sup>1,8</sup>

Chan School of Public Health, Boston, USA

**O.2.11 - Policies for healthy environments in children and youth, UKK - Level 6 Foyer, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** In response to the COVID-19 pandemic, Congress funded a Universal School Meals (USM) program that offered two school meals daily to all students at no charge regardless of family income. Prior literature on the district-level analogue to USM (known as the Community Eligibility Program [CEP]) indicates that offering meals to all students at no charge increases school meal participation, reduces stigma, and can help improve household food security and reduce diet-related disparities. The federal pandemic USM program ended with the 2021-22 school year and most states reverted to the CEP, with tiered pricing, including free-and-reduced-price meals (FRPM) for students whose families meet income eligibility criteria (and full cost for those who are not eligible). However, several states, including California and Maine, adopted a state-level USM policy. This study aimed to understand parent perceptions of the federal and new state USM policies in California and Maine in order to strengthen the policies' implementations and inform consideration of USM policies by additional states and federally.

**Methods:** Semi-structured interviews were conducted over the phone with 60 parents of students in elementary, middle, and high schools in rural and urban communities in California (n=46 parents) and Maine (n=14 parents). All interviewees met FRPM income eligibility. Using grounded theory, transcripts were analyzed qualitatively, applying principles of content analysis to identify themes and domains. Application of the codes and inter-rater reliability were conducted with trained research assistants.

**Results:** The primary themes identified were that USM saved families money and time, as parents had fewer meals to purchase and prepare for their children. Additionally, the schools' assumption of this responsibility reduced stress for parents. USM reduced stigma for parents, who described feelings of shame when they previously filled out paperwork to determine their family's free or reduced-priced meal eligibility. Parents also indicated they were satisfied with the quality and amount of food served in school meals.

**Conclusions:** Parents were satisfied with the quality and amount of food provided by school meals, and believed USM saved them money and time and reduced stress. Parents also felt USM reduced stigma for families, particularly for parents themselves.

# Food environments within and outside of schools play a critical role in curtailing rise in obesity among school age children

**Dr. Punam Ohri-Vachaspati<sup>1</sup>**, Dr. Francesco Acciai<sup>1</sup>, Ms. Kristen Lloyd<sup>2</sup>, Dr. David Tulloch<sup>2</sup>, Ms. Sarah Martinelli<sup>1</sup>, Dr. Katie Disantis<sup>3</sup>, Dr. Robin DeWeese<sup>1</sup>, Dr. Emily Melnick<sup>1</sup>, Dr. Derek DeLia<sup>2</sup>, Dr. Michael Yedidia<sup>2</sup>  
<sup>1</sup>Arizona State University, Phoenix, AZ, USA, <sup>2</sup>Rutgers University, New Brunswick, NJ, USA, <sup>3</sup>Thomas Jefferson University, Philadelphia, PA, USA

**O.2.11 - Policies for healthy environments in children and youth, UKK - Level 6 Foyer, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To identify alterable factors in the food environments in schools and their surrounding communities that were associated with trends in obesity rates among school-aged children.

**Methods:** Body mass indices were calculated at four time points between 2013 and 2020 using nurse measured heights and weights of students attending 115 K-12 schools in low-income communities. School-level obesity prevalence was used as the outcome variable. Detailed data on the food environment within schools was captured through annual surveys and summarized into indices capturing healthfulness of school lunch meals and competitive foods. The food environment within 0.25 miles of schools was captured each year during the study period. Densities and presence of different types of outlets likely to be frequented by students (limited-service restaurants, convenience stores, small grocery stores, and upgraded [healthy] convenience stores) were calculated. Data were analyzed using linear regression models adjusting for repeated measurements.

**Results:** The sample of children from 115 schools included predominantly black (47%) and Hispanic (49%) students with high rates of eligibility for free and reduced-price meals (80%). Rates of obesity significantly increased in schools with the unhealthiest school lunch meal offerings and unhealthiest a la carte options ( $p < .001$  and  $p < .01$ , respectively). Similarly, schools exposed to the greatest increase in convenience store density and limited service restaurant density saw significantly worsening obesity trends ( $p < .01$  for both). Overall, prevalence of obesity increased from 26% to 29% over the course of the study. Schools with the unhealthiest food environment both within and outside had a significant increase in the proportion of students with obesity (26% to 33%,  $p < .01$ ) over the course of the study. Schools with the healthiest food environment both within and outside did not see a significant change in obesity prevalence (24% to 25%,  $p = 0.563$ ).

**Conclusion:** These findings highlighting the importance of the school food environment on student obesity rates have significant policy implications. Both the food environments within and outside of school matter, suggesting that in addition to enhancing the quality of food served in schools, policies and interventions to improve food options around schools can help curtail the rising obesity trends.

# Hypothetical lifestyle interventions and their effects on overweight/obesity incidence in children and adolescents from vulnerable and non-vulnerable groups

**O.2.12 - Hot topics for children health behaviours, UKK - Hall B, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

## **Purpose:**

**Methods:** Our sample comprised 10 877 children aged 2 to <10 years at baseline who participated in the well-phenotyped IDEFICS/I.Family cohort. Children were followed over 14 years from 2007/2008 to 2020/21. Applying the parametric g-formula, the risk of developing OW/OB was estimated under five hypothetical lifestyle interventions regulating screen time, sugar-sweetened beverages (SSB) consumption, sleep duration, eating while doing something else and membership in a sports club. Interventions that impose adherence to recommendations (e.g. screen time recommendations) were compared to so-called 'shift' interventions that change the interventional variable by a certain amount (e.g. decreasing screen time by 30 minutes). In addition, the effectiveness of interventions in vulnerable groups such as children of parents with low/medium educational level or children of mothers with OW/OB was assessed.

**Results:** The 13-year risk of developing overweight or obesity was 30.7% under no intervention and 25.4% when multiple interventions were imposed jointly. The most effective intervention was to meet screen time recommendations which could reduce the incidence of OW/OB by 2.2 [confidence interval: 0.7-4.4] percentage points over a 13-year period. If all children were members in a sports club, the incidence could be reduced by 1.6 [0.4-2.7] percentage points. When targeting only children of parents with low/medium education, we would intervene on 19.2% of children while still reaching an intervention effect of 1.0 percentage points risk reduction. Meeting sleep recommendations (risk difference: -0.6 [-1.1;-0.3]) showed a similar intervention effect as compared to increasing sleep duration by 30 minutes/day (risk difference: -0.6 [-0.0;-0.3]).

**Conclusions:** Joint interventions addressing several lifestyle factors may be most effective. Specific emphasis should be placed on the reduction of screen time and on enabling participation in a sports club for children of families with low/medium educational background.

# Unpacking the lunchbox: what is the cost to Australian families?

**Miss Alexandra Manson**<sup>1</sup>, Prof. Rebecca Golley<sup>1</sup>, Dr. Rachel Sutherland<sup>2, 3</sup>, Prof. Luke Wolfenden<sup>2, 3</sup>, Dr. Brittany Johnson<sup>1</sup>

<sup>1</sup>Caring Futures Institute, College of Nursing and Health Sciences, Flinders University, Adelaide, Australia,

<sup>2</sup>National Centre of Implementation Science, Newcastle, Australia, <sup>3</sup>School of Medicine and Public Health, University of Newcastle, Newcastle, Australia

**O.2.12 - Hot topics for children health behaviours, UKK - Hall B, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Most Australian children bring a lunchbox packed from home, or purchase food from an onsite canteen, with most of the food consumed during school hours being misaligned with nutrition guidelines. Cost is a commonly raised barrier by parents/caregivers to healthy lunchbox provision. However, little is known about how much Australian families spend on children's school lunches. We aimed to examine the cost of current school lunchbox provision, and whether these costs differs by indicators of socioeconomic position, or nutritional quality.

**Methods:** This study was a secondary analysis of cross-sectional data, with data collected in 2017 in NSW, Australia. Lunchboxes of students aged 4-12 years at catholic primary schools were assessed at the start of the day, with nutrition and cost assessed through photography assessment methods and a validated School Food Checklist. Costs (AUD) were adjusted for inflation as of mid-2022. Descriptive statistics and multivariable linear regression analyses were performed.

**Results:** The lunchboxes of 1026 students (kindergarten to grade 6) were analysed, from 12 schools. The mean cost of lunchboxes was \$3.87(SD 1.33), containing a mean energy of 2699kJ(SD 859), with 37.3%(SD 23.9) of energy sourced from unhealthy foods. Students with only healthy items in their lunchboxes had a lower mean cost (\$3.13(SD 1.02)) than those with mostly healthy foods ( $\geq 50\%$  kJ from healthy foods) (\$3.78(SD 1.07)) or mostly unhealthy foods ( $< 50\%$  of kJ from healthy foods) contributing to their lunchbox energy (\$4.45(SD 1.69)). A preliminary multiple linear regression found the greatest predictors of higher lunchbox cost were ( $p < 0.05$ ) a higher level of socio-economic disadvantage (beta 0.15) and a higher proportion of energy from unhealthy choices (beta 0.25) when controlling for socio-demographics.

**Conclusions:** Families residing in a greater area of disadvantage have higher lunchbox costs. Further, there are higher costs for an unhealthier lunchbox, consistent with international evidence. This understanding of the cost of children's lunchboxes can direct school nutrition interventions and support families with healthy food provision. Efforts to support the packing of healthier lunchboxes, that are mindful of affordability, may reduce financial burden on families.

# Parental support and co-physical activity predicts young children's adherence to World Health Organization guidelines

Prof. Amy S Ha<sup>1</sup>, Dr. Johan Y Y Ng<sup>1</sup>, **Ms. Shan Jiang**<sup>1</sup>

<sup>1</sup>The Chinese University of Hong Kong, Shatin, Hong Kong

**O.2.12 - Hot topics for children health behaviours, UKK - Hall B, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Developing a physically active lifestyle in young children is important as habits and routines built during early childhood could carry over to later stages of their lives. Based on the World Health Organization's recommendations, young children should accrue at least 180 minutes of physical activity per day of any intensities, of which 60 minutes or more should be moderate-to-vigorous physical activity (MVPA). Children should also spend no more than 60 minutes per day on sedentary screen time. Since young children's behaviors are largely shaped by their parents, we examined how parent-related variables, in conjunction with environmental factors, impacted children's activity behaviors.

**Methods:** Participants of this cross-sectional study were 137 preschool-aged children (age = 4.4 years,  $SD = 2.9$ ; 46% girls) and their parents (80% mothers). Physical activity was measured using ActiGraph accelerometers, and participants' co-activity was extracted based on proximity data collected using the devices. Using questionnaires, parents reported children's daily sedentary screen time, the proximity between their homes and playgrounds, and their support towards children's physical activity. Children were considered to have met activity guidelines if their daily activity time and MVPA exceeded 180 and 60 minutes, respectively, and their average screen time was less than 60 minutes. A binomial logistic regression was conducted to examine whether the measured environmental and parental factors predicted children's adherence to activity guidelines.

**Results:** In this study, 16% of children met the World Health Organization's physical activity guidelines. Results of the logistic regression suggested that parents' self-reported support towards children's physical activity (e.g., logistic support, encouragement;  $B = 1.10$ ,  $p = .009$ ) and parent-child co-physical activity time ( $B = 0.04$ ,  $p = .004$ ) were significant predictors of children's adherence to activity guidelines. By contrast, the effect of proximity to playgrounds and parents' own MVPA on the outcome were not significant.

**Conclusions:** Parents' support towards young children's physical activity, either in form of providing logistic support, encouragement, or engaging in co-activity were found to be important predictors of children's adherence to physical activity guidelines. Establishing a positive attitude and developing family routines in physical activity is therefore imperative in children in early childhood.

# The association of the timing of evening food intake with adiposity among preschool-aged children in Finland – moderation by chronotype

**Miss Jenna Rahkola**<sup>1</sup>, Mr. Aku-Ville Lehtimäki<sup>1</sup>, Ms. Anna Abdollahi<sup>1,2</sup>, Dr. Henna Vepsäläinen<sup>2</sup>, Miss Josefine Björkqvist<sup>1</sup>, Dr. Ilona Merikanto<sup>3,4,5</sup>, Prof. Eva Roos<sup>1</sup>, Prof. Maijaliisa Erkkola<sup>2</sup>, Dr. Reetta Lehto<sup>1,2</sup>

<sup>1</sup>Folkhälsan Research Center, Helsinki, Finland, <sup>2</sup>Department of food and Nutrition, University of Helsinki, Helsinki, Finland, <sup>3</sup>Faculty of Medicine, University of Helsinki, Helsinki, Finland, <sup>4</sup>Department of Public Health and Welfare, Finnish Institute for Health and Welfare, Helsinki, Finland, <sup>5</sup>Orton Orthopaedics Hospital, Helsinki, Finland

**O.2.12 - Hot topics for children health behaviours, UKK - Hall B, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Later timing of food intake has been identified as a possible contributor to overweight/obesity, but the evidence is inconclusive and limited in younger children. Moreover, studying the timing of eating relative to the internal circadian time instead of the clock time has been suggested to be more relevant in this connection. Hence, we examined the association of the timing of evening food intake as clock time and relative to sleep onset (a proxy of circadian timing) with BMI z-score and waist circumference, and whether these associations are moderated by chronotype among preschool-aged children.

**Methods:** The sample consist of 627 Finnish 3–6-year-olds from a cross-sectional survey that was a part of the DAGIS research. Food intake was measured with a 3-day food record and sleep with a hip-worn actigraphy. Three variables were formed to describe the timing of evening food intake: time of the last eating occasion, time between the last eating occasion and sleep onset, and the percentage of total daily energy intake (%TDEI) consumed around sleep onset (onwards from two hours before sleep onset). Chronotype was assessed as a sleep debt corrected midpoint of sleep on weekend. Researchers measured children's weight, height, and waist circumference. The data were analyzed with linear mixed-effects models.

**Results:** The last eating occasion occurring earlier relative to sleep onset (Estimate = -0.006, 95%CI = -0.010; -0.002) and lower %TDEI consumed around sleep onset (Estimate = 2.9E-4, 95%CI = 2.0E-5; 0.001) were associated with smaller waist circumference (log-transformed) even after adjusting for several possible confounders. Other investigated associations were not significant, and no interactions with chronotype were found.

**Conclusions:** The results suggest that later eating relative to sleep onset associates with larger waist circumference in preschoolers. Results also highlight the importance of studying the timing of eating relative to sleep onset instead of actual clock time since no associations were found regarding the clock time of the last eating occasion. Further research should study whether changing the timing of eating in the evening can induce changes in adiposity measures.

# Effect of nationwide school policy on device-measured physical activity in Danish children and adolescents

**Ms. Natascha Holbæk Pedersen**<sup>1</sup>, Prof. Anders Grøntved<sup>1</sup>, Associate Professor Jan Christian Brønd<sup>1</sup>, Associate Professor Niels Christian Møller<sup>1</sup>, Assistant Professor Kristian Traberg Larsen<sup>1</sup>, Associate Professor Birgit Debrabant<sup>2,3</sup>, Dr. Sofie Koch<sup>4</sup>, Prof. Jens Troelsen<sup>4</sup>, Prof. Søren Brage<sup>5</sup>, Prof. Jasper Schipperijn<sup>4</sup>, Prof. Jacob Hjelmborg<sup>3</sup>, Prof. Niels Wedderkopp<sup>1</sup>, Associate Professor Lars Breum Christiansen<sup>4</sup>, Associate Professor Peter Lund Kristensen<sup>1</sup>

<sup>1</sup>Centre of Research in Childhood Health, Research Unit for Exercise Epidemiology, Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark, <sup>2</sup>Data Science and Statistics, Department of Mathematics and Computer Science, University of Southern Denmark, Odense, Denmark, <sup>3</sup>Epidemiology, Biostatistics and Biodemography, University of Southern Denmark, Odense, Denmark, <sup>4</sup>Research unit for Active Living, Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark, <sup>5</sup>MRC Epidemiology Unit, University of Cambridge, Cambridge School of Clinical Medicine, Institute of Metabolic Science, Cambridge, United Kingdom

**O.2.12 - Hot topics for children health behaviours, UKK - Hall B, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The Danish Government introduced a new school policy in 2014. The policy entailed several structural changes including a requirement of 45 minutes of physical activity daily integrated in scheduled lessons. The main objective of this natural experiment was to evaluate the effect of the school policy on device-measured physical activity in Danish children and adolescents aged 6-17.

**Methods:** The effect was evaluated using an interrupted time-series approach. Pre-policy data consisted of device-measured physical activity data from 2,346 children and adolescents from four historical studies completed between 2009-2012. In 2017/18, a post-policy data collection was completed in 2,470 children and adolescents. Schools, age-groups, and seasons were carefully matched. Physical activity data were collected using accelerometry. Main outcome was any bodily movement. Secondary outcomes were moderate to vigorous physical activity and mean counts per minute. Data were analyzed using mixed-effect linear regression.

**Results:** The Danish school policy interrupted a linear decreasing pre-policy trend in movement, moderate to vigorous physical activity and mean counts per minute during school hours, and increases were observed in all physical activity outcomes post-policy during a standardized school day (8:10am – 1pm). Specifically, we observed an increase during a standardized school day in 2017/2018 of 14.2 minutes of movement per day (95% CI: 11.4; 17.0,  $p < 0.001$ ), 6.5 minutes of moderate to vigorous physical activity per day (95% CI: 4.7; 8.3,  $P < 0.001$ ), and 141.8 counts per minute per day (95% CI: 108.5; 175.2,  $P < 0.001$ ). Increases were more pronounced in the youngest children (1<sup>st</sup>- 5<sup>th</sup> grade) compared to older ones (6<sup>th</sup>-9<sup>th</sup> grade). No effect was observed in any outcomes when measured during a full day.

**Conclusion:** A national school policy may be a useful strategy to increase physical activity during school time among children and adolescents, and results are important to decision-makers at all levels.

# Salad bars and primary students' fruit and vegetable consumption: A group-randomized trial with objective assessments

**Associate Professor Marc Adams**<sup>1</sup>, Prof. Michael Todd<sup>1</sup>, Assistant Professor Mindy McEntee<sup>1</sup>, Prof. Punam Ohri-Vachaspati<sup>1</sup>, **Prof. Meg Bruening**<sup>2</sup>

<sup>1</sup>Arizona State University, Phoenix, USA, <sup>2</sup>The Pennsylvania State University, University Park, USA

**O.2.12 - Hot topics for children health behaviours, UKK - Hall B, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** School salad bars are often promoted to increase children's fruit and vegetable (FV) intake. However, very little evidence exists to support those claims, especially using objective measures. Further, it is unknown how nutrition marketing may enhance the impact of school salad bars on children's FV behaviors. Thus, we sought to examine the efficacy of school salad bars and nutrition marketing on children's consumption of FVs during school lunch.

**Methods:** We conducted a cluster-randomized factorial trial between 2017 and 2019 among 13 low-income primary schools in Arizona, USA (n=3,029 children; 57.7% Hispanic; 79.1% free/reduced priced lunch) to examine changes in children's FV consumption over 10+ weeks in schools offered salad bars + nutrition marketing (n=3 schools), salad bars alone (n=3 schools), nutrition marketing alone (n=3 schools), or a wait-list control (n=4 schools). FV consumption, defined as the aggregate amount in grams of FV selected minus the amount discarded by individual trays at lunch, was measured using plate waste methodology. Negative binomial models, adjusted for student sex, grade, race/ethnicity, free/reduced-price lunch, and clustering at the school level, were used to assess the effect of salad bars, nutrition marketing, and salad bars + marketing conditions.

**Results:** Mean consumption at baseline was 69.8g ( $\pm 14.3$ ) for control, 50.0g ( $\pm 10.3$ ) for salad bar alone, 36.9g ( $\pm 7.5$ ) for marketing alone, and 41.3g ( $\pm 7.3$ ) for salad bar + marketing conditions. By 10 weeks, consumption was 47.1g ( $\pm 9.7$ ) for the control, 62.8g ( $\pm 12.8$ ) for salad bar alone, 42.0g ( $\pm 8.6$ ) for marketing alone, and 61.8g ( $\pm 11.9$ ) for salad bar + marketing conditions. Compared to the change in FV consumption between baseline and 10 weeks for the control condition, FV consumption for salad bar alone (OR = 5.28 [1.28, 21.80], p = .022), marketing alone (OR = 4.36 [1.04, 18.20], p = .044), and salad bar + marketing (OR = 3.59 [0.95, 13.60], p = .059) conditions were greater by 10 weeks, adjusting for individual-level confounding.

**Conclusions:** This trial offers strong evidence confirming salad bars increase FV consumption among low-income primary school students in the US. Relevance to national school food systems and policy will be discussed.

# Job demands and Physical Activity: A Moderated Mediation Model of Self-Regulatory Fatigue and Job Appraisals

**Prof. Cecilie Thøgersen-Ntoumani<sup>1, 2</sup>**

<sup>1</sup>University of Southern Denmark, Odense, Denmark, <sup>2</sup>Curtin University, Perth, Australia

O.2.13 - What have we learned recently on motivation and behavior change, UKK - Hall C (Level 3), June 16, 2023, 2:15 PM - 3:45 PM

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Research suggests that high job demands (such as workload or emotional demands) are associated with low levels of physical activity engagement. However, psychological mechanisms explaining this association are less well understood and research has primarily been cross-sectional. The purpose of the study was two-fold, specifically to examine: 1) whether any prospective associations between job demands (workload and emotional demands) and leisure-time physical activity was mediated by self-regulatory fatigue, and 2) if job appraisals (challenge and hindrance) moderated the indirect association between job demands and changes in leisure-time physical activity.

**Methods:** The study used a prospective survey design. Full-time working adults ( $N=461$ ;  $M_{age} = 36.29$ ; 82.2% female) completed two online surveys, one week apart. Questionnaires used to measure the constructs included the Quantitative Workload Inventory (Spector & Jex, 1998; doi:10.1037/1076-8998.3.4.356), the Emotional Demands Scale (Bakker et al., 2003; doi:10.1080/13594320344000165), the Mental Fatigue Symptom Inventory-Short Form (Stein et al., 2004; doi:10.1016/j.painsymman.2003.06.003), the Challenge and Hindrance Appraisal Scale (Searle & Auton, 2015; doi:10.1080/10615806.2014.931378) and the International Physical Activity Questionnaire (Craig et al., 2003; doi:10.1249/01MMS.0000078924.61453.FB). The moderated mediation model was tested using the PROCESS macro in SPSS (model 7), using residualised change scores.

**Results:** Workload was negatively associated with changes in leisure-time physical activity ( $b = -69.58$ ,  $t(450) = -2.35$ ,  $p = .019$ ) but results for emotional demands were not significant. Self-regulatory fatigue mediated the negative relationship between workload and changes in leisure-time physical activity (index = 11.68,  $SE = 6.13$ , 95% CI [.83, 24.98]) and between emotional demands and changes in leisure-time physical activity (index = 13.09,  $SE = 6.55$ , 95% CI [1.25, 27.02]). Moderated mediation analysis showed that job appraisals did not moderate the indirect effect of job demands and physical activity engagement, via self-regulatory fatigue.

**Conclusions:** The results provide support for a health impairment process by which high job demands exhaust employees' psychological energy resources which leads to fatigue and decreases in health-promoting behaviours. Interventions focusing on job redesign may be needed to increase leisure-time physical activity in working adults who experience high job demands.

# The experiences of night shift workers following three different dietary weight loss strategies: A qualitative study

**Ms. Corinne Davis<sup>1</sup>**, Dr. Catherine E. Huggins<sup>1,2</sup>, Dr. Sue Kleve<sup>1</sup>, Prof. Maxine P. Bonham<sup>1</sup>

<sup>1</sup>Department of Nutrition, Dietetics & Food, Monash University, Notting Hill, Australia, <sup>2</sup>Institute for Health Transformation, Global Centre for Preventive Health and Nutrition, Deakin University, Burwood, Australia

**O.2.13 - What have we learned recently on motivation and behavior change, UKK - Hall C (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Approximately 13-27% of the workforce are shift workers, who are at greater risk for obesity-related diseases. Despite this risk, there are limited weight-loss studies for night-shift workers, and no studies that explore their experiences during their weight-loss journey. The Shifting Weight using Intermittent Fasting in night shift workers (SWIFt) study compares three, 24-week weight-loss strategies: continuous energy restriction (CER), and 500-calorie fasting for 2-days per week; either during the day (5:2D), or the night shift (5:2N), with some food provided for all interventions. This qualitative study of a night-shift worker weight-loss intervention, aimed to explore the experiences of participants, in particular: 1) how intervention features influence engagement, and 2) how barriers/enablers at the individual, social, organisational, environmental levels, influence engagement.

**Methods:** This qualitative study forms part of a wider mixed-methods evaluation of the SWIFt study, which is underpinned by pragmatism as a theoretical perspective guiding research design. Semi-structured interviews were undertaken with a sub-set of participants who opted in at baseline and/or 24-weeks, with an additional option to complete fortnightly audio-diaries. A maximum-variation sampling approach was used to gain viewpoints across demographics and study-completion. Interviews/diaries were transcribed verbatim and analysed using a five-step thematic framework approach in NVivo.

**Results:** Out of the 250 participants randomised to the SWIFt study, 22 baseline interviews, 20 twenty-four-week interviews, 5 withdrawal/loss-to-follow up interviews, and 18 audio-diary sets, were completed totalling 43-hours. Four emerging themes and sub-themes include: 1) positive intervention features: 'convenience of provided foods', 'dietetic support/accountability', 'experiencing weight-loss', 'aiding shift-worker research', 'moderation approach' for CER, 'simplicity of approach' for 5:2; 2) negative intervention features: 'weight change not meeting expectations', 'limited focus on non-fasting days' for 5:2; 3) enablers external to intervention: 'high motivation/willpower', 'keeping busy', 'social support'; and 4) barriers external to intervention: 'fatigue', 'social eating events', 'availability of unhealthy food within/surrounding the workplace'.

**Conclusions:** Findings indicate that components of the SWIFt strategies were mostly well-tolerated. Positive intervention features including 'convenience of provided foods' and 'dietetic support/accountability' should be harnessed, and additional features such as a focus on non-weight related outcomes and changes to the workplace food environment, may further enhance engagement.

# Effectiveness of a multicomponent intervention promoting resistance training using outdoor gyms: ‘ecofit’, a cluster randomised controlled trial

**Prof. Ronald Plotnikoff**<sup>1,2</sup>, Dr. Anna Jansson<sup>1,2</sup>, Prof. Mitch Duncan<sup>2,3</sup>, Dr. Jordan Smith<sup>1,2</sup>, Prof. Adrian Bauman<sup>4</sup>, Prof. John Attia<sup>3</sup>, Prof. David Lubans<sup>1,2</sup>

<sup>1</sup>Centre for Active Living and Learning, University of Newcastle, Newcastle, Australia, <sup>2</sup>Active Living Research Program, Hunter Medical Research Institute, Newcastle, Australia, <sup>3</sup>School of Medicine and Public Health, University of Newcastle, Newcastle, Australia, <sup>4</sup>School of Public Health, University of Sydney, Sydney, Australia

**O.2.13 - What have we learned recently on motivation and behavior change, UKK - Hall C (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** This study aimed to determine the effectiveness of an innovative multicomponent intervention promoting resistance-based and aerobic physical activity using outdoor gyms, mHealth, and social support.

**Methods:** The effectiveness trial involved a two-arm cluster randomised controlled trial design, with assessments at baseline, 3- (primary time-point) and 9-months (follow-up). Participants were recruited from two large local government municipalities in New South Wales, Australia. Eligible participants were aged 18-80 years, had access to a smartphone, were not meeting aerobic and/or resistance-based physical activity guidelines, and passed a Pre-Exercise Screening Tool. Intervention components included: i) a purpose-built smartphone application (app) with standardised workouts linked to 12 local outdoor gyms locations, ii) social support (i.e., option to enrol as a group and join the *ecofit* Facebook group), and iii) a 90-minute introductory session. Linear mixed models were conducted with an adjusted alpha ( $p < .025$ ) to account for the two primary outcomes of upper (i.e., push-up test) and lower body (sit-to-stand test) muscular fitness.

**Results:** Participants ( $N=245$ ; mean age 53.4 yrs [ $SD=13.9$ ]; 72% female) were recruited. There were no statistically significant group-by-time effects for the primary outcomes at 3-months. There were however, statistically significant intervention effects in self-reported resistance training [RT] (0.8 times/week, 95%CI=0.5, 1.2,  $p < .001$ ), RT self-efficacy (0.5 units, 95%CI=0.2, 0.8) and implementation intentions for RT (0.9 units, 95%CI=0.5, 1.3) at 3-months. At follow-up (9-months), there were statistically significant intervention effects for both upper (1.42 repetitions, 95%CI=0.25, 2.59) and lower body (2.6 repetitions, 95%CI=0.41, 4.82) muscular fitness, self-reported RT (0.7 times/week, 95%CI=0.3, 1.1,  $p = .002$ ), RT self-efficacy (0.6 units, 95%CI=0.2, 0.9) and implementation intentions for RT (0.8 units, 95%CI=0.3, 1.3).

**Conclusions:** This appears one of the first community-based RT intervention employing a scalable, affordable approach targeting the general population. Beneficial effects on several outcomes were encouraging, particularly given the disruption caused by the COVID-19 pandemic. The positive findings warrant further examination of this scalable intervention for dissemination to other local government municipalities.

# Does a nutritional intervention aiming at improving diet quality and initiated in early pregnancy improve glucose homeostasis in pregnant individuals at risk for gestational diabetes? A randomized controlled trial

**Miss Emilie Bernier**<sup>1,2,3</sup>, Prof. Julie Robitaille<sup>1,2,3</sup>, Prof. Simone Lemieux<sup>1,3</sup>, Dr. Patricia Lemieux<sup>2,4</sup>, Mrs. Ariane Bélanger-Gravel<sup>3,5,6</sup>, Dr. John Weisagel<sup>2,4</sup>, Dr. Suzanne Demers<sup>4</sup>, Mr. Félix Camirand Lemyre<sup>7</sup>, Mrs. Mélanie Boulet<sup>8</sup>, Dr. Jean-Patrice Baillargeon<sup>9,10</sup>, Dr. Sophie Desroches<sup>1,3</sup>, Mrs. Anne-Sophie Morisset<sup>1,2,3</sup>

**O.2.13 - What have we learned recently on motivation and behavior change, UKK - Hall C (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** A healthy diet during pregnancy has favorable effects on glycemic control and is associated with a lower risk of gestational diabetes (GDM). According to Diabetes Canada, there is a need for an effective and acceptable intervention that could improve glucose homeostasis and support pregnant individuals at risk for GDM. This unicentric randomized controlled trial aims to evaluate the effects of a nutritional intervention initiated early in pregnancy, based on Canada's Food Guide (CFG), on glucose homeostasis in 150 pregnant individuals at risk for GDM, compared to usual care.

**Methods:** Population: Participants are currently being recruited (n=5 intervention; n=5 control). They are ≥18 years old, at ≤14 weeks of pregnancy, and have ≥1 risk factor for GDM according to Diabetes Canada Guidelines. Intervention: The nutritional intervention provided is based on a conceptual model based on health behavior change theory during pregnancy and on CFG recommendations and begins in the first trimester. The intervention consists of 4 individualized counseling sessions with a registered dietitian using motivational interviewing (12, 18, 24, and 30 weeks), with in-between phone call follow-ups, aiming to develop and achieve S.M.A.R.T. nutritional objectives (specific, measurable, attainable, relevant, and time-bound). Participants also have access to 10 informative web capsules on healthy eating during pregnancy developed by our team and based on CFG and other national guidelines, and to a virtual support community via a Facebook group. Control: Usual care (no nutritional intervention). Protocol: They participate in 3 on-site visits (12-14, 24-26, and 34-36 weeks) during which a 2-h oral glucose tolerance test and blood samples are taken. At every trimester and 3 months postpartum, participants complete web-based questionnaires, including 3 validated 24-hour dietary recalls to assess their diet quality using the Healthy Eating Food Index 2019, which measures one's adherence to CFG recommendations. Primary outcomes: Change in fasting blood glucose and other glucose homeostasis markers (first to third trimester) will be compared between groups.

**(Anticipated) Results:** This ongoing study will allow us to determine if a nutritional intervention initiated early in pregnancy can improve glucose homeostasis of individuals at risk for GDM, compared to usual care.

# Development and validation of a scale to evaluate the level of mindful eating in the general French population

**O.2.13 - What have we learned recently on motivation and behavior change, UKK - Hall C (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose :** Mindful eating defines a non-judgmental awareness of physical and emotional sensations experienced while eating. Studies show promising evidence of an association with healthier eating behavior and lower weight status. However, existing scales assessing the level of mindful eating are not exhaustive (e.g. environment or emotions aspects are lacking) or have specific methodological limits. Our objective was therefore to develop and validate a scale assessing the level of mindful eating in the general French population.

**Methods :** Items were created and administered to a representative sample of the general population of the NutriNet-Santé cohort. The construct validity was assessed with exploratory (EFA) and confirmatory (CFA) factor analyses. Goodness of fit was assessed by chi-square index by degrees of freedom ( $\chi^2/df$ ); comparative fit index (CFI); Tucker-Lewis index (TLI); root mean square error of approximation (RMSEA); and standardized mean square residual (SRMR). Convergent validity was estimated by correlation with other closely related scales. Discriminant validity was assessed in groups of individuals with varied sociodemographic and lifestyle profiles. Internal consistency and test-retest reliability were also examined.

**Results :** An EFA was performed on a subsample of 1302 individuals and highlighted seven dimensions: attention, hunger/satiety, non-reactivity, emotions, non-judgment, openness, connectedness with four items per dimension. A CFA was performed on 1302 individuals and the results suggested a good fit of the model:  $\chi^2/df = 3$ ; CFI = 0.97; TLI = 0.96; and RMSEA = 0.04; SRMR = 0.06. Mindful eating scores were higher for men and older individuals. A higher mindfulness eating score was associated with a lower score of cognitive restriction (TFEQ-R21) and depression (CES-D), and with a higher score of nutritional quality (mPNNS-GS), mindfulness (FFMQ), self-esteem (RSES), satisfaction with life (SWLS), optimism (LOT-R), gratitude (GQ-6) and resilience (BRS). The internal consistency of the questionnaire was satisfactory (McDonald's  $\omega = 0.82$ ) and the test-retest reliability was good (ICC = 0.86).

**Conclusions :** This study validated the first tool for assessing the level of mindful eating in general French population. This work opens the way to clinical and epidemiological research on this subject in the coming years.

# Effects of Interpersonal and Intrapersonal Behavior Change Strategies on Physical Activity among Older Adults with Fall Risks: A Factorial Randomized Trial (Ready Steady 3.0)

**Associate Professor Siobhan K McMahon<sup>1</sup>**, Prof. Beth Lewis<sup>1</sup>, Ms. Qi Wang<sup>1</sup>, Prof. Jean F Wyman<sup>1</sup>, Associate Professor Weihua Guan<sup>1</sup>, Prof. Alexander J Rothman<sup>1</sup>  
<sup>1</sup>University of Minnesota, Minneapolis, USA

**O.2.13 - What have we learned recently on motivation and behavior change, UKK - Hall C (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Despite evidence that physical activity (PA) targeting leg strength and balance reduces the serious public health problem of falls among older adults, most do not regularly perform these activities. Research examining the effects of intervention strategies targeting older adults' motivation for PA is limited and inconclusive, underscoring the need to optimize behavior change content within existing interventions. Thus, the purpose of this trial was to assess the main and interactive effects of two sets of behavioral change strategies based on empirical evidence and theory --interpersonal (e.g., social support, social comparison) and intrapersonal (e.g., goal setting, action planning) – on older adults' PA quantity.

**Methods:** Community-dwelling older adults (N=309, mean age=77, SD=5) were randomized in a 2 × 2 factorial experiment (clinicaltrials.gov NCT03326141). The two factors represented receipt (No, Yes) of interpersonal or intrapersonal behavior change strategy sets. All participants also received two core intervention components: the Otago Exercise Program adapted for small groups and a PA monitor (Fitbit Charge 2). All interventions were delivered to small groups (4 to 6 participants) in community settings over 8 weekly meetings, 90 minutes each. Average daily minutes of total PA (light, moderate, vigorous) was the primary outcome, assessed at baseline and post-intervention (1 week, 12 months) via accelerometers within the PA monitors. Main and interactive effects at each post-intervention time point were examined using ANCOVA general linear models, with baseline PA as covariates.

**Results:** Trial retention and course attendance were high. Participants who received interpersonal behavior change strategies, compared to those who did not, significantly increased their average daily minutes of total PA at post-intervention: one week (+29 min/day, SE = 7,  $p = .0035$ ,  $d = .43$ ) and 12 months (+23 min/day, SE = 8,  $p = .0031$ ,  $d = .43$ ). Intrapersonal strategies did not elicit significant changes in PA. There were no statistically significant interactions between the strategy sets.

**Conclusions:** A set of interpersonally oriented behavior change strategies is promising for increasing and sustaining PA among older adults with fall risk(s) when combined with the Otago Exercise Program, adapted for small groups, and a PA monitor.

# Reallocating sedentary time to physical activity may have beneficial effects on fatigue in patients with breast cancer: findings from the Phys-Can project

**Dr. Anne-Sophie Mazzoni (corresponding author)**<sup>1</sup>, Dr. Emelie Strandberg<sup>1</sup>, Prof. Susanne Börjeson<sup>2</sup>, Dr. Katarina Sjövall<sup>3</sup>, Prof. Sveinung Berntsen<sup>1, 4</sup>, Associate Professor Ingrid Demmelmaier<sup>1, 4</sup>, Prof. Karin Nordin<sup>1, 4</sup>

<sup>1</sup>Uppsala University, Uppsala, Sweden, <sup>2</sup>Linköping University, Linköping, Sweden, <sup>3</sup>Kristianstad University, Kristianstad, Sweden, <sup>4</sup>University of Agder, Kristiansand, Norway

**O.2.14 - What have we learned recently on cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** The health benefits of physical activity in patients with cancer is well documented, but less is known about the replacing effects of sedentary time with physical activity of different intensity. We aimed 1) to investigate the effects of reallocating sedentary time to light (LPA) or moderate-to-vigorous intensity physical activity (MVPA) on cancer-related fatigue and health-related quality of life (HRQoL) in patients with breast cancer, and 2) to determine the daily amount of sedentary time needed to be reallocated to produce minimal clinically important changes in these outcomes.

**Methods:** Pooled baseline data from the Physical training and Cancer (Phys-Can) project were used. Fatigue was assessed with the Multidimensional Fatigue Inventory questionnaire (MFI, five dimensions, 4-20 scale), and HRQoL with the European Organisation for Research and Treatment of Cancer quality of life questionnaire (EORTC QLQ-C30, 0-100 scale). Sedentary time and physical activity were measured with accelerometry. Isotemporal substitution modelling was used for the analyses.

**Results:** Overall, 436 participants with breast cancer (mean age 56 years, fatigue 11 [MFI], HRQoL 66 [EORTC QLQ-C30], LPA 254 minutes/day, MVPA 71 minutes/day) were included. Fatigue significantly decreased in two MFI dimensions when reallocating 30 minutes/day of sedentary time to LPA: reduced motivation and reduced activity ( $\beta=-0.21$ ). Fatigue significantly decreased in three MFI dimensions when reallocating 30 minutes/day of sedentary time to MVPA: general fatigue ( $\beta=-0.34$ ), physical fatigue ( $\beta=-0.47$ ) and reduced activity ( $\beta=-0.48$ ). To produce minimal clinically important changes in fatigue (-2 points on MFI), the amount of sedentary time needed to be reallocated to LPA was  $\approx 290$  minutes/day and to MVPA was  $\geq 125$  minutes/day. No effects were observed on HRQoL when reallocating sedentary time to LPA or MVPA.

**Conclusions:** Reallocating sedentary time to LPA or MVPA may have beneficial effects on cancer-related fatigue in patients with breast cancer, with MVPA having the greatest impact. Our study highlights the health benefits of replacing sedentary time with LPA, which may be a more feasible alternative than MVPA in less physically active breast cancer populations. However, in relatively healthy and physically active breast cancer populations, a large amount of time reallocation is needed to produce clinically important changes.

# Application of a Bayesian adaptive decision-theoretic approach to a multi-arm exercise oncology trial

**Associate Professor Laurien Buffart**<sup>1</sup>, Mr. Andrea Bassi<sup>2</sup>, Dr. Martijn Stuiver<sup>3</sup>, Prof. Neil Aaronson<sup>3</sup>, Prof. Gabe Sonke<sup>3</sup>, Prof. Johannes Berkhof<sup>2</sup>, Dr. Peter van de Ven<sup>4</sup>

**O.2.14 - What have we learned recently on cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Multiple randomized controlled trials have shown benefits of exercise during cancer treatment for physical fitness, fatigue, and quality of life. However, the effect on disease outcomes and the optimal exercise prescriptions are unclear. Efficient designs are needed to reduce sample sizes and costs of trials comparing multiple complex treatments. We performed present re-analyses of the data from a multi-arm exercise oncology trial using a Bayesian adaptive decision-theoretic approach to illustrate the methods and as proof-of-concept for this approach.

**Methods:** In the PACES trial, 230 breast cancer patients receiving adjuvant chemotherapy were randomized to supervised resistance and aerobic exercise (OnTrack), homebased physical activity (OncoMove) or usual care. Data were re-analyzed as an adaptive trial using a frequentist and Bayesian decision-theoretic approach incorporating interim analyses for trial continuation after every 36 patients. Endpoint was chemotherapy treatment modifications (any versus none). For Bayesian analyses, we considered a symmetric (pick-the-winner) setting, and an asymmetric setting using a superior margin. For both, settings with and without early dropping of arms were considered. Interim decisions for continuation were based on the expected decrease in the probability of an incorrect decision in the next stage, for which thresholds of 0.01 and 0.001 were considered. For frequentist analyses, we used the Pocock alpha-spending function, a maximum trial size of 218 and interim analyses after each 36 patients.

**Results:** Treatment modifications occurred in 34% of patients in the usual care and OncoMove arms versus 12% in the OnTrack arm ( $p=0.002$ ). Using a Bayesian adaptive decision-theoretic design and a continuation threshold of 0.001, 72 patients were needed to identify OnTrack as the most effective arm in the symmetric setting and 144 patients in the asymmetric setting. Using frequentist analyses, the trial would have been stopped after 180 patients, with OnTrack being superior to usual care.

**Conclusions:** A Bayesian adaptive decision-theoretic approach was shown to substantially reduce the sample size required for this three-arm exercise trial. Future trials that use this approach for continuation decisions should confirm its value. Therefore, we now apply this design to a three-arm exercise oncology trial in patients with metastatic colorectal cancer receiving chemotherapy.

# Demographics and health characteristics are associated with self-reported likelihood of participating in digitally-delivered exercise rehabilitation for improving heart health among breast cancer survivors: an observational study.

**Dr. Tamara Jones<sup>1</sup>**, Dr. Lara Edbrooke<sup>1,2</sup>, Dr. Jonathan Rawstorn<sup>3</sup>, Prof. Linda Denehy<sup>1,2</sup>, Prof. Sandra Hayes<sup>4</sup>, Prof. Ralph Maddison<sup>3</sup>, Associate Professor Aaron Sverdlow<sup>5</sup>, Prof. Bogda Koczwara<sup>6</sup>, Associate Professor Nicole Kiss<sup>3</sup>, Associate Professor Camille Short<sup>1</sup>

<sup>1</sup>The University of Melbourne, Melbourne, Australia, <sup>2</sup>The Peter MacCallum Cancer Centre, Melbourne, Australia, <sup>3</sup>Deakin University, Melbourne, Australia, <sup>4</sup>Griffith University, Brisbane, Australia, <sup>5</sup>University of Newcastle, Newcastle, Australia, <sup>6</sup>Flinders University, Adelaide, Australia

**O.2.14 - What have we learned recently on cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** This study aimed to identify demographic and health characteristics associated with perceived likelihood of uptake of digitally-delivered cardiac exercise rehabilitation among breast cancer survivors, and to explore other intervention topics of interest and service fee capabilities.

**Methods:** A sample of 208 breast cancer survivors completed a cross-sectional survey collecting likelihood of uptake of digitally-delivered cardiac exercise rehabilitation, demographic and health characteristics, knowledge of treatment side-effects, exercise behaviour, other intervention interests (e.g., diet, fatigue), and service fees. Descriptive statistics were calculated for outcomes of interest and patient characteristics. Ordered logistic regression models were used to examine associations between demographic and health characteristics and self-reported likelihood of intervention uptake (1) generally, (2) before, (3) during, and (4) after treatment.

**Results:** Participants had a mean age of 57(11) years and BMI of 27(6) kg/m<sup>2</sup>. Participants were generally representative of the Australian breast cancer population, however those meeting exercise guidelines were oversampled (44% meeting both aerobic and resistance training guidelines). Living in an outer regional area was consistently identified as the strongest predictor of self-reported likelihood of uptake across all stages of the care continuum (OR=3.86-8.57). Receiving a high number of cardiotoxic treatments was also associated with higher uptake generally (OR=1.4). In comparison, those with a higher BMI (OR=0.93-0.95) and lower education levels (OR=0.30-0.48) were less likely to uptake a digitally-delivered intervention during various treatment phases. More comorbid conditions were also associated with lower odds of uptake during treatment (OR=0.66). Secondary outcomes highlighted the need for better education about cardiotoxic treatment effects, and the desire for multifaceted rehabilitation interventions that are free or low cost for patients (median, IQR=10, 10-15AUD).

**Conclusions:** A digitally-delivered cardiac rehabilitation model may help address equity of access issues for those living regionally, and also may help reach those at high risk of cardiotoxicity due to treatment. However, those with a high BMI, low education and comorbidities may be at risk of falling through the gaps with this model. This information can inform future research and the development of intervention techniques that are critical to improve the delivery of a digital service model that is effective, equitable, and accessible.

# The role of long-term physical activity in relation to cancer-related health outcomes: a 12-month follow-up of an exercise intervention

**Dr. Anne-Sophie Mazzoni (corresponding author)**<sup>1</sup>, Dr. Ann Christin Helgesen Bjørke<sup>2</sup>, Associate Professor Andreas Stenling<sup>2,3</sup>, Prof. Sussanne Börjeson<sup>4</sup>, Dr. Katarina Sjövall<sup>5</sup>, Prof. Sveinung Berntsen<sup>1,2</sup>, Prof. Karin Nordin<sup>1,2</sup>, Associate Professor Ingrid Demmelmaier<sup>1,2</sup>

<sup>1</sup>Uppsala University, Uppsala, Sweden, <sup>2</sup>University of Agder, Kristiansand, Norway, <sup>3</sup>Umeå University, Umeå, Sweden, <sup>4</sup>Linköping University, Linköping, Sweden, <sup>5</sup>Kristianstad University, Kristianstad, Sweden

**O.2.14 - What have we learned recently on cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** While moderate-to-vigorous intensity physical activity (MVPA) is associated with various health improvements shortly after completion of exercise interventions, it remains unclear which health benefits can be expected when MVPA level is maintained in the long term in cancer survivors. We aimed to assess the associations of 1) MVPA level at 12-month follow-up and 2) long-term MVPA patterns (from post-intervention to 12-month follow-up) with cancer-related health outcomes.

**Methods:** In the Physical training and Cancer RCT, 577 participants diagnosed with breast, colorectal or prostate cancer were randomised to six months of exercise. Accelerometer-assessed physical activity and outcome data (e.g. cancer-related fatigue, health-related quality of life [HRQoL], anxiety, depression, functioning in daily life, cardiorespiratory fitness, sedentary time and sleep) were collected at post-intervention and at 12-month follow-up. Based on the sample's median of MVPA at post-intervention (i.e. high level  $\geq 65$  minutes/day or low level  $< 65$  minutes/day) and the changes between the two measurement points (i.e. increased or decreased), four categories with different long-term MVPA patterns were created: High & Increasing, High & Decreasing, Low & Increasing and Low & Decreasing. Multiple linear regression analyses were performed for the analyses.

**Results:** A total of 353 participants were included in the analyses. At 12-month follow-up, a higher MVPA level was significantly associated with lower fatigue in three dimensions (general fatigue [ $\beta=-0.33$ ], physical fatigue [ $\beta=-0.53$ ] and reduced activity [ $\beta=-0.37$ ]), higher cardiorespiratory fitness ( $\beta=0.34$ ) and less sedentary time ( $\beta=-0.35$ ). For long-term MVPA patterns, compared to participants in the "Low & Decreasing" category, those in the "High & Increasing" category reported significantly lower fatigue in three dimensions (general fatigue [ $\beta=-1.77$ ], physical fatigue [ $\beta=-3.36$ ] and reduced activity [ $\beta=-1.58$ ]), higher HRQoL ( $\beta=6.84$ ) and had less sedentary time ( $\beta=-1.23$ ).

**Conclusions:** Our results suggest that long-term physical activity is essential for improving health outcomes post-intervention in cancer survivors, even among those with high MVPA level. Cancer survivors should therefore be encouraged to maintain or increase MVPA post-intervention for additional health benefits. Our findings highlight the importance of interventions targeting physical activity maintenance in cancer survivors.

# Correlates of physical activity and dietary intake in women with ovarian cancer

**Dr. Marlou-Floor Kenkhuis<sup>1</sup>**, Dr. Yvonne Hartman<sup>1</sup>, Ms. Stephanie Stelten<sup>1</sup>, Dr. Luc van Lonkhuijzen<sup>2</sup>, Prof. Gemma Kenter<sup>2</sup>, Dr. Willemien van Driel<sup>3</sup>, Associate Professor Renate Winkels<sup>4</sup>, Dr. Nelleke Ottevanger<sup>1</sup>, Dr. Meeke Hoedjes<sup>5</sup>, Associate Professor Laurien Buffart<sup>1</sup>

<sup>1</sup>RadboudUMC, Nijmegen, Netherlands, <sup>2</sup>AmsterdamUMC, Amsterdam, Netherlands, <sup>3</sup>Nederlands Kanker Instituut, Amsterdam, Netherlands, <sup>4</sup>Wageningen University & Research, Wageningen, Netherlands, <sup>5</sup>Tilburg University, Tilburg, Netherlands

**O.2.14 - What have we learned recently on cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Studies in patients with cancer have shown that exercise and dietary interventions help to improve physical fitness and limit side effects. Knowledge of the correlates of physical activity (PA) and dietary intake can inform the design of health promotion interventions. Few studies have been performed in patients with ovarian cancer and therefore, we aimed to study levels of PA and dietary intake among patients with ovarian cancer and we investigated the correlates of these behaviors.

**Methods:** In total, 139 women who were scheduled to undergo (neo)adjuvant chemotherapy for ovarian cancer participated in this cross-sectional study. PA was measured with the Physical Activity Scale for the Elderly questionnaire and dietary intake by a Food Frequency Questionnaire specifically developed to assess adherence to the World Cancer Research Fund (WCRF) lifestyle recommendations. Correlates of PA and dietary intake included knowledge on recommendations, self-efficacy, outcome expectations, and socio-structural factors, all assessed by (self-composed) questionnaires. Backward linear regression analyses were used to examine which correlates were associated with PA or dietary intake.

**Results:** Participants reported low levels of PA with a median (range) PASE score of 50 (24-94) and dietary intake of 1902±693 kcal/day and 78±30 gram protein/day. On average, patients adhered to WCRF recommendations on 3 out of 5 components. Lower age ( $\beta=-1.2$ , 95%CI=-2.2;-0.1), lower physical outcome expectations ( $\beta=-5.1$ , 95%CI=-9.6;-0.7), higher cancer specific outcome expectations ( $\beta=10.2$ , 95%CI=4.6;15.8) and less barriers for PA change ( $\beta=-1.5$ , 95%CI=-2.7;-0.2) were independently associated with higher PA levels. A higher age ( $\beta=0.02$ , 95%CI=0.00;0.03), higher education level ( $\beta=0.3$ , 95%CI=0.08;0.48), and a higher diet related self-efficacy ( $\beta=0.06$ , 95%CI=0.03;0.09) was significantly associated with adhering to more WCRF lifestyle recommendations, whilst no correlates were found for total caloric intake or protein intake.

**Conclusion:** Patients with ovarian cancer patients are physically inactive, also when compared to patients with other cancer types, in addition they reported a suboptimal diet. Accordingly, interventions should be developed to improve PA and dietary intake, while self-efficacy, outcome expectations, and reduction of barriers could be used as targets for these interventions. The PADOVA trial examines the effect of a combined exercise and dietary intervention in ovarian cancer patients.

# Physical activity maintenance among young adult cancer survivors in an mHealth intervention: Twelve-month outcomes from the IMPACT randomized controlled trial

**Dr. Carmina G. Valle**<sup>1,2</sup>, Ms. Molly A. Diamond<sup>2</sup>, Ms. Hillary M. Heiling<sup>1,2</sup>, Ms. Allison M. Deal<sup>2</sup>, Dr. Derek P. Hales<sup>1</sup>, Dr. Brooke T. Nezami<sup>1</sup>, Dr. Jessica Gokee LaRose<sup>3</sup>, Dr. Christine M. Rini<sup>4</sup>, Dr. Bernardine M. Pinto<sup>5</sup>, Dr. Deborah F. Tate<sup>1,2</sup>

<sup>1</sup>Gillings School of Global Public Health, University of North Carolina at Chapel Hill, Chapel Hill, NC, USA,

<sup>2</sup>Lineberger Comprehensive Cancer Center, University of North Carolina at Chapel Hill, Chapel Hill, NC, USA,

<sup>3</sup>Department of Health Behavior and Policy, School of Medicine, Virginia Commonwealth University, Richmond, VA, USA, <sup>4</sup>Department of Medical Social Sciences, Feinberg School of Medicine, Northwestern University, Chicago, IL, USA, <sup>5</sup>College of Nursing, University of South Carolina, Columbia, SC, USA

**O.2.14 - What have we learned recently on cancer prevention and management, UKK - Hall D (Level 2 - main floor), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Most physical activity (PA) interventions in young adult cancer survivors (YACS) have focused on short-term outcomes, and few have evaluated PA maintenance. This study examined the effects of an mHealth PA intervention at 12 months on total PA (primary) and moderate-to-vigorous PA (MVPA) relative to a self-help group among 280 YACS.

**Methods:** YACS participated in a 12-month randomized trial that compared self-help and intervention groups. All participants received activity trackers, wireless scales, an individual videochat session, and access to a Facebook group. Intervention participants also received lessons, tailored feedback, adaptive goal setting, text messages, and Facebook prompts for 6 months, followed by tapered contacts (i.e., bimonthly lessons and tailored feedback, weekly text message, Facebook prompts). PA was measured with accelerometry and a self-report questionnaire (Godin Leisure Time Exercise Questionnaire) at baseline, 6, and 12 months. Generalized estimating equation analyses estimated intervention effects on PA outcomes from baseline to 12 months and 6 to 12 months.

**Results:** From baseline to 12 months, there were no between- or within-group differences in accelerometer-measured total PA minutes/week ( $p=.25-.57$ ). Both groups increased MVPA (intervention: +22.5 minutes/week [95% CI, 8.8-36.2],  $p=.001$  versus self-help: +13.9 minutes/week [95% CI, 3.0-24.9],  $p=.013$ ; between-group  $p=.34$ ). Over 12 months, increases in self-reported total PA were greater in the intervention versus self-help group (mean difference= +55.8 minutes/week [95% CI, 6.0-105.6],  $p=.028$ ), and between-group differences in self-reported MVPA increases approached significance (mean difference= +29.9 minutes/week [95% CI, -0.7, 60.4],  $p=.055$ ). Both groups maintained accelerometer-measured and self-reported PA (total, MVPA) from 6 to 12 months. At 12 months, 47.9% of intervention participants reported meeting national PA guidelines compared with 33.1% of self-help participants (RR, 1.45 [95% CI, 1.06-1.98];  $p=.02$ ).

**Conclusions:** The intervention was more effective than the self-help group at increasing self-reported, but not accelerometer-measured, total PA over 12 months. Both groups maintained increases in total PA and MVPA from 6 to 12 months. Overall, both digital approaches could be promising for promoting sustained PA participation and long-term health benefits in YACS, but additional research is needed to identify what strategies work for whom, and under what conditions.

# Validity and feasibility of cognitive tests in older adults' daily lives

**Ms. Fien De Block<sup>1</sup>**, Prof. Delfien Van Dyck<sup>1</sup>, Prof. Benedicte Deforche<sup>1</sup>, Prof. Geert Crombez<sup>1</sup>, Dr. Louise Poppe<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium

**O.2.15 - Cognitive function and ageing - predictors to interventions, UKK - K1 (+K2) (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** The positive effects of physical activity (PA) on cognition are widely recognized. However, research that takes into account the between-day fluctuations in cognition is still limited. This research is especially important for older adults, since large fluctuations appear to be linked with the development of dementia. To detect between-day fluctuations, validated cognitive tests that can be easily incorporated into daily life are much needed. Therefore, this study aimed to assess the validity and feasibility of three short cognitive tests assessing cognition on a daily basis.

**Methods:** For this within-subject study, thirty older adults ( $\geq 65$ y) were given a tablet on which three cognitive tests (Stroop Task (ST)), Visual Search Task (VST), Sternberg Memory Task (SMT)) and the Patient Reported Outcomes Measurement Information System (PROMIS) questionnaire, which assessed subjective cognition, were programmed. The tests assessed inhibition, attention and working memory respectively, and were completed together with the PROMIS, every evening for 14 days. Construct validity was assessed by Pearson correlations, comparing the first-day outcomes of the daily tests with (1) three tests from the validated CANTAB software assessing the same domains (MTT, MTS, PRM), and (2) the first-day total PROMIS score. Feasibility was examined by semi-structured interviews, conducted after the testing period, in which participants' experiences with the daily tests were questioned. These data were analyzed using deductive thematic analyses.

**Results:** Preliminary validity analyses showed that ST, VST and SMT reaction times, and SMT accuracy had moderate to strong correlations with their respective CANTAB outcomes ( $r=0.314-0.720$ ), and almost all daily test outcomes correlated moderately to strongly with subjective cognition ( $r=0.399-0.683$ ), except for VST reaction time. The interviews indicated that performing the daily tests for 14 days was feasible. Most participants reported no problems and found the tests easy to use, with appropriate difficulty. Further analyses will be conducted and results will be presented at the conference.

**Conclusion:** The three cognitive tests showed potential for validly measuring daily cognition. Because of the good feasibility, the tests could possibly be used to assess cognition in people's daily lives, which will have important implications for assessing the effect of PA on daily cognition.

# The daily associations between physical activity and cognitive functioning

**Dr. Tiia Kekäläinen**<sup>1</sup>, Assistant Professor Martina Luchetti<sup>2</sup>, Prof. Antonio Terracciano<sup>2</sup>, Prof. Angelina Sutin<sup>2</sup>  
<sup>1</sup>University of Jyväskylä, Jyväskylä, Finland, <sup>2</sup>Florida State University, Tallahassee, USA

**O.2.15 - Cognitive function and ageing - predictors to interventions, UKK - K1 (+K2) (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Physical activity is consistently linked to better cognitive functioning. However, these associations are rarely studied in the context of everyday life taking into account the fluctuating nature of both physical activity and cognitive functioning. This study investigated whether physical activity is associated with cognitive functioning at a daily level.

**Methods:** Participants (N = 289) from the Couples Healthy Aging Project (CHAP) were 40–70 years old cognitively intact adults living in Florida (USA) who completed a battery of cognitive tests at three random times per day for eight consecutive days using smartphones. The cognitive tests included the Symbol Search Task (processing speed) and the Dot Memory test (visual memory). Self-reported cognition (memory, speed of thinking, and sharpness of mind) from each day was asked in an additional evening survey. Physical activity was assessed with wrist-worn accelerometers during the same eight days period. The analyses were conducted with a multilevel modeling approach with two levels (days nested within individuals). Both between-person and within-person associations were included in the models.

**Results:** Between-person differences accounted for 72% (intraclass correlation) in processing speed, 42% in visual memory, 54% in self-reported memory, 54% in self-reported thinking, and 55% in self-reported mind sharpness. Thus, considerable within-person variance (28–58%) was available for further analysis. In the preliminary analysis, participants who were more physically active had faster processing speed than less physically active participants ( $B=-0.66$ ,  $SE=0.27$ ,  $p=0.016$ ). Physical activity was not associated with visual memory at the between-person or within-person level. Physical activity was associated with all self-reported cognition assessments only at the within-person level. On days when participants were more physically active than they usually were, they reported in the evening that they had better memory ( $B=0.008$ ,  $SE=0.004$ ,  $p=.041$ ), faster thinking ( $B=0.011$ ,  $SE=0.006$ ,  $p=0.006$ ), and better sharpness of mind ( $B=0.016$ ,  $SE=0.004$ ,  $p<0.001$ ) in the current day.

**Conclusions:** Daily variation in physical activity was not associated with test-based cognitive performance among cognitively intact adults. However, participants experienced better cognition on days when they were more physically active than usual. More research is needed to understand the causal pathways and daily associations between physical activity and cognition.

# From parks to cognitive health: the roles of physical activity, sedentary behaviours and metabolic risk factors

**Prof. Ester Cerin**<sup>1</sup>, Prof. Anthony Barnett<sup>1</sup>, Prof. Jonathan E. Shaw<sup>2</sup>, Ms. Erika Martino<sup>3</sup>, Associate Professor Luke D. Knibbs<sup>4</sup>, Prof. Kaarin J. Anstey<sup>5</sup>

<sup>1</sup>Australian Catholic University, Melbourne, Australia, <sup>2</sup>Baker Heart and Diabetes Institute, Melbourne, Australia, <sup>3</sup>University of Melbourne, Melbourne, Australia, <sup>4</sup>The University of Sydney, Camperdown, Australia, <sup>5</sup>University of New South Wales, Randwick, Australia

**O.2.15 - Cognitive function and ageing - predictors to interventions, UKK - K1 (+K2) (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Access to greenspace has been linked to better cognitive health. However, most studies did not account for potential environmental confounders. Also, the behavioural and biological mechanisms underpinning the observed associations are unclear. We examined the total cross-sectional effects of neighbourhood parkland on cognitive function in mid-aged and older adults and the extent to which these were explained by physical activity, sedentary behaviours and metabolic risk factors.

**Methods:** We used data from the Australian Diabetes, Obesity and Lifestyle study (N = 4141). Geographic Information Systems data were used to characterise the participants' neighbourhood environment defined as a 1-km radius street-network area around their homes. Percentage of parkland was the exposure and scores on memory, processing speed and verbal skills tests were the outcomes. Population density, percentage of commercial land, non-commercial land use mix and area level socio-economic status were included as confounders. Measures of physical activity (walking for transport, walking for recreation, vigorous gardening and resistance training), sedentary behaviours (sitting for transport, sitting for leisure) and metabolic risk factors (e.g., waist circumference (WC), HDL-cholesterol, glycated haemoglobin) were examined as potential mediators. Generalised additive mixed models accounting for spatial clustering were used to estimate the total, direct and indirect effects (through behaviours and metabolic risk factors) of parkland on cognitive functions.

**Results:** Percentage of parkland was positively associated with all cognitive function measures. The association with memory was in part mediated by walking for transport (directly and via sitting for leisure, WC and HDL-cholesterol) and resistance training (via sitting for leisure, WC and HDL cholesterol). The 'pathways' for processing speed were similar with the addition of glycated haemoglobin. The relationship between parkland and verbal skills was fully explained by resistance training and walking for transport (directly and through their effects on sitting for leisure, WC, HDL-cholesterol and dyslipidaemia).

**Conclusions:** Access to parks may benefit cognitive function in mid-to-late life by promoting some forms of physical activity that displace sitting for leisure and contribute to metabolic health, and through other mechanisms, such as socialising and stress reduction. City planning policies should ensure that residents have access to parks within walking distance.

# Effects of a motor-cognitive exercise program for seniors 65+ in urban outdoor environments

**Mrs. Katharina Zwingmann<sup>1</sup>**, Prof. Torsten Schlesinger<sup>1</sup>, Dr. Katrin Müller<sup>1</sup>

<sup>1</sup>Chemnitz University of Technology, Chemnitz, Germany

**O.2.15 - Cognitive function and ageing - predictors to interventions, UKK - K1 (+K2) (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Physical and cognitive activities can promote physical performance of several functions in everyday life in old age (e.g., dual tasking) and prevent or alleviate symptoms of diseases (e.g., depression). However, most seniors do not reach WHO physical activity recommendations. Among other things, physical limitations, lack of mobility, or financial effort act as barriers for implementation of physical activity in older age. The aim of the “MoKo-Fit” project is to promote and maintain physical and cognitive performance among seniors with a motor-cognitive exercise program (close to home, low-threshold, age-related, free).

**Methods:** For this quasi-randomized intervention study 131 subjects aged 65+ were recruited (IG: n=63; age: 72.71 years  $\pm$ 6.90; 41 female; KG: age: 75.35 years  $\pm$ 7.56; 41 female) in cooperation with community centres. The motor-cognitive exercise program included exercises to train coordination, strength, endurance, and cognition while considering individual load normative. The program was implemented by trained exercise instructors in outdoor areas (e.g., public parks) over 12 weeks (2x/week á 45-60min). By means of a comprehensive test battery before (T1) and after (T2) completion of the exercise program in the intervention (IG) and control group (CG, no intervention), motor (e.g., 6MWT) and cognitive abilities (e.g., TMT B) were recorded. Data were analysed by paired t-Tests and ANOVA (n=90 for current results).

**Results:** At T2 IG improved walking distance significantly in 6MWT (mean  $\Delta$  = 34.77m;  $p$  = .009), while CG decreased in their physical performance level (mean  $\Delta$  = -17.72m;  $p$  = .151). A Time  $\times$  Group interaction effect was revealed ( $F(1,97)$  = 5.120,  $p$  = .026,  $n2p$  = .050). Furthermore, the improvement in cognitive performance speed (TMT B) was significantly higher in the IG (mean  $\Delta$  = 21.26s;  $p$  = .005) compared to CG (mean  $\Delta$  = 3.49s;  $p$  = .449) at T2, but no significant Time  $\times$  Group interaction effect was confirmed ( $F(1,90)$  = 3.033,  $p$  = .085,  $n2p$  = .033).

**Conclusion:** Due to the improvement in motor and cognitive performance in the IG, the exercise program can be considered as successful. All measurements will be repeated six months after T2 to examine sustainable effects of the intervention.

# Increases in preschoolers' digital media use is linked with small but significant decreases in same-day physical activity: An intensive longitudinal data analysis

**Dr. Bridget Armstrong**<sup>1</sup>, Ms. Hannah Parker<sup>1</sup>, Dr. Sarah Burkart<sup>1</sup>, Dr. Layton Reesor-Oyer<sup>1</sup>, Dr. Beets Michael<sup>1</sup>, Dr. R. Glenn Weaver<sup>1</sup>, Ms. Olivia Finnegan<sup>1</sup>, Ms. Meghan Bastyr<sup>1</sup>, Ms. Lauren Von Klingraeff<sup>1</sup>, Mr. James White<sup>1</sup>, Mr. Roddrick Dugger<sup>1</sup>, Dr. Elizabeth Adams<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**O.2.16 - Predictors of children's and families' nutrition and movement behaviors, UKK - K3+4 (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Excessive screen use is linked with negative health outcomes including disrupted sleep, inactivity and poor mental health; however, much of this research is based upon measures requiring parents to estimate their child's usual screen use over long stretches of time (e.g., 6 months). This method flattens day-to-day variability and prevents us from answering the question "*on any given day is screen use replacing children's physical activity?*" This study aims to answer this question using intensive longitudinal data collected from preschoolers and their caregivers.

**Methods:** Participants included 94 parent-child dyads (child age  $M = 4.4$  years;  $SD = 0.8$ ). For 14 days, children wore an Axivity accelerometer on their non-dominant wrist to measure moderate to vigorous physical activity (MVPA). Parents were texted nightly surveys to report the number of hours their child used digital media (i.e., tablet, computer) and watched TV that day. We used mixed effects models with person-mean centering to predict day-level (level-1) MVPA from both digital media use and TV time each day. Covariates included accelerometer non-wear time, weekend/weekday, and time spent with child.

**Results:** Within-person effects showed that for every extra hour of digital media use, MVPA decreased by 2.3 minutes (95% CI -4.06 to -0.57). On days when children had more TV time than usual, they had small, non-significant decreases in MVPA ( $B = -0.76$ , 95%CI -3.2 to 1.69). However, random effects revealed significant variance around the association between TV and MVPA (Estimate = 42.64, 95%CI 18.32 to 99.24). This means that for 95% of the population, the association between TV and MVPA could vary by up to 26 minutes.

**Conclusions:** While increases in digital media use were linked with significant within-person decreases in MVPA, the magnitude of these effects were small. Thus, it is not clear that digital media use is directly replacing time that might otherwise be spent in physical activity. Yet, the significant variability around the effect of TV on physical activity indicates that, for some children, screen use may be directly supplanting activity. Identifying children for whom screen use has detrimental health effects can help guide targeted and personalized intervention strategies.

# What type of motor skills are important for physical activity intensity across childhood for boys and girls?

**Prof. Lisa Barnett**<sup>1</sup>, Dr. Gavin Abbott<sup>1</sup>, Dr. Simone Verswijveren<sup>1</sup>, Miss Brooke Colvin<sup>1</sup>, Prof. David Lubans<sup>2</sup>, Dr. Kristen Cohen<sup>2</sup>, Prof. Kylie Hesketh<sup>1</sup>, Dr. Katherine Downing<sup>1</sup>, Prof. Richard Telford<sup>3</sup>, Dr. Rohan Telford<sup>3</sup>, Dr. Trina Hinkley<sup>1</sup>, Dr. Natalie Lander<sup>1</sup>, Prof. Maïke Tietjens<sup>4</sup>, Prof. Nadja Schott<sup>5</sup>, Prof. Philip Morgan<sup>2</sup>, Associate Professor Nicola Ridgers<sup>6</sup>

<sup>1</sup>Deakin University, Geelong, Australia, <sup>2</sup>University of Newcastle, Newcastle, Australia, <sup>3</sup>University of Canberra, Canberra, Australia, <sup>4</sup>University of Muenster, Muenster, Germany, <sup>5</sup>University of Stuttgart, Stuttgart, Germany, <sup>6</sup>University of South Australia, Adelaide, Australia

**O.2.16 - Predictors of children's and families' nutrition and movement behaviors, UKK - K3+4 (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Boys are typically more physically active than girls. Motor skill competence is considered an important determinant of physical activity. Review evidence reports that boys have better object control competence than girls, but locomotor skills do not show this pattern. Little is known about how these types of skills are associated with moderate (MPA) and vigorous (VPA) physical activity for boys and girls.

**Methods:** Data on 988 children (50.8% boys) aged 3-11 years from the Australian Physical Activity and Motor Skills Study (data pooled from eight studies; 2009-2016) were included. The aim was to examine associations of object control and locomotor motor skill competence with physical activity across childhood for boys and girls. Linear models were fitted to examine associations between motor competency (Test of Gross Motor Skill Development [TGMD]) and physical activity (MPA and VPA; ActiGraph accelerometers), and then compared to non-linear restricted cubic spline models. Sex interactions were assessed.

**Results:** We found evidence of positive linear associations with object control skills for MPA ( $\beta$  [95% CI] = 0.35 [0.24, 0.46],  $p < 0.0005$ ) and VPA (0.39 [0.29, 0.49],  $p < 0.0005$ ). However, a non-linear restricted cubic spline model indicated that associations are positive but relatively weak in the low/mid ranges of object control scores, but at high ranges ( $>38/50$ ) the associations get stronger and more positive. There were no sex interactions for the object control scores. There was also evidence of positive linear associations with locomotor skills for MPA ( $\beta$  [95% CI] = 0.36 [0.22, 0.50],  $p < 0.0005$ ) and VPA (0.43 [0.31, 0.55],  $p < 0.0005$ ) activity, and no evidence of better fit with the non-linear approach. Boys and girls with low locomotor scores ( $<20/50$ ) have similar VPA, but males display greater increases in VPA with increasing locomotor scores. There was no sex interaction for MPA.

**Conclusions:** Locomotor skill mastery appears to assist boys to be more vigorously active, whereas both boys and girls benefit from increases in both MPA and VPA when reaching a certain threshold of object control skill. From an equity perspective, physical activity interventions are encouraged to focus on object control motor skill development.

# Kids to the Front: Children's perspectives of their food practices

**Ms. Sophie Wright-Pedersen<sup>1</sup>**, Dr. Foluké Abigail Badejo<sup>1</sup>, Associate Professor Helen Vidgen<sup>1</sup>, Prof. Danielle Gallegos<sup>1</sup>

<sup>1</sup>Queensland University of Technology, Brisbane, Australia

**O.2.16 - Predictors of children's and families' nutrition and movement behaviors, UKK - K3+4 (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Children are the subject of many investigations into their food practices. However, they are rarely active participants within food and nutrition related research. This study therefore aimed to explore children's food practices from their perspective using qualitative participatory methods to amplify their voice within this space.

**Methods:** Using a practice theoretical approach, 42 Australian children aged 8-12 years old (from 28 families) participated in community-based draw-and-tell interviews (n=28), Photovoice (n=15) and video ethnographic activities (n=6). Data is being thematically analysed deductively through a social practice theory lens to extract the elements, dimensions and contexts of children's food practices. In the context of public health nutrition, this is the first study to actively consider children's perspectives of their food through a practice theory lens, whilst using innovative developmentally appropriate digital methods complementary to traditional interview methods.

**Results:** Preliminary findings demonstrate that children participate and have varying degrees of agency within a range of everyday food practices across planning, procuring, preparing and consumption phases. These practices are complex with interwoven meanings, competences and materials accessible to and articulated by children. Temporal and spatial settings as well as the social worlds that children occupy are diverse and influence and shape their food practices. Children themselves also act back on and shape their own food worlds and those of others around them.

**Conclusion:** This study highlights the importance of amplifying children's perspectives and recognising their agency and influence when considering how their food practices are enacted and shaped. This is particularly significant when making decisions that aim to change the way these practices are performed. In recognising how children engage within food practices, we as practitioners may begin to understand how to shape our approaches in more meaningful and realistic ways, rather than trying to mould children to fit within our food worlds.

# Goals, facilitators, and barriers identified by caregivers in an in-home intervention to improve feeding practices and child diet quality

Ms. Andrea Ramirez<sup>1</sup>, Dr. Katelyn Fox<sup>1</sup>, Ms. Yarisbel Melo Herrera<sup>2</sup>, **Dr. Kim Gans**<sup>3</sup>, Dr. Patricia Risica<sup>1</sup>, Dr. Karen Mccurdy<sup>2</sup>, Dr. Ernestine Jennings<sup>1</sup>, Dr. Alison Tovar<sup>1</sup>

<sup>1</sup>Brown University, Providence, USA, <sup>2</sup>University of Rhode Island, Kingston, USA, <sup>3</sup>University of Connecticut, Storrs, USA

**O.2.16 - Predictors of children's and families' nutrition and movement behaviors, UKK - K3+4 (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** To explore caregivers' goals, facilitators, and barriers, as part of the Strong Families Start at Home (SFSH) study, a home-based pilot intervention aimed to improve preschool-aged children's diet by targeting feeding practices and household food environments in predominately ethnically diverse low-income families.

**Methods:** Low-income, diverse caregivers and their 2–5-year-old child were randomized into intervention (positive feeding practices/ nutrition) or control (reading readiness) groups. Caregivers received 6 visits with a community health worker (CHW) trained in motivational interviewing (3 home visits; 3 phone calls); an in-home cooking demonstration or reading activity; personalized feedback on a recorded family meal or reading activity; text-messages; and tailored printed materials. Collaboratively, the CHW and caregiver developed a feeding and nutrition plan that included specific goal(s), reasons for the plan, potential barriers to completing the plan, and some possible solutions (including social supports). A thematic analysis of the goal sheets (n=143 sheets from 33 participants) completed by CHW was used to identify patterns in goal content and anticipated facilitators and barriers with a mixed inductive-deductive approach using MAXQDA.

**Results:** Most goals selected by caregivers were to increase the home availability of healthy foods through food shopping and meal planning. Other goals were to increase structure by establishing meal and snack routines and decrease distractions at meals (i.e., screens), while others wanted to involve their children in cooking and grocery shopping. Caregivers' perceived barriers encompassed individual (i.e., stress, lack of time, child behavior), family (unplanned grocery shopping), and environmental (i.e., food availability) factors. However, caregivers only identified facilitators at the individual level (i.e., motivation).

**Conclusion:** Understanding caregivers' goals, barriers, and facilitators can help future interventions by tailoring key messages to improve feeding practices and preschool children's diets. Ethnically diverse low-income families could benefit from efforts to effectively involve the family, and by considering their socioeconomic and cultural contexts. Future interventions should provide tools to overcome common barriers (i.e., improving access to healthy food) while increasing awareness of not only individual-level but also family and environmental-level facilitators.

# Lifestyle patterns in European preschoolers: associations with socio-demographic factors and BMI

**O.2.16 - Predictors of children's and families' nutrition and movement behaviors, UKK - K3+4 (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Background:** Suboptimal energy balance-related behaviors (EBRBs) have established at different paces across the world and within countries, depending on where (sub)populations stand regarding their nutrition transition phase. EBRBs tend to combine into the so-called 'lifestyle patterns', with a potential synergistic influence on health. This study aimed at investigating variations in lifestyle patterns among preschool-aged children across Europe, their associations with different socio-demographic factors, and their links with body mass index (BMI).

**Methods:** Study sample included preschoolers (aged between 2 and 5 years) participating in nine European birth cohorts (England, France, Greece, Italy, Norway, and Spain) from the EU LifeCycle project. Child EBRBs, i.e., dietary intake, screen use, outdoor play and sleep time, and socio-demographic factors, were assessed by parental questionnaires. Trained professionals or parents measured or reported child weight and height. Based on parent-reported child EBRBs, principal component analysis was first conducted to identify cohort-specific lifestyle patterns. Multivariable linear and logistic regressions were used to investigate cross-sectional associations of sociodemographic factors with lifestyle patterns, and of lifestyle patterns with both BMI z-scores (WHO standards) and overweight status.

**Results:** The most consistent lifestyle pattern identified across datasets was distinctly unhealthy, given its characterization by at least three of the following EBRBs: suboptimal dietary intake (mainly, discretionary consumption), high screen time, low outdoor play and low sleep duration. Across cohorts, children from low-income households and born to mothers with low educational level had consistently higher scores on the unhealthy lifestyle pattern, as compared to their counterparts whose parents had higher socio-economic position. Children born to younger and multiparous mothers, and boys, adhered more to this pattern in most of the cohorts. Higher scores on this pattern were related to higher BMI in the Spanish and Italian cohorts only.

**Conclusion:** The identification of similar unhealthy lifestyle patterns, their socio-economic patterning and links to BMI as early as preschool age provides new evidence regarding the nutrition transition dynamic across different European high-income countries. These findings may assist in informing early multi-behavioral interventions aimed at reducing social inequalities in obesity-related behaviors and health outcomes across the European landscape.

# Physical Activity and Menstruation: A Scoping Review of Adolescents' Experiences

**Ms. Jessica Harvey<sup>1</sup>**, Dr. Emma Solomon-Moore<sup>1</sup>, Dr. Nick Townsend<sup>2</sup>, Dr. Jessica Francombe-Webb<sup>1</sup>, Dr. Simon Sebire<sup>2</sup>

<sup>1</sup>University of Bath, Bath, United Kingdom, <sup>2</sup>University of Bristol, Bristol, United Kingdom

**O.2.16 - Predictors of children's and families' nutrition and movement behaviors, UKK - K3+4 (Level 3), June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Physical activity (PA) levels tend to decline throughout adolescence with 81% of adolescents deemed insufficiently active globally. Furthermore, girls' PA levels decline more than boys during this time, which coincides with the onset of puberty. Menstruation is an important aspect of puberty and disengagement in PA, due to menstruation, may contribute to the declining levels of girls' activity. However, there is no existing published synthesis on how menstruation impacts PA in adolescents. The objectives of this review were to determine what is known from existing literature about adolescents' experiences of menstruation and PA, summarise methodological approaches used in this field and identify any gaps in the literature.

**Methods:** A scoping review was conducted using Arksey and O'Malley's five step scoping review methodology. On 3<sup>rd</sup> March 2022, PubMed, Web of Science, APA PsycNET, Scopus and SportDiscus were searched for relevant literature. Quantitative, qualitative and mixed-methods studies were eligible for inclusion. The studies were screened against inclusion criteria by a team of four reviewers and consensus was reached through discussion. Data were analysed using descriptive statistics, followed by a narrative synthesis. The review reporting adhered to the PRISMA-ScR checklist.

**Results:** Seventy-one studies were included in the final review. The results demonstrated a relationship between menstruation and PA in adolescents through several mechanisms a) PA may be effective in reducing dysmenorrhea severity, b) menstruation may lead to avoidance of PA due to menstrual symptoms, stigma or inadequate knowledge, c) PA may be used as a self-care technique for menstrual management and d) PA may be associated with menstrual symptoms where less active girls are more likely to have increased severity of symptoms. However, no objective measurements of PA were used across all studies, no studies were conducted in the UK and PA was not the primary focus or outcome in studies exploring menstrual experiences.

**Conclusions:** The findings indicate that menstruation influences adolescent' PA behaviour and also that PA may impact menstrual symptoms. However, studies using objective measures of PA and exploring experiences in more depth are needed to further understand this relationship in adolescents to identify strategies for girls' PA promotion.

# Scale-up of the Internet-based Professional Learning to help teachers to support Activity in Youth (iPLAY) intervention: A hybrid type 3 implementation-effectiveness trial

**O.2.17 - Translating evidence into practice - with focus on school setting, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The purpose of this study was to evaluate the scale-up of the 'Internet-based Professional Learning to help teachers support Activity in Youth' (iPLAY) intervention in primary schools using the RE-AIM framework.

**Methods:** We conducted a type 3 hybrid implementation-effectiveness study and collected data between April 2016 and June 2021, in New South Wales (NSW), Australia. RE-AIM was operationalised as: (i) Reach: Number and representativeness of students exposed to iPLAY; (ii) Effectiveness: Impact of iPLAY in a sub-sample of students (n = 5,959); (iii) Adoption: Number and representativeness of schools that received iPLAY; (iv) Implementation: Extent to which the three curricular and three non-curricular components of iPLAY were delivered as intended; (v) Maintenance: Extent to which iPLAY was sustained in schools. We conducted 43 semi-structured interviews with teachers (n = 14), leaders (n = 19), and principals (n = 10) from 18 schools (11 from urban and 7 from rural locations) to determine program maintenance.

**Results:** Reach: iPLAY reached ~31,000 students from a variety of socio-economic strata (35% of students were in the bottom quartile, almost half in the middle two quartiles, and 20% in the top quartile). Effectiveness: We observed small positive intervention effects for enjoyment of PE/sport (0.12 units, 95% CI: 0.05 to 0.20, d = 0.17), perceptions of need support from teachers (0.26 units, 95% CI: 0.16 to 0.53, d = 0.40), physical activity participation (0.28 units, 95% CI: 0.10 to 0.47, d = 0.14), and subjective well-being (0.82 units, 95% CI: 0.32 to 1.32, d = 0.12) at 24-months. Adoption: 115 schools received iPLAY. Implementation: Most schools implemented the curricular (59%) and non-curricular (55%) strategies as intended. Maintenance: Based on our qualitative data, changes in teacher practices and school culture resulting from iPLAY were sustained.

**Conclusions:** iPLAY had extensive reach and adoption in NSW primary schools. Most of the schools implemented iPLAY as intended and effectiveness data suggest the positive effects observed in our cluster RCT were sustained when the intervention was delivered at-scale.

**Conflict of interest statement:**

The authors have no relevant conflicts of interest to declare.

# Do teachers sustain scheduling of physical activity after cessation of implementation support? A long term follow-up of a randomised and controlled trial

**Dr. Cassandra Lane**<sup>1,2,3</sup>, Dr. Alix Hall<sup>1,2,3</sup>, Mr. Adam Shoesmith<sup>1,2,3</sup>, Prof. Luke Wolfenden<sup>1,2,3</sup>, Dr. Rachel Sutherland<sup>1,2,3</sup>, Dr. Nicole Nathan<sup>1,2,3</sup>

<sup>1</sup>University of Newcastle, Newcastle, Australia, <sup>2</sup>Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>3</sup>Hunter New England Population Health, Newcastle, Australia

**O.2.17 - Translating evidence into practice - with focus on school setting, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The *Physically Active Children in Education* (PACE) intervention has consistently shown to effectively improve schools' implementation of a physical activity policy. However, sustained implementation is required for the policy to reach its full public health potential and to ensure the initial investment in PACE is not wasted. Using data from a pilot randomised and controlled trial\*, we explored: (1) whether teachers sustained their scheduled weekly minutes of physical activity 18-months following delivery of PACE; (2) the odds of teacher's policy compliance being sustained; and (3) teacher's perceptions of the usefulness of strategies supporting sustainment.

**Methods:** We conducted surveys of teachers from the six intervention schools post-intervention and 18-months later. Teachers recorded their minutes of scheduled physical activity during a five-day school week in a daily log book. The main outcomes reflected the components of physical activity where a significant increase was observed during the main trial: total minutes of physical activity and energisers (short classroom physical activity breaks). Teachers also rated the usefulness (on a 5-point Likert scale) of 14 proposed strategies to support sustainment. Generalised linear mixed models assessed the difference in minutes of physical activity scheduled from post-intervention to 18-month follow-up, as well as the difference in the proportion complying with the policy requirements. Descriptive statistics explored teacher's preferences for proposed sustainment strategies.

**Results:** Valid survey responses were received from 50 teachers post-intervention and 30 teachers at 18-months. There was a significant decrease between time points for teacher's scheduled minutes of total physical activity (33 minutes; 95% confidence interval= -59.99, -6.91; p=0.014); and energisers (21 minutes; 95% confidence interval= -35.17, -7.55; p=0.003). The proportion of teacher's meeting the policy guidelines also significantly reduced (-19%; odds ratio=0.34; 0.17, 0.67; p=0.002). Strategies perceived 'most useful' in supporting sustainment were provision of physical activity equipment packs, professional learning modules delivered online or in-person, and a handover package for new staff.

**Conclusion:** Physical activity scheduling was not sustained in the long-term, corresponding to a reduction in the proportion of teachers meeting policy guidelines. These findings have informed our subsequent preparation to address this and ensure the full public health impact of PACE is realised.

# Complexities and context in scale-up: A qualitative study of academic, practitioner and policymaker experiences

Dr. Harriet Koorts<sup>1</sup>, Dr. Jaimie-Lee Maple<sup>1</sup>, Prof. Elizabeth Eakin<sup>2</sup>, Prof. Mark Lawrence<sup>1</sup>, **Prof. Jo Salmon<sup>1</sup>**

<sup>1</sup>School of Exercise and Nutrition Sciences, Institute for Physical Activity and Nutrition (IPAN), Deakin University, Geelong, Australia, <sup>2</sup>School of Public Health, The University of Queensland, Herston, Australia

**O.2.17 - Translating evidence into practice - with focus on school setting, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Scaling up population health interventions is a context-orientated, complex and dynamic process. In public health, scale-up is typically transdisciplinary, involving multiple diverse stakeholders across many sectors. Understanding the influences on effective scale-up and how they differ from multidisciplinary perspectives is essential to enhance future scaling efforts. The aim of this presentation is to present key influences on the successful scale-up of state and nationally delivered physical activity and nutrition interventions in Australia, identifying ways of improving the future scale-up of public health interventions.

**Methods:** A qualitative study involving semi-structured telephone interviews with individuals working in academic, government and non-government organisations involved in the scaling up of state and national physical activity and nutrition interventions in Australia. The WHO ExpandNet framework for scaling up provided the theoretical framework, as it contains the key elements for influencing scale-up in health. Scaled up interventions were identified via online searches, grey literature and subject matter expert recommendation. Interview questions were mapped against key principles and core areas in the WHO ExpandNet framework. Data were analysed thematically.

**Results:** Nineteen interviews with participants in government (n=3) non-government (n=5) and academic (n=11) organisations. Participants represented eight scaled up interventions targeting nutrition (n=2), physical activity (n=1) or a combination (n=5). Corresponding to the ExpandNet framework, majority of themes aligned to 'environmental attributes', including (i) political (e.g., personal agendas), (ii) social (e.g., lack of urgency) and (iii) sector/workforce (e.g., scale up accountability) factors. Influences relating to 'scale up strategy' (e.g., transparency in evaluations) were the next most commonly occurring. Themes were consistent across participants, leading to eight recommendations for future scale up research and practice.

**Conclusions:** Drawing on the WHO ExpandNet framework, we address an important gap in scale up research; identifying how elements known to impact scaling are interrelated and where hierarchies of influence exist. Attributes of the "Environment" and "Scale up strategy" consistently featured as major influences on successful outcomes. The role and transparency of evidence differed greatly between participant groups. A multisector scale up strategy for future interventions may enable the complexities of environmental and political contexts to be incorporated into scale up planning.

# Factors that influence the implementation of the DAGIS-intervention to improve self-regulation, healthy eating habits, physical activity and screen use in 3-6-year-old children in Finland

**Miss Josefine Björkqvist<sup>1</sup>**, Miss Henna Launistola<sup>1</sup>, Dr. Reetta Lehto<sup>1</sup>, Miss Hanna Paasio<sup>1</sup>, Miss Jenna Rahkola<sup>1</sup>, Dr. Henna Vepsäläinen<sup>2</sup>, Prof. Nina Sajaniemi<sup>3</sup>, Prof. Maijaliisa Erkkola<sup>2</sup>, Prof. Eva Roos<sup>1</sup>, Associate Professor Carola Ray<sup>1</sup>

<sup>1</sup>Folkhalsan Research Centre, Helsinki, Finland, <sup>2</sup>University of Helsinki, Helsinki, Finland, <sup>3</sup>University of Eastern Finland, Joensuu, Finland

**O.2.17 - Translating evidence into practice - with focus on school setting, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Early childhood education and care (ECEC) is an important setting for interventions to improve children's health; however, evidence for effective health promotion interventions in ECEC is varied and more research is needed into factors influencing implementation. The Consolidated Framework for Implementation Research (CFIR) is one of the most widely used frameworks in implementation science. This study examines determinants (barriers and facilitators) perceived by ECEC educators when implementing the DAGIS-intervention using CFIR and compares determinants across ECEC groups with low and high confidence to implement the intervention.

**Methods:** The 2017-2018 DAGIS intervention (clustered randomised controlled trial) aimed to promote healthy energy balance-related behaviours (EBRBs) and self-regulation skills among Finnish children in ECEC. The intervention included five themes: self-regulation skills, physical activity, fruit/vegetable consumption, screen time, and sugary foods/beverage consumption. Thirty-two ECEC centres participated; 13 intervention centres, 19 controls. Early educators (n=90) completed a questionnaire at baseline. Based on a motivational index formed, the most confident (n=3) and the least confident ECEC centres (n=3), were selected to participate in focus group interviews to evaluate implementation of the DAGIS intervention. Interviews were coded using CFIR and scored between -2 and 2 to indicate negative or positive influence.

**Results:** Influential constructs covered all five CFIR domains and there were distinguishing factors between highly confident and less confident ECEC centres. Implementation facilitators included design quality and access to training, whereas networks, communication and adaptability were additional facilitators for highly confident ECEC centres. Barriers, including complexity, were more influential for ECEC centres with low confidence. Lack of planning time and relative priority were barriers across ECEC centres. Educators expressed high engagement with children across intervention themes relating to self-regulation and fruit/vegetable consumption, whereas educators expressed low engagement with parents regarding intervention themes focused on home environment, including screen time. Physical activity was perceived as compatible with existing ECEC centre initiatives.

**Conclusion:** This study gives valuable insights into facilitators and barriers for implementation of interventions in ECECs. Tailoring intervention implementation and support to ECECs by implementation readiness can help improve implementation within ECECs with low confidence in running programs promoting healthy EBRBs and self-regulation among children.

# Implementation and scaling up of the Swedish Healthy School Start family support programme – a hybrid type 3 evaluation study

**Prof. Liselotte Schäfer Elinder<sup>1,2</sup>**, Associate Professor Kristy Sidney Annerstedt<sup>1</sup>

<sup>1</sup>Karolinska Institutet, Stockholm, Sweden, <sup>2</sup>Center for Epidemiology and Community Medicine, Region Stockholm, Sweden

**O.2.17 - Translating evidence into practice - with focus on school setting, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** A comparative effectiveness study (IMPROVE) of implementing the universal Healthy School Start family support programme in two relatively disadvantaged municipalities. The primary outcome is fidelity to the intervention, while effects on clinical outcomes in children and parents are monitored in a hybrid type 3 evaluation study. This 1-year programme has previously shown moderate beneficial effects on diet, physical activity, and on BMI z-score in children with obesity.

Research questions:

1. What is the fidelity to the programme at year 1 when scaled up?
2. Is there a change in school personnel's perception of acceptability, feasibility and appropriateness after completing the first year of the intervention?

**Methods:** The IMPROVE study is ongoing in all public schools (n=28) in 2 municipalities during 2021-2024. Fidelity (adherence (score 0-4) and parent's responsiveness (0-16)) to the 4 components (parent: health information, motivational interviewing, risk test for type 2 diabetes; child: 9 classroom sessions) is assessed by questionnaires to school staff (n=87) and parents (n=173). Acceptability, appropriateness, and feasibility of the programme as perceived by principals (n=22), teachers (n=43) and school nurses (n=22) is measured by a validated questionnaire (score 0-16). T-tests and linear regressions were performed.

**Results:** The average adherence score to the intervention at year 1 was high, only lowered by the motivational interviewing component performed by school nurses ( $3.6 \pm 0.57$  SD). Responsiveness was positive among parents with an average score of  $12 \pm 3.3$  SD. The average acceptability, appropriateness and feasibility scores among school personnel were higher at baseline (range 10-11) than at year 1 (range 9-10). This decrease was significant for acceptability and appropriateness ( $p=0.002$  and  $0.02$ ). However, when controlling for type of school staff and municipality there was no difference in acceptability. When controlling for the different types of school staff, the feasibility score was significantly lower in one municipality ( $p=0.009$ ), which will be discussed.

**Conclusions:** This study adds important methodological knowledge to the scaling up of evidence-based programmes in the school context. Acceptability, appropriateness, and feasibility are important indicators of implementation climate and should be investigated well ahead of implementation start and attended to.

# Teams, policies, or champions? Exploring potential pathways of implementation success for wellness initiatives in schools using the Quality Implementation Framework

**Dr. Hannah Lane**<sup>1</sup>, Dr. Hannah Calvert<sup>2</sup>, Ms. Michaela McQuilkin<sup>2</sup>, Dr. Erin Hager<sup>3</sup>, Dr. Lindsey Turner<sup>2</sup>

<sup>1</sup>Duke University School of Medicine, Durham, USA, <sup>2</sup>Boise State University, Boise, USA, <sup>3</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA

**O.2.17 - Translating evidence into practice - with focus on school setting, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Local wellness policies (LWPs) are federally-mandated policies that promote healthy eating and physical activity practices (e.g., classroom breaks, limited unhealthy foods access) in U.S. schools. Achieving quality implementation of LWPs is challenging, particularly in under-resourced schools. We describe implementation strategies reported among a national sample of U.S. schools using SISTER (a compilation of evidence-informed strategies to implement innovations in schools), then explore contextual considerations across 4 implementation phases using the Quality Implementation Framework (QIF).

**Methods:** We conducted a convergent mixed methods analysis of data from 559 schools. Informants (e.g., principals, nurses, teachers) completed 66-item surveys (e.g., 6 Likert-type items assessing Climate for Wellness). A subsample (n=50) from 39 urban and rural schools completed semi-structured interviews. Interview data were analyzed deductively using 4 QIF phases: (1) preparing for implementation; (2) creating implementation structure; (3) maintaining structure throughout implementation; (4) assessing future needs. Survey data are described through descriptives and Poisson logistic regression (adjusted for district clustering, stratification, weighting) to support interview findings across phases.

**Results:** Sixty percent of survey respondents endorsed the SISTER strategy, “Preparing a wellness champion”, 59% endorsed “Having a school-level policy representative”, and 37% endorsed “Having an implementation team.” Unique contextual considerations were identified for these strategies within each QIF phase. In Phase 1, schools with higher Climate for Wellness scores had higher odds of having an implementation team (OR=1.18; CI [1.09,1.29]; p<0.001). Myriad other supportive and hindering contextual factors were qualitatively identified. In Phase 2, we identified key attributes (e.g., intrinsic motivation) and recruitment strategies for wellness teams/champions, and described facilitators of (e.g., external partners, parent engagement) and threats to (e.g., lack of incentives, staff resistance) quality implementation. In Phases 3-4, we identified differences in monitoring approaches by SISTER strategy (e.g., 74% of policy representatives monitored implementation, 43% of teams tracked goals) and gaps in assessing future needs (e.g., 25% integrated wellness goals into school improvement plans).

**Conclusions:** Findings provide detailed understanding of how LWP implementation strategies form and are sustained, and identify key knowledge gaps across phases. Findings inform tailored support for under-resourced schools to initiate and carry out evidence-informed implementation strategies.

# The co-design of a food waste resource prototype for Australian childcare centres.

**Mrs. Audrey Elford<sup>1</sup>**, Dr. Alison Spence<sup>1</sup>, Ms. Margaret Rozman<sup>2</sup>, Prof. Karen Campbell<sup>1</sup>, Dr. Penelope Love<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition, Deakin University, Melbourne, Australia, <sup>2</sup>Healthy Eating Advisory Service, Nutrition Australia, Melbourne, Australia

**O.2.18 - Changing behaviors in early care and education settings, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** To co-design a resource for childcare centres to increase awareness and management strategies regarding food waste.

**Methods:** To inform the development of the support tool, researchers utilized the first seven steps of the IDEAS co-design framework (integrate, specify, ground, ideate, prototype, gather & build), involving childcare centres who provide food onsite in Victoria, Australia, and the Victorian government-funded support organisation (Healthy Eating Advisory Service). Centre data were collected through a survey (n=129 centres) followed by weighed food/waste audits and semi-structured interviews in a subgroup of centres (n=12 centres). Focus groups are being conducted in November 2022. Surveys collected food waste awareness and management data with statistical tests applied to determine differences by centre type (for-profit, not-for-profit), location and socioeconomic position. The semi-structured interviews aimed to understand the barriers/facilitators to food waste awareness/management and resources that may assist. Survey, audit, and interview data informed the development of a prototype of a food waste awareness tool for childcare centres which will be refined in the focus groups.

**Results:** Survey results found low food waste awareness (8%), and changes to practices in centres who had conducted food waste audits in the past with no differences by location, type or socioeconomic status. Audits identified a range in total food waste (9%-64%), with less plate waste occurring in centres who had previously conducted food waste audits (7%) compared to those who had not (17%) (p=0.04). Interview themes related to Awareness (*need focus on food waste*), Knowledge (*need to know how to reduce and manage food waste*), Skills (*educators modeling eating, cooks preparing the right amounts of food*), Beliefs about consequences (*children being involved has positive results*), and Environmental context (*a whole-centre approach*). These findings resulted in the development of a food waste awareness/management resource prototype, refined in focus groups in preparation for future pilot testing to assess acceptability and effectiveness.

## **Conclusions:**

Food waste awareness appears to influence food waste practices in childcare services, reducing food waste. A co-designed food waste resource, embedded into the childcare educational program, could be a feasible solution.

# Australian Childcare Nutrition Policies – Do they align with best practice?

**Miss Ganna Aristova<sup>1</sup>**, Miss Laura Graham<sup>1</sup>, Mrs. Audrey Elford<sup>2</sup>, Mrs. Alison Spence<sup>1,2</sup>, Mrs. Penelope Love<sup>1,2</sup>

<sup>1</sup>School of Exercise and Nutrition Science (SENS), Deakin University, Geelong, Victoria, Australia, <sup>2</sup>Institute of Physical Activity and Nutrition (IPAN), SENS, Deakin University, Geelong, Victoria, Australia

**O.2.18 - Changing behaviors in early care and education settings, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Childcare centres are an important nutrition setting with high attendance rates and significant daily dietary needs being met, however research indicates suboptimal food provision and consumption in these settings. While the use of centre-based nutrition policy is an identified strategy to improve food provision and consumption, evidence is limited regarding effectiveness in guiding best practice. This study assessed centre-based nutrition policies of childcare services in Victoria, Australia to explore the comprehensiveness of content and strength of written language to guide the implementation of best practice guidelines. The applicability of a tool validated in the United States (US) as an instrument for the Australian context was also investigated.

**Methods:** Survey and web-based data of childcare services with on-site food provision (n=1068) listed on the Australian Children's Education and Care Quality Authority website, June 2021 was utilised. Policies were analysed using the Wellness Child Care Assessment Tool (WellCCAT) focusing on the 4 healthy eating domains – Nutrition Education (provision of education for children, staff and parents), Nutrition Standards (food group serving requirements and limitation of high sugar, fat and sodium foods), Promotion of Healthy Eating (the feeding environment) and Communication/Evaluation (of healthy eating practices). Policies were assessed independently by two scorers and moderated by a third. Content analysis assessed the applicability of the WellCCAT tool for the Australian context.

**Results:** Included policies (n=122) were predominantly from metropolitan centres (57.4%) and low-medium socioeconomic areas (78.2%). Policies had low overall WellCCAT scores, particularly strength scores which were low across all four domains. Nutrition Standards had the lowest strength score. Communication/Evaluation had the lowest comprehensiveness score. Content analysis indicated that underperformance may be related to the applicability of the WellCCAT assessment tool for the Australian context, due to differences in national nutrition standards.

**Conclusion:** This study provides unique insights as to where quality improvement of Australian childcare nutrition policies could be made. Further research is recommended to determine whether WellCCAT is an applicable tool for the Australian context, therefore highlighting the possible need for country-specific policy assessment tools.

# Social media and website-supported child feeding intervention improves feeding practices and children's diet quality

**Mr. Richard Ball**<sup>1,2</sup>, Dr. Kerith Duncanson<sup>2,3</sup>, Prof. Tracy Burrows<sup>2</sup>, Dr. Lee Ashton<sup>2</sup>, Dr. Maria Henstrom<sup>4</sup>, Dr. Elena Jansen<sup>5</sup>, Prof. Clare Collins<sup>2</sup>

<sup>1</sup>Mid North Coast Local Health District, Port Macquarie, Australia, <sup>2</sup>Priority Research Centre for Physical Activity and Nutrition, University of Newcastle, Newcastle, Australia, <sup>3</sup>Health Education and Training Institute (HETI) NSW Health, Sydney, Australia, <sup>4</sup>Karolinska Institutet, Huddinge, Sweden, <sup>5</sup>John Hopkins School of Medicine, Baltimore, USA

**O.2.18 - Changing behaviors in early care and education settings, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** The Parents In Child Nutrition Informing Community (PICNIC) intervention was established in 2018 as a peer-led healthy child weight initiative in regional Australia. The aims were to determine how PICNIC influenced feeding practices of parents/carers with a child aged up to three years and impact on infant/child's diet quality.

**Methods:** Parents of an infant aged zero to two years (n=307, mean age 8.4 months) were recruited into the 12-month, single-arm pre-post intervention, which included a dietitian-delivered workshop, online meetings, project specific website, Facebook and Instagram pages and support within a Facebook closed group. Parent feeding practices were measured at baseline, 6 and 12-months using the validated 34-item, six-construct Feeding Practices and Structure Questionnaire. Feeding construct mean scores were calculated and change over time measured in Stata using regression analysis. Feeding practice mean scores at 12 months were compared with age-matched population data. Diet quality was measured 24-months post intervention using the Australian Recommended Food Score for Pre-schoolers and compared with age-matched population data.

**Results:** PICNIC parents (n=199) feeding construct mean scores significantly improved over 12 months for 'Parent-led feeding' (-0.57(-0.74,-0.43) P<0.001), 'Family Meal Environment' (0.38(0.40,1.59) P<0.001), 'Persuasive Feeding' (-0.19(-0.33,-0.46) P=0.010) and 'Food to Calm' (-0.37(-0.53,-0.22) P<0.001). Feeding construct mean scores were significantly improved after 12-months intervention compared to age-matched normative data for 'Feeding on Demand' (P<0.001), 'Family Meal Environment' (P<0.010), 'Parent-led feeding' (P<0.001), 'Persuasive Feeding' (P<0.001), 'Food to Calm' (P=0.028) and 'Food Rewards' (P<0.001). At 12 months post-intervention (mean age 34 months) PICNIC participants' mean vegetable diet quality score was significantly higher (P=0.02) than age-matched population data.

**Conclusions:** A co-designed multi-strategy, peer-led intervention supported by a dietitian-administered website and social media positively influences community parents feeding practices and young children's diet quality. This confirms the efficacy of a dietitian-led intervention using contemporary health communication strategies to disseminate nutrition and feeding messages to, and between, new parents in a community setting. Future research will explore whether these changes to parents feeding practices and children's dietary intake influence child health up to age five.

# Intervention effects of a kindergarten-based health promotion programme on health-related quality of life and child sick days

**Dr. Susanne Kobel<sup>1</sup>**, Dr. Olivia Wartha<sup>1</sup>, Prof. Jürgen Steinacker<sup>1</sup>

<sup>1</sup>Ulm University Hospital, Ulm, Germany

**O.2.18 - Changing behaviors in early care and education settings, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Good health is considered a prerequisite for coping with numerous developmental tasks. However, the change in children's everyday behaviour has obesity as a possible consequence. The health promotion programme "Join the Healthy Boat" promotes a healthy lifestyle at an early age in order to improve the health of children holistically. The aim of this work was to find out whether the programme affects children's health and health-related quality of life (HRQoL).

**Methods:** Data from 401 children ( $3.65 \pm 0.56$  years; 54.1% boys) from 57 kindergartens throughout south-west Germany were included in the analysis. Of these, 223 children were in the intervention group (IG) and 178 children in the control group (CG). Children in the IG carried out a yearlong programme on healthy eating, physical activity and leisure activities. The CG followed the normal kindergarten routine. Anthropometric data were collected objectively at the beginning and end of the year. Information on sociodemographic background, HRQoL, the number of sick days and visits to the doctor by the child, and the number of childcare-related absences from work by the parents were collected using parent questionnaires. Intervention effects were analyzed using difference measures ( $T2 - T1$ ),  $\chi^2$  tests and binary logistic regressions.

**Results:** Over the study year, the IG showed a tendency towards a greater increase in the average HRQoL than the CG ( $1.09 \pm 5.65$  vs.  $0.43 \pm 5.67$ ,  $p = 0.40$ ) and a tendency toward a greater reduction in sick days ( $-1.25 \pm 5.30$  vs.  $-0.50 \pm 5.52$ ,  $p = 0.38$ ) and doctor visits ( $-0.79 \pm 3.16$  vs.  $-0.39 \pm 2.95$ ,  $p = 0.75$ ).

**Conclusions:** The health promotion programme "Join the Healthy Boat" did not achieve any significant intervention effects on HRQoL, sick days and doctor visits of the children or on the mother's days absent from care. Nevertheless, a positive trend towards improvement in subjective and objective health can be identified. The intervention is therefore aimed in the right direction and the tendential effects have the potential to become factual if the program is operated for a longer period of time.

# Identification of on-site breakfast provision and quality in Early Care and Education (ECE) services across Victoria, Australia

**Ms. Seon Park<sup>1</sup>**, Dr. Miaobing Zheng<sup>1</sup>, Dr. Kathleen E Lacy<sup>1</sup>, Prof. Karen J Campbell<sup>1</sup>, Dr. Penelope Love<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition (IPAN), Deakin University, Geelong, Australia

**O.2.18 - Changing behaviors in early care and education settings, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** In Australia, 1.3 million children attend government-approved centre-based Early Care and Education (ECE) services, many of which provide meals and snacks on-site for children. While previous research has investigated the quality of lunches/snacks provided at ECE services and found some associations between service characteristics and quality of on-site lunch/snacks provision, the quality of breakfast provision and its association have not been examined across ECE services in Victoria, Australia. Therefore, this study aims to evaluate the breakfast provision quality in ECE services, determining associations with service characteristics.

**Methods:** Victorian ECE services participated in an online survey of 20 items that collected information on several characteristics of ECE services (location (metro vs regional), service management type (for-profit vs not-for-profit), area-level socio-economic advantage (low (1-3 SEIFA), medium (4-7 SEIFA), high (8-10 SEIFA)), National Quality Standard benchmarks (NQS; working forward, meeting, exceeding) and breakfast food items offered (i.e., breakfast cereal, bread, milk, vegetables, fruits, etc). The quality of breakfast provision was calculated based on the Victorian Health Eating Advisory Service (HEAS) breakfast guidelines (cereals, wholegrains, dairy, fruits, vegetables) and the Healthy Choices System (green, amber, red food classification). Associations between breakfast quality and service characteristics were analysed.

**Results:** A total of 50 ECE services participated. Of which, about two-thirds were in a metropolitan area, had a for-profit management type, with medium or high area-level socio-economic advantage and were meeting NQS benchmarks. Breakfast cereal, bread, and milk were more likely to be “always” provided at breakfast, but vegetables or fruits were more likely to be “Never” offered at breakfast. Only 10% and 16.7% of ECE services met the criteria for high-quality breakfasts according to HEAS and the Healthy Choices System, respectively. Providing a high-quality breakfast according to HEAS was associated with high area-level socio-economic advantage (OR: 3.04, 95%CI: 0.96, 9.19).

**Conclusions:** This study highlights that on-site breakfast provision within Victorian ECE services did not meet current nutrition guidelines. Early intervention for breakfast provision in ECE services, particularly in areas of socio-economic disadvantage is needed, given the majority of ECE services with high area-level socio-economic advantage provide high-quality of on-site breakfast provision to children.

# Barriers, facilitators and strategies to improve water access and young children's water intake in family childcare homes: Results from the Drink Well/Bebe Bien study

**Dr. Kim Gans**<sup>1</sup>, Dr. Alison Tovar<sup>2</sup>, Ms. Vanessa Esquivel<sup>1</sup>, Ms. Sarah Warykas<sup>1</sup>, Ms. Viviana Zambrano<sup>1</sup>, Ms. Michelle Miller<sup>1</sup>, Dr. Patricia Risica<sup>2</sup>, Dr. Shira Dunsiger<sup>2</sup>

<sup>1</sup>University of Connecticut, Storrs, USA, <sup>2</sup>Brown University School of Public Health, Providence, USA

**O.2.18 - Changing behaviors in early care and education settings, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Beverage access in childcare plays an important role in child diet quality. Little research has been done in family childcare homes (FCCH), which may be higher risk settings. Water is often not accessible or offered to children in FCCH. Research is needed to determine barriers and feasible strategies to improve water access and children's intake in FCCH. The Drink Well project is examining how to increase water availability/accessibility in FCCH and improve young children's beverage intake.

**Methods:** Phase 1: Formative, qualitative interviews with FCCH providers (FCCP) in low income communities to determine barriers and strategies to improve water availability and children's intake. Phase 2: Intervention pilot to increase water availability/accessibility in the FCCH (e.g. providing water stations, water filters, technical assistance, etc.) with 40 FCCP (50% Latina) operating FCCH in low income neighborhoods in RI, MA & CT that care for children aged 6-60 months. Pre-post surveys and post qualitative interviews will assess feasibility, acceptability and efficacy of the intervention.

**Results:** We completed 20 Phase 1 formative interviews with FCCP (100% female; 50% Latina; mean age 49 years; 70% < college education; care for mean of 7 children). Interviews found these barriers: children don't like taste of water; parents don't role model drinking water or provide water for children; other beverages are prioritized by parents & FCCP; perceived poor water quality/safety; worry about mess if children self-serve water; fear that if children drink too much water they won't eat meal/milk or have "accidents"; lack of supplies/equipment (e.g. filters); lack of structure in FCCH; confusion about federal food program rules for water. The pilot intervention study will occur from Dec. to June 2023. Study data to be presented will include use and acceptability of the intervention, and pre-post changes in: serving of water/beverages, water availability/accessibility, factors influencing water provision, attitudes about and challenges to water access/consumption, knowledge about beverage guidelines, FCCP own beverage intake, etc.

**Conclusion:** Drink Well/Bebe Bien addresses research gaps re. water/beverage access and intake in FCCH, and can inform future research & policies to impact low-income/ethnic minority children at highest risk for poor diet & weight-related health disparities.

# A prospective analysis of physical activity and mental health in children: the GECKO Drenthe Cohort

**Ms. Lu Yang<sup>1</sup>**, Associate Professor Eva Corpeleijn<sup>2</sup>, Associate Professor Esther Hartman<sup>1</sup>

<sup>1</sup>University of Groningen, University Medical Center Groningen, Department of Human Movement Sciences, Groningen, Netherlands, <sup>2</sup>University of Groningen, University Medical Center Groningen, Department of Epidemiology, Groningen, Netherlands

**O.3.19 - How mental and physical health is associated with nutrition and movement, UKK - Main Hall (Level 6), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Mental health problems in young people have become a global health burden. The effects of physical activity (PA) on mental health in adults are well known but are still not clear in children. The aim of this study was to investigate to what extent PA in early childhood is related to mental health in late childhood. The main innovations of this study were the objectively measured PA at very young age and longitudinal study design.

**Methods:** 846 children from the Dutch GECKO Drenthe birth cohort (51.7% boys) were enrolled in this analysis. PA was objectively measured at age 5 using ActiGraph GT3X. Mental health was assessed using the Strengths and Difficulties Questionnaire (SDQ) at age 5 and age 11. PA and SDQ data were ln-transformed. Multiple linear regression models were used to estimate the associations between physical activity volume, different PA intensities and SDQ subscales, stratified by gender, and adjusting for age, maternal education level, family size, BMI and SDQ at age 5.

**Results:** Increased moderate-to-vigorous PA (MVPA) at age 5 was significantly associated with lower peer problem scores in 11-year-old boys ( $B=-0.053$ , 95%CI -0.085 to 0.022) and girls ( $B=-0.033$ , 95%CI -0.062 to -0.003). Physical activity volume at age 5 is also inversely associated with peer problem scores in boys ( $B=-0.080$ , 95%CI -0.133 to -0.026) and girls ( $B=-0.051$ , 95%CI -0.1 to -0.002) aged 11. In contrast, increased sedentary time was associated with higher peer problem scores at age 11, but this was only significant in boys ( $B=0.100$ , 95%CI 0.024 to 0.177). With respect to hyperactivity, for boys, higher levels of MVPA and lower levels of sedentariness at age 5 were related with higher hyperactivity scores at age 11 in a partially adjusted model, and the associations became non-significant after adjusting for hyperactivity scores measured at age 5. No significant association between PA and other SDQ subscales or total difficulties scores was observed, neither in boys nor girls.

**Conclusions:** In general, children who are more physically active at age 5 have less peer problems at age 11, and more active boys have higher hyperactivity scores at age 11.

# The impact of enabling Risky Play on physical activity and wellbeing in New Zealand primary schools: The Puketāpapa Play Project

**Dr. Charlotte Jelleyman<sup>1</sup>**, Dr. Tom Stewart<sup>1</sup>, Mr. Tobias Cox<sup>1</sup>, Prof. Scott Duncan<sup>1</sup>

<sup>1</sup>School of Sport and Recreation, AUT, Auckland, New Zealand

**O.3.19 - How mental and physical health is associated with nutrition and movement, UKK - Main Hall (Level 6), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Risky play – play that is thrilling, exciting and involves potential for physical injury – is associated with positive developmental benefits, yet quality play opportunities are declining. While schools play an important role in the provision of play opportunities, investigations of risky play interventions in primary (elementary) schools are limited. This study sought to examine the efficacy of a school-based risky play intervention for increasing children's physical activity, and understand the barriers and facilitators for intervention adoption.

**Methods:** The Puketāpapa Play Project was a risky play intervention implemented in 11 Auckland primary schools. It comprised of three workshops for school staff that focused on: (1) the importance of risky play for child development, (2) strategies to facilitate risky play, and (3) mapping opportunities for risky play. Rule changes and play equipment were introduced in each school, and support and activations were provided throughout.

Wrist-worn accelerometers (Axivity AX3) were used to assess baseline 24-hour activity patterns (follow-up data collection currently underway). Focus groups and interviews with children and staff were conducted before and after the intervention. Accelerometer data were analysed using compositional data analysis, while the focus group and interview data were synthesised using thematic analysis.

**Results:** At the time of writing, baseline data were available for 147 children. Initial analysis revealed the mean activity composition was; sedentary = 10.5 hours/day, light intensity = 4.9 h, MVPA = 1 h, sleep = 7.5 h. Compositional MANOVA showed the daily activity compositions at baseline were different between boys and girls ( $F(3, 88) = 6.3$ ,  $p < 0.01$ ,  $\eta^2 = 0.18$ ) where boys had 38% (95% CI 16.6, 65.2%) more MVPA than girls. Staff interviews revealed teachers were enthusiastic towards risky play in the school environment, but lacked confidence implementing and sustaining any changes. They suggested at least one year was needed to transform the play environment. Themes arising from the children's focus groups included respecting school rules whilst also desiring more freedom.

**Conclusion:** Preliminary results revealed several barriers/facilitations to intervention adoption. Physical activity follow-up measurement is ongoing and the efficacy of the intervention will be presented at the conference.

# COVID-19 restrictions and objectively measured movement behaviors in Singaporean children

**O.3.19 - How mental and physical health is associated with nutrition and movement, UKK - Main Hall (Level 6), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** COVID-19 restrictions have affected populations around the world. We aim to investigate 24-hour movement behaviors of children aged 10 years during different phases of the pandemic in Singapore.

**Methods:** Children from the Growing Up in Singapore Towards healthy Outcomes (GUSTO) cohort were asked to wear an accelerometer (Actigraph-GT3X+) to measure their movement behaviors. Time spent in inactivity, light physical activity (LPA), moderate physical activity (MPA), vigorous physical activity (VPA) and sleep were generated using the R-package GGIR version 2.0. According to the timepoint of their assessment, children were assigned to three COVID-19 restriction groups: Pre-COVID (no restrictions), COVID1 (severe restrictions), COVID2 (moderate restrictions). Linear regression analysis was conducted to examine the associations of movement behaviors and levels of COVID-19 restrictions, with adjustment for sociodemographic factors (e.g. sex and BMI) and the respective movement behaviors at age 8.

**Results:** Of all children (n=447), those in the Pre-COVID group had an average of 585.8, 293.8, 49.9, 6.4 and 504.1 min/day of inactivity, LPA, MPA, VPA and sleep, respectively. We found that children from the COVID1 group spent the most amount of time in inactivity and the least amount of time engaging in LPA, MPA, and VPA. Compared to the children in the COVID1 group, children in the COVID2 group spent more time in LPA (22.3 min/day (CI: 10.6 - 34.2)), while children in the Pre-COVID group spent more time in VPA (1.9 min/day (CI: 0.3 - 3.6)). COVID restriction groups were strongly associated with LPA ( $p < 0.001$ ) and borderline with VPA ( $p = 0.064$ ). The other remaining movement behaviours (inactivity, MPA, sleep) had non-significant associations with COVID restriction groups.

**Conclusions:** During the severe COVID-19 restrictions, children spent more time in inactivity and less time in movement behaviors. It suggests that the COVID-19 restrictions in Singapore may have substantially changed children's movement behavior.

# Is breastfeeding duration related to health of migrant mother-child dyads experiencing homelessness? The ENFAMS cross-sectional survey.

**Ms. Alexandra Descarpentrie**<sup>1</sup>, Dr. Delphine Pocquet<sup>1</sup>, Dr. Pauline Brugailleres<sup>2</sup>, Dr. Priscille Sauvegrain<sup>1,3,4</sup>, Dr. Pauline Frenoy<sup>5</sup>, Dr. Jonathan Y. Bernard<sup>1</sup>, Dr. Blandine de Lauzon-Guillain<sup>1</sup>, Dr. Stéphanie Vandentorren<sup>2,4,6</sup>

<sup>1</sup>Université Paris Cité and Université Sorbonne Paris Nord, Inserm, INRAE, Centre for Research in Epidemiology and Statistics (CRESS), 75004 Paris, France, <sup>2</sup>Université Bordeaux, Inserm, UMR1219, PHARes team, 33000 Bordeaux, France, <sup>3</sup>Sorbonne Université, Midwifery Unit, 75013 Paris, France, <sup>4</sup>Institut convergences migrations/CNRS, Aubervilliers, France, <sup>5</sup>Université Paris Saclay, UVSQ, Université Paris-Sud, Inserm, Gustave Roussy, "Exposome and Heredity" team, CESP, 94805, Villejuif, France, <sup>6</sup>Santé publique France, French national public health agency, 94415 Saint-Maurice, France

**O.3.19 - How mental and physical health is associated with nutrition and movement, UKK - Main Hall (Level 6), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Breastfeeding has been associated with various health benefits both for the mother and her child. However, there are critical gaps in the knowledge of such relations in extremely underserved populations, such as families experiencing homelessness. Yet, breastfeeding could mitigate stress and buffer adverse health outcomes in mother-child dyads in this population. Our objective was to examine these relations in the French context.

**Methods:** Data were collected among sheltered and mainly foreign-born mothers experiencing homelessness, and their children aged 0.5-5 years, from the ENFAMS cross-sectional survey (n=481, 2013 - Great Paris area). Any breastfeeding duration, along with various health outcomes of both the mother and her child were ascertained by face to face questionnaires by trained bilingual interviewers to mothers (symptoms of depression and perceived physical and emotional health) or by trained bilingual psychologist to her child (adaptive behaviors). Other health outcomes were measured by nurses: body mass index, haemoglobin concentration (dyad) and blood pressure (mothers). Multivariable linear and modified Poisson regression analyses were performed to examine outcome-wide associations between any breastfeeding duration  $\geq 6$  months and mother-child outcomes.

**Results:** Overall, 61.6% (95% CI [54.7 to 68.4]) of the children had been (or were being) breastfed  $\geq 6$  months. Children mean age was 2.8 years [2.5 to 3.0]. Mothers' regions of birth were Africa for 63.8% [57.1 to 70.1] and outside Africa for 36.2% [29.4 to 42.9]. Proportion of food insecurity was 84.6% [79.1 to 90.0]. Multivariable analyses underlined that any breastfeeding duration  $\geq 6$  months was associated with lower systolic blood pressure (B=-0.40, 95% CI [-0.68 to -0.13]). No other relevant association was observed with the other outcomes in both mothers and children.

**Conclusions:** The importance of supporting breastfeeding to improve mothers' health holds true in the context of migration and homelessness. Such interventions should, however, account for mothers' socio-cultural heritage and structural barriers. Regarding the associations of breastfeeding duration with measures of child health and development in this population, the jury is still out and further research is recommended to overcome potential residual confounding.

# Acute effects of nitrate and breakfast on working memory and cerebral blood flow in adolescents: a randomized crossover trial

**Dr. Emerald G. Heiland**<sup>1,2</sup>, Prof. Örjan Ekblom<sup>1</sup>, Ms. Olga Tarassova<sup>3</sup>, Ms. Karin Kjellenberg<sup>1</sup>, Associate Professor Gisela Nyberg<sup>1,4</sup>, Prof. Maria M. Ekblom<sup>1,5</sup>, Dr. Björg Helgadóttir<sup>1,6</sup>

<sup>1</sup>Department of Physical Activity and Health, The Swedish School of Sport and Health Sciences (GIH), Stockholm, Sweden, <sup>2</sup>Department of Surgical Sciences, Medical Epidemiology, Uppsala University, Uppsala, Sweden, <sup>3</sup>Department of Physiology, Nutrition, and Biomechanics, The Swedish School of Sport and Health Sciences (GIH), Stockholm, Sweden, <sup>4</sup>Department of Global Public Health, Karolinska Institutet, Solna, Sweden, <sup>5</sup>Department of Neuroscience, Karolinska Institutet, Solna, Sweden, <sup>6</sup>Division of Insurance Medicine, Department of Clinical Neuroscience, Karolinska Institutet, Solna, Sweden

**O.3.19 - How mental and physical health is associated with nutrition and movement, UKK - Main Hall (Level 6), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Beneficial acute effects of dietary nitrate have been demonstrated on working memory in adults, with changes in cerebral blood flow (CBF) being a potential mechanism. However, these effects have not been studied in adolescents. Moreover, having breakfast compared to skipping may also exhibit positive effects on working memory. Therefore, this randomized crossover trial investigated the acute effects of nitrate and breakfast on working memory and changes in task-related CBF in adolescents.

**Methods:** This trial will recruit at least 43 adolescents (13–15 years old). There were three experimental breakfast conditions: (1) none, (2) regular, and (3) regular breakfast with high nitrate in the form of concentrated beetroot juice. Working memory (1-, 2-, 3-back tests) and task-related CBF (prefrontal cortex oxygenated and deoxygenated-hemoglobin changes estimated using functional near-infrared spectroscopy) were measured immediately after breakfast and 130 min later. The data collection for this study is ongoing, thus results for 35 adolescents are presented here and due to blinding of the researcher we are unable to report at this time in which condition these effects occurred, but will be revealed by the time of the conference, as well as for the results on changes in CBF.

**Results:** Preliminary results from the ongoing study showed that from pretest to posttest there was a statistically significant improvement in reaction time in all three conditions for all three n-back tests, but no intervention effects. Accuracy, however, improved from pretest to posttest in only one condition, for all three n-back tests ( $\beta$  [95% confidence interval] from linear mixed-effects models with subject as random effect: 1-back 2.8[1.2-4.3], 2-back 2.6[0.9-4.2], 3-back 3.6[2.2-5.0]), and there was a tendency towards an intervention effect between this breakfast condition and another on the accuracy of the 3-back test ( $P$  for time-by-condition interaction 0.07).

**Conclusions:** The results from this study will increase our understanding into the effects of breakfast and its composition (i.e., nitrate-rich) on acutely improving working memory in adolescents and the potential mechanisms. In turn, the results will inform on whether policies on providing breakfast in schools should be considered to improve students' cognitive performance.

# Systems dynamics for healthy and sustainable local food environments

**Ms. Tamika M Wopereis<sup>1</sup>**, Assistant Professor Coosje Dijkstra<sup>2</sup>, Ms. Frederique Rongen<sup>1</sup>, Ms. Joline J Wierda<sup>1</sup>, Prof. Emely de Vet<sup>1</sup>, Associate Professor Maartje P Poelman<sup>1</sup>

<sup>1</sup>Chair Group Consumption and Healthy Lifestyles, Wageningen University & Research, Wageningen, Netherlands, <sup>2</sup>Department of Health Sciences, Faculty of Science, Vrije Universiteit Amsterdam, Amsterdam Public Health research institute, Amsterdam, Netherlands

**O.3.20 - Sustainable food and active environments, UKK - Level 6 Foyer, June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To identify factors and leverage points that influence the neighbourhood food environment and understand through which systemic actions these factors can be adapted to trigger the transition towards healthy and sustainable food environments.

**Methods:** Three co-creation sessions were held in 2022 in a Dutch municipality using a community-based system dynamics approach. During the two first sessions, a variety of stakeholders (n=11-18), including policy makers, retailers, health coaches, chefs, citizens, conducted group model building exercises to identify factors influencing their local food environment. The exercises were based on pre-defined scripts: behaviour-over-time graphs, connection circles and drawing the causal loop diagram (CLD). Based on this first exercise, the research team identified the feedback loops and presented, discussed and fine-tuned these with the stakeholders. Also, member checks with policy advisors from other municipalities and external researchers were organised to review the CLD and to extend the model to more municipalities in the Netherlands. During the second session, based on the CLD, leverage points were identified and actions for systems change were formulated. The actions were developed by the stakeholders, taking into account their interests and capacity, the levels for change outlined in the Action Scales Model (ASM) and the previously identified leverage points.

**Results:** A total of 46 factors that influence the local food environment were identified by the stakeholders, including 7 leverage points. These factors were categorised into four larger themes: consumer- (e.g, social norms), government- (e.g, food policy), food industry (e.g., profit)- and global trend-related (e.g., digitalization) factors. The participants developed 20 actions based on the CLD: 50% targeted the events level of the ASM, 30% the structures level, 15% the goals level and 5% system beliefs.

**Conclusions:** This research yielded one of the first CLDs showing the multiple and varied factors influencing the local food environment. It underlines the importance of using a systems approach to adapt food environments. The exercises conducted initiated dialogues and collaborations between the participating stakeholders to adapt their local food environment. Yet, it was challenging for stakeholders to think in systems. More work is needed to translate systems approaches for use by non-academics.

# Current state and developments in physical activity monitoring, policy, and research in 217 countries: Global Observatory for Physical Activity - GoPA! surveys

**Dr. Andrea Ramirez Varela**<sup>1,2</sup>, Miss Juliana Mejia Grueso<sup>1,2</sup>, Prof. Michael Pratt<sup>3,5</sup>, Dr. Pedro Hallal<sup>4,5</sup>

<sup>1</sup>Universidad de los Andes, Bogota, Colombia, <sup>2</sup>Global Observatory for Physical Activity, Latin American Office, Bogota, Colombia, <sup>3</sup>University of California San Diego, San Diego, USA, <sup>4</sup>University of Illinois, Champaign/Urbana, USA, <sup>5</sup>Global Observatory for Physical Activity, USA Office, San Diego/Champaign/Urbana, USA

**O.3.20 - Sustainable food and active environments, UKK - Level 6 Foyer, June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** It is necessary to do regular evaluations of the global surveillance, policy, and research capacities in the field of physical activity and public health, in order to evaluate national capacity for promotion and advocacy. The purpose of this study was to evaluate the current state of physical activity surveillance, policy, and research throughout the world, and identify emerging trends.

**Methods:** We used data from the Global Observatory for Physical Activity (GoPA!) 2015 and 2020 surveys. The data collected throughout both phases were used to evaluate the degree of progress of national surveillance, policy, and research. The findings were reviewed and approved by GoPA! official country representatives.

**Results:** The worldwide 5-year progress in surveillance, policy, and research indicators was moderate, with the majority of countries either making improvements or maintaining the same level from 2015. The total physical activity promotion capacity was found to be highest in Europe, while it was determined to be the lowest in Africa and low and middle-income nations. In particular, 48.1%, 40.6%, and 42.1% of the countries increased or remained at the highest level for surveillance, policy, and research respectively; 40.6%, 36.8%, and 18.8% continued to remain at the intermediate level for surveillance, policy, and research respectively; 8.3%, 15.8%, and 28.6% decreased or continued to remain at the lowest level for surveillance, policy, and research respectively; and data was unavailable for 3.0%, 6.8%, and 10.5% for surveillance, policy, and research respectively. Despite a large percentage of the world's population benefiting from at least some policy, surveillance, and research in physical activity, GoPA! estimates that 145 million people, or 2% of the world population, live in countries with a low capacity for physical activity promotion (equivalent to Russia's population); 49.6 million people live in a country without surveillance (equivalent to Spain's population); 629.4 million people are without policy (equivalent to Latin America's population), and 108.7 million people are without research (equivalent to Egypt's population).

**Conclusions:** Despite the fact that engaging in physical activity is an essential behavior for maintaining the population's good health, there are significant inequalities in the capacity to promote physical activity worldwide.

# Understanding the Use of Social Infrastructures to Prevent and Cope with Household Food Insecurity in the United States

**Ms. Gabby Headrick<sup>1</sup>**, Ms. Kiera Abdul<sup>1</sup>, Ms. Shireen Guru<sup>2</sup>, Ms. Allison DeHoney<sup>3</sup>, Dr. Alyssa Moran<sup>1</sup>, Dr. Pamela Surkan<sup>1</sup>, Dr. Samina Raja<sup>2</sup>, Dr. Yeeli Mui<sup>1</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA, <sup>2</sup>University at Buffalo, Buffalo, USA,

<sup>3</sup>Urban Fruits & Veggies LLC, Buffalo, USA

**O.3.20 - Sustainable food and active environments, UKK - Level 6 Foyer, June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Food insecurity (FI) in the United States disproportionately impacts low-income and Black (vs. White) households. COVID-19 further exacerbates this health inequity. Households cope with FI by using formal (e.g., federal nutrition assistance programs) and informal (e.g., family members) social infrastructures. Coping strategies are proactive, to avoid FI (e.g., use of nutrition programs), and reactive, to deal with FI (e.g., skipping meals). Little is known about how households use different social infrastructures synergistically to proactively and reactively cope with FI.

**Methods:** We completed in-depth, semi-structured interviews between May 2022 and July 2022 with n=40 individuals (73% experiencing FI) living in low-income and predominantly Black households in Buffalo, New York. The interview guide was informed by the Family Resilience Framework and the Social-Ecological Model and included questions about how households cope with FI by drawing on resources in their household, community, and from government programs. We transcribed interviews verbatim and used inductive and deductive coding to organize data, followed by an emergent thematic analysis.

**Results:** We identified seven themes to describe proactive and reactive strategies used across social infrastructures. Three occurred at the household level: (i) food acquisition strategies; (ii) eating pattern strategies; and (iii) individual agency. Two occurred at the community level: (iv) social connection; and (v) community food support. Finally, two related to government programs: (vi) social benefit assistance strengths; and (vii) social benefit assistance shortfalls. Proactive strategies identified included budgeting and couponing for food, home cooking, sharing meals with people outside the household, receiving transportation support to food sources, and using Supplemental Nutrition Assistance Program (SNAP) benefits. Reactive strategies identified included delaying the payment of other household expenses (e.g., car repairs), stretching food supplies and modifying eating patterns (e.g., not eating meat), wanting to maintain independence from family and friends by using charitable food supports, and receiving financial support from people outside the household to buy food.

**Conclusions:** Households predominately used formal social infrastructures proactively while they used informal social infrastructures reactively. Strengthening formal social infrastructures (e.g., increasing SNAP benefits) may proactively protect against FI while fostering interpersonal connections may provide support needed when circumstances are severe.

# A novel approach for the optimisation of heterogeneous diets can promote public health and keep diets within planetary boundaries for climate change

Dr. Patricia Eustachio Colombo<sup>1,2</sup>, **Prof. Liselotte Schäfer Elinder**<sup>1,3</sup>, Mr. Esa-Pekka Nykänen<sup>4</sup>, Dr. Emma Patterson<sup>1,5</sup>, Dr. Anna Karin Lindroos<sup>5,6</sup>, Dr. Alexandr Parlesak<sup>7,8</sup>

<sup>1</sup>Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden, <sup>2</sup>MRC Epidemiology Unit, Institute of Metabolic Science, School of Clinical Medicine, University of Cambridge, Cambridge, United Kingdom, <sup>3</sup>Centre for Epidemiology and Community Medicine, Region Stockholm, Stockholm, Sweden, <sup>4</sup>Functional Foods Forum, University of Turku, Turku, Finland, <sup>5</sup>The Swedish Food Agency, Uppsala, Sweden, <sup>6</sup>Department of Internal Medicine and Clinical Nutrition, the Sahlgrenska Academy at University of Gothenburg, Gothenburg, Sweden, <sup>7</sup>Department of Nutrition, Exercise and Sports, Copenhagen University, Copenhagen, Denmark, <sup>8</sup>Personalized Nutrition, Duale Hochschule Baden-Württemberg, Heilbronn, Germany

**O.3.20 - Sustainable food and active environments, UKK - Level 6 Foyer, June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Current dietary habits have substantial negative impacts on the health of people and the planet. Novel approaches are needed to develop sustainable food-based recommendations that consider the diversity in diets.

**Methods:** We combined hierarchical clustering analysis with linear programming to design nutritionally adequate, health-promoting, climate-friendly and culturally acceptable diets using Swedish national dietary data. Diets were optimised for the average consumption of the total population as well as for three identified dietary clusters.

**Results:** All optimised diets had lower shares of animal-sourced foods and contained higher amounts of plant-based foods. These dietary shifts reduced climate impacts by up to 53% while leaving much of the diet unchanged. The optimised diets of the three clusters differed from the optimised diet of the total population.

**Conclusion:** Our cluster-based optimisation approach may therefore be able to generate more acceptable and realistic alternatives for a sustainable diet. All optimised diets differed considerably from the food-group pattern of the EAT-Lancet diet.

# Could targeted food subsidies improve diets and reduce carbon footprints? A simulation study of SNAP, the major US food assistance program

**Dr. Diego Rose<sup>1</sup>**, Dr. Rodrigo Aranda<sup>2, 3</sup>, Dr. Amelia Willits-Smith<sup>1, 4</sup>, Dr. Keelia O'Malley<sup>1</sup>

<sup>1</sup>Tulane University, New Orleans, USA, <sup>2</sup>University of Southern California, Los Angeles, USA, <sup>3</sup>University of Wisconsin, Milwaukee, USA, <sup>4</sup>University of North Carolina, Chapel Hill, USA

**O.3.20 - Sustainable food and active environments, UKK - Level 6 Foyer, June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Globally, human food systems account for a third of greenhouse gas emissions (GHGE). Can dietary behaviors be modified to address this environmental problem, while also improving nutrition? In the US, the Supplemental Nutrition Assistance Program (SNAP), serves 42 million people per month by expanding the purchasing power of low-income households. To date, there has been no large-scale effort by SNAP to subsidize plant-based foods, which have lower climate impacts, health benefits, and are under-consumed in the US. The purpose of this study is to simulate the effects of such a subsidy on the nutritional quality and associated GHGE of diets consumed by SNAP-eligible individuals.

**Methods:** Consumer response to changes in food prices was estimated using an integrated economic model, the "generalized almost ideal demand system," and data from the National Household Food Acquisition and Purchase Survey. Estimates from this model were used to simulate the purchasing behavior of SNAP-eligible individuals in the US National Health and Nutrition Examination Survey (NHANES) under various subsidy scenarios. We examined the effects of a 1%, 5%, and 10% subsidy on "fruits and vegetables," or "plant protein foods" (legumes, seeds, nuts, and soy), or both on subsequent changes in diet quality and dietary GHGE. Diet quality was measured with the US Department of Agriculture's Healthy Eating Index (HEI). Dietary GHGE was based on an existing GHGE database linked to NHANES foods.

**Results:** In all subsidy scenarios, mean HEI scores increased and mean GHGE associated with dietary changes declined. However, the simulated changes were small. Even a 10% subsidy on both fruits and vegetables and plant protein foods, resulted in <1% increase in HEI and <1% decline in GHGE.

**Conclusions:** Contributions from all economic sectors, including agriculture and food, are needed to address the urgent problem of climate change. This program strategy offers a relatively low-cost way to change the direction of emissions from food in the US, while improving diet quality, albeit in a minor way. Additional research could address whether the promotional effect of a subsidy program could increase impacts even more by drawing attention to the benefits of plant-based foods.

# Regional Cross-sector Partnerships Promoting Physical Activity and a Sustainable Food System: What They Do and How They Do It

**Dr. Kadia Saint-Onge**<sup>1,2</sup>, Ms. Jany St-Cyr<sup>3</sup>, Ms. Nathalie Bedrossian<sup>2</sup>, Ms. Jessica Lambert-De Francesch<sup>1,2</sup>, Prof. Nazeem Muhajarine<sup>4,5</sup>, Prof. Lise Gauvin<sup>1,2</sup>

<sup>1</sup>School of Public Health, Université de Montréal, Montreal, Canada, <sup>2</sup>Centre de recherche du Centre hospitalier de l'Université de Montréal (CR CHUM), Montreal, Canada, <sup>3</sup>Department of Psychology, Université du Québec à Montréal, Montreal, Canada, <sup>4</sup>Department of Community Health and Epidemiology, University of Saskatchewan, Saskatoon, Canada, <sup>5</sup>Saskatchewan Population Health Evaluation and Research Unit (SPHERU), Saskatoon, Canada

**O.3.20 - Sustainable food and active environments, UKK - Level 6 Foyer, June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Cross-sector partnerships are recognized as an effective strategy to successfully promote healthy lifestyles. They can be defined as collaboration between three or more economic sectors (private, public, and non-profit). Cross-sector partnerships are complex and warrant a better understanding of their processes and perceived outcomes. This study developed a model of the inner workings of two cross-sector partnerships in Montreal, Canada: Montreal Physiquement Active (MPA) and the Conseil du Système Alimentaire Montréalais (CSAM).

**Methods:** We conducted semi-structured in-depth interviews with purposefully sampled stakeholders representing diverse profiles (MPA n=10, CSAM n=12). Interviews were conducted online, recorded, transcribed, and thematically analyzed to ascertain the functioning and added value of participating in these partnerships. We then triangulated these data with documentation on the partnerships' websites (e.g., annual reports, action plans) and applied logic modeling to draft the partnerships' theory of change.

**Results:** Analysis produced a theory of change common to MPA and CSAM. Activities were: mobilizing partners (engaging present and recruiting new stakeholders), mobilizing resources (e.g., funding, best practices, and staff), and coordinating sub-activities. Sub-activities were: developing and maintaining relationships, facilitating working groups, organizing and supporting co-development workshops, and lastly, sharing knowledge. Sub-activities granted access to stakeholder networks and broader knowledge of the context as well as the development of truly integrated action plans and collaborative projects. This resulted in a unified "360° vision" of current realities and priorities in the field of physical activity and the food system in Montreal. Data show that in the medium term, participation in MPA and CSAM contributes to build stakeholders' capacity for action.

**Conclusions:** Interestingly, the main perceived outcome of the studied partnerships also happens to be a fundamental component to cross-sector partnership success: sharing a common vision. This finding highlights the dynamic and circuitous workings of cross-sector partnership in healthy lifestyle promotion. Cross-sector partnerships are essential for equitable and efficacious health promotion. Yet maintenance of stakeholder engagement is a commonly reported barrier. By illustrating the functioning and added value of participation in cross-sector partnership, this study may contribute to bolster stakeholder engagement and foster partnership development.

# Prospective Associations of Genetic Risk and Replacement of Sedentary Time by Active Time with Incident Chronic Obstructive Pulmonary Disease (COPD): A UK Biobank study

**Ms. Haeyoon Jang<sup>1</sup>**, Ms. Mengyao Wang<sup>1</sup>, Dr. Shan Luo<sup>1</sup>, Dr. Shiu Lun Au Yeung<sup>1</sup>, Dr. Youngwon Kim<sup>1,2</sup>  
<sup>1</sup>School of Public Health, Li Ka Shing Faculty of Medicine, The University of Hong Kong, Hong Kong, Hong Kong, <sup>2</sup>MRC Epidemiology Unit, University of Cambridge School of Clinical Medicine, Cambridge, United Kingdom

**O.3.21 - From genes to physical and psychosocial health outcomes, UKK - Hall B (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Regular participation in physical activity is known to be associated with lower risk of chronic obstructive pulmonary disease (COPD). However, little is known about whether the prospective associations of sedentary time (ST) replaced by active time with COPD risk differ by genetic susceptibility to COPD.

**Methods:** This study included 63,454 white British participants with valid wrist-worn accelerometry data and no prevalent COPD. Acceleration measured through wrist-worn accelerometry was used to define ST (<30 milli-g excluding self-reported sleep time), light physical activity (LPA; 30-125 milli-g), and moderate-to-vigorous physical activity (MVPA; >125 milli-g). Weighted polygenic risk scores (PRS) for COPD were derived based on 71 genome-wide significant single nucleotide polymorphisms associated with COPD. A total of 695 COPD incidence cases (defined based on hospital admission and death records) were accrued over a median 7.0-year follow-up. Cox regression using compositional isotemporal substitution modelling was fit, with adjustment for confounders (e.g., age, sex, smoking, alcohol consumption, residential air pollution and Townsend deprivation index). The associations for pairwise replacement of ST by more active time across levels of PRS and in the full sample were tested in this study.

**Results:** Greater genetic susceptibility to COPD was associated with higher COPD risk. An increase in the ratio of ST to all other behaviours was associated with a higher hazard of COPD (Hazard Ratio [HR]: 2.29, 95%CI: 1.57-3.33), after adjusting for confounders and PRS for COPD. Lower hazards of COPD were associated with higher MVPA (HR: 0.85, 95%CI: 0.81-0.89). Pairwise replacements of 30minutes/day of ST by MVPA and LPA were associated with approximately 7% and 4% lower COPD hazards in the full sample; and relatively lower hazards of COPD at low, intermediate (except by LPA) and high genetic risk. No interaction between PRS and each movement behaviour was observed (P-values: 0.806 (ST), 0.785(LPA), and 0.596(MVPA)).

**Conclusions:** Reallocation of ST into MVPA or LPA is associated with a lower risk of COPD, regardless of genetic susceptibility to COPD. Replacing ST with more physically active time should be a key lifestyle-modification strategy for prevention of COPD in the general population including those at high genetic risk.

# Association of a Physical Activity/Sedentary Time Ratio with All-Cause Mortality Risk

Dr. Roslin Botlero<sup>1</sup>, Ms. Parneet Sethi<sup>2</sup>, Associate Professor Danijela Gasevic<sup>1</sup>, Prof. Neville Owen<sup>2,4</sup>, **Prof. David Dunstan**<sup>2,3</sup>

<sup>1</sup>Monash University, Melbourne, Australia, <sup>2</sup>Baker Heart and Diabetes Institute, Melbourne, Australia, <sup>3</sup>Deakin University, Melbourne, Australia, <sup>4</sup>Swinburne University, Melbourne, Australia

**O.3.21 - From genes to physical and psychosocial health outcomes, UKK - Hall B (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Achieving a healthier 'balance' between time spent in physical activity and sedentary behaviour is now widely advocated for achieving multiple health benefits. However, physical activity risk identification and counselling efforts have not accounted for the interplay of physical inactivity and sedentary behaviour. A new risk identification tool was used to calculate the ratio of daily time spent in physical activity and in sitting (physical activity/sedentary time ratio). Here, we examine the association of the physical activity/sedentary time ratio with all-cause mortality risk.

**Methods:** During 78,406 person-years of follow-up (median follow up 14.3 years), there were 885 deaths (15% of the sample) among the 5,836 participants in wave 2 in the Australian Diabetes, Obesity and Lifestyle Study (AusDiab). Self-reported daily physical activity time (Active Australia Questionnaire) and daily sitting time was used to calculate the physical activity/sedentary time ratio for each participant (with a value of 0.1 applied for those reporting zero minutes of either behaviour). Quartiles of the physical activity/sedentary time ratio in relation to all-cause mortality (reference: Q4 – high PA/low ST) were examined using the Cox proportional hazard model adjusted for age, sex, education status, marital status, smoking status, total energy intake, energy intake from alcohol, waist circumference and number of comorbidities.

**Results:** In the crude model, compared to high PA/ low ST (Quartile 4) those from Quartile 1 (low PA/high ST) were at a significantly higher risk of all-cause mortality (1.77; 95% CI, 1.46 to 2.13), as were those in the combined category of Quartiles 2 and 3 (1.24; 95% CI 1.04-1.48). In the fully adjusted model, there was a slight attenuation of the effect sizes, but the results remained statistically significant.

**Conclusions:** A less favourable 'balance' of time spent in physical activity and in sedentary behaviour (physical activity/sedentary time ratio) is associated with elevations in all-cause mortality risk. The application of a physical activity/sedentary time ratio approach may assist with risk identification in clinical and public health practice and with the tailoring of risk mitigation approaches.

# Comparative effectiveness RCT of produce prescription models to improve health outcomes in pediatric populations

**Dr. Shreela Sharma**, Ms. Mallika Mathur, Dr. Allison Marshall, Dr. Ru-Jye Chuang, Dr. Prajakta Yeragi, Dr. Vinay Prabhu, Dr. Sandra McKay, Dr. Mary Aitken, Dr. Christine Markham, Mr. Mike Pomeroy, Ms. Azar Gaminian, Ms. Megan Hall

**O.3.21 - From genes to physical and psychosocial health outcomes, UKK - Hall B (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Food prescription programs are gaining traction in the U.S., however, the data on the impact of such approaches in pediatric populations is limited. The purpose of our comparative effectiveness randomized controlled trial (RCT) is to evaluate the effectiveness of two produce prescription strategies (at-home delivery and grocery store vouchers) in improving obesity-related health outcomes and dietary behaviors among low-income 5–12-year-olds.

**Methods:** The target sample size of this ongoing 12-month study from September 2022 to August 2023 is 150 participants. Eligible children are being recruited from two pediatric clinics in Houston, Texas. Child eligibility criteria are aged 5-12 years, Medicaid recipients/low-income uninsured, body-mass index (BMI) percentile  $\geq 85$  and living within 10 miles of a Brighter Bites distribution site. Brighter Bites is a national non-profit that provides fresh produce plus nutrition education to families proven to improve child behavioral outcomes. Following completion of baseline measures, participants are randomized into one of three study arms to receive: (1) Bi-weekly \$25 vouchers redeemable for produce at retail stores (n=50 children), (2) Bi-weekly produce delivery to participants' homes through DoorDash (n=50 children), and (3) wait-list usual care controls from the clinics (n=50 children). All participants will also receive nutrition education materials. Main outcome measures are child BMI z-scores, blood pressure, hemoglobin A1c, liver panel, and lipids panels. Secondary outcomes including child food insecurity, diet quality and home nutrition environment will be collected through parent surveys in both Spanish and English. All outcome measures are collected at baseline and post-intervention. Process evaluation will measure program dosage, reach, acceptability and feasibility used mixed methods.

**Results:** At this time, we have successfully recruited and randomized 40 participants (recruitment completion February 2023). For outcome analysis, linear or logit regression analysis will be utilized to compare change in outcomes across the two intervention arms with comparison group participants adjusting for baseline differences. We will also conduct dose-response analyses. We will present the study design, approach, study measures, baseline data and preliminary findings of this real-world evaluation.

**Conclusions:** This study will demonstrate the impact and feasibility of food prescription strategies on pediatric health and behavioral outcomes in at-risk populations.

# A novel Lifestyle-based Prediction Model for risk of type 2 diabetes mellitus: a calibration and validation study integrating polygenic risk scores and wearable indicators

**Ms. Qiaoxin SHI<sup>1</sup>**, Ms. Haeyoon Jang<sup>1</sup>, Ms. Mengyao Wang<sup>1</sup>, Miss Zhu Liduzi Jiesisibieke<sup>1</sup>, Dr. Shan Luo<sup>1</sup>, Dr. Yuk Fai Wan<sup>3,4,5</sup>, Dr. Shiu Lun Au Yeung<sup>1</sup>, Dr. Youngwon Kim<sup>1,2</sup>

**O.3.21 - From genes to physical and psychosocial health outcomes, UKK - Hall B (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Accurate prediction of type 2 diabetes (T2D) is critical for prevention of T2D. However, the utility of polygenic risk scores (PRS) and lifestyle behaviors as predictors of T2D has yet to be fully explored. Our study aims to develop and cross-validate a novel lifestyle-based prediction model (LBPM) for T2D that integrates lifestyle predictors including wearable-device-measured physical activity (PA) and explore whether the addition of PRS to the LBPM could enhance the predictive accuracy.

**Methods:** This study included 150,437 white British individuals without diabetes at baseline from UK Biobank (Application 43528). The LBPM was established incorporating the following predictors: age, sex, body mass index, diet (0-3; generated based on self-reported food categories), smoking status (never, previous, current), alcohol consumption (never, past, current 1-2 times/week, current  $\geq 3$  times/week), and PA (wrist-worn accelerometry-derived Euclidean Norm Minus One). Weighted PRS for T2D was calculated based on 138 single-nucleotide polymorphisms associated with T2D in genome wide association studies. Cox regression was used to train and cross-validate the LBPM (with and without PRS). C-index (through a meta-analyzed 5-folds cross-validation) and net reclassification index (NRI) were used to assess models' discriminant ability. Calibration was examined by plotting mean observed Kaplan-Meier estimates against mean predicted probabilities.

**Results:** Of 150,437 participants, 6,062 incident T2D cases (derived from primary care data) were observed over a 7.5-year median follow-up. All predictors including PRS in the LBPM were associated with the risk of T2D ( $P$ -values  $< 0.01$ ). The C-index of the LBPM and LBPM with PRS added was 0.737 (95% Confidence Interval [CI]: 0.723-0.752) and 0.755 (95% CI: 0.741-0.770), respectively. The addition of PRS to the LBPM led to an overall continuous NRI of 18.8% (6.7% for cases and 12.1% for non-cases), suggesting an improvement in identifying cases against non-cases. Calibration plots of LBPM and LBPM with PRS added showed good performance, with a regression slope of 1.094 and 1.097, respectively.

**Conclusions:** Adding T2D-specific PRS to the LBPM can enhance the prediction of T2D risk. The LBPM has much potential to serve as an accurate, practical T2D prediction tool where either lifestyle indicators alone or combined with genotype information are available.

# Fit and Fabulous: Shifting the Focus from Weight to Physical Activity to Promote Cardiorespiratory Fitness among Diverse Young Adults in the United States

**Dr. Eydie Kramer-Kostecka<sup>1</sup>, Dr. Sarah Espinoza<sup>1</sup>,** Dr. Laura Hooper<sup>1</sup>, Dr. Nicole Larson<sup>1</sup>, Dr. Daheia Barr-Anderson<sup>1</sup>, Dr. Dianne Neumark-Sztainer<sup>1</sup>

<sup>1</sup>University of Minnesota, Minneapolis, USA

**O.3.21 - From genes to physical and psychosocial health outcomes, UKK - Hall B (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Cardiorespiratory fitness (CRF) is an important determinant of cardiovascular disease (CVD) risk, yet it is understudied among populations diverse in weight status and ethnic and racial background. This study investigates relationships between CRF, physical activity (PA), and weight among an ethnically/racially and weight diverse sample of young adults enrolled in the EAT (Eating and Activity over Time) study.

**Methods:** Young adults (n=95; mean age=27.2±1.9 years; 64.2% female; 75.8% Black, Indigenous, or Persons of Color) from the Midwest United States completed a 3-minute submaximal exercise step test. Participants' age- and sex-normed CRF ratings (Excellent-Very Poor) were determined by post-exercise radial artery palpation heart beat counts (HBC). Sociodemographic characteristics and weekly hours of light, moderate, and vigorous PA were captured with surveys. Participants reported specific activities with the Activities Completed over Time in 24-Hours (ACT24) recall. Anthropometrics were measured by trained researchers. Stepwise multivariate regression models examined cross-sectional associations between weekly PA and post-exercise HBC, adjusting for sociodemographic characteristics and body mass index (BMI). Additionally, to determine if CRF ratings varied in ways contrary to a "weight equals health" narrative, participants were categorized to higher (n=60, ≥25.0 kg/m<sup>2</sup>, mean BMI=31.5±4.3) and lower BMI (n=35, <25.0 kg/m<sup>2</sup>, mean BMI=22.1±2.4) groups.

**Results:** In initial analyses, unadjusted models ( $\beta=-3.12$ ;  $p<0.001$ ) and models adjusted for sociodemographic factors ( $\beta=-2.51$ ;  $p=0.005$ ), weekly hours of vigorous PA (VPA) was significantly associated with lower post-exercise HBC, an indicator of greater CRF. The inverse relationship between VPA and HBC, although weakened and no longer statistically significant, remained in the same direction when BMI was added to the model ( $\beta=-1.47$ ;  $p=0.085$ ). Not all participants in the higher BMI group had lower CRF (Average-Excellent=35.0%) and not all participants in the lower BMI group had higher CRF (Below Average-Very Poor=40.6%). Future analyses will be conducted and will examine contributions of specific vigorous activities to CRF using the ACT24 recall.

**Conclusions:** Vigorous PA appears to support CRF among young adults. Further, individuals of higher weight can achieve average CRF or better. Behavioral researchers and practitioners should consider a strengths-based approach by focusing on PA, rather than weight, to support CRF among weight-diverse populations.

# The causal effects of psychosocial well-being and emotion-driven impulsiveness on food choices among European adolescents

**Ms. Stefanie Do<sup>1,2</sup>**, Prof. Vanessa Didelez<sup>1,2</sup>, Dr. Claudia Böhnhorst<sup>1</sup>, Dr. Juul M.J. Coumans<sup>3</sup>, Prof. Lucia Reisch<sup>4</sup>, Dr. Unna N. <sup>1</sup>Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, <sup>2</sup>University of Bremen, Bremen, Germany, <sup>3</sup>Teaching and Learning Centre, Open University of the Netherlands, Heerlen, Netherlands, <sup>4</sup>Cambridge Judge Business School, University of Cambridge, Cambridge, United Kingdom, <sup>5</sup>Altrecht Eating Disorders Rintveld, Zeist, Netherlands, <sup>6</sup>Institute of Food Sciences, National Research Council, Avellino, Italy, <sup>7</sup>Department of Chronic Diseases, National Institute for Health Development, Tallinn, Estonia, <sup>8</sup>Research and Education Institute of Child health, REF, Strovolos, Cyprus, <sup>9</sup>Department of Pediatrics, Medical School, University of Pécs, Pécs, Hungary, <sup>10</sup>University of Gothenburg, School of Public Health and Community Medicine, Institute of Medicine, Gothenburg, Sweden, <sup>11</sup>Department of Public Health, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>12</sup>GENUD (Growth, Exercise, Nutrition and Development) Research Group, Instituto Agroalimentario de Aragón (IA2), Instituto de Investigación Sanitaria Aragón (IIS Aragón), Centro de Investigación Biomédica en Red Fisiopatología de la Obesidad y Nutrición (CIBEROhn), University of Zaragoza, Zaragoza, Spain

**O.3.21 - From genes to physical and psychosocial health outcomes, UKK - Hall B (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Low psychosocial well-being (PWB) and high emotion-driven impulsiveness (EDI) have been found to be associated with unhealthy eating in adolescents. Yet, it is not clear whether an intervention on one or the other might be more effective in reducing unhealthy food choices. We, therefore, aimed to investigate and compare the (separate) causal effects of PWB and EDI on the propensity to consume foods high in sugar and fats among European adolescents.

**Methods:** In total, 2,065 adolescents (mean age: 13.4; 52% female) participating in the IDEFICS/I.Family cohort were included, providing data from examinations in 2009/10, 2013/14, and 2021/22. Food choices were operationalized using sweet (score range: 0 to 68.4) and fat (score range: 0 to 72.6) propensity calculated from self-reported food frequency data. Self-reported EDI was assessed using the negative urgency subscale from the Urgency, Premeditation, Perseverance, Sensation Seeking, and Positive Urgency (UPPS-P) Impulsive Behaviour Scale. PWB was assessed using the KINDLR Health-Related Quality of Life Questionnaire. We estimated, separately, the average causal effects of PWB and EDI on sweet and fat propensity applying a semi-parametric doubly robust method (targeted maximum likelihood estimation).

**Results:** We estimated that high levels of PWB, compared to low levels, decreased average sweet propensity (mean difference (MD) = -1.43 [-2.61 to -0.25]). A smaller effect was estimated for fat propensity. We further estimated that low levels of EDI, compared to high levels, decreased average sweet propensity (MD = -2.07 [-3.26 to -0.87]) and fat propensity (MD = -1.85 [-2.88 to -0.81]). The effects on sweet propensity were stronger for girls and adolescents with overweight or obesity compared to boys and thin or normal weight adolescents, respectively.

**Conclusions:** These findings advance our understanding of how psychological factors affect unhealthy food choices. Comparing both psychological factors, an intervention targeting EDI would be marginally more effective in reducing sweet and fat propensity.

# AccNet24: An open-source deep learning framework for classifying 24-hour activity behaviours from wrist-worn accelerometer data under free-living environments

**Dr. Vahid Farrahi<sup>1,2</sup>**, Mr. Muhammad Usman<sup>2</sup>, Mr. Mehrdad Rostami<sup>2</sup>, Dr. Mourad Oussalah<sup>1,2</sup>

<sup>1</sup>Research Unit of Health Sciences and Technology, University of Oulu, Oulu, Finland, <sup>2</sup>Center for Machine Vision and Signal Analysis, University of Oulu, Oulu, Finland

**O.3.22 - Improving physical activity measurements in adults, UKK - Hall C (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Despite a promising paradigm shift from threshold-based approaches to using machine learning methodologies for measuring activity behaviours, there is no robust data processing methods for classifying 24-hour activity behaviour categories from accelerometry data. The present study developed and validated a deep learning-based framework for classifying 24-hour activity behaviours from wrist-worn accelerometry.

**Methods:** Using an openly available dataset with free-living wrist-based raw accelerometry data from 151 participants (aged 18–91 years), we developed and validated a deep learning framework named AccNet24 to classify 24-hour activity behaviours. The AccNet24 framework was designed to operate with two-dimensional (2D) images rather than one-dimensional raw acceleration data. Based on the recent success in medical image analysis, this aimed to transform the signal processing problem into a machine vision problem, enabling the use of advanced deep learning techniques originally proposed for image data. First, the acceleration signal (x, y, and z-axes) was segmented into 30-second nonoverlapping windows, and signal-to-image conversion was performed for each segment. Deep features were automatically extracted from the signal images using transfer learning and transformed into an uncorrelated, lower-dimensional feature space. These transformed features were then employed to classify the activity behaviours as sleep, sedentary behaviour, and light-intensity and moderate-to-vigorous physical activity using a bidirectional long short-term memory (BiLSTM) recurrent neural network. AccNet24 was trained and validated with data from 101 and 25 randomly selected participants and tested with the remaining unseen 25 participants. We also extracted 112 hand-crafted time and frequency domain features from 30-second windows and used them as inputs to five commonly used conventional machine learning classifiers, including random forest, support vector machines, artificial neural networks, decision tree, and naïve Bayes to classify the 24-hour activity behaviour categories.

**Results:** Using the same training, validation, and test data and window size, the classification accuracy of AccNet24 outperformed the accuracy of the other five machine learning classification algorithms by 16%–30% on unseen data.

**Conclusion:** Following the conceptual shift towards 24-hour accelerometry, AccNet24 appears to be a step towards more precise assessment of 24-hour activity behaviour categories. The next-generation accelerometry analytics may rely on deep learning techniques for activity prediction.

# Time-varying effects and mediation of physical activity on smoking cessation

**Dr. Donna Coffman**<sup>1</sup>, Mr. Nicholas Huffnagle<sup>2</sup>, Dr. Megan Piper<sup>3</sup>

<sup>1</sup>University Of South Carolina, Columbia, USA, <sup>2</sup>Children's Hospital of Pennsylvania, Philadelphia, USA,

<sup>3</sup>University of Wisconsin, Madison, USA

**O.3.22 - Improving physical activity measurements in adults, UKK - Hall C (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** The purpose of this study was to investigate the effect physical activity has on an attempt to quit smoking, and whether this effect varies over time and/or is mediated by cravings to smoke. Previous research has demonstrated that cravings to smoke are associated with higher odds of relapse, and that the strength of this effect increases throughout a quit attempt. A bout of physical activity has also been shown to reduce cravings to smoke. We hypothesized that physical activity would have a time-varying effect on smoking mediated by cravings to smoke.

**Methods:** The Wisconsin Smokers Health study was a randomized, placebo-controlled trial of five smoking cessation therapies. Each day, participants measured their steps with a pedometer and completed Ecological Momentary Assessments of their cravings to smoke. Using time-varying effect models, we analyzed data from 7-days prior to the target quit day through 7-days following quit day. Participants were grouped by their daily step count and considered “less active” if they averaged less than 10,000 steps per day.

**Results:** We found evidence among less physically active smokers that 1,000 additional steps per day on the first 1-3 days of a quit period is associated with a lower odds of smoking relapse on those days. We were also able to replicate previous findings that the effect of cravings to smoke on smoking odds increases during the first week post-quit day as time from quit day increases. Although steps per day was associated with lower relapse, and less active smokers had higher cravings and higher relapse rates, we did not find evidence for mediation.

**Conclusion:** These findings could be used to tailor smoking cessation interventions to people at high risk of relapse and failure to successfully quit. A bout of 1,000 steps is roughly a 15-minute walk. Encouraging this kind of behavior when cravings are high could lead to successful quitting for less active smokers. Future cessation research with a focus on framing physical activity as a protective tool against smoking relapse could be valuable for creating more efficient interventions.

# A method for using GPS, accelerometer and heart rate data to estimate the physical activity intensity associated with e-cycling and other modes of transport

**Dr. Jessica Bourne<sup>1</sup>**, Mr. Alex Colyer<sup>2</sup>

<sup>1</sup>University of Bristol, Bristol, United Kingdom, <sup>2</sup>Imperial College London, London, United Kingdom

**O.3.22 - Improving physical activity measurements in adults, UKK - Hall C (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Active travel (AT) has the potential to increase physical activity (PA) at a population level. Policymakers need accurate data to determine the potential of AT initiatives to promote PA and compare this to other transport modes. E-bikes have the potential to increase transport related PA and may substitute for motorized vehicles. The activity associated with e-cycling in a real-world setting is unclear. Traditional devices that measure acceleration do not accurately capture cycling. This study provides a method for identifying different modes of transport and determines the PA associated with these modes.

**Methods:** As part of a pilot RCT participants wore a GPS receiver (Qstarz) and combined accelerometer and heart rate monitor (Actiheart) for seven days and completed a travel diary. Using QGIS, trip origin, destination, start- and end-time were manually identified from GPS data. Trips were matched with travel diary data using spatial and temporal trip features. Trip duration, distance and average speed were calculated from GPS data using Python. Trip mode was identified using travel diaries. Group calibrated branched equation models were used to calculate PA energy expenditure (EE) and presented as metabolic equivalents (METs). The intensity of activity attributable to different transport modes was determined by matching GPS and travel diary derived temporal trip data with Actiheart data using the Python Pandas package.

**Results:** A total of 577 trips from 19 participants were used in this analysis. Of these, 366 were made by private motorized vehicle (PMV), 27 by bus, 156 by walking, 24 by e-bike and four by bicycle. E-cycling trips were on average 9.9(SD=6.9)km in length with an average duration of 38.5(20.2)minutes. By comparison the average trip distance made by PMV was 8.2(18.0)km, walking was 0.8(1.2)km and bus was 7.2(8.4)km. E-cycling was conducted at a higher intensity than walking (4.5[SD=1.6] vs 3.1[0.8]METs respectively) and conventional cycling (3.6[0.9]METs). Driving a PMV and taking the bus were sedentary activities.

**Conclusion:** This study classified the intensity of activity associated with e-cycling in a real-world setting using GPS, acceleration, and heart rate data. This method can be applied to future intervention studies.

# Detrended fluctuation analysis using accelerometry data and cognitive and physical function in the 1970 British Cohort Study

**Dr. Jo Blodgett<sup>1</sup>**, Dr. Matthew Ahmadi<sup>2</sup>, Prof. Emmanuel Stamatakis, Prof. Mark Hamer<sup>1</sup>

<sup>1</sup>Institute of Sport Exercise & Health, Division of Surgery & Interventional Science, University College London, London, United Kingdom, <sup>2</sup>Charles Perkins Centre and Prevention Research Collaboration, Sydney School of Public Health, The University of Sydney, Sydney, Australia

**O.3.22 - Improving physical activity measurements in adults, UKK - Hall C (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Detrended fluctuation analysis (DFA) is a novel technique that captures similarities in fluctuation patterns across fixed temporal periods (e.g. hours, days, wear periods). High stability across time suggests healthy fractal activity complexity, whereas greater randomness in fluctuation patterns may indicate underlying disease processes and is associated with mortality, frailty, disability and Alzheimer's disease. The importance of fractal stability in mid-life remains unexplored. We quantified fractal regulation patterns in 24-hour accelerometer data and examined associations with cognitive and physical function in midlife.

**Methods:** Up to 5,239 individuals from the 1970 British Cohort Study were included in analysis. At age 46, individuals wore thigh-mounted accelerometers for seven consecutive days and completed tests of cognitive (verbal fluency, memory, processing speed; composite z-score derived) and physical (grip strength, one-legged balance with eyes closed) function. Temporal correlations of acceleration magnitude across 25 time scales (range: 1min to 10hrs) were used to obtain DFA values. Linear regressions examined associations between standardised DFA coefficients and each outcome. Covariates included sex, education, self-reported health, disability, BMI, smoking, alcohol consumption, and daily activity.

**Results:** DFA was normally distributed (mean $\pm$ SD: 0.90 $\pm$ 0.06; range: 0.72-1.25). Males, those with higher education, better self-reported health, lower BMI and never-smokers had higher DFA, indicating greater stability. In sex-adjusted models, 1SD increase in DFA was associated with 0.10 (0.03,0.17) increase in composite cognitive z-score; associations were strongest for verbal fluency (0.33 (0.16,0.50) increase in animals named). Associations were attenuated in fully-adjusted models (0.03 (-0.05,0.09) and 0.15 (-0.02,0.32), respectively). There was no association between DFA and grip strength in females. In males, 1SD increase in DFA was associated with -0.55kg/m<sup>2</sup> (95%CI: -0.90,-0.21) lower grip strength in fully adjusted models. Higher DFA was non-linearly associated with worse balance in males and better balance in females.

**Conclusions:** Greater fractal stability was associated with better cognitive function. This could indicate potential mechanisms through which fractal physiology complexity may scale up to and contribute to cognitive clinical endpoints. Conversely, greater fractal stability was associated with poorer physical function in males; further exploration of sex differences in fractal physiology may improve understanding of underlying mechanisms of the sex-ageing paradox.

# Within- and between-person associations of psychological factors that influence healthy or unhealthy dietary intake in Ecological Momentary Assessment studies: A systematic review and meta-analysis

**Prof. Ann DeSmet<sup>1</sup>**, Mr. Bernard Asare<sup>2</sup>, Dr. Dominika Kwasnicka<sup>3</sup>, Prof. Daniel Powell<sup>4</sup>, Prof. Felix Naughton<sup>5</sup>, Dr. Verena Schneider<sup>6</sup>, Dr. Jan Keller<sup>7</sup>, Assistant Professor Gill ten Hoor<sup>8</sup>, Associate Professor Peter Verboon<sup>9</sup>, Dr. Olga Perski<sup>10</sup>, Dr. Dimitra Kale<sup>6</sup>, Dr. Pierre G rain<sup>1</sup>

<sup>1</sup>Universit  libre de Bruxelles, Brussels, Belgium, <sup>2</sup>Curtin University, Perth, Australia, <sup>3</sup>University of Melbourne, Melbourne, Australia, <sup>4</sup>University of Aberdeen, Aberdeen, United Kingdom, <sup>5</sup>University of East Anglia, Norwich, United Kingdom, <sup>6</sup>University College London, London, United Kingdom, <sup>7</sup>Freie Universit t Berlin, Berlin, Germany, <sup>8</sup>Maastricht University, Maastricht, Netherlands, <sup>9</sup>Open University of the Netherlands, Heerlen, Netherlands, <sup>10</sup>University of California, San Diego, San Diego, USA

**O.3.22 - Improving physical activity measurements in adults, UKK - Hall C (Level 3), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Dietary behaviors and their correlates can fluctuate from moment-to-moment. Ecological Momentary Assessment (EMA) appears well-suited to study these fluctuations. This research aims to present a comprehensive review and meta-analysis of EMA studies that examine associations of psychological constructs (including cognitions, emotions and the processes operating on these) and (un)healthy dietary intake at the within- and/or between-person level

**Methods:** This systematic review focused on studies targeting healthy adults who report any healthy (e.g., fruit and vegetable intake, healthy snacking, homemade food) or unhealthy (e.g., unhealthy snacking, sugar-sweetened beverages, fast food) dietary intake. To be included in the review, studies needed to include multiple (i.e., two or more) within-day, daily or weekly assessments of at least one psychological predictor and diet and to have reported either (or both) within- or between-person predictor-behavior associations. We searched Ovid MEDLINE, Embase, PsycINFO, and Web of Science. Electronic and hand searches were conducted in January 2020 and updated in 2021. The search was restricted to human studies in English, published in peer-reviewed journals. Multilevel, random-effects meta-analyses of within- and between-person associations are conducted in RStudio with the metafor and robumeta packages.

**Results:** The search yielded 119 studies on diet, of which 48 were included in the review (combined n=6820; mean age=31.4y; 74.6% female) and 34 in the meta-analysis (combined n=5664). Most studies examined unhealthy snacking (n=29) and/or fruit and vegetable consumption (n=16) as outcomes, and negative affect (n=20), positive affect (n=16) and/or daily hassles and stress (n=12) as psychological correlates. EMA was most often performed with mobile devices (n=26), online/website (n=7) or combining sources (n=7). Average study duration was 18.0 days ( $\pm 36.6$ ). Most studies prompted several times per day (n=29), four used burst designs. Meta-analyses on associations between correlates and (un)healthy diet are currently ongoing and will be finalized in March 2023.

**Conclusion:** EMA research on diet is heavily focused on snacking and affect and could be expanded to other domains. Meta-analytic findings will highlight how psychological correlates and (un)healthy diet are associated at within-and between levels, providing input for, e.g., just-in-time adaptive dietary interventions.

# Four-year follow-up of metabolic risk factors in children treated for obesity in the preschool age: Pooled secondary outcomes from a Randomized Controlled trial

Ms. Stella Wennborg<sup>1</sup>, Dr. Anna Ek<sup>1</sup>, Dr. Karin Eli<sup>2,3</sup>, Prof. Paulina Nowicka<sup>1,4</sup>, **Dr. Markus Brissman<sup>1,5</sup>**

<sup>1</sup>Karolinska Institutet, Department of Clinical Science, Intervention and Technology (CLINTEC), Division of Pediatrics, Stockholm, Sweden, <sup>2</sup>Unit for Biocultural Variation and Obesity, School of Anthropology and Museum Ethnography, University of Oxford, Oxford, United Kingdom, <sup>3</sup>Warwick Medical School, University of Warwick, Coventry, United Kingdom, <sup>4</sup>Department of Food Studies, Nutrition and Dietetics, Uppsala University, Uppsala, Sweden, <sup>5</sup>Allied Health Professionals Function, Occupational Therapy & Physiotherapy, Karolinska University Hospital, Stockholm, Sweden

**O.3.23 - Latest findings on metabolic health outcomes, UKK - Hall D (Level 2 - main floor), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** To assess long-term metabolic health in preschool children with obesity and the association to change in child weight status.

**Methods:** A total of 177 families with 4- to 6-year-old children with obesity were recruited to the randomized controlled More and Less Study (ML). ML aimed to compare the effect of a parent support program on child weight status to standard treatment. In addition, metabolic risk factors, fasting insulin, HbA1c, HDL, LDL, triglycerides, were collected. The association between metabolic risk factors and weight status (body mass index standard deviation score, BMI-SDS) were assessed outside of randomization at baseline and at follow-up after 12 and 48 months by linear mixed models.

**Results:** A total of 92 children had blood samples collected, age 5.3, 61% female, 2.9 BMI-SDS. Overall, there was a positive association between BMI-SDS over time (per unit) and HbA1c 1.5 (95%CI 1.48 – 3.96,  $p<0.001$ ), fasting insulin 2.72 (1.48 – 3.96,  $p<0.001$ ) and HDL -0.16 (-0.23 to -0.09,  $p<0.001$ ). Importantly, a reduction of BMI-SDS by  $\geq 0.25$  was associated with improvement of HbA1c -1.37 (95%CI -0.28 to -2.46,  $p=0.015$ ) and triglycerides -0.19 (-0.36 to -0.03,  $p=0.02$ ) at 12-month follow-up. At 48-month follow-up, reduced BMI-SDS by  $\geq 0.5$  was associated with improved levels of total cholesterol -0.3 (95%CI -0.57 to -0.03,  $p=0.03$ ).

**Conclusions:** Metabolic risk factors can be seen already in preschool children with obesity. However, early initiated treatment interventions resulting in a clinically relevant reduction of weight status can lead to long-term improvement on metabolic risk factors and thus lower the negative effects on future health.

The protocol for the study is registered with the clinical trials registry [clinicaltrials.gov](https://clinicaltrials.gov) (ID: NCT01792531)

# Impact of an unhealthy lifestyle on risk of incident hospitalisation for cardiovascular disease in people with diabetes

**Dr. Alice Gibson**<sup>1,2</sup>, Miss Emma Sainsbury<sup>1</sup>, Prof. Emmanuel Stamatakis<sup>2</sup>, Dr. Joanne Gale<sup>1</sup>, Prof. Stephen Colagiuri<sup>2</sup>, Prof. Peter Cistulli<sup>2</sup>, Prof. Clara Chow<sup>4</sup>, Prof. Natasha Nassar<sup>1,3</sup>

<sup>1</sup>Menzies Centre for Health Policy and Economics, Sydney, Australia, <sup>2</sup>Charles Perkins Centre, Sydney, Australia, <sup>3</sup>Childrens Hospital at Westmead, Sydney, Australia, <sup>4</sup>Westmead Applied Research Centre, Sydney, Australia

**O.3.23 - Latest findings on metabolic health outcomes, UKK - Hall D (Level 2 - main floor), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Lifestyle is the cornerstone of diabetes management. However, few large-scale studies have investigated the relationship between a healthy lifestyle and the risk of non-fatal cardiovascular disease (CVD) outcomes in people with diabetes. The aim of this study was to investigate the association between lifestyle risk factors, individually and in combination, and incident hospitalisation for CVD in people with diabetes.

**Methods:** This prospective cohort study linked data from the 45 and Up Study, Australia, to administrative health records. The study participants were 25,713 men and women, aged  $\geq 45$  years, with diabetes at baseline. Lifestyle behaviours were assessed by a self-report questionnaire, and a healthy lifestyle score was used to categorise participants into three risk groups based on five equally contributing risk factors: physical activity, sedentary behaviour, sleep duration, diet quality and smoking status. Incident CVD complications were ascertained using linked hospitalisation data up until 2019. Cox proportional hazards models were used to investigate the association between lifestyle and incident hospitalisation for CVD.

**Results:** Sixteen percent of the participants were in the low-risk, 62% were in the medium-risk, and 22% in the high-risk (least healthy) lifestyle group. During 177,851 person-years of follow-up, there were 6,519 incident hospitalisations for CVD. Compared with the low-risk lifestyle group, risk of incident CVD complications was 50% higher among participants in the high-risk lifestyle group (aHR 1.50; 95% CI 1.38, 1.64), and 17% higher among the medium-risk group (aHR 1.17; 1.09, 1.26). Current smoking was the lifestyle variable most strongly associated with the risk of incident CVD complications (aHR 1.58; 95% CI 1.43, 1.75), followed by sleep ( $<5$  or  $>11$  hours per day, aHR 1.24; 95% CI 1.11, 1.39), physical activity ( $< 150$  mins/week, aHR 1.21; 95% CI 1.14, 1.28), and sitting ( $> 9$  hours per day, aHR 1.21; 95% CI 1.12, 1.31). There was no consistent association between diet quality and risk of incident CVD complications.

**Conclusions** A large proportion of adults with diabetes are not adhering to healthy lifestyle recommendations, and this was associated with an increased risk of hospitalisation for CVD. Our findings highlight the importance of lifestyle behaviour change for reducing the burden of CVD in adults with diabetes.

# Dietary quality, physical activity and cardiovascular disease: A causal inference inquiry

**Associate Professor Ding (Melody) Ding<sup>1</sup>**, Mr. Joseph van Buskirk<sup>1</sup>, Dr. Philip Clare<sup>1</sup>, Prof. Adrian Bauman<sup>1</sup>, Dr. Binh Nguyen<sup>1</sup>

<sup>1</sup>The University of Sydney, Sydney, Australia

**O.3.23 - Latest findings on metabolic health outcomes, UKK - Hall D (Level 2 - main floor), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** A high-quality diet and sufficient physical activity (PA) are both cornerstones of a healthy lifestyle. While evidence supports the importance of both behaviours in the prevention of chronic diseases, such as cardiovascular disease (CVD), studies on their joint effects are scarce. Furthermore, observational studies are inherent to confounding bias. Despite the advancement of causal inference methods, they are rarely applied to PA and nutritional epidemiology research. Therefore, we aim to examine independent and joint associations of diet and PA with CVD using causal inference modelling.

**Methods:** We used data from Australia's 45 and Up study, a large population-based cohort study of adults aged 45+ years. Participants filled out baseline (2006-09) and follow-up (2012-15) questionnaires, which were linked to hospital and mortality records (until Dec 2019). PA was measured using the validated Active Australia Questionnaire and was further categorised into quartiles. Diet was measured using a modified validated dietary quality index comprising items regarding the consumption of fruit, vegetable, fish, processed meats and red meats and was further categorised into low, medium, and high. Primary outcomes were CVD hospitalisation and mortality (defined using ICD-10 codes I00-99) and the secondary outcome was all-cause mortality. An inverse probability weighting approach was adopted. Individual exposure trajectories are weighted to approximate random assignment to exposure groups, adjusting for time-dependent confounding, and confounding due to other covariates, selected based on a directed acyclic graph.

**Results:** During a median follow-up of 12 years (n=204,542), 32,947 participants had a CVD hospitalisation, 3,226 died from CVD, and 17,380 died from any causes. Both diet and PA had non-significant associations with CVD admission and strong and significant associations with CVD mortality (HR: 0.57-0.75 for PA and 0.63-0.71 for diet). PA has a significant association with all-cause mortality (HR: 0.56-0.78) and diet did not (HR: 0.90-0.97). There was no multiplicative or additive interaction between diet and PA, and the group with the highest quality diet and PA levels consistently had the lowest risk for all outcomes.

**Conclusions:** Middle-aged and older adults should adhere to both quality diet and PA recommendations to minimise the risk of CVD and all-cause mortality.

# Physical activity and sedentary behaviour compositions within 24-h cycle in women with PCOS – associations with cardiometabolic health.

**Ms. Emilia Pesonen<sup>1,5</sup>**, Dr. Vahid Farrahi<sup>2,5</sup>, Dr. Meri-Maija Ollila<sup>1,5</sup>, Prof. Raija Korpelainen<sup>3,4,5</sup>, Prof. Terhi Pilttonen<sup>1,5</sup>, Dr. Maisa Niemelä<sup>2,4,5</sup>

<sup>1</sup>Department of Obstetrics and Gynecology, Research Unit of Clinical Medicine, University of Oulu and Oulu University Hospital, Oulu, Finland, <sup>2</sup>Research Unit of Health Sciences and Technology, University of Oulu, Oulu, Finland, <sup>3</sup>Research Unit of Population Health, University of Oulu, Oulu, Finland, <sup>4</sup>Department of Sports and Exercise Medicine, Oulu Deaconess Institute Foundation sr., Oulu, Finland, <sup>5</sup>Medical Research Center, Oulu University Hospital and University of Oulu, Oulu, Finland

**O.3.23 - Latest findings on metabolic health outcomes, UKK - Hall D (Level 2 - main floor), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Polycystic ovary syndrome (PCOS) is the most common endocrine disorder in reproductive-aged women (prevalence 13–16%). Up to 70% of women with PCOS have pre-obesity/obesity and there is 2–3-fold risk for metabolic comorbidities compared to non-PCOS women. Lifestyle modification, including increasing physical activity (PA), is recommended as first-line treatment for PCOS. However, it is not known if affected women need more tailored physical activity guidelines compared to other women. Given this, our aim was to determine for the first time, the association of 24-hour composition of sleep, sedentary behaviour (SB), light PA (LPA), and moderate-to-vigorous PA (MVPA) with cardiometabolic health in women with PCOS.

**Methods:** The study is part of the 46-year follow-up of the Northern Finland Birth Cohort 1966. In addition to questionnaires about health and socioeconomic status, the follow-up included clinical examinations: tissue composition (bioimpedance measurement), waist circumference, fasting blood sample, and 120-min oral glucose tolerance test (OGTT). Participants wore a Hookie-accelerometer for 14 days, from which time spent in SB, LPA, and MVPA were determined. Sleep time was self-reported. 24-hour activity composition was composed and transformed to isometric log coordinates (ilr). The PCOS population (n=192) consisted of women with two of the following criteria: irregular menstrual cycle, clinical or biochemical hyperandrogenism, anti-müllerian hormone level  $\geq 3.2$  ng/ml (surrogate for polycystic ovarian morphology). Association between daily activity composition and cardiometabolic health was analysed with multivariate linear regression using ilr-coordinates and confounders (sociodemographic factors, smoking, alcohol consumption, and waist circumference). Unstandardized betas with 95% confidence intervals (CI) and *p*-values are reported.

**Results:** In women with PCOS, more time in MVPA relative to other behaviours was associated with lower visceral fat area ( $\beta = -0.11$ , 95%CI -0.19 to -0.03,  $p=0.006$ ) and lower insulin at 0min ( $\beta = -0.15$ , 95%CI -0.30 to -0.004,  $p=0.045$ ) and at 60min ( $\beta = -0.26$ , 95%CI -0.45 to -0.07,  $p=0.009$ ) in OGTT. More time in LPA relative to other behaviours was associated with lower fasting glucose ( $\beta = -0.09$ , 95%CI -0.181 to -0.005,  $p=0.038$ ).

**Conclusion:** More MVPA and LPA was associated with better cardiometabolic health in women with PCOS after accounting for the 24-hour activity composition and confounders including waist circumference.

# Mediation analysis to identify mechanisms responsible for weight loss in the Strong Hearts, Healthy Communities 2.0 community-randomized trial

**Dr. Chad Rethorst<sup>1</sup>**, Ms. Margaret Demment<sup>1</sup>, Dr. Alexandra MacMillan Uribe<sup>1</sup>, Dr. Jacob Szeszulski<sup>1</sup>, Dr. Phrashiah Githinji<sup>1</sup>, Dr. Miriam Nelson<sup>3</sup>, Dr. David Strogatz<sup>4</sup>, Dr. Sara Folta<sup>5</sup>, Dr. Regan Bailey<sup>2</sup>, Dr. Rebecca Seguin-Fowler<sup>2</sup>

<sup>1</sup>Texas A&M Agrilife Research - Institute for Advancing Health Through Agriculture, Dallas, TX, USA, <sup>2</sup>Texas A&M Agrilife Research - Institute for Advancing Health Through Agriculture, College Station, TX, USA,

<sup>3</sup>Hampshire College, Amherst, MA, USA, <sup>4</sup>Tufts University - Friedman School of Nutrition, Boston, MA, USA,

<sup>5</sup>Bassett Research Institute, Cooperstown, NY, USA

**O.3.23 - Latest findings on metabolic health outcomes, UKK - Hall D (Level 2 - main floor), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Behavioral intervention development is an iterative process that ideally involves using data at each stage to inform intervention refinements for subsequent evaluation, with implementation and dissemination as the end-goal. One approach to behavioral interventions optimization is to evaluate the mechanisms by which an intervention improves health outcomes. As previously reported, the Strong Heart, Healthy Communities-2.0 (SHHC-2.0) intervention resulted in significant weight loss compared to control. This study used mediation analysis to identify mechanisms by which the SHHC-2.0 intervention reduced body weight.

**Methods:** SHHC-2.0 was a community-randomized trial conducted in 11 rural, medically underserved communities with women, age  $\geq 40$  years, who had obesity (BMI  $>30$ ) or were physically inactive and overweight (BMI  $>25$ ). Five communities were randomized to intervention (87 women) and six communities to control (95 women). Psychosocial (attitudes, self-efficacy, social support) and behavioral (diet and physical activity) measures were evaluated as potential mediators. Sobel test was used to derive the indirect effect and standard error of the intervention through mediators. Separate regression models were used to determine 1) the intervention effects on the mediator and, 2) intervention and mediator effects on weight. Models were adjusted for community site (random effect), age, and education.

**Results:** SHHC-2.0 had significant direct effects on Rapid Eating Assessment for Participants-Short (REAP-S), Healthy Eating Attitudes (HEA), uncontrolled eating score, cognitive restraint score, emotional eating score, self-reported and objectively-measured physical activity, family participation in exercise, and attitude toward exercise. For weight loss, REAP-S [ $z = 1.097(0.636)$ ,  $p = 0.042$ ], HEA [ $z = 1.095(0.588)$ ,  $p = 0.03$ ], and cognitive restraint [ $z = -1.099(0.640)$ ,  $p = 0.043$ ] were identified as significant mediators.

**Conclusions:** Changes in dietary behaviors, attitudes, and cognitive restraint are mechanisms by which SHHC-2.0 reduced weight. Physical activity was not a significant mediator, which is consistent with previous findings on the role of physical activity in weight loss. Self-efficacy and social support, though conceptualized as intervention mechanisms, were not identified as significant mediators. Intervention refinements that target these conceptualized mechanisms hold potential to bolster effectiveness.

# Seaweed supplementation for metabolic and cardiovascular health: a double-blind RCT in women with metabolic syndrome

**Dr. Catherine Elliot<sup>1</sup>**, Dr. Michael Hamlin<sup>1</sup>, Dr. Marie Magnusson<sup>2</sup>, Dr. Christopher Glasson<sup>2</sup>, Dr. Greg Jacobson<sup>2</sup>, Dr. Christopher Battershill<sup>2</sup>

<sup>1</sup>Lincoln University, Christchurch, New Zealand, <sup>2</sup>University of Waikato, Hamilton, New Zealand

**O.3.23 - Latest findings on metabolic health outcomes, UKK - Hall D (Level 2 - main floor), June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** The purpose of this 8-week double blind RCT was to investigate the effects of a seaweed capsule (2g/day) on chronic metabolic and cardiovascular profiles compared to a control (placebo) capsule. The seaweed was a New Zealand-grown green macroalgae (*Ulva* sp. B) which has only been investigated in rat trials.

**Methods:** Criteria for participation was female adults over 18 y.o. with  $\geq 2$  indicators of metabolic syndrome (MS), including waist circumference greater  $>88$  cm; fasting triglycerides  $\geq 150$  mg/dL, high density lipoprotein cholesterol  $<50$  mg/dL; systolic blood pressure  $\geq 130$  mmHg and/or diastolic  $\geq 85$ ; and fasting glucose  $>110$  mg/dL. Forty-four participants (55 y.o.  $\pm 11$ , BMI  $35.3 \pm 9.2$ , number of MS indicators  $3.5 \pm 1.0$ ) self-selected through online advertisements (23 in experimental group). Body composition, waist/hip ratio, brachial blood pressure, pulse wave velocity (applanation tonometry), central augmentation and pulse pressure (both at aorta), blood glucose, Haemoglobin A1c, and blood lipids were collected in a laboratory pre and post supplementation. In SPSS, a repeated measures ANOVA, with Bonferroni correction, was conducted to assess pre-post differences for groups.

**Results:** A seaweed dosage variable (by body mass,  $n=19$ ) was investigated through regression on the above health predictor variables after controlling for diet and exercise. Tests of between-subjects effects showed no significant group X time effect of the seaweed supplement, although there were beneficial trends. Seaweed dosage was predicted best by waist:hip ratio, HbA1c, systolic BP, LDL ( $p=.001$ ,  $R^2 = .825$ ).

**Conclusions:** A 2g seaweed dosage per day did not illicit significant differences. Future studies should address the limitation of this study, such as increasing the seaweed dosage overall, increasing the dosage with increased body mass, increasing the duration of dosage and increasing the sample size. Significant differences did not appear in this dataset as was found with improved body composition and lipids in a rat trial. With correct dosage, green seaweed may significantly lower the risk factors for chronic health condition and benefit those with metabolic syndrome.

# The Dutch Obesogenic Built environment CharacterisTics (OBCT) Index: Validation and Improvement

**Msc. Thao Minh Lam**<sup>1,2,3</sup>, Ms. Haykanush Ohanyan<sup>1,2,3,4</sup>, Dr. Nicolette R den Braver<sup>1,2,3</sup>, Associate Professor Ilonca Vaartjes<sup>5</sup>, Prof. Derek Karssenbergh<sup>6</sup>, Mr. Alfred J Wagtendonk<sup>3,4</sup>, Prof. Joline WJ Beulens<sup>1,2,5</sup>, Dr. Jeroen Lakerveld<sup>1,2,3,4</sup>

**O.3.24 - Healthy food and activity environments, UKK - K1 (+K2) (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** A composite indicator is a potentially useful tool to characterize the multifactorial obesogenic environment. However, such indices are subjective to choices made during the development process, especially in weighting components. This study aimed to (1) describe the novel Obesogenic Built environment CharacterisTics (OBCT) index, (2) validate this index using a large population health monitor, (3) improve this index with variable selection and rescaling approaches.

**Methods:** The OBCT index was constructed for 12,821 Dutch administrative neighborhoods and consists of 17 components from both food (densities of five food outlet types) and physical activity (PA) environments (walkability, drivability, bikeability and sports facilities). We linked the index to residential addresses of 253,604 adult participants of the 2016 Dutch Health Monitor, a nationwide cross-sectional survey; split the data randomly into a training (two-thirds; n=169,064) and a testing subset (one-third; n=84,540). In the training set, we used non-parametric cubic regression spline to assess index association with body mass index (BMI), adjusted for individual demographic characteristics. Effect modification by age, sex and urbanicity was examined. As improvement, we adopted two reweighting strategies: (1) variable selection using BMI as outcome (2) rescaling the food environment components by neighborhood address density.

**Results:** The original OBCT index ranges from 0 (leptogenic) to 100 (obesogenic) and was only moderately correlated to the food (Spearman's  $\rho=0.55$ ) and the PA environmental scores ( $\rho=0.39$ ). In the training set, mean BMI was 25.4 (SD=5.10) kg/m<sup>2</sup> with oversampling of adults >65 years old (50.9%), mean OBCT index was 40.3 (SD=11.2). The index had a significant non-linear association with BMI in a fully-adjusted model ( $p<0.05$ ) though explained variance was low ( $R^2=0.0662$ ). Effect modification by age, sex and urbanicity was significant. Variable selection only increased model fit slightly ( $R^2=0.0686$ ). Rescaling improved the index correlation with the PA environment considerably ( $\rho=0.80$ ) and food environment slightly ( $\rho=0.59$ ); however, index association with BMI remained limited ( $R^2=0.0658$ ).

**Conclusion:** The association between the original OBCT index and BMI is non-linear. Variable selection and rescaling only slightly improved the index's explanatory power. Reweighting using random forest might further improve model fit, the results of will be presented at the conference.

<sup>1</sup>PROFITH "PROmoting FITness and Health through physical activity" Research Group, Sport and Health University Research Institute (iMUDS), Department of Physical Education and Sports, Faculty of Sport Sciences, University of Granada, Granada, Spain, <sup>2</sup>La Inmaculada Teacher Training Centre, University of Granada, Granada, Spain

**O.3.24 - Healthy food and activity environments, UKK - K1 (+K2) (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The first aim was to analyze the effectiveness of a school-based cycling intervention on the usual and daily mode of commuting to/from school, among Spanish adolescents. The second aim was to examine the effectiveness of the same intervention on commuting sedentary time and commuting physical activity levels, during the trip to/from school.

**Methods:** A total of 161 adolescents (n=76 cycling group) for aim-1 and 131 adolescents (n=64 cycling group) for aim-2, from Almería, Granada, Jaén, and Valencia (Spain) participated in the PACO study, a randomized controlled trial in the school. Adolescents self-reported their usual and daily mode of commuting to/from school (last week) through a questionnaire. Moreover, they wore an accelerometer (seven days) to record their sedentary time and physical activity levels (light and moderate-to-vigorous) during the trip to/from school (i.e., 30 min before and 30 min after school). The cycling intervention included four sessions during one month (120 min/session, except 60 min/first session). The control group was asked to maintain usual lifestyle. Binary logistic regression models were used to analyze the changes in the usual mode of commuting to/from school (active vs. passive) between baseline and follow up separately for both groups. The effects of the school-based cycling intervention on daily mode of commuting, commuting sedentary time and commuting physical activity were conducted according to the per-protocol principle (i.e., attending at least 75% of the sessions) using an analysis of covariance.

**Results:** The school-based cycling intervention had a statistically significant effect on commuting sedentary time (-6.55 min/day, -0.61 standard deviations,  $p < 0.01$ ). No other effects were observed on usual and daily mode of commuting to/from school and commuting physical activity outcomes (all,  $p > 0.05$ ).

**Conclusions:** A 4-week school-based cycling intervention reduced commuting sedentary time in comparison with control group peers in Spanish adolescents, yet we did not observe effects on usual and daily mode of commuting to/from school and commuting physical activity. School-based interventions may be feasibly effective strategies to modify the commuting behavior to/from school and physical activity. Nevertheless, it might be necessary to implement a longer period of cycling intervention and to continue testing further school-based cycling interventions.

# Quantifying area-level physical activity offerings in social context: a novel concept that goes beyond walkability and greenspace

**Prof. Dafna Merom**<sup>1</sup>, Miss Drew Meehan<sup>1</sup>, Prof. Philayrath Phongsavan<sup>2</sup>, Dr. Ori Gudes<sup>3</sup>

<sup>1</sup>Western Sydney University, Penrith, Australia, <sup>2</sup>The University of Sydney, Camperdown, Australia, <sup>3</sup>University of New South Wales, Randwick, Australia

**O.3.24 - Healthy food and activity environments, UKK - K1 (+K2) (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Studies have consistently found that greenspace and the built environment can support active living. However, there is no systematic quantification of physical activity (PA) opportunities in social context at the area level, despite the critical role that social support has on sustaining individual's participation in PA. This study aimed to: 1) create a social physical activity index for area (SPAIFA); 2) determine area-level factors that explain SPAIFA variations, and; 3) identify clusters where low level of walkability and/or greenness are compounded by low SPAIFA.

**Methods:** Six local government areas (LGAs) from western and south-western Sydney were selected. Social physical activities were found by web crowdsourcing and ground truthing using search engine's map tools (Bing and Google), councils' websites, social media, sports specific and venues websites. Database included venue address, venue type, PA type, provider (private/public) target age group, schedule and cost. The database was linked to suburb demographic profile, socio-economic index for area, walkability and greenness scores and proportion of past week low-to-no exercise. Spatial analysis techniques were used to identify clusters and outliers using ArcGIS Pro software and QGIS.

**Results:** 176 suburbs were assessed. The mean SPAIFA was 10.4 activities per 10,000 population across all suburbs but with large variations between LGAs; with the highest mean being 18.2 per 10,000 people to the lowest of 6.9 per 10,000 people. Being at the highest quartile of SPAIFA was significantly associated with high socio-economic index for area and low proportion of low/no-exercises, but not with walkability or greenspace scores. Spatial analysis identified three clusters of low SPAIFA within the lowest walkability and/or lowest greenness scores and three clusters of highest SPAIFA complementing within the highest walkability and/or greenness scores.

**Conclusions:** To support populations to be physically active SPAIFA is an additional indicator that can be used by local governments and policy makers for benchmarking and monitoring. More importantly, efforts can be directed to areas where natural and/or urban design are not conducive for PA. Expanding the index to capture other domains relevant for health (eg., art activities, support groups) can become a social prescribing resource for health professionals.

# The effect of food environment interventions on dietary behavior in tertiary education settings: a systematic scoping review and meta-analysis

**Dr. Eden Barrett**<sup>1,2</sup>, Miss Ashleigh Hart<sup>3</sup>, Dr. Saiuj Bhat<sup>4,5</sup>, Dr. Matti Marklund<sup>1,2,6</sup>, Dr. Daisy Coyle<sup>1,2</sup>, Miss Maddie Heenan<sup>1,2</sup>, Prof. Simone Pettigrew<sup>1,2</sup>, Prof. Jason Wu<sup>1,2</sup>

<sup>1</sup>George Institute for Global Health, Sydney, Australia, <sup>2</sup>University of New South Wales, Sydney, Australia,

<sup>3</sup>University of Sydney, Sydney, Australia, <sup>4</sup>Royal Perth Hospital, Perth, Australia, <sup>5</sup>University of Western Australia, Perth, Australia, <sup>6</sup>Johns Hopkins University, Baltimore, USA

**O.3.24 - Healthy food and activity environments, UKK - K1 (+K2) (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Tertiary education institutions, where hundreds of millions of people work and study globally, are a key setting for healthy food environment interventions. We aimed to synthesize the evidence for the design and effectiveness of healthy food environment interventions in improving the dietary behavior of students and staff in tertiary education settings.

**Methods:** Academic databases were searched for studies published before October 2022. Studies were eligible if they assessed the impact of a food environment intervention on dietary behavior (purchases or consumption) in students or staff at tertiary education settings and targeted at least one of the following food environment elements: placement, price, product, or promotion. Business-related outcomes were included as secondary outcomes. Randomised controlled trials (RCTs) and quasi-experimental studies were eligible. Findings were synthesised in narrative form, organised by element targeted. Where comparable dietary outcome data were available from  $\geq 10$  interventions, findings were also pooled using random effects meta-analysis.

**Results:** Of 9107 studies initially identified, 53 (75% quasi-experimental) were included, describing 69 separate interventions. Two-thirds ( $n=47$ , 68%) of interventions demonstrated significant improvements in dietary behavior, including  $n=32/49$  (65%) of single-element interventions and  $n=15/20$  (75%) of multi-element interventions. Among single-element interventions, the one intervention targeting placement and all three targeting price improved dietary behavior. Most ( $n=9/10$ , 90%) interventions targeting product improved dietary behavior, while  $n=19/35$  (54%) targeting promotion did. Pooled findings from nine studies reporting changes in energy content following interventions demonstrated a significant decrease in energy content purchased or consumed (-8.9%; 95%CI: -11.2, -6.5). Nearly all interventions ( $n=11/12$ , 92%) that evaluated impact on business-related outcomes found significant increased total sales revenue following the intervention or had no impact.

**Conclusions:** We found encouraging evidence supporting the role of food environment interventions in tertiary education settings to support healthy dietary behaviors of students and staff without compromising business revenue. There is a need for more rigorously designed and longer-term studies, including RCTs, to further ascertain the precise effects of such interventions.

# The role of the physical food environment on the diet-related behaviours of adolescents: a mobile Ecological Momentary Assessment study

**Miss Sarah Shaw**<sup>1,2</sup>, Associate Professor Sarah Crozier<sup>1,3</sup>, Prof. Cyrus Cooper<sup>1,2</sup>, Associate Professor Dianna Smith<sup>4</sup>, Prof. Mary Barker<sup>1,2,5</sup>, Prof. Christina Vogel<sup>1,2,3,6</sup>

<sup>1</sup>MRC Lifecourse Epidemiology Centre, University of Southampton., Southampton, United Kingdom, <sup>2</sup>NIHR Southampton Biomedical Research Centre, University of Southampton and University Hospital Southampton NHS Foundation Trust., Southampton, United Kingdom, <sup>3</sup>NIHR Applied Research Collaboration Wessex, Southampton Science Park, Innovation Centre, Chilworth., Southampton, United Kingdom, <sup>4</sup>Geography and Environmental Science, University of Southampton. , Southampton, United Kingdom, <sup>5</sup>School of Health Sciences, Faculty of Environmental and Life Sciences, University of Southampton., Southampton, United Kingdom, <sup>6</sup>Centre for Food Policy, City, University of London, London, United Kingdom

**O.3.24 - Healthy food and activity environments, UKK - K1 (+K2) (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** During adolescence, many young people start making more independent food purchases. Little, however, is known about the role physical food environments play in these decisions. This study aimed to use ecological momentary assessment (EMA) and global positioning systems (GPS) to understand associations between community and consumer environments and adolescents' food purchasing and dietary behaviours.

**Methods:** A one-week observational study was conducted with 108 adolescents, aged 11-18 years, from Hampshire, UK. Participants completed a demographic questionnaire and a validated 20-item Food Frequency Questionnaire which assessed diet quality. Participants also used an EMA mobile phone app which captured GPS data for adolescents' journeys, and on which adolescents recorded their use of food outlets and food purchases during the 7 days. A community environment healthfulness score was calculated using GPS-generated activity spaces and food outlet location data from Ordnance Survey Points of Interest. Consumer environment factors describing use of promotions, money spent, and store placement were recorded for each purchase. The healthfulness of purchases made on each purchasing occasion were assessed against UK healthy eating guidelines. Eighty adolescents recorded 273 purchasing occasions and 65 participants had valid GPS data. Fully adjusted linear regression and multilevel logistic regression models were used to investigate associations between community and consumer environment exposures, and diet quality and food purchasing outcomes.

**Results:** Adolescents with greater exposure to healthier community environments tended to have better quality diets ( $\beta$  0.18 SD/SD; 95%CI -0.08, 0.44;  $p=0.17$ ), with the strongest relationships observed among adolescents from lower socio-economic backgrounds ( $\beta$  0.55 SD/SD; 95% CI 0.04, 1.07;  $p=0.04$ ). Fast-food outlets, cafes and small supermarkets were the most frequently used food outlets by young people. Spending more money was associated with healthier purchases (OR 1.40 per  $\approx$ £5.00 category; 95% CI 1.06, 1.83;  $p=0.02$ ) but no notable associations were observed for promotions and prominent store placement.

**Conclusions:** This study provides insight into the relationship between features of physical food environment and the healthfulness of foods purchased by adolescents. These data suggest that increasing the numbers of healthier food outlets and reducing the price of healthy foods could support healthier food choices among young people.

# Differences in online grocery delivery service use and food and drink purchase behaviour before and during the COVID-19 pandemic: a longitudinal analysis of UK purchase data

**Dr. Amy Yau<sup>1</sup>**, Dr. Cherry Law<sup>1,2</sup>, Dr. Laura Cornelsen<sup>1</sup>, Prof. Jean Adams<sup>3</sup>, Prof. Emma Boyland<sup>4</sup>, Dr. Thomas Burgoine<sup>3</sup>, Prof. Frank de Vocht<sup>5,6</sup>, Prof. Martin White<sup>3</sup>, Prof. Steven Cummins<sup>1</sup>

<sup>1</sup>London School of Hygiene & Tropical Medicine, London, United Kingdom, <sup>2</sup>University of Reading, Reading, United Kingdom, <sup>3</sup>University of Cambridge, Cambridge, United Kingdom, <sup>4</sup>University of Liverpool, Liverpool, United Kingdom, <sup>5</sup>University of Bristol, Bristol, United Kingdom, <sup>6</sup>NIHR Applied Research Collaboration West, Bristol, United Kingdom

**O.3.24 - Healthy food and activity environments, UKK - K1 (+K2) (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Online grocery delivery services (OGDS) provided a way to reduce physical contact with others during the COVID-19 pandemic. However, OGDS may not have been equally available to all households and may have exacerbated health inequalities. Pre-pandemic, OGDS use was more prevalent among higher-income households and was associated with healthier purchases. This study aimed to explore whether there were differences in the sociodemographic patterning of OGDS use and online grocery purchases, before and during the pandemic.

**Methods:** Item-level take-home food and drink purchase data from households in London and the North of England (n=1,245) were obtained from the UK Kantar Fast Moving Consumer Goods Panel. Purchases from the early stages of the pandemic [23/03/2020-14/06/2020] (n=636,762), during the UK's strictest lockdown period, were compared to the same period in 2019 [25/03/2019-16/06/2019] (n=562,573). We categorised households as using OGDS: 1) in 2019 and 2020 (persistent user), 2) in 2020 but not in 2019 (new adopter), 3) in 2019 but not in 2020 or 4) not in 2019 or 2020. We used logistic regression to estimate the likelihood of OGDS use by sociodemographic characteristics. T-tests were used to test differences in monthly household purchases.

**Results:** Households with an annual income of  $\geq$ £40,000 were more likely to be persistent users (OR 2.18, 95% CI 1.20; 3.94 for £40,000-£50,000 vs  $<$ £20,000). Households with shoppers aged  $\geq$ 65 years vs 18-34 years were more likely to be new adopters (OR 2.30, 95% CI 1.10; 4.80). New adopters had the greatest reduction in monthly in-store shopping, 2.7 occasions (95% CI 2.1; 3.3) [33.8%]. Among persistent users, monthly online purchasing increased by 16,891 kcal (95% CI 8,171; 25,610) [27.9%], but the proportion of energy that was from fruit and vegetables decreased, -1.7% (95% CI -0.5; -2.9).

**Conclusions:** Higher rates of adoption among the oldest age group may reflect greater caution due to higher risk of severe illness from COVID-19 with age. Persistent users continued to benefit from OGDS. However, reductions in fruit and vegetable purchases relative to other food categories suggest a shift in focus to purchasing products with a longer shelf-life or product shortages.

# Nutrition and technology use in underserved communities

**Prof. Clare Collins**<sup>1,2</sup>, Ms. Hannah McCormick<sup>1,2</sup>, Ms. Tsz Ting Yip<sup>1</sup>, Dr. Hannah Brown<sup>1</sup>, Dr. Sasha Fenton<sup>1,2</sup>, Dr. Vanessa Shrewsbury<sup>1,2</sup>

<sup>1</sup>University of Newcastle, Callaghan, Australia, <sup>2</sup>Hunter Medical Research Institute, Callaghan, Australia

**O.3.25 - Lifestyle and healthy weight development, UKK - K3+4 (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Optimal dietary intakes are associated with lower risk of adverse pregnancy outcomes, yet accessing accurate nutrition information in pregnancy can be challenging for women. In addition, surveys confirm pregnant women may not be aware of specific food and nutrient recommendations, with limited nutrition information adapted to meet the needs of underserved communities, including culturally and linguistically diverse (CALD) groups. Given potential reach and scale of online technologies this mode could be exploited to ensure nutrition information is accessible to all. This presentation provides an overview of current knowledge of dietary patterns and technology use during pregnancy and by underserved communities.

**Methods:** Our team previously conducted a review of publicly available phone apps that included nutrition and / or weight gain advice pregnancy. We also reviewed pregnancy nutrition resources available from public health websites for women from CALD and/ or lower literacy backgrounds and surveyed CALD pregnant women from CALD with assistance from community programs and services that support them. We subsequently began a work program to address the gaps identified through co-creation of nutrition resources.

**Results:** Nutrition resources available through government and health service organisations addressed healthy eating, gestational weight gain (GWG), gestational diabetes, food safety, alcohol and vitamin and minerals. We identified 33 resources designed for CALD pregnant women, with 16 tailored to lower literacy, but none addressed GWG. Major app stores held over 120 pregnancy apps, with pregnancy specific nutrition topics ranging from zero to seven. While both quality and quantity of information varied, frequently topics were food safety, alcohol, fish and environmental contaminants, with fewer providing information on GWG or specific foods group recommendations during pregnancy.

A resource was co-created, 'Pregnancy Weight Gain', along with two meal plans and written and pictorial shopping lists, nutrition analyses and snack guides and made available online. The GWG resource has been translated into five languages.

**Conclusions:** Given pregnant women from underserved communities are more vulnerable in terms of diet-related adverse pregnancy outcomes, it is important to develop resources that are culturally appropriate and to be aware of limitations within current publicly available, including apps.

# Monthly variations in children's height, weight, and BMI gain

**Dr. R Glenn Weaver<sup>1</sup>**, Dr. Elizabeth Adams<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>, Dr. Sarah Burkart<sup>1</sup>, Dr. Michael Beets<sup>1</sup>, Mr. James White<sup>1</sup>, Ms. Olivia Finnegan<sup>1</sup>, Ms. Julia Xuanxuan<sup>1</sup>, Mr. Roddrick Dugger<sup>1</sup>, Ms. Lauren Von Klinggraeff<sup>1</sup>, Ms. Hannah Parker<sup>1</sup>, Ms. Meghan Bastyr<sup>1</sup>, Ms. Alexandra da Silva Bandeira<sup>1</sup>, Dr. Christopher Pfladderer<sup>1</sup>, Dr. Layton Reesor-Oyer<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**O.3.25 - Lifestyle and healthy weight development, UKK - K3+4 (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** What drives accelerated summer body mass index (BMI) gain remains unclear. The Circadian and Circannual Rhythm Model (CCRM) posits BMI gain is biologically driven by shifting light-dark cycles, accelerating during summer when days are longer (i.e., height gain slows while weight gain accelerates) and slowing during winter when days are shorter (i.e., weight gain slows while height gain accelerates). The Structured Days Hypothesis (SDH) proposes accelerated summer BMI gain is due to the removal of structured school days which leads to accelerating weight gain during school breaks (e.g., winter/spring/summer break). This study explored monthly height, weight, and BMI z-score (zBMI) change during and outside of summer to understand which theory better predicts zBMI change.

**Methods:** Children's (N=147, 8.2 years) height and weight were measured monthly during the 2021-2022 school year, and once in summer 2022 (mid-July). Age and sex specific zBMI was calculated using CDC growth charts. Monthly percent change in children's height and weight and monthly change in zBMI were calculated. Coefficient of variation (CV) explored variability in children's monthly height, weight, and zBMI change.

**Results:** Consistent with the SDH, monthly percent weight change was larger and more variable ( $\Delta=1.1\%$ ,  $SD=3.3\%$ ,  $CV=3.0$ ) with height change relatively constant throughout the year ( $\Delta=0.37\%$ ,  $SD=0.98\%$ ,  $CV=1.42$ ). Mean monthly percent weight change was highest during July ( $\Delta=3.3\%$ ,  $SD=11.0\%$ ), as predicted by both theories. Weight change was lowest in December prior to school winter break ( $\Delta=-0.5\%$ ,  $SD=2.6\%$ ), as predicted by the CCRM. Consistent with the SDH, spikes in weight gain were observed in January ( $\Delta=2.1\%$ ,  $SD=2.5\%$ ) following winter break and March ( $\Delta=2.1\%$ ,  $SD=1.6\%$ ) following spring break. Change in monthly zBMI mirrored changes in weight with spikes in July ( $\Delta=0.07$ ,  $SD=0.44$ ), January ( $\Delta=0.03$ ,  $SD=0.19$ ) and March ( $\Delta=0.05$ ,  $SD=0.15$ ) and a decrease in December ( $\Delta=-0.10$ ,  $SD=0.19$ ).

**Conclusions:** zBMI change was driven by larger and more variable weight change, compared to height. Both the CCRM and SDH may partially explain BMI gain but the SDH may better predict changes. Interventions to mitigate accelerated weight gain may be warranted during winter and spring break from school.

# Maternal diet quality trajectories from pregnancy to postpartum and associations with sociodemographic characteristics

Mrs. Meaghan Sexton-Dhamu<sup>1</sup>, Prof. Li Ming Wen<sup>2,3</sup>, **Dr. Katherine Livingstone<sup>1</sup>**, Dr. Ewa Szymlek-Gay<sup>1</sup>, Dr. Miaobing (Jazzmin) Zheng<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition School of Exercise and Nutrition Sciences, Deakin University, Geelong, Australia, <sup>2</sup>School of Public Health and Sydney Medical School, The University of Sydney, Sydney, Australia, <sup>3</sup>Health Promotion Unit, Population Health Research and Evaluation Hub, Sydney Local Health District, Sydney, Australia

**O.3.25 - Lifestyle and healthy weight development, UKK - K3+4 (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Maternal diet quality from pregnancy to postpartum has significant effects on maternal and child health, but how maternal diet quality changes (i.e., trajectories) during this time remains unclear. This study aimed to examine maternal diet quality trajectories from pregnancy to postpartum and its sociodemographic characteristics using two diet quality indices.

**Methods:** Data of 473 women from the Healthy Beginning trial were used. Dietary intake was collected at four time points: pregnancy (24–34-weeks gestation) and 1, 2, and 3.5 years postpartum. Diet quality scores were calculated using the 2013 Dietary Guideline Index (DGI-2013) and the RESIDential Environment Guideline Index (RDGI). Group-based trajectory modelling was used to identify maternal diet quality trajectories from pregnancy to 3.5 years postpartum. Multinomial logistic regression was used to assess associations between sociodemographic characteristics and identified maternal diet quality trajectories.

**Results:** For both DGI-2013 and RDGI, two stable trajectories of low or high diet quality from pregnancy to 3.5 years postpartum were identified. Women who were tertiary educated (OR 0.41; 95%CI 0.22, 0.77) and married (OR 0.44; 95%CI 0.21, 0.95) were less likely to follow the low DGI-2013 trajectory group compared with women with no tertiary education or who were not married, respectively. In contrast, women who smoked during pregnancy were more likely (OR 1.74; 95%CI 1.13, 2.69) to follow the low DGI-2013 trajectory group compared with women who have never smoked. Similar results were found for maternal education and smoking status during pregnancy and the low RDGI trajectory group. In addition, women who were unemployed (OR 1.78; 95%CI 1.13, 2.78) also had higher odds of following the low RDGI trajectory. For both the DGI-2013 and RDGI trajectories, no associations were found for maternal age, country of birth and pre-pregnancy body mass index.

**Conclusions:** From pregnancy to postpartum, women followed stable trajectories of low or high diet quality. Women without tertiary education or who smoked or were unemployed during pregnancy had a higher likelihood of following a low maternal diet quality trajectory. Two diet quality indices showed similar findings. The present study highlights the importance of targeting these women for future nutrition interventions.

# Longitudinal characterisation of appetite traits associated with healthy and overweight growth patterns in the first 7 years of life.

**Dr. Anna Fogel<sup>1</sup>**, Dr. Beatrice Franzolini<sup>1</sup>, Dr. Andrea Cremaschi<sup>1</sup>, Prof. Maria De Lorio<sup>1</sup>, Dr. Mary Chong Foong-Fong<sup>1</sup>, Dr. Keri McCrickerd<sup>1</sup>, Dr. Fabian Yap<sup>3</sup>, Prof. Yung Seng Lee<sup>4</sup>, Prof. Keith Godfrey<sup>2</sup>, Dr. Neerja Karnani<sup>1</sup>, Prof. Johan Eriksson<sup>1</sup>

<sup>1</sup>Singapore Institute for Clinical Sciences, Singapore, Singapore, <sup>2</sup>Medical Research Council Lifecourse Epidemiology Unit, University of Southampton, Southampton, United Kingdom, <sup>3</sup>KK Women's and Children's Hospital, Singapore, Singapore, <sup>4</sup>Department of Paediatrics, Yong Loo Lin School of Medicine, National University of Singapore, Singapore, Singapore

**O.3.25 - Lifestyle and healthy weight development, UKK - K3+4 (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Variations in appetite traits are expressed early in life. Little is known about longitudinal patterns of appetite traits and how they differ across children with healthy and overweight growth trajectories. Identifying early behavioural markers of obesity risk will inform how and when to intervene. The purpose of this study was to characterise detailed longitudinal patterns of appetitive traits among children with different growth trajectories.

**Methods:** The participants were 273 children from the Growing Up in Singapore Towards healthy Outcomes (GUSTO) cohort. We derived BMI z-scores from anthropometry at 14 time-points (12, 15, 18 months, and 2, 3, 4, 4.5, 5, 5.5, 6, 6.5, 7, 8, and 9 years). Using the Child Eating Behaviour Questionnaire, we assessed appetite traits at 1, 3, 5, and 7 years. Questionnaires were evaluated to estimate appetite latent traits using methods from item response theory, in particular a mixed effect partial credit score model. Hierarchical clustering was then employed to cluster children based on growth trajectories and appetite traits.

**Results:** We identified two distinct clusters of children with a stable healthy weight trajectory (n=239), and an overweight trajectory (n=34) characterised by a gradual increase in BMI over time reaching overweight around 2 years and obesity around age 6 years. The two clusters did not differ in appetite traits at age 12 months. From 3 years old, children with an overweight trajectory were reported to enjoy food more (p<0.001), to be less responsive to signals of satiety (p<0.001) and to eat faster (p<0.001), and from 5 years to also be less fussy (p<0.001). The healthy weight cluster reported an increase in food avoidance and a decrease in food approach traits over time; there was little change in these traits over time among children with an overweight trajectory. Satiety responsiveness was the overall strongest differentiator between the two clusters from 3 years.

**Conclusions:** We identified four appetite traits differentiating children with healthy and overweight trajectories from age 3 years, with satiety responsiveness emerging as the strongest differentiator. Interventions might be most effective if implemented before age 3 years, with satiety responsiveness the most promising target for intervention.

# Parental lifestyle patterns around pregnancy and risk of childhood obesity

**Dr. Marion Lecorquillé**<sup>1</sup>, Ms. Mireille Schipper<sup>2</sup>, Dr. Aisling O'Donnell<sup>3</sup>, Dr. Alexander Douglass<sup>3</sup>, Mr. Malamine Gassama<sup>4</sup>, Dr. Marie-Aline Charles<sup>1,4</sup>, Prof. Cecily C Kelleher<sup>3</sup>, Dr. Catherine Phillips<sup>3</sup>, Dr. Romy Gaillard<sup>2</sup>, Dr. Sandrine Lioret<sup>1</sup>, Dr. Barbara Heude<sup>1</sup>

<sup>1</sup>Université Paris Cité and Université Sorbonne Paris Nord, Inserm, INRAE, Center for Research in Epidemiology and Statistics (CRESS), F-75004, Paris, France, <sup>2</sup>The Generation R Study Group (Na 29-15), Erasmus University Medical Center, PO Box 2040, 3000 CA, Rotterdam, Netherlands, <sup>3</sup>School of Public Health, Physiotherapy and Sports Science, University College Dublin, Dublin, Ireland, <sup>4</sup>UMS Elfe Team, Inserm, EFS, Aubervilliers, Paris, France

**O.3.25 - Lifestyle and healthy weight development, UKK - K3+4 (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The prevalence of overweight in children remains high, with strong social inequalities observed at early ages. So far, most studies have evaluated the effects of perinatal factors on childhood obesity separately, with only a few studies assessing the combined effect of parental lifestyle factors. Our project aims to identify parental lifestyle patterns in preconception and during pregnancy, and to study their associations with the risk of overweight and obesity (OW-OB) in school-aged children.

**Methods:** We harmonized and interpreted results from four European mother-offspring cohorts (EDEN, Elfe, Lifeways, and Generation R) with data available for 1900, 18000, 1100, and 9500 families (mothers, fathers, and young children), respectively. Perinatal factors were collected with questionnaires and included mothers' and fathers' smoking habits, body mass index (BMI), dietary quality and inflammatory index, physical activity, and sedentary behavior. We applied principal component analyses to identify lifestyle patterns in preconception and pregnancy and subsequently assessed their prospective associations with child BMI z-score and risk of OW-OB (as defined with the IOTF25 threshold) between 5 and 12 years using multivariable linear and logistic regressions.

**Results:** Among the various lifestyle patterns identified, two patterns explained most of the variance and were consistent across cohorts. These patterns were characterized by « high parental smoking, low maternal diet quality and/or high maternal sedentary behaviour » and « high parental BMI and low gestational weight gain ». A one-SD increase in the first pattern was associated with higher risk of overweight in Elfe [OR (95%CI) 1.32 (1.23;1.42)]. The second pattern was consistently associated with higher BMI z-score and risk of overweight in children at any age in most cohorts.

**Conclusions:** Our results provide a better understanding of how perinatal factors combined into lifestyle patterns may synergistically be associated with the risk of child OW-OB. Examination of the potential facilitators and barriers of the family lifestyle patterns identified, with a specific focus on socio-economic inequalities, geographic origin and psychological factors is warranted. Collectively the results from this project will help inform the development of future childhood obesity prevention strategies at the population level, or more personalized for groups at risk.

# Examining Parent-Child Interactions during Active Play with and without Digital Games

Dr. Richard Boles<sup>1</sup>, **Dr. Laura Bellows<sup>2</sup>**, Dr. Nan Zeng<sup>3</sup>, Ms. Abigail Flesher<sup>1</sup>, **Prof. Susan Johnson<sup>1</sup>**

**O.3.25 - Lifestyle and healthy weight development, UKK - K3+4 (Level 3), June 17, 2023, 2:00 - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Active play, in nurturing relationships with parents, is essential to healthy development and learning. This study examined the quality of parent-child active play interactions using interactive digital games with preschool-aged children.

**Methods:** A cross-sectional, within subjects, repeated measures design was used with mother-father-child triads. Parents were instructed to play with their child as they normally would, during 3, 6-minute movement-based activity sessions: (1) Traditional Toys (e.g., balls, bean bags, hoops, tunnel, etc.); (2) Tablet-based Mobile App (e.g., Jungle Gym); and (3) Active Video Game (e.g., Dancing). Parent-child play interactions were videotaped and then observationally coded by researchers trained to criterion for type and quality across 5 domains using the Parents Interacting with Children: Checklist of Observation Linked to Outcomes (PICCOLO): Affection, Responsiveness, Encouragement, Teaching, and Playfulness.

**Results:** Tests of repeated measures (GLM) for each of the parenting domains across play conditions were shown to support the hypothesis that a significant difference exists in parenting behaviors across domains, depending on play condition. Specifically, Affection, Responsiveness, and Encouragement were highest in the Traditional Toys condition, followed by the Mobile App condition, and lowest in the Active Video Game condition:  $F(1.3, 24.4)=6.83$ ,  $p=.01$ , partial eta squared ( $\eta_p^2$ )=.26;  $F(2, 38)=14.94$ ,  $p=.001$ ,  $\eta_p^2=.44$ ;  $F(1.4, 26.4)=17.19$ ,  $p=.001$ ,  $\eta_p^2=.47$ , respectively. Teaching was highest in the Mobile App condition, followed by Traditional Toys then the Active Video Game conditions,  $F(1.7, 33.1)=3.41$ ,  $p=.051$ ,  $\eta_p^2=.15$ . Mothers and fathers demonstrated significant differences in parenting ( $p<.05$ ) for Responsiveness and Playfulness in the Traditional Toys condition, Playfulness in the Mobile App condition, and Teaching in the Active Video Game condition.

**Conclusions:** Different types of parenting behaviors are elicited during parent-child interactions focused on physical activity, depending on the structure of the game. These differences (and in some instances, similarities) in parenting behaviors may foster multiple aspects of child development during physical activity. Future research will clarify the specific parenting behaviors that may be most responsible for differences across conditions and be used to further develop and test interventions designed to foster child development and enhance physical activity.

# Effects of the Sleep SAAF Responsive Parenting Intervention on Infants' Sleep: A Randomized Clinical Trial among Black American Families

**Dr. Justin Lavner<sup>1</sup>**, Dr. Emily Hohman<sup>2</sup>, Dr. Steven Beach<sup>1</sup>, Dr. Brian Stansfield<sup>3</sup>, Dr. Jennifer Savage<sup>2</sup>

<sup>1</sup>University of Georgia, Athens, USA, <sup>2</sup>The Pennsylvania State University, State College, USA, <sup>3</sup>Augusta University, Augusta, USA

**O.3.26 - Hot topics on physical activity and sleep, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Black Americans experience sleep disparities beginning in infancy and continuing throughout the lifespan, calling for early interventions to improve sleep. This study aimed to investigate whether a responsive parenting (RP) intervention for Black mothers improves infant sleep and increases responsive sleep parenting practices.

**Methods:** The Sleep SAAF (Strong African American Families) study is a randomized controlled trial comparing an RP intervention with a safety control condition over the first 16 weeks postpartum. Data were collected between spring 2018 and summer 2021. Families were recruited from the mother/infant nursery at Augusta University Medical Center, Augusta, GA, USA, and completed home visits at 1, 3, 8, and 16 weeks postpartum. Primiparous Black mother-infant dyads were screened for eligibility using medical records. 292 families were eligible, 234 enrolled, 212 were randomized, 203 provided data at 3 weeks, 187 provided data at 8 weeks, and 194 provided data at 16 weeks. The RP intervention curriculum focused on infant sleep, soothing/crying, and feeding. The control group received a safety intervention. Community Research Associates delivered the interventions during home visits at 3 and 8 weeks postpartum. Mothers reported on bedtime routine and sleep behaviors, infant sleep duration, and nighttime waking and feeding at 3, 8, and 16 weeks postpartum.

**Results:** Randomized mothers were Black/African American (100%) and non-Hispanic (99%); 49% participated in the Supplemental Nutrition Assistance Program (SNAP). At 16 weeks, infants in the RP group had longer reported nighttime sleep duration ( $481 \pm 135$  vs.  $441 \pm 126$  minutes,  $p=.03$ ), longer total sleep duration ( $765 \pm 223$  vs.  $693 \pm 182$  minutes,  $p=.02$ ), fewer nighttime wakings ( $1.5 \pm 0.9$  vs.  $1.8 \pm 1.0$ ,  $p=0.01$ ), and greater likelihood of meeting guidelines of >12 hours of total sleep/day (64.9% vs. 45.8%,  $p=0.008$ ) than controls. Relative to controls, mothers in the RP group reported engaging in more responsive parenting practices such as putting the baby to bed while awake and giving the baby a few minutes to fall back asleep on their own, and were less likely to feed their baby as the last activity before bed.

**Conclusions:** An RP intervention for Black American families improved infant sleep and increased responsive sleep parenting practices.

# Sport characteristics and objectively measured physical activity and sedentary levels in children

**Dr. Daniela Rodrigues<sup>1,2</sup>**, Prof. Aristides Machado-Rodrigues<sup>1,3</sup>, Assistant Professor Augusta Gama<sup>1,4</sup>, Assistant Professor Maria-Raquel Silva<sup>1,5</sup>, Assistant Professor Helena Nogueira<sup>1,6</sup>, Associate Professor Cristina Padez<sup>1,2</sup>

<sup>1</sup>University of Coimbra, CIAS – Research Centre for Anthropology and Health, Coimbra, Portugal, <sup>2</sup>University of Coimbra, DCV – Department of Life Sciences, Coimbra, Portugal, <sup>3</sup>High School of Education, Polytechnic Institute of Viseu, Viseu, Portugal, <sup>4</sup>Department of Animal Biology, Faculty of Sciences of the University of Lisbon, Lisbon, Portugal, <sup>5</sup>Faculty of Health Sciences, University Fernando Pessoa, Porto, Portugal, <sup>6</sup>University of Coimbra, Faculty of Letters, Coimbra, Portugal

**O.3.26 - Hot topics on physical activity and sleep, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Current guidelines recommend children accrue 60 minutes of moderate-to-vigorous physical activity (MVPA) per day. Nevertheless, a substantial proportion of children and adolescents are not active enough to benefit their health. We examined how children's participation in different organized sports contributed to physical activity (PA) levels, sedentary time, achieving PA recommendations, and to body mass index (BMI).

**Methods:** This cross-sectional study included 332 6-to-10-years-old children. PA was measured for 1 week via accelerometers; children's height and weight were objectively collected. Organized sport participation was parent-report and later classified into three categories: indoor vs. outdoor; individuals vs. team; combat vs. individual aesthetic vs. racing vs. invasion. Sex- and BMI-adjusted one-way ANCOVA was used to examine the effect of the sport categories in terms of PA levels (i.e., sedentary, light, moderate, vigorous, and moderate-to-vigorous).

**Results:** Boys, more than girls, were engaged in outdoor and team sports, whereas the majority of girls practiced an individual aesthetic sport while half of the boys were involved in an invasion sport. The minutes per day in moderate and vigorous PA was significantly higher in boys compared to girls, while the inverse was found for the sedentary time. Overall, more boys than girls were meeting the PA guidelines. Children engaged in outdoor sports (vs. indoor) had two times the odds to achieve the PA guidelines, as they accumulate more vigorous PA (VPA) and moderate to vigorous PA (MVPA). Being involved in team sports (vs. individual) was significantly associated with lower minutes per day in sedentary activities. The likelihood of having overweight or obesity was 2-times higher in children not engaged in any organized sport (vs. practicing).

**Conclusion:** Findings point that promoting outdoor and team sports are likely to decrease children's sedentary behavior, increase daily VPA and MVPA. We highlight the potential importance of promoting participation in those sports as a strategy to increase overall PA levels in children, particularly girls.

# Impacts of restricted nighttime sleep on child health outcomes: A meta-analysis of experimental evidence

**Ms. Lauren von Klinggraeff<sup>1</sup>**, Ms. Michal Smith<sup>1</sup>, Dr. Sarah Burkart<sup>1</sup>, Dr. Christopher D. Pfledderer<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>, Dr. R. Glenn Weaver<sup>1</sup>, Dr. Michael W. Beets<sup>1</sup>, Dr. Elizabeth L. Adams<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**O.3.26 - Hot topics on physical activity and sleep, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Health guidelines recommend adequate sleep for optimal child health. Understanding the impact of restricted nighttime sleep on health outcomes in youth can provide valuable evidence to inform behavioral interventions. This study conducted a meta-analysis on experimental studies restricting nighttime sleep in children.

**Methods:** We conducted a systematic search of PubMed, CINAHL Complete, PsychINFO, Web of Science, and EMBASE. Studies were included if they intentionally restricted nighttime sleep in healthy children (ages 0-18 years) and reported measures of health-related outcomes during both typical and restricted sleep conditions. Health-related outcomes were extracted and categorized into three domains: emotional functioning, cognitive functioning, and observable behaviors. Multilevel meta-analyses, nesting effects within studies, were performed separately for positive and negative outcomes within each domain (six separate models).

**Results:** Studies (k=25) reported outcome data for 944 children (2.5-18 years) providing 222 effects. Most studies reported within-person data (k=23) and half utilized randomized cross-over designs (k=13). Nighttime sleep duration averaged 509±41min (typical sleep) and 347±28min (restricted sleep), with typical sleep conditions lasting an average of 4±2 nights and restricted conditions lasting 4±2 nights. Positive emotional functioning (e.g., happiness) increased after typical sleep (ES 0.61, 95CI -0.67, 1.90), while negative emotional functioning (e.g., irritability) increased after restricted sleep (emotional ES -0.23, 95CI -1.03, 0.56). Positive cognitive functioning (e.g., memory) significantly improved (ES 1.95, 95CI 0.03, 0.36) in typical sleep conditions while negative cognitive functioning (e.g., inattention) increased during restricted sleep (cognitive ES -0.15, 95CI -0.32, 0.02). Similarly, positive behaviors increased in typical sleep conditions (e.g., physical activity; ES 0.18, 95CI -0.06, 0.42) while negative behaviors increased during restricted sleep (e.g., consumption of sugar sweetened beverages; ES -0.15, 95CI -0.31, 0.01).

**Conclusion:** Children with restricted nighttime sleep exhibit worse outcomes, including emotional functioning, cognitive functioning, and health behaviors, when compared to children with adequate sleep. Identifying when children may be most likely to experience less-than-typical sleep in natural settings can provide targets for behavioral interventions to improve sleep and mitigate the effects of sleep restriction in everyday life.

# Comparing perceptions of activity compensation to accelerometer data in primary school children: The REACT Study

**Ms. Brittany Swelam**<sup>1</sup>, Dr. Lauren Arundell<sup>1</sup>, Prof. Jo Salmon<sup>1</sup>, Associate Professor Nicky Ridgers<sup>1,2</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition (IPAN), Deakin University, Burwood, Australia, <sup>2</sup>Alliance for Research in Exercise, Nutrition, and Activity (ARENA), University of South Australia, Adelaide, Australia

**O.3.26 - Hot topics on physical activity and sleep, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Activity compensation in children is poorly understood. It is currently unknown whether children's perceptions of compensatory responses to certain scenarios may predict device-measured compensation. The aim of this study was to explore within-day compensatory responses of primary school children following experimental conditions delivered at school.

**Methods:** Children (aged 8-12 years; n=360) participated in at least one of three experimental conditions across six weeks: (a) restricted light-, moderate-, and vigorous-intensity physical activity (LMVPA); (b) imposed moderate- to vigorous-intensity physical activity (MVPA); and (c) imposed light-intensity physical activity (LPA). Prior to the first experimental condition, children completed a self-report measure assessing their perceptions of their 'usual' within-day compensatory behaviour in response to scenarios of restricted/imposed activity. During the 'usual' and experimental condition weeks, children wore a hip-mounted ActiGraph accelerometer. To describe self-report and device-measured compensation data, heat mapping and compensation matrices were completed for each experimental condition. ROC analyses explored the predictive accuracy of children's perceptions of their usual within-day compensation via survey sub-scales into device-measured within-day compensatory percentage categories (e.g., partial compensation, overcompensation), which were derived from daily and time period specific counts per minute.

**Results:** The analytical sample included 201 participants in the restricted LMVPA condition, 209 in the imposed MVPA condition, and 154 in the imposed LPA condition. Most participants' (92.5%) perceptions of their compensatory behaviour matched their device-measured compensation following the restricted LMVPA condition, but not the imposed MVPA (47.4%) and LPA (43.5 %) activity conditions. Over two-thirds (≥68.8%) of children compensated at least 50% of their activity from the experimental condition within that same day. The ROC analyses indicated that the survey sub-scales did not differentiate between the device-measured compensation classification groups (area under the curve: 0.503-0.727).

**Conclusions:** Regardless of the experimental condition (i.e., imposed or restricted activity), most children compensated their activity based on device-measured data. Although children's perceptions of their usual compensatory behaviour did not predict their device-measured compensatory responses, the presence of device-measured compensation warrants the consideration of compensatory responses in future interventions to mitigate potentially harmful compensatory responses. Future research should identify which perturbation thresholds prompt compensatory responses.

# Longitudinal effects of dog ownership status on children's movement behaviours: Findings from the PLAYCE cohort study

**Ms. Emma Adams<sup>1,2</sup>**, Associate Professor Kevin Murray<sup>2</sup>, Associate Professor Hayley Christian<sup>1,2</sup>

<sup>1</sup>Telethon Kids Institute, University of Western Australia, Perth, Australia, <sup>2</sup>School of Population and Global Health, The University of Western Australia, Perth, Australia

**O.3.26 - Hot topics on physical activity and sleep, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Regular physical activity is important for children's physical and mental health, yet many children do not achieve recommended amounts of physical activity. Dog ownership has been associated with increased physical activity in children, however, there have been no longitudinal studies examining this relationship. This study uses data obtained from the Play Spaces and Environments for Children's Physical Activity (PLAYCE) cohort study to examine the longitudinal effects of dog ownership on children's movement behaviours.

**Methods:** Change in dog ownership from preschool (T1, age 2-4) to fulltime school (T2, age 5-6) was used as a natural experiment with four distinct dog ownership status groups (continuing non-dog owners, continuing dog owners, dog acquired, and dog loss). Daily movement behaviours, including physical activity, sedentary time, sleep, and screen time, were collected using accelerometry and parent-report surveys for 602 children. Linear mixed effects regression models were used for analysis.

**Results:** Girls who acquired a dog had a significant increase in objectively measured daily total physical activity by an average of 62.6 minutes per day ( $p=0.010$ ) which was made up of increases in light activities and games (46.8 minutes,  $p=0.043$ ) and brisk walking (15.4 minutes,  $p<0.001$ ). Girls who lost a dog had a significant decrease in daily light activities and games (-65.2 minutes,  $p=0.031$ ). Girls who were continuing non-dog owners increased their daily total physical activity by 27.4 minutes ( $p=0.017$ ). For boys, there were no significant changes in daily total physical activity, and inconsistent changes in specific levels of physical activity. There were significant increases in parent-reported weekly frequency of unstructured physical activity for the dog acquired groups (boys=8.4 times/week, girls=7.1 times/week; both  $p<0.001$ ) and significant decreases in unstructured physical activity for the dog loss groups (boys=-6.4 times/week,  $p=0.004$ ; girls=-9.9 times/week,  $p<0.001$ ). There were no significant associations for structured physical activity, outdoor play, sleep, or screen time.

**Conclusions:** The influence of dog ownership on children's movement behaviours begins in early childhood and differs by child sex. Further research should examine the specific contributions dog-facilitated physical activity makes to children's overall physical activity, including the intensity and duration of dog walking and play.

# Effects of reducing leisure screen time on physical activity and sedentary body positions in children and parents

**Mr. Jesper Schmidt-Persson<sup>1</sup>**, Mr. Martin Gillies Banke Rasmussen<sup>1,2</sup>, Ms. Sarah Overgaard Sørensen<sup>1</sup>, Ms. Sofie Rath Mortensen<sup>1,3</sup>, Ms. Line Grønholt Olesen<sup>1</sup>, Associate Professor Jan Christian Brønd<sup>1</sup>, Associate Professor Søren Brage<sup>1,4</sup>, Associate Professor Peter Lund Kristensen<sup>1</sup>, Prof. Anders Grøntved<sup>1</sup>

<sup>1</sup>University of Southern Denmark, Odense, Denmark, <sup>2</sup>Steno Diabetes Center Odense, Odense, Denmark,

<sup>3</sup>Naestved-Slagelse-Ringsted Hospitals, Slagelse, Denmark, <sup>4</sup>University of Cambridge, Cambridge, United Kingdom

**O.3.26 - Hot topics on physical activity and sleep, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The purpose of this study was to investigate the effects of reducing leisure screen time on physical activity during weekdays and weekend days in children and adults. Furthermore, we investigate the effect on time spent in specific physical activity types (standing/moving, walking, running, cycling) and sedentary body positions (sitting, lying).

**Methods:** We conducted a cluster randomized controlled trial between June 2019 and March 2021. Families with children aged 4-14 years were randomized to an intervention or a control group. The intervention group had to reduce leisure screen time to less than 3 hours/week and handover their smartphones and tablets for two weeks. Intervention adherence was objectively assessed using tracker applications and TV-monitors. Participants in the control group had to carry on as usual. Physical activity was measured at baseline and two-week follow-up using two accelerometers worn on the thigh and hip in elastic belts. Accelerometer data were classified into physical activity types (standing/moving, walking, running, cycling) and sedentary body positions (sitting, lying) using validated algorithms. Mixed linear regression models were used to assess the effect of the intervention.

**Results:** We included 89 families, and 45 families (86 children, 82 adults) were allocated to the intervention group and 44 families (95 children, 82 adults) to the control group. Children and adults in the intervention group increased their engagement in physical activity between 15:00 to 18:00PM on weekdays (children: 18.5 min/weekday 95%CI: 12.2 to 24.8, adults: 8.2 min/weekday 95%CI: 1.6 to 14.9) and during all hours on weekend days (e.g. between 12:00 to 15:00PM: 23.1 min/weekday 95%CI: 12.3 to 33.8) compared to the control group. Analyses of total time spent in the different physical activity types and sedentary body positions showed significant differences for children's time spent walking (10.9 min/weekday, 32.8 min/weekend day) and lying (-42.9 min/weekday, -72.3 min/weekend day) in favour of the intervention group.

**Conclusions:** Reducing leisure screen time in families increases children's engagement in physical activity, particularly during weekends and afternoon hours on weekdays. Thus, future interventions should aim to reduce leisure screen time during these periods to enhance prevention of physical inactivity in children.

# “Ignorance is Bliss”? An Investigation of Calories on Menus and Body Image Across the Lifespan

**Miss Sarah Galway<sup>1</sup>**, Miss Julia Lavalle<sup>1</sup>, Dr. Kimberley Gammage<sup>1,2</sup>

<sup>1</sup>Brock University, St Catharines, Canada, <sup>2</sup>Brock-Niagara Centre for Health and Well-Being, St Catharines, Canada

**O.3.27 - Improving lifestyle behaviours in different population groups, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 2:00 PM - 3:30 PM**

## **SIG - Primary Choice:** H. Policies and environments

It is well known that obesity burdens health care systems through increased health care costs. One way to address obesity rates is via public policy. The *Healthy Menu Choices Act* requires that all restaurants in Ontario, Canada with 20 or more locations post calories on their menus as a strategy to decrease obesity rates. However, the effect of calorie labelling on reducing caloric intake is minimal, and researchers have suggested examining potential unintended consequences of mandated calorie labelling

**Purpose:** The purpose of the present study was to qualitatively examine the relationship between calories on menus and body image in men and women across the lifespan.

**Methods:** Thirty-four men and women aged 20-82 were recruited and completed a semi-structured interview. Participants were asked questions related to their body image and use and perceptions of calorie information on restaurant menus. They referred to a menu with calories on it during the interview to facilitate conversations. Interviews were audio recorded and transcribed verbatim, and then analyzed using Braun and Clarke's reflexive thematic analysis.

**Results:** Many responses were paradoxical in nature, and participants contradicted themselves while explaining their use of calories on menus in relation to their body image. These contradictory responses were evident across three themes including: 1) perceptions versus actions 2) “it's not funny when your pants don't fit”: appearance concerns and calorie use, and 3), the good, the bad and the ugly: emotional and affective responses to calories on menus. Most participants thought calorie labelling was beneficial for those who were overweight or uneducated regarding nutrition, and opinions often included weight-biased and stigmatizing attitudes towards individuals living in larger bodies. Participants were more likely to use calorie information when they were dissatisfied with their weight or appearance. Participants also identified negative consequences, such as feelings of shame and guilt, as a result of calorie labelling on menus.

**Conclusion:** Participants use of calorie information on menus to influence meal choice was dependent on contextual and individual factors including body image. Future research can examine how to promote healthy eating amongst a broad population to target obesity prevention more effectively.

# Barriers and facilitators for participation in and implementation of workplace health promotion programs

**Ms. Denise Smit<sup>1,2</sup>**, Ms. Jennifer Campmans<sup>1</sup>, Dr. Sandra van Oostrom<sup>1</sup>, Dr. Josephine Engels<sup>3</sup>, Prof. Karin Proper<sup>1,2</sup>

<sup>1</sup>National Institute for Public health and the Environment, Bilthoven, Netherlands, <sup>2</sup>Amsterdam UMC, Amsterdam, Netherlands, <sup>3</sup>HAN University of Applied Sciences, Nijmegen, Netherlands

**O.3.27 - Improving lifestyle behaviours in different population groups, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Workplace health promotion programs (WHPPs) can benefit both employers and employees. However, WHPPs are not always successful in practice. A lack of proper implementation of WHPPs and low participation rates might contribute to ineffectiveness of WHPPs. The current study was conducted in preparation for the implementation and evaluation of an integrated WHPP. Integrated WHPPs target multiple lifestyle factors at different levels (individual and organizational) and are therefore potentially more effective compared to single component WHPPs in improving lifestyle behaviors. The aim of this study was to identify the barriers and facilitators for participation in and implementation of an integrated WHPP, according to employees and employers respectively.

**Methods:** Data on the barriers and facilitators for participation was collected by means of 62 peer-to-peer interviews with employees. Data on the barriers and facilitators for implementation was collected with 2 online focus groups with employers. Interviews and focus groups were transcribed verbatim and analyzed using thematic content analysis. Data was coded both deductively, using the Consolidated Framework for Implementation Research (CFIR) consisting of five domains: 1) Intervention Characteristics, 2) Outer Setting, 3) Inner Setting, 4) Characteristics of Individuals, and 5) Process, and inductively. For the analysis of the peer-interviews, the framework was complemented with two constructs of the Social Ecological model. Subsequently, the constructs were rated to indicate whether they were a barrier or facilitator for participation or implementation.

**Results:** Numerous barriers and facilitators within all five domains of the CFIR were identified. Support of supervisors is an important facilitator for both participation and implementation. Co-workers who motivate each other facilitate participation in WHPP. Including employees in the development and implementation of WHPPs is an important facilitator for implementation. A main barrier for participation is an organizational culture where vitality is not yet a topic to discuss. Implementation of WHPPs is hampered by scattered initiatives within an organization.

**Conclusions:** Our findings on the barriers and facilitators for participation in and implementation of WHPPs according to employees and employers will be used to develop a tailored implementation plan. This may contribute to more successful implementation and higher participation rates of the integrated WHPP.

# Marketing of ultra-processed products targeted at adolescents on Instagram

**Dr. Gastón Ares<sup>1</sup>**, Ms. Florencia Alcaire<sup>1</sup>, Ms. Vanessa Gugliucci<sup>1</sup>, Mr. Leandro Machín<sup>1</sup>, Ms. Carolina de León<sup>2</sup>, Ms. Virginia Natero<sup>1</sup>, Dr. Tobias Otterbring<sup>3</sup>

<sup>1</sup>Universidad de la República, Montevideo, Uruguay, <sup>2</sup>Intendencia de Montevideo, Montevideo, Uruguay,

<sup>3</sup>University of Agder, Kristiansand, Norway

**O.3.27 - Improving lifestyle behaviours in different population groups, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To examine the prevalence and power of Instagram posts of ultra-processed products targeted at adolescents in Uruguay, a high-income Latin American country.

**Methods:** Cross-sectional exploratory design. A total of 2,014 Instagram posts promoting ultra-processed products or brands commercializing such posts, generated by 118 Instagram accounts between August 15th, 2020, and February 15th, 2021, were analyzed. Nine indicators of food marketing targeted at adolescents were developed based on previous studies to identify posts targeted at adolescents. Inductive coding was used to describe the content of the posts. Data were analyzed using generalized linear models to compare the content of posts targeted and not targeted at adolescents.

**Results:** Posts targeted at adolescents accounted for 17.6% of all the Instagram posts. Graphic design and adolescent language were the most frequent strategies to target posts at adolescents, followed by explicit references to adolescents or young adults and memes. Posts targeted at adolescents mainly promoted snacks and discretionary foods. Differences in the content of posts targeted and not targeted at adolescents were identified. Posts targeted at adolescents tended to significantly ( $p < 0.05$ ) less frequently include references to nutrition, health and wellbeing and product processing compared to those not targeted at adolescents.

**Conclusions:** The study breaks new ground by analyzing the prevalence and exploring the characteristics and content of Instagram posts promoting ultra-processed products to adolescents. Results stress the need to implement food digital marketing regulations to reduce the vulnerability of adolescents to the deleterious effect of unhealthy food marketing and provide empirical evidence to inform their development.

# Exploring facilitators and barriers for a physically active lifestyle during office hours

**Mr. Oskar Halling Ullberg**<sup>1</sup>, Prof. Susanna Toivanen<sup>1,5</sup>, Prof. Abby C. King<sup>3,4</sup>, Prof. Katarina Bälter<sup>1,2</sup>

<sup>1</sup>Division of Public Health Sciences, Mälardalen University, Västerås, Sweden, <sup>2</sup>Department of Medical Epidemiology and Biostatistics, Karolinska Institutet, Stockholm, Sweden, <sup>3</sup>Department of Epidemiology and Population Health, Stanford University School of Medicine, Stanford, CA, USA, <sup>4</sup>Stanford Prevention Research Center, Department of Medicine, Stanford University School of Medicine, Stanford, CA, USA, <sup>5</sup>Department of Public Health Sciences, Stockholm University, Stockholm, Sweden

**O.3.27 - Improving lifestyle behaviours in different population groups, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Office work is characterized by sedentary work, contributing to a physically inactive lifestyle.

**Method:** Here, data were collected from an 8-week long intervention study on sustainable lifestyle, SOFIA; on office workers that used the app the Stanford Healthy Neighborhood Discovery Tool to take photos of and describe the environment at work or connected to work, that facilitated or hindered them from having a physically active lifestyle during office hours. Photos and text narratives were analyzed deductively using qualitative content analysis.

During November 2022, 35 photos were taken, and more photos will be added to the analysis during the spring of 2023, when the intervention will be repeated.

**Results:** Three themes have emerged so far: The built environment, building design, and office ergonomics. Facilitators for physical activity in the built environment were access to pedestrian features such as parks and sidewalks, whereas participants working in a more urban setting described the lack of greenery and parks for walks as a barrier. Factors regarding building design highlight that the location of stairs and elevators affects the employee's behavior to move around in the building. Also, offices high up in the building are seen as a barrier for movement, making it too strenuous to climb the stairs for 10+ floors. Access to showers and exercise equipment in the same office building was described as a positive facilitator for exercise during, before, or after the workday. The access to secure and protected bike sheds and the ability to store bikes indoors were important facilitators for active commuting to and from work. All offices in the study were equipped with adjustable desks, which are seen as a facilitator to break up static work. In the activity-based offices, there was a wish from the employees to implement active workstations with treadmills for indoor walk-and-talk.

**Conclusion:** This study highlights environmental factors that facilitate or hinder a physically active lifestyle in an office context. Knowledge for this study may improve the working environment and the health among office workers and should be considered when building new or renovating old office buildings.

# Toddler milk: A scoping review of research on consumption, perceptions, and marketing practices

**Ms. Ana Paula C. Richter**<sup>1,2</sup>, Dr. Anna H. Grummon<sup>3,4</sup>, Dr. Jennifer Falbe<sup>5</sup>, Dr. Lindsey Smith Taillie<sup>2,6</sup>, Dr. Deshira D. Wallace<sup>1</sup>, Dr. Allison J. Lazard<sup>7,8</sup>, Dr. Shelley D. Golden<sup>1</sup>, Dr. Marissa G. Hall<sup>1,2,8</sup>

<sup>1</sup>Department of Health Behavior, Gillings School of Global Public Health, University of North Carolina, Chapel Hill, USA, <sup>2</sup>Carolina Population Center, University of North Carolina, Chapel Hill, USA, <sup>3</sup>Department of Nutrition, Harvard TH Chan School of Public Health, Boston, USA, <sup>4</sup>Department of Pediatrics, Stanford University School of Medicine, Palo Alto, USA, <sup>5</sup>Department of Human Ecology, UC Davis, Davis, USA, <sup>6</sup>Department of Nutrition, Gillings School of Global Public Health, University of North Carolina, Chapel Hill, USA, <sup>7</sup>Hussman School of Journalism and Media, University of North Carolina, Chapel Hill, USA, <sup>8</sup>Lineberger Comprehensive Cancer Center, University of North Carolina, Chapel Hill, USA

**O.3.27 - Improving lifestyle behaviours in different population groups, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** We aimed to summarize the literature about toddler milk to address what is known about: 1) caregivers' toddler milk purchasing and feeding behaviors, 2) toddler milk marketing, and 3) how marketing practices influence caregivers' beliefs about toddler milk.

**Methods:** In January 2022, we systematically searched six databases (i.e., PubMed, PsycINFO, Scopus, Cochrane Central, Embase, and CINAHL) and screened references to identify articles about toddler milk, following guidelines from the Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews (PRISMA-ScR). Two investigators independently screened abstracts and full-texts, and a third investigator resolved discrepancies. For each included study, we extracted the title, author, year, journal, country, setting of data collection, sample characteristics, country's economic level, funding source, study aims, study design, outcomes, sample size, setting of population (e.g., rural), characteristics of participants (e.g., gender, race, income, and educational level, if reported), and key research findings related to toddler milk. We synthesized the extracted data qualitatively to assess patterns.

**Results:** Articles addressed topics in five areas: (1) consumption and feeding behaviors; (2) demographic correlates of toddler milk purchasing and consumption; (3) perceptions and beliefs; (4) sales; (5) marketing practices and responses to marketing. Most of the 48 included studies were conducted in high-income countries ( $k=29$ ) or in lower-middle, middle, or upper-middle income countries ( $k=16$ ). Three studies were conducted with participants from a range of country income levels. The included studies suggested that toddler milk sales are growing rapidly worldwide. Findings also revealed that toddler milk packages (e.g., labels, branding) resemble infant formula packages, and that toddler milk marketing practices may function as indirect advertising for infant formula. Purchasing, serving, and consumption of toddler milk were higher in Black and Hispanic populations than non-Hispanic White populations, and young caregivers with higher educational attainment and income were more likely to offer toddler milk to their children.

**Conclusions:** Findings suggest a need for policies to prevent cross-marketing of toddler milk and infant formula, reduce the unnecessary provision of toddler milk to infants and toddlers, and prevent caregivers from being misled about toddler milk healthfulness.

# “Let’s don’t go back:” perspectives of state and local School Meal Program administrators on sustaining COVID-19-related operational changes

**Dr Hannah Lane<sup>1</sup>**, Dr. Lindsay Ballengee<sup>1</sup>, Ms. Kiran Grover<sup>1</sup>, Ms. Janny Dinh<sup>3</sup>, Ms. Mercedes Brown<sup>1</sup>, Ms. Marisa Kirk-Epstein<sup>2</sup>, Ms. Margaret Read<sup>2</sup>

<sup>1</sup>Duke University School of Medicine, Durham, USA, <sup>2</sup>Share Our Strength, Washington D.C., USA, <sup>3</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA

**O.3.27 - Improving lifestyle behaviours in different population groups, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 2:00 PM - 3:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** School meal programs (SMPs) reduce food insecurity and promote a healthy diet among schoolchildren, but not all eligible children participate. In the first two years of COVID-19, SMPs underwent many policy and administrative changes in order to remain operational. If sustained, these changes could increase participation rates long-term. This study describes operational changes related to communication, partnerships, staffing, and improved financial support (e.g, no-cost meals, higher reimbursement) in the first two years of COVID-19, in order to identify strategies to translate those changes into sustainable practice.

**Methods:** We conducted 15 semi-structured interviews with 8 state agency representatives (administer funds and oversee SMPs) and 7 school district administrators (operate programs in school districts) between December 2021- June 2022. We coded data using a hybrid deductive/inductive approach across four domains: (1) communication across administrative levels, (2) staffing, (3) partnerships, (4) financial support. We used the Expert Recommendations for Implementing Change (ERIC; set of research-tested strategies for implementing innovations) to develop sustainability guidance and policy recommendations.

**Results:** Communication between national, state and local administrators and students/families became more frequent and efficient during COVID-19. ERIC strategies to sustain positive communication outcomes include: Centralize technical assistance, Create a learning collaborative, Organize team meetings, Distribute educational materials. SMP staff roles/responsibilities were revised iteratively as the pandemic evolved to better anticipate challenges (e.g., staffing shortages, financial changes). Sustainability strategies include: Revise professional roles, Organize team meetings, and Alter incentive structures. Findings suggest that local partnerships formed during COVID-19 were highly valued, but administrators needed more infrastructure/capacity to maintain them. Potential strategies to sustain partnerships were: Develop resource sharing agreements, Build a Coalition. Participants described the direct impacts of improved financial support including increased participation, reduced stigma, higher quality meals, and increased staff morale. A single sustainability strategy was identified: Alter allowance structures.

**Conclusions:** Findings informed implementation guidance for sustaining COVID-related operational changes in order to increase participation and reduce stigma related to SMPs, thereby reducing food insecurity and improving diet among schoolchildren. Findings strongly support federal and state policy changes to expand SMPs, including increasing reimbursement rates and offering meals free of charge to all students.

# POSTER PRESENTATIONS

## Sedentary behavior, physical activity, and health behavior in the situation of covid-19 pandemic of Bangkok's office workers

**Dr. Raweewan Maphong**<sup>1</sup>, Associate Professor Sonthaya Sriramatr<sup>2</sup>

<sup>1</sup>Chulalongkorn University, Bangkok, Thailand, <sup>2</sup>Srinakharinwirot University, Bangkok, Thailand

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** The purposes of this study were to study changes in health behaviors and factors influencing health behaviors of office workers (OW) living in Bangkok during the Covid-19 pandemic.

**Methods:** The online survey was designed to collect data of physical activity (PA), sedentary behavior (SB), stress, healthy food consumption, and sleep quality from 494 OW (199 males, 295 females), aged 28.82 (6.4) years. Multinomial logistic regression was used to determine the factors influencing health behaviors due to the pandemic. The fully adjusted models were mutually adjusted for the other factors (gender, age, education, income, marital status, type of residence, and the number of people living together).

**Results:** During the pandemic, OW reported having good health, healthy food consumption, good sleep quality, and moderate PA; but their stress and SB were increased. Undergraduate OW reported being 4 times healthier than those with postgraduate education (OR = 4.30). Those with bachelor's degrees reported 3 times less stress than OW with postgraduate degrees (OR = 3.54). The PA of OW who earn 20,000-30,000 Baht/month was 3 times lower compared to higher earners (OR = 3.11). Younger and female OW had 2 times increase in SB (OR = 2.01 and 2.30, respectively). Officers who lived in single-family homes and apartments reported consuming 3 times less and twice as many healthy foods as those who lived in dorms, consequently, (OR = 2.57 and 2.40, respectively). The OW who lived in a single house and condominiums reported 2 and 4 times less good sleep quality compared to those who lived in dorms (OR = 2.16 and 4.71, respectively). If returned to normal, OW wants to work as a hybrid, be more physically active, eat a nutritious diet, put greater emphasis on sleep and reduce SB.

**Conclusions:** Changes in health behaviors as a result of an epidemic depend on a number of factors, including age, education, and accommodation. After the pandemic, Bangkok OW increased their desire to take care of their health. Organizations should take into account the factors that influence health behaviors and have policies in place to promote better health of their workforce.

# Findings from the ‘Vivo Play Scientist’ program – a community based intervention involving the use of wearable activity trackers and an eHealth application.

**Prof. Patricia Doyle-Baker<sup>1</sup>**, Dr. Jennie Petersen<sup>1</sup>, Ms. Dalia Ghoneim<sup>1</sup>, Ms. Anita Blackstaffe<sup>1</sup>, Ms. Calli Naish<sup>1</sup>, Associate Professor Gavin McCormack<sup>1</sup>

<sup>1</sup>University of Calgary, Calgary, Canada

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Interventions incorporating wearable technology and eHealth applications encourage participants to self-regulate physical activity (PA) and sedentary behaviour (SB). In 2020, a Calgary (Canada) recreational facility developed and implemented the ‘Vivo Play Scientist (VPS)’ program, which provided participants with a free wearable activity tracker (WAT; Garmin Vivofit4) with the option of connecting to a customized eHealth dashboard. **Objective:** To evaluate the effectiveness of the VPS program on PA and SB.

**Methods:** Our concurrent mixed-method study included a single-arm repeated-measures design with semi-structured interviews. Participants ( $\geq 18$  years;  $n=87$ ) completed three self-administered online surveys ( $T_0$ , before receiving WAT/dashboard;  $T_1$ , 4-weeks;  $T_2$ , 8-weeks). The surveys captured sociodemographic characteristics, PA behaviour, motivation, SB, WAT and eHealth use and perceived usefulness. Some participants ( $n=23$ ) completed semi-structured telephone interviews on their program experiences. PA and SB were compared between the three time points using Friedman’s tests and the interview data was analyzed using thematic methodology.

**Results:** The mean age of participants was 39.8 (SD 7.4) years and 74.7% were female. Approximately half of all participants had used wearable technology (46.0%) or an eHealth application (49.4%) prior to the intervention. On average, participants wore the WAT on 6.4 (SD 1.7) days in the past week at  $T_1$  and on 6.0 (SD 2.2) days in the past week at  $T_2$ . On average participants used the dashboard on 1.6 (SD 2.1) days in the past week at  $T_1$  and 1.0 (SD 1.8) days in the past week at  $T_2$ . Average levels of perceived usefulness and ease of use for the Vivofit4 and dashboard remained high during the 8-week program ( $T_1$  to  $T_2$ ). The average time spent walking at 8-weeks was significantly higher compared with baseline ( $T_0$  180.34 vs.  $T_2$  253.79 min/week,  $p=.005$ ). Compared to baseline, the mean time spent sitting was significantly lower at 8-weeks ( $T_0$  334.26 vs.  $T_2$  267.13 min/day,  $p<.001$ ). Participants described how the WAT output and “move” notifications encouraged them to modify their PA and SB.

**Conclusions:** Providing adults with a free WAT and eHealth application has the potential to facilitate improvements in PA and SB in the short-term, even under COVID-19 pandemic public health restrictions.

# Sustainable Development for Mobile Health Applications Using the Human-Centered Design Process

**Miss Qingfan An**<sup>1</sup>, Dr. Marjorie Kelley<sup>2</sup>, Assistant Professor Audra Hanners<sup>2</sup>, Associate Professor Po-Yin Yen<sup>3,4</sup>

<sup>1</sup>Umeå University, Umeå, Sweden, <sup>2</sup>The Ohio State University, Columbus, USA, <sup>3</sup>Washington University School of Medicine in St. Louis, St. Louis, USA, <sup>4</sup>Barnes-Jewish College, St. Louis, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** There is well-documented scientific evidence indicating that mobile health (mHealth) applications (apps) for health behavior change can improve the quality of life, relieve symptoms and restore health for patients. In addition to improving patients' health outcomes, mHealth apps also reduce health care utilization and the cost burdens associated with disease management. Currently, patients and healthcare providers (HPs) have a wide variety of choices among commercially available mHealth apps. However, due to the high resource costs and low user adoption of mHealth apps, the cost-benefit relationship remains controversial.

**Methods:** When compared to traditional expert-driven approaches, applying human-centered design (HCD) may result in more useable, acceptable, and effective mHealth apps. After reviewing the current HCD practices in the mHealth for health behavior change domain, we made recommendations on HCD practices when developing mHealth apps.

**Results:** These recommendations focus on employing cultural considerations, applying iterative evaluation, incorporating novelty in design outcomes, and considering privacy and reliability across the entire HCD process. To guide the development of mHealth apps, we also suggest a sociotechnical lens toward HCD practices to promote the sustainability of mHealth apps.

**Conclusion:** Future research should consider standardizing the HCD practice to help mHealth researchers and developers avoid barriers associated with inadequate HCD practices.

# Physical activity during the COVID-19 pandemic in the UK: a qualitative analysis of free-text survey data

**Miss Verity Hailey<sup>1</sup>**, Dr. Alexandra Burton<sup>1</sup>, Prof. Mark Hamer<sup>1</sup>, Dr. Daisy Fancourt<sup>1</sup>, Dr. Abigail Fisher<sup>1</sup>

<sup>1</sup>University College London, London, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Several quantitative studies have found a decline in physical activity in response to COVID-19 pandemic restrictions. The aim of the present study was to use large-scale free text survey data to qualitatively gain a more in-depth understanding of the impact of the COVID-19 pandemic on physical activity, then map barriers and facilitators to the Capability, Opportunity, Motivation, and Behaviour (COM-B) Model of Behaviour to aid future intervention development.

**Methods:** Data was gathered from the COVID-19 Social Study, a large scale, longitudinal, observational, panel study of adults living in the UK during the COVID-19 pandemic. 17,082 participants provided a response to the free text module, and data from those who mentioned a physical activity related word in any context were included in the analysis. Data were analysed using thematic analysis using an inductive approach, and key themes identified.

**Results:** 5396 participants provided 7490 quotes related to physical activity. The sample were predominately female (84%), white (British/Irish/Other) (97%) and aged <60 years (57%). Seven key themes were identified: the importance of outdoor space, changes in daily routine, COVID-19 restrictions prevented participation, perceived risks or threats to participation, the importance of physical health, the importance of physical activity for mental health and the use of technology.

**Conclusion:** Future physical activity interventions could encourage people to walk outdoors, which is low cost, flexible, and accessible to many. Developing online resources to promote and support physical activity provides a flexible and accepted way to deliver quality content to a large audience. Online resources can provide activities that can easily be undertaken both outdoors and indoors e.g. in the home environment to facilitate year-round participation.

# Context is Everything: The development of an electronic time-use diary to concurrently measure context during accelerometer wear protocols for youth

**Dr. Michael Beets**<sup>1</sup>, Dr. Christopher Pfladderer<sup>1</sup>, Dr. Sarah Burkart<sup>1</sup>, Miss Xuanxuan Zhu<sup>1</sup>, Dr. Layton Reesor-Oyer<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>, Dr. R. Glenn Weaver<sup>1</sup>, Dr. Elizabeth Adams<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Variation in where youth spend their time within and across days can have an impact on their 24hr movement behaviors. Current methods to capture time-use often sample a limited number of days and are burdensome for participants. This presentation describes the development of an electronic time-use diary which allows contextual data to be collected over multiple, consecutive days via smartphone and mapped onto accelerometry data to create contextually rich, time-segmented data for understanding contextual influences on youth 24hr movement behaviors.

**Methods:** Initial considerations during the development of the time-use diary were: 1) ease of completion by parent (time to complete), 2) contextual comprehensiveness (programs, settings, events, and activities linked to youth 24hr movement behaviors), and 3) the ability to capture duration of events (start and end times of activity contexts in 15min increments). We contracted with the open-source R package GGIR to create a novel day-segment analysis package for backend processing.

**Results:** The time-use diary was created in Qualtrics. The time-use diary was deployed in a cohort study of US children's school/summer behaviors using a 14-day accelerometer wear protocol. The diary was distributed at 7:30PM each night to a parent's smartphone via an automated texting service developed by our research team. The time-use diary involved parents completing a series of questions about their child's previous 24hrs, starting with bedtime the previous night, waketime, meal timing, snack consumption, accelerometer wear time compliance, and the setting-specific contexts of their child's activities (e.g., afterschool program, sports, friend's house). Each completed time-use diary had time/date stamped information which was used to map onto accelerometry data for segmentation within and across days. An average of 6,671 time-use diaries were completed on an average of 614 children across five, 14-day periods (2021-2022). The average duration to complete the time-use diary was 6.7min (3.3-12.3min 25<sup>th</sup> to 95<sup>th</sup> quantile). Children had on average 11 time-use diaries completed per 14-day measurement period.

**Conclusion:** The creation of a participant-friendly time-use diary facilitates capturing important contextual information that can be used to further the understanding of how youth spend their time and the impact of context on 24hr movement behaviors.

# Exercise providers in the UK are not using the physical activity guidelines to inform their strength prescription with older adults

**Dr. Ashley Gluchowski<sup>1</sup>**

<sup>1</sup>University of Manchester, Manchester, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Strength recommendations have been embedded within the UK's Chief Medical Officers' physical activity guidelines since 2011. In 2019, the strength recommendations were given a more prominent position in the accompanying infographic. However, there is limited evidence that these recommendations underpin strength prescription in the older adult population. This study aimed to explore exercise providers' engagement with the guidelines to gain a nuanced understanding of their awareness, knowledge, and implementation of evidence-based strength training prescription to their older adult clientele.

**Methods:** Fifteen exercise providers working with older adults in the UK participated in one online interview. A general inductive approach was used to generate themes from the data. Five major themes were found – 1. The strength guidelines, 2. Building strength, 3. The motivators and barriers to working with the older adult population, 4. The interpretation of evidence-based strength training, and 5. The future of strength training.

**Results:** Most (n=9), but not all, exercise providers were familiar with the guidelines, however, other sources of exercise information seemed to be preferred. Only one provider had implemented the guidelines into their practice, as guidelines were generally felt to be irrelevant to their clientele. The words '*strength*' and '*exercise*' were avoided, as they were known to intimidate older adults. Job satisfaction was notably high in our participants, but financial barriers to evidence-based prescription were mentioned throughout our conversations. Strength training took on a variety of meanings and resulted in exceptionally varied prescription. The future of strength training prescription needs to overcome a number of barriers in order for evidence to become widely adopted in practice.

**Conclusions:** From our interviews, the strength programmes described are likely not optimised for strength gain and other important outcomes and benefits to the older adult population. Since increased strength has been shown to decrease individual and societal burden of age-associated disease, multi-morbidity, and all-cause mortality, we hope these findings continue to draw attention to, and further the debate, research, and drive for practical change in the way we promote and disseminate evidence-based strength training to the older adult population and the ones who provide this service.

# Are Physical Activity and Loneliness interrelated with in older people and Long-Covid Patients? Findings from a longitudinal study over 6 years and an RCT Study

**Prof. Sonia Lippke**<sup>1</sup>, Dr. Volker Cihlar<sup>2</sup>

<sup>1</sup>Jacobs University Bremen, Bremen, Germany, <sup>2</sup>Bundesinstitut für Bevoelkerungsforschung, Wiesbaden, Germany

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** To investigate (1) How physical activity (PA) and loneliness are interrelated, (2) What predicts PA over and beyond loneliness – both in community-dwelling older adults and Long-Covid Patients participating in an RCT empowering them to self-manage their disease. The innovative contribution about this research is to combine primary and secondary prevention perspectives (older healthy adults, Long-Covid patients).

**Methods:** Two studies were conducted with a longitudinal research design. Measures were taken by means of interviews; analyses performed with SPSS employing binary and multivariate analyses as well as MPlus running a structural equation model.

In study 1 with older adults, three-measurement survey was conducted over 6 years (n=5,002 in T1, n=2,501 in T2, n=1,561 in T3). Participants were aged 54-70 years. Of the sample 55% was female.

In study 2 with Long-Covid patients were assessed also three times and randomized to Intervention Group (Self-management support by Counselors and via web-based services, Assessment at a clinic, n=51), a Control Group (CG, same as IG but no Assessment; n=62) and a Comparison Group which only was measured by questionnaires (n=63). Participants were aged 20-61 years. The sample consisted of 63% women.

**Results:** In older adults, the proportion of physically active individuals increased over time (T1 53.8%; T2 58.6%; T3 66.4%). Loneliness was partially correlated with PA. In the path model, subsequent PA was predicted by previous PA, self-rated physical and mental health, but not loneliness. Lonely individuals appeared more likely to report poor self-rated health, high neuroticism, low extraversion, and low conscientiousness. Long-Covid patients' PA was significantly correlated with the risk factor adiposity but not with loneliness directly but indirectly. However, more sleeping problems were associated with more loneliness and less PA.

**Conclusions:** Helping lonely individuals and Long-Covid patients to become adequately physically active and thereby managing health limitations could be an important target for future PA interventions. Taking behavioral nutrition and sleep routines into account can help as well becoming sufficiently physically active. Implications are tailored approaches also based on to multiple behavior change theory taking loneliness into account.

**Keywords:** Loneliness, physical activity, path analysis, big five, behavior change.

# Adapting a home-based obesity prevention intervention to promote healthy family routines in deprived neighbourhoods in Germany using qualitative focus groups

**Dr. Heide Busse**<sup>1</sup>, Dr. Tilman Brand<sup>1</sup>, Miss Marie Schepan<sup>1</sup>, Miss Elisabeth Rataj<sup>2</sup>, Associate Professor Jess Haines<sup>3</sup>, Dr. Maike Wolters<sup>4</sup>, Prof. Hajo Zeeb<sup>1</sup>, Prof. Wolfgang Ahrens<sup>4</sup>, Other - on behalf of the GrowH! consortium<sup>5</sup>

<sup>1</sup>Department Prevention and Evaluation, Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, <sup>2</sup>State Association for Health and Academy for Social Medicine Lower Saxony (Landesvereinigung für Gesundheit und Akademie für Sozialmedizin Niedersachsen e. V.) , Bremen, Germany, <sup>3</sup>Department of Family Relations & Applied Nutrition, College of Social & Applied Human Sciences, University of Guelph, Guelph, Canada, <sup>4</sup>Department Epidemiological Methods and Etiological Research, Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, <sup>5</sup>Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Family-based approaches have been identified as an effective way to promote child health and prevent childhood obesity. The “Healthy Habits, Happy Homes” intervention involves health educators trained in motivational interviewing providing home visits with participating families to support them in improving self-selected family health behaviours. The intervention has been found effective in North America and will be tested for feasibility and acceptability in Germany. To assure its relevancy, we aimed to contextually adapt the intervention by conducting focus groups with parents and stakeholders in Germany.

**Methods:** Parents were recruited through local community centres. Stakeholders, health educators currently working in schools and communities in the local area, were recruited through existing contacts. Focus groups were arranged either face-to-face or online, depending on participants' preferences. Semi-structured topic guides were employed to obtain views on the relevancy of the target intervention behaviours and materials and to discuss recruitment and communication. Focus groups were audio-recorded, transcribed and analysed using thematic analysis.

**Results:** Three focus groups were conducted with parents (n=15 mothers) and two focus groups with stakeholders (n=14) lasting approximately 90 minutes in length. Participants generally deemed the intervention useful and relevant for the German context and agreed with the selected range of health behaviours. Suggestions were made to additionally plan for ‘family time’ and ‘family communication’ within visits. Some participants identified that home visits could make families feel controlled or judged, suggesting that a ‘neutral’ meeting space should be offered in addition to home visits. Visits with families should be provided depending on the family’s availability, which might likely involve weekends. Contact with families is best kept through mobile phone or WhatsApp and all intervention material should be in easy-to-understand, simple language.

**Conclusions:** Results contributed to the adaption of the “Healthy Habits, Happy Homes” intervention materials and study processes for the German context. Being flexible and providing families with an element of choice were seen as important aspects when working with families in health promotion activities. Study results also helped inform the design of the planned feasibility study of the intervention in Germany, which is the next step in this research project.

# Effects of Personalized Exercise Prescriptions and Social Media through m-Health on Elderly Cancer Survivors' Physical Activity and Quality of Life

**Prof. Zan Gao<sup>1</sup>**, Ms. Suryeon Ryu<sup>1</sup>, Mr. Wanjiang Zhou<sup>1</sup>, Ms. Kaitlyn Adams<sup>1</sup>, Dr. Mohamed Hassan<sup>1</sup>, Dr. Rui Zhang<sup>1</sup>, Dr. Anne Blaes<sup>1</sup>, Dr. Julian Wolfson<sup>1</sup>, Dr. Ju San<sup>1</sup>

<sup>1</sup>University of Minnesota, Minnesota, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** To our knowledge, few studies have integrated multiple m-health approaches to promote physical activity (PA) and health in elderly cancer survivors. Therefore, the purpose of this project was to examine the effects of a multi-component intervention (personalized exercise prescription and social media) on cancer survivors' PA and other health outcomes, compared to prescription only, Facebook only, and attention control conditions.

**Methods:** A total of 126 cancer survivors ( $\bar{X}$  age = 60.37  $\pm$  7.41 years) were recruited from the U.S. for this 6-month study. They were randomly placed to 4 groups with each receiving a Fitbit tracker and installing its companion app: 1) received weekly personalized exercise prescriptions via email, 2) received weekly Facebook health education and interacted with one another, 3) received both conditions 1 and 2, and 4) control condition: adopted usual care. Cancer survivors' PA daily steps, quality of life (i.e., physical health and mental health), and PA determinants (e.g., self-efficacy, social support) were measured at baseline, 3 months, and 6 months.

**Results:** Final sample size included 123 cancer survivors with only 3 dropouts. The results revealed the 3 intervention conditions had greater improvements in PA daily steps than the control group over time (all  $p < 0.05$ ; partial eta-squared = 0.05-0.12 with small, medium, and large effect sizes classified as 0.01, 0.06, and 0.14). Notably, Cancer survivors in the multi-component condition demonstrated more improvements (+1,514 steps/day) in steps than personalized exercise prescription only arm (+420 steps/day) and Facebook only arm (+419 steps/day). Similarly, those in the multi-component condition had the most improvement in physical health as compared with other 3 conditions and in mental health as compared to the 2 other intervention conditions ( $p < 0.05$ ). Also, those in the intervention conditions showed greater increased self-efficacy and enjoyment than those in the control condition ( $p < 0.05$ ). No other significant difference were identified.

**Conclusions:** The study findings suggested that the implementation of multi-component mobile health intervention had positive effects on cancer survivors' PA, quality of life, and certain PA determinants. Also, offering sole m-health intervention may be beneficial to cancer survivors' PA and certain PA determinants.

# The importance of nutrition in pregnancy and the impact of food insecurity (FI) for maternal and infant health and well-being

**Dr. Nicola Heslehurst<sup>1</sup>**, Ms. Zoe Bell<sup>1</sup>, Dr. Gina Nguyen<sup>1</sup>, Dr. Steph Scott<sup>1</sup>

<sup>1</sup>Newcastle University, Newcastle, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** FI exists when there is inadequate access to sufficient, safe, nutritious foods to meet dietary needs/preferences for healthy lives. FI removes individuals “healthy diet choices”. FI prevalence in HICs is increasing, particularly among young women and children; life course stages with increased nutritional demands. This symposium provides an overview of completed and on-going systematic review evidence from HICs on FI during life course stages around pregnancy.

**Methods:** Quantitative evidence from global HICs reports associations between FI and maternal diet/nutrition in pregnancy, gestational weight gain (GWG) and pregnancy health outcomes. Qualitative evidence reports experiences of FI and nutritional health/wellbeing amongst childbearing-age women in European HICs, women’s pregnancy-specific experiences of FI among global HICs, and UK newspaper portrayal of maternal FI.

**Results:** Seven studies reported associations between maternal FI and diet/nutrition outcomes, including reduced fruit, vegetable and Vitamin E intake and diet quality, and increased red/processed meat intake. Nine studies reported mixed results for FI and GWG which showed both increased and reduced GWG, and inadequate GWG. Twenty-two qualitative studies reported European women’s experiences of attempting to access sufficient food, inability to meet nutritional needs, how FI was embedded into their everyday lives, and embodied unhealthful physical, social, nutritional and mental health. There were 254 UK newspaper articles, which portrayed the government as the main driver of FI, and mothers and children suffering the health consequences and requiring access to food aid strategies. The reviews exploring FI and pregnancy outcomes and pregnancy-specific experiences in global HICs are on-going.

**Conclusions:** Women experiencing FI around pregnancy life course stages have poorer nutritional health and wellbeing, and the psychosocial impact is substantial. As FI is a determinant of diet behaviour, which removes individual agency, interventions to reduce health inequalities are required to support healthy nutrition in this population. News media is powerful at shaping public perceptions and framing health issues, which could influence government response to public demands for change. The empathetic newspaper portrayal of maternal FI suggests there is public support for policy and intervention in this population to address health inequalities and improve health and well-being of women and their children.

# Associations of motivation and interpersonal context with self-report and objective physical activity of married partners

**Prof. Elizabeth Richards**, Prof. Melissa Franks, Prof. Sharon Christ, Dr. Anna Forster, Prof. Shirley Rietdyk  
<sup>1</sup>Purdue University, West Lafayette, USA

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** A. Ageing

**Purpose:** Physical activity (PA) prevents chronic disease yet a majority of developed countries' populations do not meet PA guidelines. This highlights the importance of understanding a broad range of psychosocial PA correlates such as autonomous motivation. In addition, married partners are concordant in their PA, which is an additional factor to consider beyond individual-level motivation. Further, most research uses self-reported PA specific to exercise when assessing correlates. Understanding how motivation relates to a broad range of PA measured objectively is an important next step to identify target points for future interventions. This study examined the associations of motivation with self-report and objective PA among husbands and wives. The associations of partner's PA is also examined.

**Methods:** Two community samples (n=74 couples; age range 25-74 years) were recruited to study PA in the context of committed relationships. Motivation was assessed with the relative autonomy index (RAI) derived from the Behavioral Regulation in Exercise Questionnaire-3. Self-report moderate-to-vigorous PA (MVPA) was measured with the Godin Leisure Time Exercise questionnaire. Objective MVPA was assessed with Actigraph™ accelerometers. Bivariate correlations and multiple regression analyses, adjusting for accelerometer wear time, body mass index, age, self-rated health, and partner MVPA, were conducted.

**Results:** Husbands' and wives' self-reports and objective MVPA were correlated ( $r=.36-.43$ ;  $p<.01$ ) and their RAI were weakly correlated ( $r=.26$ ;  $p<0.10$ ). For wives', RAI was significantly associated with self-report MVPA ( $\beta=.48$ ;  $p<0.01$ ) but not objective MVPA ( $\beta=.06$ ;  $p>0.10$ ). In husbands, RAI was also significantly associated with self-report MVPA ( $\beta=.33$ ;  $p<0.01$ ) but not objective MVPA ( $\beta=.05$ ;  $p>0.10$ ). Husbands' and wives' objective MVPA was significantly associated with spouses' MVPA ( $\beta=.40-.43$ ;  $p<0.01$ ).

**Conclusions:** Findings suggest RAI is associated with self-reports of MVPA for exercise but not with overall MVPA measured objectively, which includes exercise and non-exercise activity. Motivation is likely associated with PA for health purposes (such as leisure time activity) rather than all forms of activity measured by accelerometry. In couples, PA participation may not be solely an individual endeavor but also linked to the PA of the spouse. These results highlight the importance of considering the interpersonal context of marital partners when assessing PA factors.

# Parental travel behaviours, accompaniment, and children's active transportation: A multi-site study

**Mrs. Victoria Hecker**<sup>1</sup>, Dr. Sébastien Blanchette<sup>2</sup>, Dr. Guy Faulkner<sup>3</sup>, Dr. Negin Riazi<sup>4</sup>, Dr. Mark Tremblay<sup>5</sup>, Dr. François Trudeau<sup>6</sup>, Dr. Richard Larouche<sup>1</sup>

<sup>1</sup>Faculty of Health Sciences, University of Lethbridge, Lethbridge, Canada, <sup>2</sup>Department of Kinesiology, Crandall University, Moncton, Canada, <sup>3</sup>School of Kinesiology, University of British Columbia, Vancouver, Canada, <sup>4</sup>Department of Health Sciences, Brock University, St. Catharines, Canada, <sup>5</sup>Healthy Active Living and Obesity Research Group, CHEO Research Institute, Ottawa, Canada, <sup>6</sup>Département des sciences de l'activité physique, Université du Québec à Trois-Rivières, Trois-Rivières, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Active transportation (AT) can be an important source of physical activity in children, but most previous research has focused on the trip to/from school. This study investigated whether parents' travel mode to school as a child, current travel mode to work, and parental accompaniment on the trip home from school are associated with their children's AT to/from multiple locations.

**Methods:** Grade 4-6 children were recruited from urban, suburban, and rural schools in the regions of Vancouver, Ottawa and Trois-Rivières. Parents reported their current travel mode(s) to work, school travel mode as a child, and how many days they accompanied their child home from school. During 7 consecutive days, children self-reported the number of active trips that they took to and from different locations (school, houses of friends and relatives, parks, shops, sport venues, etc.) in a diary. The analytic sample included 1699 children (55% girls) and multiple imputation was performed to replace missing data. Generalized linear mixed models based on a negative binomial distribution were used to investigate the association between parental behaviours and their child's AT. The models were stratified by gender and adjusted for child age, parent gender, level of urbanization, and school-area socioeconomic status.

**Results:** Children whose parents took the bus to school as a child reported 12% less active trips (95%CI 0.79-0.99). For each day a parent accompanied their child home from school, children participated in 7% less active trips (95%CI for girls 0.90-0.97, boys 0.90-0.96). Boys living in Vancouver had 51% more active trips compared to Ottawa as a reference site (95%CI 1.13-2.04). There were no significant associations for parent's current travel mode.

**Conclusions:** Our findings suggest that children may have more opportunities for AT if parents allow them to come home from school unaccompanied. Given that parents may drive their child to/from school on the way to work, interventions to promote children's AT should address the perceived convenience of driving and encourage active commuting to work among parents. More research is needed to investigate why children engage in less AT if their parents took the bus as children.

# Relative importance of determinants of changes in eating behavior during the transition to parenthood: priorities for research and interventions

**Dr. Vicka Versele**<sup>1,2</sup>, Dr. Marijn Stok<sup>3</sup>, Prof. Dirk Aerenhouts<sup>1</sup>, Prof. Peter Clarys<sup>1</sup>, Prof. Benedicte Deforche<sup>1,4</sup>, Prof. Eva D'Hondt<sup>1</sup>, Prof. Roland Devlieger<sup>2,5,6</sup>, Prof. Annick Bogaerts<sup>2,7,8</sup>, Prof. Tom Deliens<sup>1</sup>

<sup>1</sup>Faculty of Physical Education and Physiotherapy, Department of Movement and Sport Sciences, Vrije Universiteit Brussel, Brussels, Belgium, <sup>2</sup>Faculty of Medicine, Department of Development and Regeneration, KU Leuven, Leuven, Belgium, <sup>3</sup>Department of Interdisciplinary Social Science, Utrecht University, Utrecht, Netherlands, <sup>4</sup>Faculty of Medicine and Health Science, Department of Public Health and Primary Care, Ghent University, Ghent, Belgium, <sup>5</sup>Obstetrics and Gynaecology, University Hospitals KU Leuven, Leuven, Belgium, <sup>6</sup>Department of Obstetrics, Gynaecology and Fertility, GZA Campus Wilrijk, Antwerp, Belgium, <sup>7</sup>Faculty of Medicine and Health Sciences, Centre for Research and Innovation in Care (CRIC), University of Antwerp, Antwerp, Belgium, <sup>8</sup>Faculty of Health, University of Plymouth, Plymouth, Plymouth, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Understanding the relative importance of determinants of changes in eating behavior throughout pregnancy and postpartum is crucial when developing interventions aiming to improve eating behavior in this lifechanging phase. We aimed to investigate to what extent determinants of changes in eating behavior affect expecting and first-time parents' eating behavior, taking sex into account. A second aim was to involve experts in the field of maternal health and/or nutrition/physical activity and/or public health prioritizing the determinants.

**Methods:** A list of 54 determinants was rated by first-time parents on a scale of 1 (no impact) to 10 (very high impact). Descriptive statistics were used to describe each determinant, independent samples t-tests to examine sex differences. Experts rated the determinants on a level of modifiability, relationship strength and population-level effect, after which a 'priority for research'-score was generated based on these ratings.

**Results:** During pregnancy, the top three determinants receiving the highest scores for women were at the individual level, namely 'health concerns', 'physiological changes' and 'fatigue'. For men the three most important determinants were at the individual level, namely 'health concerns' and 'health consciousness', and at the interpersonal level, namely 'influence of the pregnant partner'. Postpartum, the three highest rated determinants by women were related to the baby (interpersonal), namely 'adaptation to the rhythm of the baby', 'baby becomes priority' and 'practical constraints because of the baby'. For men, 'adaptation to the rhythm of the baby' (interpersonal) received the highest score, followed by 'fatigue' and '(lack of) anticipation' (both at the individual level). According to the experts, the determinants 'professional support' (interpersonal), 'food knowledge' (individual) and 'home food availability' (environmental) were of highest priority for both sexes and during both periods, as these were rated as highly modifiable, strongly related to eating behavior and having a high population level effect.

**Conclusions:** During pregnancy and postpartum, research priority should go to interventions supported through health professionals, aimed at both parents, and with a focus on food and health education. Postpartum, an additional focus towards supporting balance between one's own health and care for the baby is advised.

# Mashing Three Potatoes with One Fork: Examples of Advancing Implementation Science, Nutrition Research, and Community Priorities in a Single Project

**Dr. Taren Swindle, Dr. Julie Rutledge**

<sup>1</sup>University of Arkansas for Medical Sciences, Little Rock, USA, <sup>2</sup>Louisiana Tech University, Ruston, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Community-Engaged Dissemination and Implementation Research (CEDI) emphasizes the importance of partner engagement in effective implementation projects. Examples of effective CEDI projects in nutrition research are limited. The purpose of this presentation is to describe two CEDI projects that advanced the implementation of evidence-based nutrition practices in the early care and education (ECE) setting. We illustrate common methods for identifying and prioritizing determinants of implementation with community partners, selecting and specifying implementation strategies as aligned with community priorities, and evaluating the success of our strategies using Effectiveness-Implementation Hybrid Designs.

**Methods:** Project 1 aimed to increase uptake and fidelity of 4 evidence-based practices (EBPs) for nutrition promotion in ECE. Project 2 aimed to decrease (i.e., de-implement) use of inappropriate feeding practices and increase use of EBPs at nutrition lessons and meals. For both projects, we identified determinants of implementation through in-depth interviews with front-line implementers who were high and low (i.e., deviant) on EBPs. Next, we sorted identified barriers and facilitators into high, medium, and low priority using a card sort activity with a panel of community partners. The research team aligned the prioritized determinants with potential implementation strategies and presented them to the panel. The panel then rated each potential strategy on its importance and feasibility for achieving the desired goals of the project and provided input on the specification of selected strategies before testing. Finally, both projects deployed a Hybrid Type III implementation trial to evaluate success. Implementers provided qualitative feedback on their experiences to inform further iteration of strategies.

**Results:** Both projects impacted targeted implementation outcomes in the desired direction. Project 1 demonstrated significantly improved fidelity to 3 of 4 targeted EBPs as well as improvements in implementers' perceived appropriateness of the practices and their organizational readiness for change. Project 2 demonstrated significantly decreased inappropriate feeding practices and increased EBPs at both nutrition lessons and meals. Qualitative feedback provided specific ways to improve each of the implementation strategies for both projects (e.g., reminders of resources).

**Conclusions:** CEDI approaches can improve the relevance and success of implementation projects for advancing the use of nutrition research evidence in community settings.

# How to involve teachers at vocational schools as ambassadors for physical activity in childcare

Ms. Vanessa Kaiser, Ms. Celine Maisel, **Mr. Holger Hassel**

<sup>1</sup>Coburg University Of Applied Sciences, Coburg, Germany

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** During the project “QueB 2 – developing quality with and through physical activity (PA)” fourteen childcare centres in Bavaria developed their setting to activity friendly environments by themselves. In the second phase different strategies to empower multipliers in spreading awareness for PA were tested. Currently, the aim is to involve teachers at vocational schools for early childhood education in order to reach out and sensitize prospective educators for PA. Therefore, the integration of project planning tools in the curriculum to ensure high qualitative and sustainable interventions is essential.

**Methods:** Educational materials for teachers at vocational schools were developed in three steps: (1) To train future educators in planning PA interventions four workshops in two schools with 80 students were implemented. (2) A theoretical model for project planning then helped to categorize the collected recommendations and sample projects from the students and, based on this, to create a manual for project development. (3) After testing the materials in class, utilisation and acceptance were reflected with the help of a short questionnaire.

**Results:** The categorized results of the second step were summarized in a manual for planning PA interventions in childcare centres. Additionally, a short tutorial by video was designed. These two variations form the basis of the educational materials to enable teachers to disseminate PA promotion in class. Both instructional materials were published on a website and provided for free in order to be used by the interested target group. In step three, teachers tested the proceeding in class and filled in the short questionnaire. The majority of teachers perceived the training material as useful, appreciated its clear structure and appealing design. An increased awareness of factors concerning PA in childcare centres was also emphasized by the teachers.

**Conclusions:** Teachers at vocational schools considered the materials as useful to embed parts of planning PA interventions in childcare settings in the curriculum. Transferring developed manuals to multipliers by providing suitable training modules seem to be a successful and sustainable way to ensure quality in planning processes.

# Real-Time Predictors of Food Parenting Practices and Child Eating Behaviors in Racially/Ethnically Diverse Families within the Context of Food Insecurity

**Dr. Jerica Berge<sup>1</sup>**

<sup>1</sup>University of Minnesota, Minneapolis, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Prior research indicates associations between controlling food parenting practices (e.g., pressure-to-eat, restriction) and factors that increase risk for cardiovascular disease in children (e.g., low diet quality, obesity). However, little is known about whether these associations depend on food security status, race/ethnicity, or sex/gender. This study aimed to examine associations between real-time parental stress and depressed mood, food parenting practices, and child eating behaviors within the context of food insecurity.

**Methods:** Children ages 5-9 and their families (n=631) from six racial/ethnic groups (African American, Hispanic, Hmong, Native American, Somali/Ethiopian, White) were recruited for this study through primary care clinics in Minneapolis/St. Paul, MN in 2018. Ecological momentary assessment was carried out over seven days with parents at two time points, 18 months apart. Generalized estimating equations with a binomial variance family and logistic link to account for multiple daily observations for each family/child were run. To examine moderation, interaction terms between the predictor variables and child race/ethnicity, sex, and food security status at the data collection time point, were added separately to each model.

**Results:** High levels of parental stress and depressed mood experienced earlier in the day were associated with controlling food parenting practices and child food fussiness at dinner the same night. Results were dependent on food insecurity status, race/ethnicity, and child gender. Specifically, parents from immigrant/refugee households were more likely to engage in restrictive food parenting practices in the face of stress, whereas Black and Native American parents were more likely to engage in pressure-to-eat food parenting practices. In addition, the association between high stress and engaging in controlling food parenting practices was dependent on being a daughter and from a food insecure household.

**Conclusions:** Health care professionals may want to consider screening, or continue screening, parents for stress, depressive symptoms, and food insecurity during well child visits and discuss the influence of these factors on every day food parenting practices and child eating behaviors. Additionally, future research should consider using real-time interventions such as ecological momentary intervention to reduce parental stress and depressed mood to promote healthy food parenting practices and child eating behaviors.

# The Use of Virtual Reality to Assess the Impact of Geographical Environments on Walking and Cycling: A Systematic Literature Review

**Ms. Marzieh Ghanbari<sup>1</sup>**, Prof. Martin Dijst<sup>1, 3</sup>, Dr. Roderick McCall<sup>2</sup>, Dr. Camille Perchoux<sup>1</sup>

<sup>1</sup>Luxembourg Institute of Socio-Economic Research (LISER), Esch Sur Alzette, Luxembourg, <sup>2</sup>Luxembourg Institute of Science and Technology, Esch-sur-Alzette, Luxembourg, <sup>3</sup>University of Luxembourg, Esch-sur-Alzette, Luxembourg

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** This systematic literature review aims to identify attributes of geographical environments investigated in relation with walking and cycling behaviors, using Virtual Reality technologies. This study further aims to report on the impacts of environmental correlates of physical activity on people's attitudes and emotional experiences.

**Methods:** PubMed, Scopus, EBSCO, IEEE Xplore, and Cochrane Library were explored for articles published between January 2010 and February 2022. The search strategy was based on three keywords and their synonyms and types, which include: a) Virtual Reality (VR), b) Active behavior, and c) Built environment. The articles were limited to the English-language, reporting information relating to adults (+18), and were published in journals. There was no restriction for gender. Studies on indoor environments, driving simulation, disease-specific groups, interventions related to other disciplines (e.g. Military, Emergency evacuation, and Education), and studies that optimized the methodology or software were excluded. The full protocol is available from PROSPERO (ID=CRD42022308366).

**Results:** In total 75 out of 8992 original studies met the selection criteria. Expected results will consider different population characteristics (e.g. age ranges, socio-economic status, and participants' previous experience with VR), different study designs, and experiment session information (e.g. duration of experiment, length of exposure). It will also account for the different attributes of the walking and cycling behaviors, like walking speed, heart rate, heart rate variability and environmental characteristics of the built and natural environments; for instance, greenness and crowdedness. Expected results will identify and summarize the effects of geographical environment on walking and cycling in Virtual Reality experiments, and excavates the advantages and disadvantages of utilizing Virtual Reality in these studies, providing details on the consistency and limitations of the existing literature.

**Conclusions:** The findings of this review will identify the gaps in the literature and will provide valuable recommendations for future research to implement effective policy interventions to increase physical activity.

**Keywords:** Virtual Reality, Walking, Cycling, Experiment, Geographical environments

# Strategies to Increase Student School Meal Participation: A Systematic Review

Dr. Amelie Hecht<sup>1</sup>, **Dr. Deborah A. Olarte<sup>2</sup>**, Dr. Gabriella McLoughlin<sup>3</sup>, Dr. Juliana Cohen<sup>2</sup>

<sup>1</sup>The Lab at District of Columbia, Washington, District of Columbia, USA, <sup>2</sup>Merrimack College, North Andover, USA, <sup>3</sup>Temple University, Philadelphia, USA

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** G. Children and families

**Purpose:** School meals play a critical role in promoting child nutrition and advancing equity. However, in the United States (US) many students do not participate in the National School Lunch Program or the School Breakfast Program. To increase student participation in school meals, a better understanding of evidence-based strategies that increase participation rates is warranted.

**Methods:** A systematic review was conducted to understand which interventions, initiatives, and policies increase school meal participation. Four electronic databases were searched (PubMed, Academic Search Ultimate, Education Resources Information Center, and Thomson Reuters' Web of Science) to identify peer-reviewed and government studies conducted in the US and published in English through January 2022. Study quality (i.e., risk of bias) was assessed using the Newcastle-Ottawa Scale for cross-sectional and cohort studies.

**Results:** Thirty-four articles met inclusion criteria. This review found strong evidence to support alternative breakfast models (e.g., breakfast in the classroom or grab-and-go breakfast) increase participation. Specifically, alternative breakfast models in combination with universal free school meals had greater effects on improving participation than either strategy alone. There is also strong evidence that restrictions on competitive foods (i.e., foods sold outside the school meal program through vending machines, à la carte, or school stores) increase school meal participation. Restrictions on competitive foods may also promote equity in schools by eliminating a two-tiered system of food service inaccessible to many children from households with low incomes. There is promising evidence that stronger nutrition standards do not negatively impact meal participation, and in some cases, may promote meal participation. There was limited high-quality evidence on the effect of taste tests, modified menu options, changes to the meal period length, changes to the cafeteria environment, and wellness policies.

**Conclusions:** Several interventions and policies may shape meal participation, such as alternative breakfast models, strategies to increase student enrollment in free and reduced-price meals and policies that ban meal shaming. Additional rigorous research is needed to explore these and other strategies to promote meal participation, including school-based interventions and local and state policies.

# A qualitative analysis of patient-provider conversations around movement behaviors during infant well-child visits

**Dr. Elizabeth Adams<sup>1</sup>**, Ms. Meghan Bastyr<sup>1</sup>, Dr. Laura Caccavale<sup>2</sup>, Dr. Romesh Wijesooriya<sup>2</sup>, Dr. Layton Reesor-Oyer<sup>1</sup>, Dr. Christopher Pfledderer<sup>1</sup>, Dr. Michael Beets<sup>1</sup>, Dr. R. Glenn Weaver<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>, Dr. Sarah Burkart<sup>1</sup>, Dr. Melanie Bean<sup>2</sup>

<sup>1</sup>University of South Carolina, Columbia, USA, <sup>2</sup>Virginia Commonwealth University, Richmond, USA

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** G. Children and families

**Purpose:** Infant well-child visits offer multiple opportunities to deliver evidence-based guidance on movement behaviors that promote health and well-being. This includes time in physical activity (e.g., active play, tummy time), sedentary behavior (e.g., screen time, restrictive devices), and sleep. However, the extent to which these topics are discussed in clinical settings is unknown, particularly during infancy. This study conducted an in-depth qualitative analysis of patient-provider conversations around movement behaviors during well-child visits to understand guidance parents receive and their questions/concerns regarding these behaviors within the first months of life.

**Methods:** Mother-infant dyads (N=20) were enrolled in this longitudinal pilot study. For each dyad, well-child visits at 2, 4, and 6 months of age were audiorecorded. Patient-provider conversations were transcribed and analyzed using thematic analyses. Themes around physical activity, sedentary behavior, and sleep were derived. Within each theme, dialogue was further conceptualized into pediatrician-initiated guidance and parent-initiated questions/concerns. Themes were compared across ages, and percentages were derived for the frequency of initiated topics discussed.

**Results:** Sleep was the most discussed movement behavior. Discussions centered around: 1) safe sleep practices (e.g., Sudden Infant Death Syndrome), 2) sleep duration and timing, and 3) parenting practices at bedtime and night wakings (e.g., sleep training). Pediatricians provided the most guidance around safe sleep and parenting practices at 2-months (45% and 70% of visits, respectively), while parents had the most questions/concerns about sleep duration and timing (initiated in 15-25% of visits across ages). Physical activity was discussed less often, and themes included: 1) active play (e.g., tummy time), 2) reaching motor milestones (e.g., rolling over), and 3) safe movement (e.g., baby proofing). Active play guidance was most commonly provided at 2-months (30% of visits), with safe movement guidance provided mostly at 6-months (55% of visits). Sedentary behaviors of screen time and restrictive devices were almost never discussed (5% of visits).

**Conclusions:** Although sleep was commonly discussed during infant well-child visits, guidance on physical activity and sedentary behaviors was minimal. These findings can inform enhancements to clinical care and identify opportunities for providing additional guidance, particularly regarding reducing sedentary behaviors to support healthy habits early in life.

# Do Adolescents' Physical Activity and Screen Time Differ across Settlement Types? Findings from the Otago Region, New Zealand

Associate Professor Asaduzzaman Khan<sup>1</sup>, Prof. Melody Smith<sup>2</sup>, Dr. Enrique García Bengoechea<sup>3,4</sup>, Prof. John Spence<sup>5</sup>, **Prof. Sandra Mandic<sup>6,7</sup>**

<sup>1</sup>University of Queensland, Brisbane, Australia, <sup>2</sup>The University of Auckland, Auckland, New Zealand, <sup>3</sup>Sport Ireland, Dublin, Ireland, <sup>4</sup>University of Limerick, Limerick, Ireland, <sup>5</sup>University of Alberta, Edmonton, Canada, <sup>6</sup>Auckland University of Technology, Auckland, New Zealand, <sup>7</sup>AGILE Research Ltd., Wellington, New Zealand

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Unhealthy lifestyle behaviours including insufficient physical activity (PA) and high screen time (ST) have been frequently reported among urban adolescents in developed countries. Knowledge about those behaviours among adolescents living in less urbanized areas and rural settings is limited. This study compared PA and ST among New Zealand adolescents attending schools across different settlement types.

**Methods:** Adolescents (n=2,113) from 23 of 27 secondary schools in the Otago region, New Zealand participated in the Built Environment and Active Transport to School (BEATS) Studies between 2014 and 2018. Adolescents self-reported their PA and recreational ST in an online questionnaire completed at school under supervision of research staff. The proportion of adolescents meeting PA ( $\geq 60$  min of moderate-to-vigorous PA/day) and recreational ST guidelines ( $\leq 2$  hrs/day) was calculated. Based on school location, participants were categorized into four groups: 'large-urban' area (n=1,125; 11 schools), 'medium-urban' area (n=260; 3 schools), 'small-urban' area (n=562; 5 schools) and 'rural' setting (n=166; 5 schools). Differences between the groups were compared using ANOVA and Chi-square tests.

**Results:** Overall, few adolescents met recommendations for PA (20.0%) and ST (14.1%). Differences across settlement types were observed for PA ('large-urban', 'medium-urban', 'small-urban', 'rural': 16.8%, 16.5%, 26.3%, 25.3%;  $p < 0.001$ ), motorised transport to school (66.5%, 56.6%, 48.6%, 54.8%;  $p < 0.001$ ) and sport participation at school (67.6%, 63.8%, 53.7%, 66.3%;  $p < 0.001$ ) and outside school (49.4%, 54.2%, 59.4%, 61.4%;  $p < 0.001$ ). Average daily ST outside school was significantly higher for adolescents living in the large urban areas compared to rural settlements ( $5.5 \pm 3.0$  vs.  $4.8 \pm 3.2$  hours/day;  $p = 0.040$ ). Weekend day average ST was higher for adolescents living in large and medium urban areas ( $6.9 \pm 3.5$  hours/day for both areas) compared to rural settlements ( $5.8 \pm 3.4$  hours/day;  $p < 0.05$ ). Weekday average ST was not different across settlement types ( $5.0 \pm 2.9$ ,  $5.0 \pm 2.8$ ,  $5.0 \pm 2.9$ ,  $4.4 \pm 3.0$ ;  $p = 0.112$ ).

**Conclusions:** Overall, few New Zealand adolescents met recommended PA and ST guidelines and unhealthy behaviours were more common among those living in large urban areas compared to rural settings. Therefore, health promotion interventions for adolescents should be comprehensive and tailored to urban and rural settings.

# Are fathers involved in developing healthy behaviours in adolescents? : A qualitative inquiry from Kolkata, India

**Dr. Neha Rathi**<sup>1</sup>, Prof. Anthony Worsley<sup>2</sup>, Prof. Sangeeta Kansal<sup>1</sup>

<sup>1</sup>Department of Community Medicine, Institute of Medical Sciences, Banaras Hindu University, Varanasi, India, <sup>2</sup>School of Exercise and Nutrition Sciences, Deakin University, Geelong, Australia

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** G. Children and families

**Purpose:** Unhealthy dietary behaviours and sedentary lifestyle among Indian adolescents poses a significant public health challenge. The mounting prevalence of adolescent obesity and its associated adverse consequences are top concerns for policy makers and public health professionals. Family diet is viewed as a primary contributor to these health adversaries, with parents influencing their adolescents' food intake. Yet, much of the existing research exploring parenting influences on adolescents' diet focuses on mothers while fathers' involvement in shaping eating and physical activity behaviours of their young ones is underreported in the literature, more so in the LMIC context. Therefore, this qualitative inquiry aimed to describe Indian fathers' perceptions of developing healthy behaviours in adolescents.

**Methods:** Convenience sampling was used to recruit 36 fathers of adolescents aged 10-19 years from Kolkata, India. Based on the study aim and literature review, an interview guide with a series of open-ended questions was prepared and pre-tested. In-depth, semi-structured interviews were conducted either face-to-face or over Zoom/telephone in Hindi, Bengali, and English. All interviews were digitally recorded, transcribed verbatim, and translated to English. Underpinned by the Template Analysis technique, transcribed data were analysed both manually as well as using the NVivo software program. This study received ethical approval from the Institutional Ethics Committee of Banaras Hindu University (Dean/2021/EC/3006).

**Results:** Five themes were identified during thematic analysis which included (i) Limited engagement of fathers in food related tasks particularly cooking for adolescents; (ii) Fathers can play a crucial role in setting food rules e.g. restricting television viewing during mealtime (iii) Challenges to developing healthy dietary behaviour in adolescents e.g. fussy eating i.e. dislike of green vegetables, love of junk food; (iv) Fathers' engagement in adolescents' physical activity was mostly restricted to weekends; (v) Barriers to routine involvement in adolescent upbringing e.g. full-time paid employment, poor financial status.

**Conclusions:** This growing understanding of paternal parenting behaviour highlights the need to engage fathers in lifestyle-based interventions to promote health and wellbeing in vulnerable Indian adolescents while alleviating the risk of triple burden of malnutrition.

# Barriers and facilitators perceived by healthcare professionals for implementing lifestyle-related treatment modalities in osteoarthritis: a cross-sectional study

**Ms. Sioukje Bouma<sup>1</sup>**, Dr. Martin Stevens<sup>1</sup>, Prof. Lucas van der Woude<sup>2,3</sup>, Prof. Ron Diercks<sup>1</sup>, Dr. Inge van den Akker-Scheek<sup>1</sup>

<sup>1</sup>University of Groningen, University Medical Center Groningen, Department of Orthopedics, Groningen, Netherlands, <sup>2</sup>University of Groningen, University Medical Center Groningen, Center for Human Movement Sciences, Groningen, Netherlands, <sup>3</sup>University of Groningen, University Medical Center Groningen, Department of Rehabilitation Medicine, Groningen, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Osteoarthritis (OA) is a highly prevalent degenerative joint disorder, accounting for a significant burden at the patient level and societal level. International guidelines recommend the use of lifestyle-related treatment modalities (LRTMs) aimed at increasing physical activity and weight reduction. However, it has been demonstrated that LRTMs are currently underutilized as OA treatment. To gain more insight into this evidence-practice gap, previous work of our research team identified influencing factors for applying LRTMs from the perspective of healthcare professionals (HCPs). The aim of the current study was to identify within these influencing factors which are perceived as the main barriers and facilitators to the opinion of various primary and secondary HCPs for implementing LRTMs in patients with hip and/or knee OA.

**Methods:** A cross-sectional study. Data were collected using an online survey, distributed among primary and secondary HCPs: general practitioners (in-training), physiotherapists, orthopedic surgeons (in-training), nurse practitioners or physician assistants orthopedics (in-training), exercise therapists, dieticians, lifestyle counselors and other HCPs in general practice. The survey section on barriers and facilitators consisted of thirty-two research-derived statements about implementing LRTMs. Based on participants' responses to these statements, 'barriers' and 'facilitators' were presented as factors with 'major agreement' ( $\geq 75\%$ ), 'minor agreement' (60-75%) or 'no agreement' ( $< 60\%$ ).

**Results:** The survey was completed by 213 participants. Seven 'barriers' and twenty 'facilitators' were identified. Two of three 'major agreement barriers' were related to the social, political, and legal context (i.e. organization of Dutch healthcare system (84.5%) and lifestyle climate in Dutch society (78.4%)), and the other to capacity for organizational change (i.e. audits within organization (81.2%)). The total number of 'barriers' differed per subgroup of HCPs, with the highest number (12) among orthopedic surgeons (in-training) and the lowest number (4) among dieticians, physiotherapists and lifestyle counselors.

**Conclusions:** The results suggest that the implementation of LRTMs within OA care could be improved by focusing on societal factors rather than individual HCP factors. National preventive policies on health promotion seem required to counteract the expected increase in healthcare demand and costs due to OA. Future research is needed to match relevant implementation strategies to all barriers identified.

# Physical Activity, Screen Time and Dietary Behaviours in New Zealand Adolescents Prior to and Following the Onset of the COVID-19 Pandemic

**Prof. Sandra Mandic**<sup>1,2</sup>, Associate Professor Asaduzzaman Khan<sup>3</sup>, Dr. Enrique García Bengoechea<sup>4,5</sup>, Prof. John Spence<sup>6</sup>, Associate Professor Kirsten Coppel<sup>7</sup>, Prof. Melody Smith<sup>8</sup>

<sup>1</sup>Auckland University of Technology, Wellington, New Zealand, <sup>2</sup>AGILE Research Ltd., Wellington, New Zealand, <sup>3</sup>University of Queensland, Brisbane, Australia, <sup>4</sup>Sport Ireland, Dublin, Ireland, <sup>5</sup>University of Limerick, Limerick, Ireland, <sup>6</sup>University of Alberta, Edmonton, Canada, <sup>7</sup>University of Otago, Dunedin, New Zealand, <sup>8</sup>The University of Auckland, Auckland, New Zealand

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Insufficient physical activity (PA), high screen time (ST), unhealthy dietary patterns and clustering of these behaviours among adolescents in developed countries were reported prior to the COVID-19 pandemic. While emerging international evidence suggests these health behaviours worsened during the pandemic, data from many countries are lacking. This study compared PA, ST and dietary behaviours in New Zealand adolescents five to six years prior to (T1) and during (T2) the COVID-19 pandemic.

**Methods:** Adolescents (n=2,085; age: 15.2±1.4 years; 51.8% female) from all 12 secondary schools in Dunedin, New Zealand, participated in the Built Environment and Active Transport to School (BEATS) studies in 2014/2015 (T1; n=1,266) and 2021/2022 (T2; n=819). Participants self-reported PA, recreational ST (TV/computer/video games) and dietary behaviours in an online survey. The proportion of adolescents meeting guidelines for PA (≥60 minutes of moderate-to-vigorous PA/day), recreational ST (≤2 hours/day) and fruit and vegetable (F&V) intake (>1/day each for both fruit and vegetables) was calculated. Data were analysed using ANOVA and Chi-square tests.

**Results:** At both time points, few adolescents met health behaviour guidelines. Compared to T1, a greater proportion of adolescents at T2 met guidelines for PA (16.7% vs 23.1%; p<0.001) and ST (13.3% vs. 18.3%; p<0.002) while no significant difference was observed for F&V intake (29.6% vs. 27.0%; p=0.193) and all three health behaviours (2.1% vs. 2.1%; p=0.106). At T2, average daily ST outside school was lower on weekend days (6.9±3.5 vs. 6.1±3.6 hours/day), but higher on weekdays (5.0±2.9 vs. 5.6±2.9; p<0.001) compared to T1. Higher weekly intake of sweets (3.1±3.1 vs. 3.5±3.2 times/week; p=0.005) and lower weekly intake of fruit (8.1±4.9 vs. 7.7±4.9 times/week; p=0.027) and sugary soft drinks (2.6±3.2 vs. 1.8±2.8 times/week; p<0.001) were found at T2 versus T1.

**Conclusions:** In 2021-2022, New Zealand adolescents self-reported higher levels of PA, weekday ST and consumption of sweets, and lower weekend ST and intake of fruit and sugary soft drinks compared to pre-pandemic levels. Worsening of health behaviours, particularly related to weekday screen time and consumption of fruit and sweets during the COVID-19 pandemic, reinforces the need for comprehensive health promotion for adolescents.

# Comparing the Effectiveness and Appeal of Delivering the Whole Body Approach (WBA) Program via Text Messages and In-Person to Northern Illinois Food Bank Clients

**Dr. Henna Muzaffar<sup>1</sup>**, Miss Ashley Werner<sup>1</sup>, Miss Olivia Bosse<sup>1</sup>, Mrs. Kelly Brasseur<sup>2</sup>

<sup>1</sup>Northern Illinois University, Dekalb, USA, <sup>2</sup>Northern Illinois Food Bank, Geneva, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To compare the effectiveness and appeal of delivering a virtual and in-person health promotion program regarding eating competence, interest and enjoyment in physical activity, and confidence related to consuming and providing fruits and vegetables for low-income food pantry users.

**Methods:** Non-experimental design comparing a text message and an in-person ten-week Whole Body Approach (WBA) program delivered to two convenience, purposive samples of Northern Illinois Food Bank users. The text message group (TMG) recruited 156 participants from Northern Illinois Food Bank's mobile food pantry, My Pantry Express (MPX). The in-person group (IPG) recruited 19 participants from Northern Illinois Food Bank's pantry, Winnebago Community Market in Rockford, Illinois. The maximum capacity for the IPG was 20 participants due to classroom size restrictions. The text message program was delivered from February to April 2021, and the in-person program was delivered from February to April 2022. The topics discussed in both programs included stress management, relationship with food, mindful eating, healthy body image, and enjoyable movement. Outcome measurement tools included Eating Competence Satter Inventory 2.0 (ecSI 2.0), fruit and vegetable Self-Efficacy Questionnaire, and the Interest/Enjoyment subscale of the Motives for Physical Activity Revised (MPAM-R). Independent samples t-test was used to compare post-intervention outcome measures in participants who completed both the pre- and post-surveys for the text message program and in-person program.

**Results:** There was a significant difference in post-intervention outcomes between the TMG and IPG programs for eating attitudes ( $p = 0.007$ ), food acceptance ( $p = 0.030$ ), internal regulation ( $p = 0.030$ ), eating context ( $p = 0.032$ ), and overall eating competence ( $p = 0.006$ ). There was also a significant difference ( $p = 0.004$ ) for motives for physical activity between the two intervention groups. There was not a significant difference between the two intervention groups for their overall self-efficacy for consumption of fruits and vegetables ( $p > 0.05$ ).

**Conclusion:** Post-intervention outcome measures were significantly better for IPG compared to TMG for all variables of overall eating competence and motives for physical activity. Future studies may include comparing the effectiveness of the TMG and IPG with a hybrid (50% in-person and 50% virtual) WBA group.

# Yoga instructors' experiences of adapting tele yoga in the Successful Ageing (SAGE) yoga trial: lessons for telehealth delivery

**Dr. Heidi Gilchrist<sup>1,2</sup>**, Dr. Abby Haynes<sup>1,2</sup>, Dr. Juliana Oliveira<sup>1,2</sup>, Prof. Cathie Sherrington<sup>1,2</sup>, Prof. Anne Tiedemann<sup>1,2</sup>

<sup>1</sup>School of Public Health, Faculty of Medicine and Health, The University of Sydney, Camperdown, Gadigal Country, Australia, <sup>2</sup>Institute of Musculoskeletal Health, The University of Sydney, Sydney Local Health District, Camperdown, Gadigal Country, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Live online yoga classes (tele yoga) for older participants are known to be acceptable and feasible, but little is known about which strategies optimise engagement. This paper identifies practical lessons learnt in the delivery of the Successful Ageing (SAGE) yoga trial. We 1) explore challenges and opportunities experienced by the yoga instructors when moving the SAGE yoga program online and 2) describe how yoga instructors adapted to manage these challenges and leverage opportunities presented by tele yoga. We provide transferable information for health and exercise professionals who want to deliver, or who are already delivering, online classes for older people.

**Methods:** The SAGE yoga trial is a novel randomised controlled trial testing the effect of a yoga-based exercise program on falls among 700 community-dwelling people aged 60+ years. Our realist process evaluation sought to explain outcomes of high satisfaction and adherence described by most participants, focusing on what was working for whom, and conditions which supported this. This study draws on focus groups, semi-structured interviews and participant observation with four SAGE yoga instructors. Multiple data sources enabled analytic triangulation. Data were analysed using six previously developed program theories, combined with inductive coding and an analytical workshop.

**Results:** The SAGE yoga instructors identified four concerns about delivering tele yoga for older people: threats to safety, altered interpersonal dynamics, challenges to facilitating mind-body connection and difficulties with technology. The instructors used eight modifications to manage these challenges: a 1:1 participant interview prior to program commencement, more descriptive verbal instructions, increased focus on interoception, increased attention and support, slower more structured class flow, simplifying poses, adapting the studio environment and IT support. Tele yoga required the development of new skills and adaptive teaching strategies.

**Conclusions:** This study provides unique insights into the challenges of delivering tele yoga to older people from the perspective of the yoga instructor and identifies pragmatic strategies instructors developed to overcome these challenges and maximise engagement with tele yoga, presenting them in a typology of transferable lessons. These manageable strategies could be applied to a wide range of telehealth classes, improving the uptake and adherence of beneficial online programs and services.

# Associations between screen time and drawing ability at 3.5 years in children from the French nationwide Elfe birth cohort

**Dr. Lorraine Poncet**<sup>1</sup>, Ms. Melea Said<sup>1</sup>, Mr. Shuai Yang<sup>1</sup>, Dr. Falk Mueller-Riemenschneider<sup>2, 3</sup>, Dr. Claire Berticat<sup>4</sup>, Dr. Michel Raymond<sup>4</sup>, Dr. Melissa Barkat-Defradas<sup>4</sup>, Dr. Marie-Aline Charles<sup>1, 5</sup>, Dr. Jonathan Y Bernard<sup>1, 6</sup>

<sup>1</sup>Centre for Research in Epidemiology and Statistics (CRESS), Université de Paris, Inserm, INRAE, Paris, France, <sup>2</sup>Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore, <sup>3</sup>Berlin Institute of Health, Charité University Medical Centre, Berlin, Germany, <sup>4</sup>ISEM, University of Montpellier, CNRS, EPHE, IRD, Montpellier, France, <sup>5</sup>Unité Mixte Inserm-Ined-EFS Elfe, INED, Aubervilliers, France, <sup>6</sup>Singapore Institute for Clinical Sciences (SICS), Agency for Science, Technology and Research (A\*STAR), Singapore, Singapore

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Screen use in young children has long raised considerable concern for its potential negative impact on overall cognitive development. However, little is known regarding screen time and drawing ability, a specific dimension of cognition. We aim to assess the associations between screen time and drawing ability, and examine whether these are confounded by family socioeconomic status and children's activities competing with screen time.

**Methods:** We used data from the Elfe birth cohort, which enrolled 18,329 new-borns in 2011, across 349 randomly selected maternity units in France. At age 3.5 years, children underwent the Draw-a-person test during home visits; drawings were collected and scored using the 12-point McCarthy score. Data on total and device-specific screen time, household sociodemographic characteristics and children's competing activities were collected from parents in phone interviews at 3.5 years. Among 7,577 children with valid data on screen time and drawing score, we examined the associations between screen time and the McCarthy score using multivariable zero-inflated Poisson regression models. Analyses were controlled for household socioeconomic characteristics (model 1) and competing activities (e.g. drawing/painting practice, playing outdoors, sleep time) (model 2) separately. Analyses were stratified according to child sex.

**Results:** In unadjusted models, total screen time was associated with drawing score. Increased total screen time was associated with a higher likelihood to obtain a null score for boys (OR=1.15, 95 % CI=1.07-1.23) and girls (OR=1.13, 95 % CI=1.03-1.24). In girls only, increased total screen time was associated with a higher drawing score above zero (coef=-0.02, 95 % CI=-0.04; -0.01). Overall, estimates were slightly stronger when considering TV time only. After adjusting for SES characteristics, associations were no longer observed. When controlling for competing activities only, total screen time and TV time remained associated with drawing score in boys and girls.

**Conclusion:** The associations between screen time and drawing score in 3.5-year-old children was confounded by family SES, not by activities competing with screen time.

# Family facilitators, barriers and strategies of healthy eating among adolescents – Qualitative interviews with parent-adolescent dyads

**Ms. Kiki SN Liu<sup>1</sup>**, Dr. Kai Sing Sun<sup>2</sup>, Ms. Joyce PY Tsang<sup>1</sup>, Dr. Julie Y Chen<sup>1</sup>, Prof. Cindy LK Lam<sup>1</sup>

<sup>1</sup>Department of Family Medicine and Primary Care, The University of Hong Kong, Hong Kong, Hong Kong, <sup>2</sup>JC School of Public Health and Primary Care, The Chinese University of Hong Kong, Hong Kong, Hong Kong

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Healthy eating is vital in reducing adolescent obesity and future non-communicable diseases. While family influence on adolescent eating habits is well-studied in Western populations, little is known in Chinese families. Exploring family facilitators, barriers and strategies of healthy eating among adolescents in Chinese families can provide directions for future interventions in local setting.

**Methods:** A theoretical framework of dietary knowledge, attitudes and practices was applied to guide the qualitative semi-structured interviews with each parent-adolescent dyad. The dyads were purposively sampled by age, gender, dietary intake and household income. The transcripts were coded by thematic analysis to identify the key family factors.

**Results:** Twenty-five adolescents (aged 12 to 19 years) and their mothers participated. Thirteen adolescents were female, and eight reported healthy eating of 5 or more servings of fruit and vegetables (FV) per day. A total of fourteen themes under five domains were identified: **A) Family health** with 1) Illness experience in the family; **B) Parental knowledge** on 2) Dietary recommendations, 3) Preparation of healthy food, and 4) Healthy food choice; **C) Parental attitudes** towards 5) Importance of healthy eating, and 6) Priority of family health; **D) Socioeconomic factors** of 7) Time concern, and 8) Cost concern; and **E) Food parenting practices** in 9) Nutrition education, 10) Role modelling, 11) Food provision, 12) Child involvement, 13) Parental supervision, and 14) Cultivation of food preference. Parenting styles had an influence on themes 12 to 14. Families reported useful strategies such as incorporating healthy ingredients in adolescents' favourite recipes, provision of a variety of FV at home, and involvement of adolescents in meal preparation.

**Conclusions:** Positive parental attitudes towards healthy eating, healthy food provision, and authoritative parenting style were key facilitators, where deficiency in dietary knowledge in parents, time and cost concerns, and limited family discussion on food-related issue were key barriers. There is a need to resolve the barriers through public education to empower parents with practical nutrition knowledge; to adopt an authoritative style in food parenting practices; to discuss more on healthy eating; and to acquire practical skills on time- and cost-saving healthy cooking.

# Feasibility and acceptability of a package of interactive health education lessons and take-home activities, to improve children's diets, reduce sedentary behaviours, and introduce habit formation among primary school children in Singapore

**Ms. Cindy Mei-Jun Chan<sup>1</sup>**, Dr. Michael Chia<sup>2</sup>, Dr. Falk Müller-Riemenschneider<sup>1</sup>, Dr. Zoe Jane-Lara Hildon<sup>1</sup>, Dr. Mary Foong-Fong Chong<sup>1,3</sup>

<sup>1</sup>Saw Swee Hock School of Public Health, National University of Singapore and National University Health System, Singapore, Singapore, <sup>2</sup>Physical Education & Sports Science Academic Group, National Institute of Education, Nanyang Technological University, Singapore, Singapore, <sup>3</sup>Singapore Institute for Clinical Sciences, Agency for Science, Technology and Research, Singapore, Singapore

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** A large proportion of children globally are not meeting dietary and movement recommendations. School-based interventions have shown promising results but should be multicomponent to be effective. As part of a multicomponent intervention programme (Promoting hEalthy Diet and Active Lifestyle, PEDAL), we co-developed a package of interactive health education lessons and take-home activities with health and education professionals to improve children's diets, reduce sedentary behaviours, and introduce habit formation. Prior to the full-scale PEDAL programme, the feasibility of the health education package was assessed qualitatively, focusing on the implementation (e.g., adherence and barriers) and acceptability (e.g., satisfaction and appropriateness) among students and teachers.

**Methods:** Ten teachers underwent a training workshop and conducted the lessons and activities with Primary 5 students (aged 10 to 12 years old) in two primary schools (n=404). Upon lesson completion, 16 students (n=8 girls) and 5 teachers (n=1 female) took part in five semi-structured focus group discussions (FGD). The FGDs were audio-recorded, and data was extracted using the scribing approach and analysed inductively using thematic analysis.

**Results:** Teachers found the lessons easy to implement as the videos and slides were provided to them, and the lessons were generally pitched at an appropriate level to students. However, some found teaching the topic of habit formation challenging to less academically inclined students. Teachers also struggled to complete all lessons in the package within the intended 3-month period due to other school activities and suggested more time for completion. The students reported that they enjoyed the PEDAL lessons more than the typical health education lesson as they were entertained by the educational videos and the quiz games which require them to answer with body movements. They also liked the variety of take-home activities but faced challenges in completing them due to the lack of parental support at home. Overall, students and teachers expressed that the information on habit formation and the activities increased their awareness and skills in forming healthy habits.

**Conclusions:** Feedback from this study is valuable to inform the roll-out of the full-scale multi-component PEDAL programme involving parental engagement and improving the school canteen environment.

# Prevalence of Meeting 24-hour Movement Guidelines among school children in Kuala Lumpur, Malaysia

**Dr. Jyh Eiin Wong<sup>1</sup>**, Dr. Airu Chia<sup>2</sup>, Miss Kar Mun Chong<sup>1</sup>, Dr. Denise Choon Lian Koh<sup>3</sup>, Dr. Nor Aini Jamil<sup>1</sup>, Dr. Mary Foong-Fong Chong<sup>2</sup>, Prof. Bee Koon Poh<sup>1</sup>

<sup>1</sup>Universiti Kebangsaan Malaysia, Kuala Lumpur, Malaysia, <sup>2</sup>National University of Singapore, Singapore, <sup>3</sup>Universiti Kebangsaan Malaysia, Bangi, Malaysia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** A healthy balance of movement behaviours, namely physical activity, sedentary behaviour and sleep across a 24-hour day has been associated with positive growth and health in children. However, less is known about the adherence to 24-hour movement guidelines among school children in a multiethnic Asian context. To address this knowledge gap, this study aims to examine the prevalence of meeting 24-hour movement guidelines among schoolchildren in Malaysia.

**Methods:** My E-Diary for Activities and Lifestyle (MEDAL) is a web-based time-use diary developed to assess diet and movement behaviour of Asian schoolchildren. A total of 297 Malaysian children (51% girls) aged  $10.7 \pm 0.6$  years from seven primary schools in Kuala Lumpur self-reported their daily activities on MEDAL for four days, including a weekend day. Based on self-reported moderate-to-vigorous physical activity (MVPA), screen viewing and sleep, adherence to movement guidelines were calculated. Adherence to movement guidelines was defined as  $\geq 60$ min MVPA/day,  $\leq 2$ h screen-viewing/day, and 9–11h of sleep/night.

**Results:** On average, children spent  $42 \pm 54$ min on MVPA,  $3.4 \pm 2.0$ h on screen activities and  $10.1 \pm 1.9$ h sleeping daily. Approximately 25%, 27%, and 45% of children met MVPA, screen and sleep recommendations respectively. Only 3% of children met all recommendations, while 32% did not meet any recommendation. The prevalence of meeting at least one of the recommendations was highest among Indian children, but did not differ by sex.

**Conclusions:** While two-in-three children met at least one of the movement guidelines, adherence to all three guidelines was very low in this sample of urban schoolchildren. Greater emphasis should be given to increase overall physical activity and reduce sedentary behaviours, especially screen time, among schoolchildren in Malaysia.

# Home-based cooking intervention delivered with a smartphone app to improve eating behaviors in Swiss children aged 7-9 years: a feasibility study

**Dr. Joyce Haddad<sup>1</sup>**, Dr. Maria Vasiloglou<sup>2</sup>, Mrs. Franziska Scheidegger-Balmer<sup>1</sup>, Dr. Ulrich Fiedler<sup>1</sup>, Prof. Klazine Van der Horst<sup>1</sup>

<sup>1</sup>Bern University of Applied Sciences, Bern, Switzerland, <sup>2</sup>University of Bern, Bern, Switzerland

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Digital interventions in real-life home settings that support health behavior are needed, especially in Switzerland. This study aimed to develop and evaluate the feasibility of using a mobile application in Swiss households, and compare dietary behavior and food acceptability between children who cooked with limited parental support with children who were not involved in cooking.

**Methods:** A 10-week randomized controlled trial was conducted between August and December 2020. Parents in both groups were given access to a mobile-app which delivered easy-to-follow recipes weekly. Each recipe emphasized one of two generally disliked foods (Brussels sprouts or whole-meal pasta). Children in the intervention group were involved in the meal preparation of the recipes with limited parental support, while the control group were only served parent-prepared meals. Parents were asked to photograph and weigh the food components from the child's plate before and after consumption. After each meal, parents were asked to report whether their child liked the meal and the target food, and how the appetite of the child was that day.

**Results:** Of 24 parents who completed the baseline questionnaires and fulfilled the inclusion criteria, 18 parents and their children completed the evaluation phase. The median (range) age of the children was 8 (7 to 9) years. For the total child sample, mean baseline Brussel sprouts and whole-meal pasta intakes were 19 grams (SD=24.2) and 86 grams (SD=69.7) per meal, respectively. No meaningful differences in Brussels sprouts and whole-meal pasta intake were found post-intervention or between intervention groups. More children reported a neutral or positive liking towards the target foods in the intervention group compared to those in the control group.

**Conclusion:** This was the first evidence-based mobile application developed to reach and support Swiss families during the height of the COVID-19 pandemic. This study demonstrated that integrating digital interventions in the home environment and promoting meal preparation has the potential to improve child reported acceptance of healthy foods. Using such technology is important, as it can play a key role in improving children's dietary behavior, saving time for parents, and engaging families in cooking and consuming healthier meals.

# How social norms of Spanish parents are associated with their children's active commuting to school

Miss Hanna Forsberg<sup>1</sup>, **Mrs. Ximena Palma-Leal**<sup>2,3</sup>, Miss Ana Ruiz-Alarcón<sup>4</sup>, Dr. Susana Aznar<sup>5</sup>, Ms. Pablo Campos-Garzón<sup>2</sup>, Dr. Stina Ruberg<sup>1</sup>, Dr. Anna-Karin Lindqvist<sup>1</sup>, Dr. Palma Chillón<sup>2</sup>, Dr. Francisco Javier Huertas Delgado<sup>4</sup>

<sup>1</sup>Health, Education and Technology, Luleå University of Technology, Luleå, Sweden, <sup>2</sup>PROFITH Research Group, Department of Physical Education and Sports, Faculty of Sport Sciences, Sport and Health University Research Institute (iMUDS), University of Granada, Granada, Spain, <sup>3</sup>IRyS Group, School of Physical Education, Pontificia Universidad Católica de Valparaíso, Viña del Mar, Chile, <sup>4</sup>PA-Help "Physical Activity for Health Promotion" Research Group, 'La Inmaculada' Teacher Training Centre, University of Granada, Granada, Spain, <sup>5</sup>PAFS Research Group, Department of Physical Activity and Sport Sciences, Faculty of Sports Sciences, University of Castilla-La Mancha, Toledo, Spain

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Social norms (subjective and descriptive) refer to the perception of what other significant people think about me performing a behaviour, as well what other significant people are doing (respectively). These social norms have been reported as important determinants for parents' intentions to let their child use active commuting to and from school, because parents ultimately decide how their children commute to and from school. The aims of this study were to describe the social norms of Spanish parents and their children's mode of commuting to and from school, and to analyse the associations between the social norms of Spanish parents and their children's active commuting to and from school.

**Methods:** A total of 410 parents (74.6% mothers) and their children (49.8% girls) from Spain were included in this cross-sectional study. Social norms of parents, and children's mode of commuting to and from school were self-reported by parents. Two binary logistic regression models were used to analyse the associations between social norms of parents (independent) and the mode of commuting to and from school (dependent), separately in each model. The models were adjusted for child's age and distance to school.

**Results:** The average for social norms of parents was  $1.80 \pm 0.81$  (ref. scale from 1 [low social norms] to 4 [high social norms]), and most of their children used active commuting (i.e., walking and cycling) to school (60.0%), and from (61.7%) school. When parents reported higher social norms, their children tended to actively commute to school (Odd Ratio [OR]: 1.92; CI95%: 1.30-2.83;  $p < 0.001$ ), and from school (OR: 2.40; CI95%: 1.56-3.69;  $p < 0.001$ ), compared to parents who reported lower social norms.

**Conclusions:** This study has identified that social norms of Spanish parents are a key factor to increase their children's active commuting to and from school. Therefore, if parents perceived greater visibility in the neighbourhood of significant people walking or cycling, their children will be more likely active in their trip to and from school, and they will obtain multiple health benefits.

# A qualitative study exploring elementary school teachers' experiences teaching nutrition in Canada

**Dr. Beatriz Franco-Arellano<sup>1</sup>**, Dr. Ellen Vogel<sup>1</sup>, Dr. Matthew Stein<sup>2</sup>, Miss Vanessa Laketa<sup>1</sup>, Miss Jacqueline Brown<sup>1</sup>, Dr. JoAnne Arcand<sup>1</sup>

<sup>1</sup>Faculty of Health Sciences, Ontario Tech University, Oshawa, Canada, <sup>2</sup>Faculty of Social Science and Humanities, Ontario Tech University, Oshawa, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** A higher level of food literacy among children is associated with higher diet quality. Nutrition education in schools is a key strategy to establish food literacy and promote healthy eating habits. Nutrition is a component of Canadian elementary school curricula; however, limited research assessing the factors that impact the implementation of nutrition education in schools exists. This study explored elementary school teachers' views, attitudes, practices, barriers and drivers related to teaching nutrition.

**Methods:** A qualitative descriptive study involving online focus groups (n=2, 6 participants, each session averaged 90-minutes) and individual interviews (n=2, 2 participants, each interview averaged 30-minutes) was conducted among Canadian elementary teachers (Grades KG-8). Recruitment occurred via social media. The Consolidated Framework for Implementation Research informed the semi-structured interview guide that contained probes, which was pilot tested before use. Interviews were audio-recorded and verbatim transcripts prepared. An anonymized summary of each focus group or individual interview was sent to participants for member checking. Two researchers independently and inductively coded the transcripts using content analysis.

**Results:** Participants (n=8) considered nutrition to be an important curriculum subject for children; albeit they had mixed feelings about how nutrition has impacted their own personal lives. There were several barriers when teach nutrition including insufficient availability of nutrition-specific resources, training, support from the school boards and time to prepare lesson plans. The cost of procuring classroom materials was considered a barrier. Participants strongly agreed that nutrition is not prioritized in the provincial school curriculum, nor is its instruction standardized. When teaching nutrition to higher-level grade students (i.e., 7<sup>th</sup> - 8<sup>th</sup> grades), participants cautiously provided content to avoid triggering mental or eating disorders among students. Importantly, integrated, hands-on, interactive activities, like cooking activities and field trips were recognized by participants as among the best strategies to teach nutrition to children, regardless of the grade.

**Conclusion:** This study revealed several barriers that impact the implementation of nutrition curricula in schools, including lack of time, training, and resources; as well as costs. This research highlights the complexity and pressure of teaching nutrition in Canadian elementary schools and the need to better support teachers.

# Adherence to the WHO Global guidelines for physical activity, sedentary behaviour, and sleep for Japanese children under 5 years of age: Interim analysis of the SUNRISE International study of movement behaviours in the early years

**Prof. Chiaki Tanaka**<sup>1</sup>, Prof. Masayuki Okuda<sup>2</sup>, Prof. Shigeho Tanaka<sup>3</sup>, Prof. Minoru Takakura<sup>4</sup>, Dr. Shinpei Okada<sup>5</sup>, Dr. Masashi Watanabe<sup>6</sup>, Dr. Kensaku Sasayama<sup>7</sup>, Prof. Kyota Takami<sup>8</sup>, Mr. Takuya Watanabe<sup>9</sup>, Dr. Kar Hau Chong<sup>10</sup>, Dr. Penny L Cross<sup>10</sup>, Dr. Rebecca Calleia<sup>10</sup>, Prof. John J Reilly<sup>11</sup>, Prof. Mark S Tremblay<sup>12</sup>, Prof. Anthony Okely<sup>10</sup>

<sup>1</sup>Tokyo Kasei Gakuin University, Tokyo, Japan, <sup>2</sup>Yamaguchi University, Yamaguchi, Japan, <sup>3</sup>Kagawa Nutrition University, Saitama, Japan, <sup>4</sup>University of the Ryukyus, Okinawa, Japan, <sup>5</sup>Physical Education and Medicine Research Foundation, Nagano, Japan, <sup>6</sup>Ibaraki University, Ibaraki, Japan, <sup>7</sup>Mie University, Mie, Japan, <sup>8</sup>Hosei University, Tokyo, Japan, <sup>9</sup>Junior College Division, University of Aizu, Fukushima, Japan, <sup>10</sup>University of Wollongong, Wollongong, Australia, <sup>11</sup>University of Strathclyde, Glasgow, United Kingdom, <sup>12</sup>Children's Hospital of Eastern Ontario Research Institute, Ottawa, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** SUNRISE is an international study of movement behaviours in the early years. In Japan, the main study started in October, 2021 and will continue until 2024. We examined adherence to the World Health Organization's (WHO) Global guidelines for physical activity, sedentary behaviour and sleep for children under 5 years of age in Japan as an interim analysis.

**Methods:** Data on 3 to 4-year-old children from urban and rural areas in Japan obtained by the beginning of November, 2022 were used for analysis. Physical activity was measured using a triaxial accelerometer (ActiGraph GT3X). Screen time and sleep duration were assessed via parent questionnaire. Meeting the WHO guidelines was defined as participating in, over a 24-hour period:  $\geq 180$  mins of total physical activity, of which at least 60 minutes was of moderate-to vigorous-intensity physical activity,  $\leq 1$  hr of sedentary screen time, restrained for  $\leq 1$  hr at a time, and 10-13 hrs of sleep (including naps).

**Results:** Participants included 185 children ( $4.2 \pm 0.5$  years old, girls  $n=91$ , boys  $n=94$ ; urban  $n=57$ , rural  $n=128$ ). The proportions of children meeting physical activity, sedentary behaviour, sleep and all guidelines were 68.6%, 29.1%, 87.6% and 16.2%, respectively. There were no significant differences in the proportions between urban and rural children. A higher proportion of boys than girls met the physical activity guideline (78.7% vs, 58.2%), with average total physical activity and moderate-to vigorous-intensity physical activity in girls ( $195.2 \pm 40.6$  min/day and  $80.6 \pm 26.5$  min/day) shorter than in boys ( $217.5 \pm 36.6$  min/day and  $104.3 \pm 28.1$  min/day), even after adjustment for age and sector (urban or rural). There were no significant differences in sedentary behaviour or sleep between girls and boys.

**Conclusions:** Japanese 3 to 4-year-old girls were less active than boys. Continuing the survey and increasing the number of participants will provide more information to confirm or refute these initial findings.

# Results from the 2022 India Report Card: Physical activity patterns among children and youth in India

**Dr. Jasmin Bhawra**<sup>1</sup>, Dr. Tarun R Katapally<sup>2</sup>, Dr. Anuradha Khadilkar<sup>3</sup>, Dr. Krishnaveni Ghattu V<sup>4</sup>, Dr. Kumaran Kalyanaraman<sup>5</sup>

<sup>1</sup>Toronto Metropolitan University, Toronto, Canada, <sup>2</sup>Western University, London, Canada, <sup>3</sup>Hirabai Cowasji Jehangir Medical Research Institute, Pune, India, <sup>4</sup>Epidemiology Research Unit, CSI Holdsworth Memorial Hospital, Mysuru, India, <sup>5</sup>University of Southampton, Southampton, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Research has shown a physical inactivity epidemic in India, which has critical implications for both long-term health outcomes and the global economy. To date, physical activity among Indian children and youth has not been well-studied. The 2022 India Report Card (IRC) aimed to assess 11 indicators of active living to address existing data gaps and inform active living programs and policies.

**Methods:** As part of the Active Healthy Kids Global Alliance (AHKGA), 57 countries (including India) participating in the Global Matrix 4.0 Report Card initiative assessed 10 indicators of active living among children and youth: *Overall Physical Activity, Organized Sport, Active Play, Active Transportation, Sedentary Behavior, Family and Peers, School, Community and Built Environment, Government Strategies, and Physical Fitness*. Yoga was added to the IRC given its cultural significance. A systematic search of peer-reviewed and grey literature published since the 2018 IRC was conducted. Studies were appraised based on representativeness, sample size, and data quality. Each indicator was assessed with an evidence-based and globally standardized rubric developed by AHKGA to assign grades (A+ to F).

**Results:** Although a major proportion of Indian children and youth appear to participate in *Active Transportation* (B-), they are not meeting recommended *Physical Activity* (C) and *Sedentary Behaviour* guidelines (D-), and not practicing *Yoga* (D-) regularly. Based on the grades assigned to *Community and Built Environment* (D), and *Government* strategies (C+), some of the active living challenges faced by Indian children and youth could be attributed to the dearth of progressive urban planning policies. *Organized Sport, Active Play, Family and Peers, and Physical Fitness* were all graded incomplete due to lack of data.

**Conclusions:** The 2022 IRC reiterated the need for nationally representative active living research and renewed government investments to facilitate active living among children and youth. Although most children and youth are not accumulating recommended levels of physical activity, there are encouraging signs of active transportation—a phenomenon that needs to be explored further. Evidence generated by the 2022 IRC suggests opportunities for improvement not only in India, but also the 56 other countries taking part in Global Matrix 4.0.

# Factors that influenced behaviour change amongst adults who participated in a physical activity coaching intervention: a qualitative investigation using the theoretical domains framework and COM-B

**Dr. Stephen Barrett**<sup>1,2</sup>, Associate Professor Stephen Begg<sup>2</sup>, Associate Professor Paul O'Halloran<sup>3</sup>, Mr. Kane Rodda<sup>1</sup>, Mrs. Gabrielle Barrett<sup>1</sup>, Prof. Jeff Breckon<sup>4</sup>, Prof. Michael Kingsley<sup>2,5</sup>

<sup>1</sup>Bendigo Health, Bendigo, Australia, <sup>2</sup>La Trobe University, Bendigo, Bendigo, Australia, <sup>3</sup>La Trobe University, Melbourne, Melbourne, Australia, <sup>4</sup>Teesside University, Middlesbrough, United Kingdom, <sup>5</sup>University of Auckland, Auckland, New Zealand

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Behaviour change interventions have shown promise for improving physical activity (PA) but the underlying mechanisms by which the interventions promote behaviour change are rarely identified. Behavioural science tools such as the COM-B (capability, opportunity, motivation – behaviour) and the Theoretical Domains Framework (TDF) can help in understanding behaviour change and inform intervention development. The aim of this study was to identify the enablers and barriers to PA among insufficiently physically active adults that completed a PA telephone coaching intervention.

**Methods:** We conducted semi-structured interviews with a purposive sample of participants who completed a telephone coaching intervention designed to increase PA. Thematic analysis were conducted using an interpretive description approach. Emerging themes were mapped against the COM-B and TDF. Participants' responses were analysed for descriptions of behaviour change techniques and microskills used during the telephone coaching intervention.

**Results:** We interviewed 18 participants (72% women) with a mean age of  $54 \pm 5$  years. Four theme were identified that mapped directly onto five components of COM-B, and 10 domains of the TDF. Participants highlighted that the strength-based and autonomy-supportive intervention helped to evoke their own reasons for change, which influenced PA behaviour change. Participants noted how they were encouraged to reflect on their individual social and/or professional strengths, and how these skills were transferred to set appropriate PA goals and self-regulate PA behaviour. A number of relational components (e.g., collaboration, supporting self-efficacy) were deemed influential for promoting change, and should be considered when designing future behaviour change interventions.

**Conclusions:** This study provides a first-hand understanding of how participants viewed a PA telephone coaching intervention and identified some of the factors that influenced PA change. The findings support the beneficial effect of using theory-informed behaviour change techniques, and delivering them in a relational style that promotes autonomy and collaboration. The lived experiences of participants should play a key role in the design and implementation of behaviour change interventions that aim to increase PA in insufficiently active adults.

# Lessons learned from implementing an integral system approach for evidence-based interventions in six regions in The Netherlands

**Dr. Joske Nauta**, Ms. Gioia Muru, Dr. Femke van Nassau  
<sup>1</sup>AmsterdamUMC, Amsterdam, Netherlands

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** In 2021, six regions in the Netherlands received a grant to stimulate an integral system approach for implementing evidence-based interventions in their local community. In this study, we evaluate the implementation process. The lessons learned were evaluated on three levels - practice, policy and governance - in order to develop a practical tool to support other regions in implementing an integral system approach.

**Methods:** We conducted desk research on the knowledge that was developed within the six regions to inform the development of the interview guide. We interviewed at least three project members per consortium to get insight into the success factors and barriers for implementation. We interviewed representatives of the practice, policy and governance level. The analysis were based on a codebook using a thematic approach. Following the interviews, co-creation sessions were organized with representatives of the six regions. The first aim of these sessions was to assess the representativeness of the overarching findings. Next, a practical tool to support future integral system approaches for implementing evidence-based interventions was co-designed with the representatives of the six consortia.

**Results:** We will present the lessons learned within the six local consortia: a broad variety of evidence-based interventions was implemented through the integral system approaches. Using a systematic approach to develop the implementation plan was deemed helpful. It was deemed important to have representatives of practice, policy and governance involved as stakeholders throughout implementation. Furthermore, tailoring of evidence based interventions to the local context was essential for optimal uptake. Lastly, while considerable effort was put into establishing the local consortia, many of the consortia were under pressure because of the discontinuation of funding beyond the project. Furthermore, we will present the practical tool to support future integral system approaches for the three levels of interest: practice, policy and governance.

**Conclusions:** Conducting overarching evaluation studies on factors that impact the implementation of evidence-based interventions are important to generate generalizable knowledge regarding the implementation processes. This knowledge then needs to be translated into practical tools to support stakeholders from practice, policy and governance in future efforts to implement interventions into their local systems.

# The development of a mobile app to support dietary education and adherence among heart failure patients

**Ms. Bridve Sivakumar**<sup>1</sup>, Ms. Maria Ricupero<sup>2</sup>, Ms. Anisha Mahajan<sup>3</sup>, Mr. John Wenger, Ms. Katherine Jefferson<sup>1</sup>, Dr. Jillianne Code<sup>4</sup>, Dr. JoAnne Arcand<sup>1</sup>

<sup>1</sup>Ontario Tech University, Oshawa, Canada, <sup>2</sup>University of Toronto, Toronto, Canada, <sup>3</sup>University of Guelph, Guelph, Canada, <sup>4</sup>The University of British Columbia, Vancouver, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Adherence to dietary sodium and fluid restriction are key to improving heart failure (HF) outcomes. Mobile apps may be a promising and novel way to support patients with adherence through education and monitoring. Despite the growing number of apps to support HF management, most focus solely on symptom monitoring. Few have dedicated features to support dietary education and adherence. To describe the development of a mobile app designed to support dietary education and adherence among HF patients.

**Methods:** Guided by the Obesity-Related Behavioural Intervention Trials model, our interdisciplinary team (4 Registered Dietitians, 1 patient representative, 1 PhD student, and 1 industry partner) iteratively developed a mobile app for HF patients to provide education about dietary sodium and fluid restriction. The Discovery phase of the app development included qualitative interviews with patients and healthcare providers (i.e., HF cardiologist and nurses) to identify needs, motivations, and challenges of app use for HF management; as well as background research in mHealth app development, behaviour change, and nutrition pedagogy. Insights from the discovery phase informed the systematic development of app content and design, grounded in the Theoretical Domains Framework, and aligned with established HF guidelines. Behaviour change techniques (BCTs) and gamification elements from mHealth and nutrition literature, and those mentioned within the qualitative interviews were identified and selected for app development.

**Results:** Five learning modules were developed that provide information on dietary sodium recommendations in HF, contributors of sodium in the diet, nutrition labelling, lowering dietary sodium, and fluid restriction. Seven BCTs were integrated into the app, including shaping knowledge, information about health consequences, information on antecedents, feedback on behaviour, behavioural practice/rehearsal, goal setting, and action planning. Gamified components of the app included the use of an avatar and point-system to engage patients in their learning. The next step of the app development process involves user-testing sessions among HF patients to optimize app content and features.

**Conclusions:** Results from this study can produce a feasible intervention that may support dietary education and adherence in the HF population to improve self-care, quality of life, and HF outcomes.

# Effectiveness of digital interventions to reduce sedentary behaviours in (home-) office employees: a systematic review.

**Miss Iris Parés Salomón**, Mr. Fernando Martín Bozas, Mrs. Anna M. Puig Ribera, Mrs. Anna M. Señé Mir, Mrs. Cristina Vaqué Crusellas, Mr. Alan Coffey, Dr. Kieran P. Dowd, Mrs. Karin Proper, Mrs. Judit Bort Roig  
<sup>1</sup>Universitat de Vic, Vic, Spain

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** The pandemic instigated a hybrid paradigm among office-based jobs, resulting in increases of employees sitting time, especially when working from home. Although sedentariness at work is closely related to the evolution of technology, the potential of digital solutions has been highlighted as an opportunity in the previous literature (up to 2017). The purpose of this systematic review was to assess the effectiveness of digital interventions to reduce sitting behaviours in (home-) office employees.

**Methods:** A systematic literature search was conducted in five databases (PubMed, Web of Science, Scopus, CINAHL and PsycINFO) between September 2017 and September 2022 using a combination of keywords related to office work, sedentary behaviour, and technology. Randomised controlled trials of digital interventions conducted in computer or screen-based jobs were included. Data regarding the study and intervention characteristics, outcomes and main findings were extracted, and a qualitative synthesis was performed.

**Results:** A total of 21 articles met the inclusion criteria. Most of the studies focused on office-workers (60.4% female; 41.2 years old). The duration of the intervention ranged from 2 weeks to 12 months. Using digital media for delivering information (e.g., digital text or videos to present educational materials or tips) and mediated organisational support and social influences through digital communication features (e.g., emails conveying managers' approval and competition or challenges) were the most represented intervention techniques (n=20). While 11 studies used passive data collection through a mobile phone based application or external activity tracker (e.g., W@W-App, FitBIT, Garmin watch, Darma cushion), only two studies self-reported sedentary behaviours with a digital log (i.e., online diary). Overall, seven studies reported significant differences between groups, with the intervention group showing significant decreases in occupational sitting time (from -0.17 to -1.35 hours/workday). Two studies reported significant differences between groups in total daily sitting time (-0.98 and -4.66 hours/day).

**Conclusions:** Findings reported large variability of digital and behavioural change features that may enhance work and daily sitting time reductions. However, more research is needed to contribute to the understanding of digital solutions for reducing sitting behaviour among (home-) office workers in this new hybrid paradigm.

# Stakeholder's experiences of tailoring strategies to support implementation of the Dose Adjustment for Normal Eating (DAFNE) structured patient education programme for people with type 1 diabetes: a mixed methods study

**Dr. Fiona Riordan<sup>1</sup>**, Dr. Claire Kerins<sup>1</sup>, Prof. Luke Wolfenden<sup>2</sup>, Dr. Sheena McHugh<sup>1</sup>

<sup>1</sup>University College Cork, Cork, Ireland, <sup>2</sup>School of Medicine and Public Health, College of Health, Medicine, and Wellbeing, the University of Newcastle, Callaghan, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Tailored implementation strategies are effective in supporting implementation of healthcare interventions. However, which tailoring approaches are most feasible and acceptable to stakeholders as well as the outcomes important to them are not well understood. Dose Adjustment for Normal Eating (DAFNE) is an evidence-based patient education programme recommended as part of diabetes management, but little is known about current implementation and how best to support delivery. As part of a multiple case study, we are working with Irish DAFNE centres to tailor strategies, evaluate stakeholder's experiences of the tailoring process, and understand what guidance and evidence they use and value during the process.

**Methods:** DAFNE teams complete a site survey on implementation culture, climate, and readiness before participating in three group discussions to prioritise determinants and select and operationalise strategies, first, based on their own preferences, and subsequently guided to consider criteria and evidence. Using a mixed methods convergent design, their experiences of the tailoring process are evaluated using multiple data sources (research logs, non-participant observation, and post-tailoring surveys and interviews). A triangulation protocol will be used to integrate the findings. Data will be combined using joint displays for within and cross-case analysis.

**Results:** In total, 18 hospitals have been invited to participate in the tailoring process, 5 centres have completed the tailoring process and 3 are ongoing. Team prioritised current determinants important to address now, including lack of available resources (e.g., lack of admin. support), access to knowledge and information (e.g., familiarity with course content), and networking and communication (e.g., long-standing relationships). Preliminary results indicate the tailoring process is acceptable and feasible allowing educators 'to sit and discuss DAFNE specifically', albeit additional guidance and evidence appears not to be used when prioritising determinants.

**Conclusions:** This study will advance our current understanding of approaches to tailoring which are feasible and acceptable to clinical stakeholders, and (2) stakeholder decision-making; what guidance and evidence they use and value during the tailoring process. The findings will be valuable for implementation researcher community, yielding insight into best practices for developing tailored strategies to enhance implementation of evidence-based programmes, including those focused on behavioural nutrition.

# Learning outcomes from Implementation of an Online Training Resources and Program Package for a Family Healthy Weight Program in the US– Building Healthy Families

**Mrs. Ali Malmkar<sup>1</sup>**, Dr. Kate Heelan<sup>1</sup>, Prof. Jennie Hill<sup>2</sup>, Ms. Caitlin Golden<sup>3</sup>, Dr. R. Todd Bartee<sup>1</sup>, Dr. Bryce Abbey<sup>1</sup>, Dr. Gwenndolyn Porter<sup>3</sup>, Dr. Paul Estabrooks<sup>2</sup>

<sup>1</sup>University of Nebraska at Kearney, Kearney, USA, <sup>2</sup>University of Utah, Salt Lake City, USA, <sup>3</sup>University of Nebraska Medical Center, Omaha, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Packaging program materials and training resources as well as the use of community learning collaboratives (LC) have been proposed as methods to improve community implementation capacity to address obesity among rural children. To test the hypothesis that the use of a turn-key, train-the-trainer, implementation package with a community LC can improve program coordinator learning outcomes and family program attendance to a greater degree when compared to coordinators that receive the turn-key package alone.

**Methods:** Communities were assigned to either a LC (n=4) or Package Only (PO, n=3) study condition. LC communities received the Building Healthy Families (BHF) Online Training Resources and Program Package (BHF Resources) and attended bimonthly sessions to discuss and collaboratively resolve implementation barriers while PO communities only received access to the BHF Resources. As part of BHF, coordinators complete overall and role specific (e.g., program logistics, nutrition, lifestyle, physical activity) training modules with video guidance and detailed lesson plans, PowerPoints, handouts, and objectives for each program component. Knowledge checks (KC) followed each training module that focused on core BHF principles and session specific content to improve implementation fidelity. Coordinators completed an overall KC, which required a score of 80% or higher to unlock weekly educational session guides which included optional KCs.

**Results:** Scores on the overall KCs ranged from 73% to 100% and did not differ based on condition. There was a significant difference in the percentage of KCs completed between LC (79.8%) and PO (56.3%) communities ( $p<0.05$ ). The LC communities scored significantly higher on the session specific KC's ( 95.2% v 89.3%,  $p<0.05$ ). Average attendance across program sessions was 58.8% and differed by LC (72.7%) and PO (40.1%,  $p<0.05$ ). Interestingly, a strong relationship ( $r=0.82$ ,  $p<0.05$ ) was found between KC percent completed and participant attendance.

**Conclusion:** These findings demonstrate the benefit of a LC in supporting the community implementers in the completion of, and performance on, KCs. These findings also support the hypothesis that attendance is related to implementation team preparation as measured by KC completion and performance.

# Clinical Trial of a mHealth intervention component to Increase Self-Monitoring of Physical Activity and Eating Behaviors Among Adolescents: A Feasibility Study

**Dr. Justin Moore<sup>1</sup>**, Mrs. Camelia Singletary<sup>1</sup>, Ms. Alexandra Peluso<sup>1</sup>, Dr. Joseph Skelton<sup>1</sup>, Dr. Brie Turner-McGrievy<sup>2</sup>, Dr. Rahma Ajja<sup>1</sup>, Dr. Edward Ip<sup>1</sup>, Dr. David Miller<sup>1</sup>

<sup>1</sup>Wake Forest University School of Medicine, Winston-Salem, USA, <sup>2</sup>University of South Carolina, Columbia, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** This study was designed to test the feasibility of utilizing a tailored suite of mobile health (mHealth) components to augment an existing evidence-based in-person pediatric weight management program.

**Methods:** The intervention consisted of six mHealth components designed to increase patient/caregiver exposure to traditionally delivered clinical content: (1) a mobile-enabled website, (2) dietary/physical activity tracking, (3) caregiver podcasts, (4) animated videos for adolescent patients, (5) interactive messaging, and (6) tailored clinical feedback informed by a web-based dashboard. Target enrollment was 80 youth with obesity (13-18 years) and caregiver dyads to be randomized to standard care (Brenner FIT) or standard care plus mHealth components (Brenner mFIT). Only enrolled participants who completed baseline measures were randomized, and follow-up measures were completed at 3- and 6-months. Feasibility was assessed in terms of screening, recruitment, randomization, retention, fidelity, and the assessment process. The number of patients screened per month, the number enrolled per month, the proportion of those enrolled who are eligible, and the number who remain enrolled in the study by condition were all tracked.

**Results:** Most measures of feasibility were low. Overall, 1162 dyads were pre-screened for eligibility based on age criteria. Of those, 435 were screened for full eligibility by study staff. Of 435, 173 dyads were eligible for enrollment based on inclusion criteria. Twenty-five dyads (50 participants) consented. Thirty-three participants completed baseline psychosocial questionnaires, 16 participants completed at least two 24-hour dietary recalls, and 20 (youth) participants returned accelerometers. Of the 15 consenting dyads, fifteen completed baseline measures, with seven randomized into the intervention group and eight were randomized into the control group. Ten dyads were retained at three months, with seven retained at six months. All seven of dyads randomized to the intervention logged into the website, all seven set at least one goal, six linked their activity tracker, and four youth downloaded at least one video and seven caregivers downloaded a podcast.

**Conclusions:** Overall, our results suggest that the assessment protocol was overly burdensome, the intervention had moderate acceptability, and the study as designed was not feasible to complete, at least in the context of a global pandemic.

# Identifying the Landscape of Research Related to Physical Activity and Quality of Life in Breast Cancer Survivors: Topic-Modeling Analysis

**Miss Suryeon Ryu<sup>1</sup>**, Dr. Zan Gao<sup>1</sup>

<sup>1</sup>University of Minnesota - Twin Cities, Minneapolis, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** While breast cancer is the most prevalent cancer type among females, the survival rate has increased tremendously in the past decades due to early detection and improved cancer treatments. However, living with and beyond cancer can be distressing. A large volume of physical activity (PA) interventions have been implemented to improve breast cancer survivors (BCS)' quality of life (QoL). Despite the importance of QoL, previous studies have not yet investigated the primary research topics and trends in this area of inquiry. Thus, this study aims at examining the major topics and recent 5-year trends in research related to BCS' PA and QoL.

**Methods:** A total of 743 research titles and abstracts were retrieved from the Web of Science database based on the following keywords: breast cancer survivor, quality of life, and physical activity/exercise. The search was restricted to English articles and Science Citation Index Expanded or Social Sciences Citation Index from 2001 to November 2022. The text-mining package (i.e., yTextminer) was used to analyze the top 10 topics and research trends. In detail, this study used topic-modeling techniques (i.e., Latent Dirichlet allocation and Dirichlet-multinomial regression).

**Results:** The results demonstrated that the key topics as follows: (1) prevalence, predictors, and association of comorbid conditions (e.g., fatigue, pain, and depression); (2) intervention effect on fatigue, muscle strength, and aerobic capacity (e.g., home-based); (3) facilitators and barriers (e.g., social cognitive theory); (4) intervention effect on psychological health (e.g., community-based); (5) weight intervention (e.g., risk factor); (6) diet intervention (e.g., health eating); (7) survivorship care (e.g., menopausal symptom and bone); (8) Tai-Chi intervention (e.g., mental health) ; (9) yoga intervention (e.g., fatigue, pain, depression, and sleep); and (10) rehabilitation intervention (e.g., shoulder and motion). In addition, topics 4,6,7,8, and 10 presented trends upward (hot topics), whereas topics 1,2,3, and 5 demonstrated downward trends (cold topics).

**Conclusions:** Findings from this study provide empirical evidence to support an understanding of current and future research trends in BCS' PA and QoL.

# Are fitness and body composition related to active commuting to school in preschool children: The PREFIT project

Dr. Emilio Villa-González<sup>1</sup>, **Dr. YAIRA BARRANCO-RUIZ<sup>1</sup>**, Dr. Joaquín Sánchis-Moysi<sup>2</sup>, Dr. Idoia Labayen<sup>3</sup>, Dr. Jorge Marín-Puyalto<sup>4</sup>, Dr. Miguel Ángel Rojo-Tirado<sup>5</sup>, Dr. Enrique G. **Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Previous studies have revealed a positive association between active commuting to school (ACS), physical fitness (PF), and body composition. The existing evidence has focused mainly on school children and adolescents; however, little is known about preschoolers. This study aimed to compare physical fitness (PF) and body composition in a large sample of Spanish preschool children (3- to 5-year-old) according to the habitual mode of commuting to and from school.

**Methods:** A total of 2,571 Spanish preschool children from 10 towns/cities of Spain participated in this study ( $4.53 \pm 0.84$  years; 47.3% girls). Participants' parents or guardians completed a questionnaire at home reporting their children's habitual mode of commuting to the school, afterward categorized into active or passive commuters. PF level was assessed with the validated PREFIT battery, including cardiorespiratory fitness (CRF) (20m shuttle-run test), upper-body muscular strength (handgrip strength test), lower-body muscular strength (standing long-jump test), speed-agility (4x10m shuttle-run test), and balance (one-stand leg test). Percentiles of the participant's PF were calculated according to these fitness categories: very low ( $X < P10$ ), low ( $P10 \leq X < P25$ ), medium ( $P25 \leq X < P75$ ), and high ( $P75 \leq X$ ). Body composition was also analyzed through the calculation of the Body Mass Index (BMI) (body weight (Kg)/ and height (m)<sup>2</sup>).

**Results:** Half of the participants (50.1%) were passive commuters (primarily boys, 52%). Most participants (74.4%) showed normal weight, and  $\approx 50\%$  presented a medium PF level in all fitness components. No differences were found between active and passive commuters regarding BMI. However, active commuters showed higher CRF levels ( $19.8 \pm 11.3$  vs.  $18.9 \pm 11.1$  shuttles;  $p=0.04$ ) compared to passive commuters. No differences were observed in other PF components.

**Conclusion:** Most of the Spanish preschoolers evaluated showed a normal weight and a medium PF level. Also, those who actively commuted to school presented better CRF levels than passive commuters. Further

studies are needed to investigate the relationship between active commuting to school behavior and health variables such as fitness and body composition in preschool children.

# Effects of a telematic postural education program (the PEPE study) on back care knowledge in schoolteachers.

**Dr. Josep Vidal-conti<sup>1</sup>**, Dr. Aina Maria Galmés-Panadés<sup>1</sup>

<sup>1</sup>Physical Activity and Sport Sciences Research Group (GICAFE). Institute for Educational Research and Innovation (IRIE). University of the Balearic Islands, Palma, Spain

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Low back pain (LBP) is a prevalent musculoskeletal disease that affects a large percentage of the working population, including teachers. The WHO has identified the school as an effective environment for improving child health. For this reason, the figure of the teacher is a fundamental piece in the process of knowledge acquisition about postural education and prevention of LBP among schoolchildren. The present study aims to determine the effect of a telematic postural education program on back care knowledge in primary school teachers.

**Methods:** The PEPE study (Proyecto de Educación Postural en la Escuela) was performed in Majorca (Spain), with 85 primary school teachers, of whom 17.6% were physical education teachers and 82.4% were classroom teachers. The sample was selected from different clusters (schools) using convenience sampling and randomly distributed into an experimental group (5 schools) or a control group (5 schools). Participants were evaluated two times, at baseline and after 16 weeks of intervention. The study was based on two different structured and self-administered questionnaires: Low Back Pain Knowledge Questionnaire (LKQ), to investigate into specific knowledge about LBP; and COSACUES-AEF Questionnaire, that aims to measure the knowledge that young people have about health and back care related to the practice of activity and physical exercise. The effects of intervention between groups on the outcome were analysed by using the SPSS General Linear Model (GLM) for the repeated measure procedure.

**Results:** The knowledge of participants at baseline was 17.3 in LKQ (range scale 0–24) and 4.3 in COSACUES (range scale 1–10). Type of teacher group (physical education teachers vs. classroom teachers) showed significant differences in COSACUES ( $p=0.011$ ) and no differences in LKQ ( $p=0.217$ ). The knowledge of participants improved after the intervention in both groups, but no significant differences were achieved.

**Conclusions:** Our results further strengthen the evidence of the need to enhance knowledge related to LBP and postural education in primary school teachers. Nevertheless, this telematic intervention has not managed to improve back care knowledge in schoolteachers.

# Reliability of the Breakfast Consumption Spanish Questionnaire for children and adolescents

Mr. Pablo Campos-Garzón<sup>1</sup>, Dr. Romina G. Saucedo-Araujo<sup>1</sup>, Dr. Manuel Herrador-Colmenero<sup>1,2</sup>, **Dr. Yaira Barranco-Ruiz<sup>1,3</sup>**

<sup>1</sup>PROFITH "PROmoting FITness and Health through physical activity" Research Group, Sport, and Health University Research Institute (iMUDS), Department of Physical Education and Sports, University of Granada, Granada, Spain, <sup>2</sup>La Inmaculada Teacher Training Centre, University of Granada, Granada, Spain, <sup>3</sup>Faculty of Education and Sport Sciences, University of Granada, University Campus of Melilla, Melilla, Spain

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Breakfast is commonly considered one of the most important meals of the day and an essential part of a healthy diet. In fact, children who have breakfast before going to school show better academic results, have more engagement, and improvements in memory and attention during lessons. Currently, there are several methodologies to analyze young people's breakfast habits. Short food questionnaires seem to be the most appropriate because they are quick and easy to administer or self-administer. Therefore, the aim of the study was to assess the reliability (i.e., constancy, coherence, and consistency) of the Breakfast Consumption Spanish Questionnaire (BCS-Q) in a sample of Spanish children and adolescents.

**Methods:** A total of 239 participants, 92 were children (10.7±0.7 years old; 48%girls) and 154 adolescents (14.1±1.7 years old; 48%girls) completed twice a questionnaire separated 14 days on the same days of the week and the same schedule between March-April 2018. The BCS-Q included 21-questions where they were asked about the habitual intake of typical foods for breakfast in Spain, which were categorized into (1) dairy group, (2) meat and protein group, (3) dried fruits group, (4) vegetable group, (5) fruit group, (6) cereal and sugar group, and (7) oil and fats group. The reliability of the BCS-Q was analyzed by the test-retest calculating the kappa coefficient ( $\kappa$ ) and the Spearman correlation coefficient (Rho) for the seven food categories. In addition, the analysis was performed separately for children and adolescents.

**Results:** Children showed a poor-to-moderate agreement in the dairy group ( $\kappa$ :0.16-0.52; Rho: 0.16-0.52) and an acceptable-to-good agreement in the rest of the food groups ( $\kappa$ :0.37-0.72; Rho: 0.36-0.72). On the other hand, adolescents showed a poor-to-good agreement in the meat and protein group ( $\kappa$ :0.05-0.61), a moderate-to-very good agreement in the dairy group ( $\kappa$ :0.44-0.83; 0.45-0.83), and an acceptable-to-good agreement in the rest of food groups ( $\kappa$ :0.29-0.69; Rho:0.29-0.69).

**Conclusion:** The Breakfast Consumption Spanish Questionnaire is a reliable tool for assessing breakfast habits in Spanish children and adolescents. Future studies focused on the analysis of breakfast habits of Spanish youth will be able to use this easy and self-administered tool to simplify the comparison between studies.

# Family Meals and Screentime are Associated with Self-Perceived Weight in US Middle School Students

**Dr. Lori Spruance<sup>1</sup>**, Ms. Kate Jenkins<sup>1</sup>

<sup>1</sup>Brigham Young University, Provo, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Research has demonstrated that individuals who perceive themselves as overweight have increased psychological stress and are less likely to engage in healthy promoting activities including eating a healthy diet and engaging in physical activity. Yet, there is a lack of understanding of what factors contribute to perception of weight. The purpose of this study was to explore factors related to self-perceived weight among a sample of diverse middle school students in the United States.

**Methods:** A national convenience sample of American adolescents ages 11 to 14 was recruited through Qualtrics to participate in an online survey. Models were built to explore the relationships between self-perceived weight and various other variables (family meals, screentime, peer influences on physical activity and nutrition). Data were analyzed separately for males and females.

**Results:** The largest race/ethnicity represented in this sample was White/European (33%) followed by Black/African American (22%). Just under half of all participants were eighth grader and there were slightly more males than females that participated in the survey (58%).

More than 70% of participants perceived themselves as being overweight or obese. Self-perceived overweight was associated with the importance of family meals among females. As the importance of meals within their families increased, the likelihood of self-perception of being overweight went down ( $p=0.0002$ ). Self-perceived overweight was associated with screen time for males. As screen time increased, self-perceived weight decreased ( $p<.0001$ ).

**Conclusions:** This study showed that family meals are protective of self-perceived weight status for females. This demonstrates the importance of continuing to encourage family meals to reduce psychological stress and enhance engagement with health promoting activities, like physical activity and healthy dietary intake. Interestingly, higher screen time was associated with decreased odds of perception of being overweight/obese, despite being well-documented in the literature that screentime increases overweight and obesity risk.

# The Relationship between eHealth literacy, physical activity and sedentary behaviors among Chinese college students: A cross-sectional study

**Ms. Shan Jiang<sup>1</sup>**, Prof. Amy S. Ha<sup>1</sup>

<sup>1</sup>The Chinese University of Hong Kong, Hong Kong, Hong Kong

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** eHealth literacy was used to evaluate skills in finding, accessing, and using health information online to enhance one's level of knowledge, competence, and behavior in relation to a healthy lifestyle. Previous studies have shown that promoting eHealth literacy can facilitate healthy behaviors, such as nutrition and sleep. However, there's an unclear correlation between college students' eHealth literacy and physical activity (PA) or sedentary behavior (SB), and few research has investigated the moderating effect of individual factors. This study was to examine the relationship between eHealth literacy, PA, and SB among college students with majors in health (Chinese medicine, sports science) and non-health (science, social science).

**Methods:** A snowball sampling method was adopted to recruit 1210 students to complete questionnaire surveys online. Individual factors (e.g., gender, university major, age, education level, birthplace), International Physical Activity Questionnaire - Short Form, and Chinese version of the eHealth Literacy Scale were assessed. A path analysis was conducted using Mplus 8.3 to determine correlations between eHealth literacy, PA, and SB with a potential influence of individual factors.

**Results:** 1124 participants, aged 18 to 28 (male: 56.58%), responded to survey with a response rate of 93%. The mean eHealth literacy score was 32.63 (SD 6.40), and scores differed significantly with major. 22% of young adults were physically inactive without adherence to WHO guidelines, and male college students had higher PA and lower SB than females ( $p < .001$ ).

A path analysis showed that the total effects of eHealth literacy on walking were 0.1, 0.15 on moderate to vigorous physical activity (MVPA), and -0.08 on SB. There was a correlation between PA and SB ( $\beta = -0.18$ ,  $p < .001$ ). Higher eHealth literacy predicted students' MVPA for social science ( $\beta = 0.28$ ,  $p < .01$ ) and science students ( $\beta = 0.15$ ,  $p < .01$ ) significantly. But there's no significance of the relationship of eHealth literacy, MVPA, and SB in health-related majors.

**Conclusions:** College students with higher eHealth literacy were more active and less sedentary. Majors and gender were associated with eHealth literacy and PA. Hence, more health education programs at universities are needed for non-health majors and female students.

# Acceptability and engagement with a Child and Family Health text message service: The Healthy Beginnings for HNE Kids program

**Ms. Tessa Delaney<sup>1,2,3</sup>**, Ms. Nayerra Hudson<sup>1</sup>, Ms. Jessica Pinfold<sup>1</sup>, Ms. Margaret Hayes<sup>1</sup>, Dr. Paul Craven<sup>1,2,3</sup>, Prof. John Wiggers<sup>1,2,3</sup>, Prof. Luke Wolfenden<sup>1,2,3</sup>, Ms. Sarah Young<sup>1,2,3</sup>, Ms. Sinead Redman<sup>1</sup>, Mr. Daniel Groombridge<sup>1</sup>, Ms. Karen Gillham<sup>1</sup>, Dr. Rachel Sutherland<sup>1,2,3</sup>

<sup>1</sup>Hunter New England Local Health District, Wallsend, Australia, <sup>2</sup>School of Medicine and Public Health, The University of Newcastle, Wallsend, Australia, <sup>3</sup>Hunter Medical Research Institute, New Lambton Heights, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Interventions delivered direct to parent mobile phones (mHealth) present a significant opportunity to supplement usual face-to-face health care offered by Child and Family Health (CFH) services. Despite this, little is known about end user acceptability and engagement with CFH mHealth models of care. To assess maternal acceptability and engagement with 'Healthy Beginnings for HNE Kids', a text message program designed to support families with age and stage development and best practice infant feeding behaviours from birth to five years.

**Methods:** Computer assisted telephone interviews were undertaken with mothers of infants aged 6-8 months in the Hunter New England region of NSW Australian from May to December 2022 (data collection ongoing). Guided by the 'theoretical acceptability framework' women were asked to report their 'affective attitude' (program likeability, approval and interest), 'intervention coherence' (if text messages were easy to understand) and 'self-efficacy' (confidence to breastfeed) on a 5-point likert scale ('strongly agree' to 'strongly disagree'). Acceptability of timing and dose of text messages and program engagement (frequency of reading messages and clicking links) were also assessed.

**Results:** At present, 90 women have completed the survey (data collection ongoing). The program found high levels of 'affective attitude' with 93% of women 'liking' the program, 96% indicating it 'met their approval' and 88% finding the text messages 'interesting' (agreed/strongly agreed). All participants found the text messages easy to understand and 63% believed it increased their confidence to breastfeed (agreed/strongly agreed). Almost all women found the number and frequency of text messages (95%) and the time-of-day messages were received acceptable (96%). Most women reported to reading the text messages 'always' or 'very often' (76%), however only 44% clicked on the website links 'always' or 'very often'.

**Conclusions:** The findings suggest there is high program acceptability (affective attitude, intervention coherence, self-efficacy and timing and dose of messages) and end user engagement with a Child and Family Health text message model of care. Such models of care may be appealing to policy makers interested in increasing reach and optimizing care provided by CFH services.

# Association between the use of weight management strategies and weight change among Australian adults over 12 months

**Dr. Ben Singh**<sup>1</sup>, Prof. Timothy Olds<sup>1</sup>, Mr. Ty Ferguson<sup>1</sup>, Prof. Wendy Brown<sup>2</sup>, Dr. Lisa Matricciani<sup>1</sup>, Prof. Adrian Esterman<sup>1</sup>, Prof. Carol Maher<sup>1</sup>

<sup>1</sup>Alliance for Research in Exercise Nutrition and Activity (ARENA), University of South Australia, Adelaide, Australia, <sup>2</sup>University of Queensland, Brisbane, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** To: i) describe the weight management strategies used by a sample of Australian adults; ii) examine whether use of weight management strategies was associated with weight change over 12 months; and iii) examine the psycho-sociodemographic characteristics of those who used each strategy.

**Methods:** Data were from a 12-month cohort study, involving a community-based sample of Australian adults (n=368, mean age=40.1, SD=5.8). Demographic characteristics were self-reported at baseline. Participants were encouraged to weigh themselves, preferably daily but at least weekly using Fitbit Aria body weight scales (Aria 2 or Aria Air scales, Fitbit Inc., San Francisco, CA). Data were remotely gathered using custom-developed "FitnessLink" software. The use of weight management strategies were obtained using a self-report survey at eight timepoints during the 12-month period. The relationship between weight management strategies, change in weight over the 12-month period and psycho-sociodemographic characteristics was assessed using linear mixed effect models and univariate multinomial logistic regression.

**Results:** Most participants (81%) reported using at least one weight management strategy over the 12 months. The most common weight management strategies were being physically active or exercising (reported by 77%), restricting calories (63%), fasting (41%), counting calories (28%), using supplements (24%) and using diet pills (6%). Exercising or being physically active for weight control was the only strategy significantly associated with weight change (between group difference relative to those not reporting the strategy: -1.2 kg,  $p<0.01$ ). Participants who reported accepting their bodyweight were less likely to report the use of weight management strategies (OR=0.38,  $p<0.01$ ). Compared with females, males were less likely to count calories (OR=0.49,  $p<0.01$ ).

**Conclusions:** Overall, the use of weight management strategies was common in a sample of Australian adults. Public health weight management approaches should include strategies that are associated with effective weight management, and also address the perceptions that individuals have about their bodyweight.

# Parent views on food in schools: a review of the literature

**Miss Alexandra Manson<sup>1</sup>**, Prof. Rebecca Golley<sup>1</sup>, Dr. Brittany Johnson<sup>1</sup>

<sup>1</sup>Caring Futures Institute, College of Nursing and Health Sciences, Flinders University, Adelaide, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Currently little is known about what parents think about the different ways that food is provided in schools around the world. There are no systematic reviews synthesising parent/caregiver views on lunchbox and school provided meal service models. To ensure school food systems cater to the needs of families, these perspectives should be understood. This mixed papers systematic review aimed to identify parents/caregivers perspectives on system characteristics of importance within school food provision models internationally.

**Methods:** A systematic search was performed in May 2022 across three databases, screened by one reviewer. Qualitative, quantitative and mixed-methods studies were eligible if they reported parent perspectives on the food environment or provision during school hours. Results were collated according to the Bayesian methods to translate quantitative results to qualitative findings and summarised narratively.

**Results:** Eighteen studies, including eight qualitative, four quantitative and six mixed methods studies were included in the review. Studies were predominantly from Australia (n=5), US (n=3), UK (n=3) and Europe (n=2). Studies described perspectives on lunchbox provision and school meal models. Regardless of the school food provision model, key themes included financial cost, adequate nutrition, meeting child preferences and the influence of peers. These characteristics influenced the model adopted and the food provided by families. Challenges of policy and monitoring, school food environments and food preparation were additionally described by parents as challenges in lunchbox food provision. Further, parents positioned themselves as responsible for ensuring their child is fed well and considered lunchboxes an enabler for monitoring intake. Compromise was also a consistent theme discussed throughout the studies, with parents making compromises between certain aspects according to their family priorities.

**Conclusions:** While parents have different priorities, cost, nutrition, and enjoyment of food by children are common parent priorities for school food internationally. Challenges were identified throughout the lunchbox literature, demonstrating the difficulties which can be experienced in this model. School food systems should strive to prioritise low cost, quality food options in a positive food environment to facilitate acceptable food provision, while striving to alleviate provision barriers experienced by parents through providing nutritious, affordable meals in all schools.

# What is the cost of implementing Smartphone Cardiac Rehabilitation, Assisted self-Management (SCRAM) through centralised and satellite models in routine practice?

**Mr. Narayan Subedi**<sup>1</sup>, Dr. Lan Gao<sup>1</sup>, Dr. Jonathan Rawstorn<sup>1</sup>, Dr. Harriet Koorts<sup>1</sup>, Prof. Ralph Maddison<sup>1</sup>

<sup>1</sup>Deakin University, Burwood, Melbourne, Australia

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To identify and compare the costs of implementing SCRAM via two delivery models (*centralised* and *satellite*) in routine healthcare services.

**Methods:** This study was conducted as part of the SCRAM randomised controlled trial to evaluate the effects of a smartphone-delivered cardiac rehabilitation program across three sites (Sunshine hospital, University Hospital Geelong, and Bendigo Hospital) in Victoria, Australia, in 2019. We proposed two delivery models: *centralised* involving delivery from a single location, and *satellite*, involving – delivery from 17 local healthcare sites. The cost items (human resource – salary of exercise physiologist, registered nurse, administrative officer, logistics – polar heart rate sensor, laptop, and smartphone, and utilities – office rent, server hosting and stationery) were obtained from SCRAM trial records, and review of published data followed by expert consultation. We used publicly available sources for cost estimation, such as PayScale for salary. Eligible consumers were estimated using cardiovascular disease prevalence data and existing referral and utilisation rates to centre-based programs. Sensitivity analysis assessed the impact of cost variation of the input variable on the output, while budget impact analysis assessed affordability.

**Results:** The average annual cost of delivering SCRAM for 2,350 consumers via the *centralised* and *satellite* models was AUD 1,006,353 and AUD 1,267,449, respectively. The *satellite* model was more expensive than the *centralised* model by AUD 261,096. The cost per consumer was AUD 428 for the *centralised* model and AUD 537 for the *satellite* model. Salary for an exercise physiologist and office rent were the two major cost items contributing nearly 75% of the annual cost.

**Conclusions:** This study showed that a *satellite* delivery model was more expensive than a *centralised* delivery for a smartphone-based cardiac rehabilitation program. Both programs offer utility for service delivery, but this information will inform policymakers and CR providers for planning and budgeting resources required for implementing cardiac telerehabilitation in Victoria, Australia and similar settings offering flexibility.

# Screening tools for children's health behaviours in primary healthcare settings: A systematic review

Miss Dimity Dutch<sup>1</sup>, Dr. Lucinda Bell<sup>1</sup>, Dr. Dorota Zarnowiecki<sup>1</sup>, **Dr. Brittany Johnson<sup>1</sup>**, Prof. Elizabeth Denney-Wilson<sup>2</sup>, Dr. Rebecca Byrne<sup>3</sup>, Ms. Heilok Cheng<sup>2</sup>, Ms. Chris Rossiter<sup>2</sup>, Miss Alexandra Manson<sup>1</sup>, Dr. Kamila Davidson<sup>4</sup>, Prof. Rebecca Golley<sup>1</sup>

<sup>1</sup>Caring Futures Institute, Flinders University, Adelaide, Australia, <sup>2</sup>The University of Sydney, Sydney, Australia,

<sup>3</sup>School of Exercise and Nutrition Sciences, Faculty of Health, Queensland University of Technology, Brisbane, Australia, <sup>4</sup>School of Public Health and Social Work, Faculty of Health, Queensland University of Technology, Brisbane, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Child health behaviour screening tools in primary healthcare have potential as a transformative and effective strategy to support health, growth and development in children. Health behaviour screening is an innovative and alternative approach to growth monitoring and supports the early identification of suboptimal behaviours to target strategies for intervention. This systematic review aimed to examine the effectiveness, acceptability and feasibility of child health behaviour screening tools used in primary healthcare settings.

**Methods:** A systematic search of studies published in English in five databases (CINAHL, Medline, Scopus, PsychInfo and Web of Science) prior to July 2022. Eligible studies were those 1) describing screening tools for health behaviours (dietary, physical activity, sedentary or sleep-related behaviours) used in primary healthcare settings in children birth to 16 years of age, 2) those reporting the acceptability, feasibility or effectiveness on child or practitioner behaviour, or 3) the implementation strategy of the screening tool. Screening and data extraction were conducted in duplicate and results narratively synthesised.

**Results:** The search identified 7145 papers, of which 452 full-text articles were screened for eligibility and 22 studies reporting on 14 unique screening tools were included. Four screening tools measured diet, physical activity, sedentary and sleep behaviours domains, with most screening tools only measuring two or three behaviour domains. 10 studies reported screening tools were effective in changing practitioner self-reported behaviour, knowledge, self-efficacy and provision of health behaviour education. Administration of screening tools varied across studies including mode (paper vs online), timing (prior to or during appointment) and parent or practitioner completion. Implementation strategies described included practitioner training and integration into electronic medical records. Practitioners and parents identified various benefits and challenges to screening, however child views were not captured.

**Conclusions:** Few screening tools exist to facilitate comprehensive screening of children's health behaviours in primary health care. Research investigating parent, child and practitioner views on screening, and effectiveness on improving child health behaviours are needed.

# Are Apps a good idea to support health behaviour change post gestational diabetes ?

**Dr. Anna Roesler<sup>1</sup>**, Dr. Kaley Butten<sup>1</sup>, Dr. Marlien Varnfield<sup>1</sup>, Dr. Pennie Taylor<sup>1</sup>

<sup>1</sup>Commonwealth Scientific Industrial Research Organisation, Adelaide, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Globally, gestational diabetes (GDM) is associated with increased risk of adverse outcomes for both mothers and their children during and post pregnancy. The primary treatment for GDM and associated adverse health outcomes is lifestyle modification, delivered either face to face or via telemedicine. Currently, mobile health applications (Apps) are utilised during GDM to virtually connect women with the healthcare team to support behaviour change, but following birth such App support ceases. This study aims to explore healthcare providers' views on extending an established GDM App, MoTher, to support maternal health behaviour change following GDM.

**Methods:** Semi structured interviews were conducted with healthcare providers with experience in diagnosis and care of women diagnosed with GDM. Healthcare providers recruited for interview were engaged with the MoTher App used in four hospitals in Brisbane, Australia. Interviews were transcribed and thematically analysed with NVivo 11 software.

**Results:** Fourteen interviews were conducted with healthcare providers, including dietitians (3), diabetes educators (3), endocrinologists/obstetricians (3), nurses (2), midwives (2), and general practitioners (1). The preliminary findings indicate that healthcare providers believe women are left 'abandoned' following GDM. Currently no structured services exist supporting health change and reduction of diabetes risk post birth. App support in the post pregnancy period could partly fill this gap, but consideration of how funding structures can be applied to incorporate digital health tools for practice outcomes is required. Apps for women post GDM need to be simple; positively framed; provide resource links and quality health information; and include important reminders, specifically for the oral glucose tolerance test. Women also need to have ownership of their health information for dissemination and use as required. Therefore, important health information should be retained to optimise personalised care via Apps, however, risks and data safety needs further consideration.

**Conclusions:** Healthcare providers unanimously agree that extending digital health supports post GDM is valuable. This is an opportune time to create health behaviour change and decrease risk of diabetes. These findings, in combination with currently underway research, will guide future digital health support surrounding GDM.

# Amount vs contextual screen use trajectories from age 2 to 11-12 years in relation to cognitive development at age 11-12 years in children from the EDEN birth cohort

**Mr. Shuai Yang<sup>1</sup>**, Dr. Lorraine Poncet<sup>1</sup>, Mrs. Muriel Tafflet<sup>2</sup>, Prof. Hugo Peyre<sup>3,4,5</sup>, Prof. Franck Ramus<sup>3</sup>, Dr. Barbara Heude<sup>1</sup>, Dr. Jonathan Y. Bernard<sup>1,6</sup>

<sup>1</sup>Université Paris Cité, Inserm, INRAE, Centre de Recherche en Épidémiologie et Statistiques, Paris, France,

<sup>2</sup>Unité mixte Inserm-Ined-EFS ELFE, Ined, Aubervilliers, France, <sup>3</sup>Laboratoire de Sciences Cognitives Et Psycholinguistique (ENS, EHESS, CNRS), Ecole Normale Supérieure, PSL Research University, Paris, France, <sup>4</sup>Neurodiderot, Inserm UMR 1141, Paris Diderot University, Paris, France, <sup>5</sup>Département de psychiatrie de l'enfant et de l'adolescent, Hôpital Robert Debré, APHP, Paris, France, <sup>6</sup>Singapore Institute for Clinical Sciences (SICS), Agency for Science, Technology and Research (A\*STAR), Singapore, Singapore

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Whether screen use is related to children's cognitive development lacks evidence from longitudinal studies. We aimed to investigate screen use trajectories from 2 to 11-12 years in association with cognitive development at age 11-12 years in children from the French EDEN birth cohort.

**Methods:** Parents reported whether TV is on during family meals (4-point Likert: never, sometimes, often, or always) at ages 2, 3, 5-6, and 8 years, and their child's screen time at the same ages and up to 11-12 years. Overall, verbal and non-verbal abilities of children were derived from subtests of the Peabody Picture Vocabulary scale and the Wechsler Intelligence Scale for Children (4<sup>th</sup> Edition) at 11-12 years, and standardized (mean=100, SD=15). Screen time and TV-on during family meals trajectories were identified by latent profile and latent class analyses, respectively. Their associations with cognitive development at age 11-12 years were assessed by linear regression models adjusted for baseline sociodemographic, behavioral confounders at age 11-12 years (outdoor play time and sleep duration), and children's cognition at age 2 years. Multiple imputations were performed among children (N=459) with  $\geq 1$  screen use information and  $\geq 1$  outcome measurement.

**Results:** Children's screen time trajectory from age 2 to 11-12 years was classified into 4 groups: low-user (11.8%), average-user (31.2%), later-user (40.7%), and high-user (16.3%). TV-on during family meals trajectory from age 2 to 8 years was classified into 3 groups: never (41.0%), sometimes (33.3%), and often/always (25.7%). Regarding screen time trajectories, there were no differences between groups in overall, verbal and non-verbal abilities. TV-on during family meals was consistently associated with lower cognitive abilities: compared to never, having TV sometimes or often/always on during family meals was associated with lower overall (sometimes:  $\beta$  [95% CI]: -4.1 [-7.5, -0.7]; often/always: -1.6 [-5.6, 2.4]), verbal (sometimes: -1.5 [-4.9, 1.9]; often/always: -1.3 [-5.3, 2.8]), and non-verbal (sometimes: -5.1 [-8.6, -1.6]; often/always: -1.0 [-5.2, 3.1]) abilities.

**Conclusion:** Our study shows that TV-on during family meals, but not screen time, is associated with lower children's cognitive development. Future studies need to better account for the context of screen use, not only screen time.

# Pilot study to strengthen primary prevention of colorectal cancer through motivational and community-based approaches, depending on individual risk level, among individuals receiving colonoscopy

**Mrs. Olivia Pérol<sup>1,2</sup>**, **Mr. Rodolf Mongondry<sup>1</sup>**, Mrs. Magali Dubois<sup>1</sup>, Mrs. Aurélia Maire<sup>1</sup>, Mrs. Alix Goerens<sup>1</sup>, Dr. Pamela Funk<sup>1</sup>, Associate Professor Béatrice Fervers<sup>1,2</sup>, Dr. Anne Cattey-Javouhey<sup>1</sup>  
<sup>1</sup>Centre Leon Berard, Lyon, France, <sup>2</sup>INSERM U1296, Lyon, France

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

## **SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Many colorectal cancers (CRC) could be prevented by modifying individual risk behaviors (sedentary lifestyle, overweight, diet, alcohol). The time of CRC screening is an opportunity to promote and educate about CRC risk factors. The PRECÔTION project proposes an innovative digital program, using informative, motivational and community-based approaches to raise awareness and initiate individual prevention actions according to individual risk. The main objective is to evaluate the feasibility of the program in each risk group. The study will also assess the acceptability of the device, compliance and preliminary effects on lifestyle, physical activity level and knowledge of CRC risk factors.

**Methods:** Participants will be assessed to identify their individual risk factors (physical activity, nutrition, body composition) and their motivation to change their behaviors. The evaluation will determine their CRC risk level and assign them to one of 3 groups (low, moderate, high risk) to benefit from an adapted and personalized intervention.

All participants, will receive physical activity and dietary support via digital media (videos and podcasts) based on a motivational approach. Each video addresses a specific topic, with practical exercises that allow participants to practice immediately and over time.

Participants will be provided an application allowing them to interact with each other. Monthly, participants will have the opportunity to take part in a discovery session of physical activity in community. They will be welcomed to come accompanied by a relative. Participants will also be given an interactive logbook to record their participation in the different tools and to reinforce the motivational dimension. Participants with a moderate to high risk will also benefit from a collective health education session. Participants with a high risk level will receive three individual motivational coaching sessions and a connected watch to track their daily step count.

**Results:** Ongoing recruitment

**Conclusion:** Our project is a first step to test these different tools and to adapt them if needed. In a second phase, we intend to develop a larger scale study to measure the effects of this personalized intervention on health and its impact in terms of prevention to reduce the number of avoidable cancers.

# The role of sociodemographic factors on changes in food habits during transition to retirement

Dr. Hanna Lagström<sup>1,2</sup>, Dr. Mirkka Lahdenperä<sup>3</sup>, Dr. Tasnime Akbaraly<sup>4</sup>, **Prof. Sari Stenholm<sup>1,2</sup>**, Prof. Jenny Head<sup>5</sup>

<sup>1</sup>Department of Public Health, University of Turku, Turku, Finland, <sup>2</sup>Centre for Population Health Research, University of Turku, Turku, Finland, <sup>3</sup>Department of Biology, University of Turku, Turku, Finland, <sup>4</sup>Inserm, U1198, Université Montpellier, Ecole Pratique des Hautes Etudes, Montpellier, France, <sup>5</sup>Department of Epidemiology and Public Health, University College London, London, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Transition to retirement is an important turning point in life, which is accompanied by changes in many aspects of life. These changes may also predispose or lead to changes in food habits, but this is scarcely studied. The aim of this study was to examine changes in fish, red meat, vegetables and fruit consumption, as indicators of recommended food habits, before and after retirement transition over a 32-year follow-up.

**Methods:** The data were from the Whitehall II study, a cohort of 10,308 British civil servants aged 35 to 55 years at study induction (years 1985–1988). Since then, data collection have taken place every 2-3 years. The participants reported their employment status at each phase and data was organized into pre-retirement (max. 16 years prior) and post-retirement (max. 16 years after) periods. Food consumption was assessed by the Food Frequency Questionnaire. Changes in food consumption before and after retirement were assessed using liner regression analyses with generalized estimating equations adjusting for gender, retirement age, occupational status, marital status and financial hardship.

**Results:** Before retirement, fish was consumed on average 1.79 (SD 1.75), red meat 5.49 (SD 3.74), vegetables 25.25 (SD 12.42) and fruit 16.50 (10.67) times per week. Fish consumption differed between pre- and post-retirement periods ( $p=0.02$ ) by decreasing before retirement especially among those with financial hardships and staying at the same level after retirement. Weekly red meat consumption differed between pre- and post-retirement periods ( $p=0.02$ ) by staying even before retirement and increasing markedly after retirement, especially among people in the lowest occupational group. Vegetables and fruit consumption increased both pre- and post-retirement, but more strongly during pre-retirement than post-retirement ( $p<0.001$  for both). Single participants increased more vegetable consumption during post-retirement compared to married participants.

**Conclusion:** The transition to retirement was associated with increased consumption of vegetables and fruits. No association was found for the consumption of fish, but slight increase of red meat consumption was observed. There is a need for further studies that more thoroughly investigate the effects of retirement on diet and underlying factors in order to develop health guidance targeted at retiring employees.

# What are the characteristics of people aged 60+ who signed up to a 12-month trial of yoga?

**Prof. Anne Tiedemann**<sup>1</sup>, Dr. Juliana Souza De Oliveira<sup>1</sup>, Prof. Cathie Sherrington<sup>1</sup>, Prof. Stephen Lord<sup>2</sup>, Ms. Giane Caon Camara<sup>1</sup>, Ms. Shannon Colley<sup>1</sup>, Prof. Adrian Bauman<sup>3</sup>, Prof. Kaarin Anstey<sup>4</sup>, Associate Professor Anne Grunseit<sup>5</sup>, Prof. Kirsten Howard<sup>6</sup>, Ms. Romina Sesto<sup>7</sup>, Prof. Roberta Shepherd<sup>3</sup>

<sup>1</sup>Institute for Musculoskeletal Health, The University of Sydney and Sydney Local Health District, Camperdown, Australia, <sup>2</sup>Neuroscience Research Australia, Randwick, Australia, <sup>3</sup>Faculty of Medicine and Health, The University of Sydney, Camperdown, Australia, <sup>4</sup>UNSW Ageing Futures Institute, University of New South Wales, Randwick, Australia, <sup>5</sup>School of Public Health, University of Technology Sydney, Ultimo, Australia, <sup>6</sup>Menzies Centre for Health Policy and Economics, Faculty of Medicine and Health, The University of Sydney, Camperdown, Australia, <sup>7</sup>Yoga To Go, Petersham, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Yoga is growing in popularity and provides benefits for physical and mental health outcomes, including balance, mobility, mental well-being and quality of life. The Successful AGEing trial (ACTRN 12619001183178) is the first trial internationally to evaluate the effect of yoga-based exercise on falls among people aged 60+. We aim to describe the characteristics of the SAGE trial participants and provide insight into the attributes of older people who are attracted to yoga programs, to inform future implementation.

**Methods:** Community-based participant recruitment occurred between October 2019 and October 2021 in NSW, Australia. Inclusion criteria were: aged 60+; living independently at home; not currently participating in yoga or had not regularly participated during the past year; able to travel to an intervention location for face-to-face classes or able to access online classes via the internet. Exclusion criteria were: cognitive impairment (scoring  $\leq 4$  on the Memory Impairment Screen); insufficient English; inability to walk 10 metres unassisted; progressive neurological disease (eg, Parkinson's disease) or a medical condition precluding exercise (eg, unstable cardiac disease). Participants were randomly allocated to either: (1) the group-based, supervised, 80-session SAGE yoga exercise program, emphasising standing balance postures, or to (2) a seated yoga relaxation program, delivered in two group-based sessions and then carried out independently at home. The primary outcome was the rate of falls in 12 months after randomisation, measured via monthly surveys.

**Results:** 700 people (mean age 66, SD 5.8) were recruited for the trial. 572 (82%) participants were female and 367 (52%) had taken part in yoga previously. In terms of their general health and reported medical conditions, participants were healthier than the broader Australian population at this age: they took an average of 2 medications (SD 1.8), 178 (25%) participants reported no medical conditions, 40 (6%) had diabetes, 80 (11%) had asthma and 19 (3%) had heart disease. However, 178 (25%) participants self-rated their balance as fair/poor, and 229 (33%) reported 1 or more falls in the past year, which is consistent with population estimates.

**Conclusions:** This trial of yoga recruited a relatively healthy sample of older people, most of whom were female.

# A theory-driven, qualitative exploration of university students' awareness of sedentary behaviour

**Dr. Brenda Berendsen<sup>1</sup>**, Ms. Lieke van den Eijnde<sup>2</sup>, Dr. Dennis de Ruijter<sup>3</sup>

<sup>1</sup>Dept. of Nutrition and Movement Sciences, Maastricht University, Maastricht, Netherlands, <sup>2</sup>Smart Health, Rotterdam, Netherlands, <sup>3</sup>Dept. of Health Promotion, Maastricht University, Maastricht, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** University students spent approximately 10 hours per day in sedentary behaviour (SB), which is associated with chronic diseases and academic achievement. Awareness of unhealthy behaviour is a precondition for behaviour change. In order to systematically develop interventions aimed at interrupting SB, we explored awareness of university students of SB using in-depth interviews.

**Methods:** This qualitative, in-depth study explored four aspects of awareness, i.e. knowledge, risk perception, cues and cognizance, in six full-time university students at Maastricht University of 21±1 years via interviews grounded in the I-change model. The interviews assessed these four aspects of awareness in relation to SB. To further explore cognizance, participants wore an activPAL3 accelerometer continuously for 7 consecutive days. The time spend sedentary and occurrences of prolonged sedentary bouts were compared with data from the interview. Interviews were transcribed ad verbatim, and coded in NVivo using a coding tree.

**Results:** Three of six students did not know the term SB. Two students were aware of the advice to interrupt SB. All students had a low risk perception of developing physical diseases related to SB. In general, environmental characteristics in university buildings and homes were identified as cues for SB. The workload was mentioned as an internal cue to sit by three students. On average, students self-reported a lower average sedentary time and a higher number of sedentary bouts longer than 30 minutes compared to objective data. Educational activities at university were perceived as promoting SB by all students. Main strategies to reduce SB were planning breaks in studying time and educational activities, exercising in the evenings, walking with pets, and using standing desks.

**Conclusions:** Some university students are aware of the definition of SB, but generally not aware of their own SB and associated risks. Strikingly, after being told by the interviewer that the negative effect of SB might not be compensated with long bouts of PA, students still proposed exercising after studying as a strategy to reduce the risks of SB. This, and the low cognizance level imply that interventions with feedback and guided goal setting may be required to promote interruptions in SB.

# Identification of foods commonly used by older adults in England, France and Norway for protein enrichment to prevent undernutrition.

**Dr. Øydis Ueland<sup>1</sup>**, Dr. Miriam Clegg<sup>2</sup>, Ms. Alexia Geny<sup>3</sup>, Dr. Lisa Methven<sup>2</sup>, Dr. Guro Rognså<sup>1</sup>, Ms. Rachel Smith<sup>2</sup>, Dr. Claire Sulmont-Rossé<sup>3</sup>, Dr. Virginie Van Wymelbeke-Delannoy<sup>3</sup>, Ms. Ida Synnøve Grini<sup>1</sup>  
<sup>1</sup>Nofima, Ås, Norway, <sup>2</sup>University of Reading, Reading, United Kingdom, <sup>3</sup>INRAE, Dijon, France

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Identification of commonly used dishes suitable for protein enrichment by older adults in a home setting.

**Background:** The risk of undernutrition is a major problem for older adults as they have similar nutritional requirements per/kg bodyweight as younger adults but are typically smaller eaters. Older adults have a higher need for protein and so developing nutritional interventions that increase protein intake are essential. Considering that older people do not change their food habits that easily, fortifying their regular meals with protein provides a relevant and flexible strategy to improve the nutritional value of their diet. A first step towards successfully enabling older adults to enrich their own foods is to identify dishes that are commonly prepared and consumed by older people spanning different food cultures.

**Methods:** During autumn 2021, 65 older adults across England, France and Norway, (aged 70-90 years, 20 in each country), were asked to complete food diaries for four days (three weekdays, and one weekend day) in the span of two weeks. Respondents lived in their own home, cooked their own meals, did not follow very restricted diets, or suffer from allergies. Data collected were type and amount of food, drinks, and condiments consumed, time of food consumption, and cooking methods.

**Results:** Many similar dishes were reported by the respondents in the three countries, although it varied for which meal the dishes were most commonly consumed. Based on summaries of the most frequently mentioned dishes in the three countries and for different meals, the following food matrices were selected for recipe optimization: for breakfast, lunch, afternoon tea, evening meal, dessert, snack products (Granola, oat-meal porridge, pancakes, French toast, cake/muffins), and for lunch, dinner (pureed soup, Bolognese, mashed potatoes).

**Conclusion:** The dishes selected for recipe optimization should cover foods consumed throughout the day to provide older adults at risk of undernutrition a means to enrich their meals without compromising sensory or usage characteristics of the dish. In addition, the recipes should cover different food matrices to cater for different preferences of the older adults.

# Aspects of nutritional deficits and cognitive outcomes - Triangulation across time and subject domains among students and teachers in TIMSS

**Prof. Frøydis Nordgård Vik<sup>1</sup>**, Prof. Trude Nilsen<sup>2</sup>, Prof. Nina Cecilie Øverby<sup>1</sup>

<sup>1</sup>University of Agder, Kristiansand, Norway, <sup>2</sup>University of Oslo, Oslo, Norway

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Studies of the relationships between breakfast intake and academic achievements among adolescents are scarce. The research questions are:

- 1) How has students' prevalence of breakfast intake changed between 2015 and 2019 and how has teachers' perceptions of students' lacking basic nutrition changed between 2015 and 2019?
- 2) What are the associations between breakfast skipping and academic achievements in mathematics and science in 2015 and in 2019, and what are the associations between teachers' perceptions of students' lack of basic nutrition and academic achievements in these topics, in 2015 and in 2019?
- 3) To what extent may breakfast skipping explain changes in achievement in science and mathematics from 2015 to 2019?

**Methods:** A representative sample of Norwegian 9<sup>th</sup> graders based on Trends in International Mathematics and Science Study (TIMSS), N= 4499 (2015) and N=4685 (2019) and their teachers. This study is a trend study using structural equation modelling, triangulation and mediation analysis.

**Results:** We found that the prevalence of breakfast intake among students have worsened (27%) from 2015 to 2019; fewer students eat breakfast. The teachers' perceptions of students' lacking basic nutrition have also worsened (7%) from 2015 to 2019. We found a significant association between breakfast skipping and lower achievements in both mathematics and science among Norwegian 9<sup>th</sup> graders, both in 2015 and 2019. This was reported both by the students themselves and their teachers. Further, mediation analyses showed that being hungry when arriving at school explained 4.1 out of 13 points of the decrease in science achievement and 4.7 points out of 8 points in mathematics achievement. The associations are still significant when adjusted for gender, SES, and minority.

**Conclusions:** This study revealed a significant positive association between breakfast intake and school achievements among Norwegian 9<sup>th</sup> graders. This was found for both mathematics and science achievements, in 2015 and 2019, reported both by the students and their teachers. Mediation analyses showed that breakfast skipping explained 1/3 of the decrease in science achievement and more than half of the decrease in mathematics achievement from 2015-2019. Actions from the educational - and health system to address these issues are warranted.

# One's meat another's poison? Social and personal norm perceptions across different meat consumers types

**Miss Sofia M. M. Wolfswinkel<sup>1</sup>**, Dr. Sanne Raghoobar<sup>2</sup>, Dr. Hans Dagevos<sup>3</sup>, Prof. Emely de Vet<sup>1</sup>, Associate Professor Maartje P. Poelman<sup>1</sup>

<sup>1</sup>Consumption and Healthy Lifestyles group, Wageningen University & Research, Wageningen, Netherlands,

<sup>2</sup>Consumption and Healthy Lifestyles group, Education and Learning Sciences Group, Wageningen University & Research, Wageningen, Netherlands, <sup>3</sup>Wageningen Economic Research Wageningen University & Research, Wageningen, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** To promote the protein transition that enhances public and planetary health, it seems crucial that prevailing meat consumption norms shift towards more plant-based norms in Western societies. Social and personal norms are considered a barrier to meat consumption reduction. The perception of these norms may vary across meat consumers. Therefore, understanding the current perceptions of meat consumption norms is important, particularly by acknowledging meat consumer heterogeneity. This study aims to investigate the extent to which different meat consumers types perceive social norms and personal meat consumption norms, and dynamic meat reduction norms.

**Methods:** British meat eaters (n=1205, 25-65 years) participated in an online cross-sectional survey. Meat (substitute) consumption was measured with the adapted Oxford Meat Frequency Questionnaire. Descriptive, injunctive and personal norm perceptions were measured for meat consumption (e.g., "It is likely that others would choose meat at the [supermarket/restaurant/worksite cafeteria]"). Dynamic norm perceptions (e.g., "An increasing number of people around me are starting to lower their meat consumption") were measured for meat reduction. All norm perceptions were measured with two items, on a 7-point Likert scale. Two-step cluster analysis was conducted to identify types of meat consumers. ANOVAs were conducted to assess differences in norm perceptions between meat consumer types.

**Results:** Based on meat (substitute) consumption, four types of meat consumers were identified: Meat lovers (n=398), Exceeders (n=103), Flexitarians (n=158), Moderates (n=546). Significant ( $p < .001$ ) differences were found in descriptive ( $F(3, 1291) = 14.5$ , partial  $\eta^2 = 0.04$ ), injunctive ( $F(3, 1201) = 11.2$ , partial  $\eta^2 = 0.03$ ), personal ( $F(3, 1201) = 19.6$ , partial  $\eta^2 = 0.05$ ), and dynamic ( $F(3, 1201) = 28.4$ , partial  $\eta^2 = 0.07$ ) norm perceptions between the meat consumer types. Flexitarians portrayed the lowest meat consumption norms and the highest dynamic norms, Meat Lovers and Exceeders opposite to Flexitarians, and Moderates perceive norms stronger than Flexitarians but weaker than Meat Lovers and Exceeders ( $p < .05$ ). To illustrate, Flexitarians indicated the highest dynamic norm perception ( $M = 5.1$ ,  $SD = 1.3$ ), followed by Exceeders and Moderates ( $M = 4.2$ ,  $SD = 1.5$ ;  $M = 4$ ,  $SD = 1.6$ ), and Meat Lovers ( $M = 3.7$ ,  $SD = 1.6$ ).

**Conclusion:** Findings show that normative perceptions about meat eating differed across meat consumers. This heterogeneity across meat consumers should be acknowledged in future social norm interventions aiming for meat reduction.

# Evaluation of stimulating local stakeholder collaboration to implement the Combined Lifestyle Intervention (CLI) in the Netherlands

**Ms. Gioia Muru<sup>1</sup>**, Dr. Femke van Nassau<sup>1</sup>, Dr. Joske Nauta<sup>1</sup>

<sup>1</sup>Amsterdam UMC, location VUmc, Amsterdam, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The Combined Lifestyle Intervention (CLI), covered by the basic health insurance since 2019, aims to achieve and maintain a healthy lifestyle through behavior change. However, the implementation is not yet reaching its potential. The purpose of this study was to evaluate facilitators and barriers for setting up new- or strengthen existing local stakeholder collaboration in order to ultimately foster better implementation of the CLI.

**Methods:** The qualitative design included stakeholder interviews, field notes from network meetings and document analyses of implementation plans. Thematic analysis was used to code the interviews and documents resulting in 4 themes.

**Results:** In the collaboration with different stakeholders, it was important everyone's interest was known and aligned. In setting up new collaborations performing a needs assessment was therefore essential. It was also critical to set preconditions before starting to implement the CLI, which included setting up contracts with health insurers, making agreements on overhead costs and finding a suitable referral and declaration system. The third topic was communication, which indicated the need for more visibility of the CLI for healthcare professionals as well as the target group to stimulate the referral process. Lastly, the need for tailoring the CLI to different target groups was expressed.

**Conclusion:** The study showed that strong collaboration between key stakeholders contributed to the implementation of the CLI. However, these collaborations require structural investment from all parties. In addition, preconditions and a communication plan (as a part of a implementation plan) are also needed to support implementation of the CLI.

# Fidelity, Attitudes, and Influence Typologies (FAIT): Practical Approach to Informing Identification of Implementation Champions and Facilitation

Dr. Julie Rutledge<sup>1</sup>, **Dr. Taren Swindle<sup>2</sup>**, Dr. Dong Zhang<sup>2</sup>, Ms. Janna Martin<sup>2</sup>, Mrs. Peyton Percle Murray<sup>1</sup>, Dr. Geoffrey Curran<sup>2,3</sup>

<sup>1</sup>Louisiana Tech University, Ruston, USA, <sup>2</sup>University of Arkansas for Medical Sciences, Little Rock, USA,

<sup>3</sup>Central Arkansas Veterans Healthcare System, Little Rock, USA

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Implementation facilitation has been described as a “black box” with over 72 distinct roles and 22 complex skills. Tools to inform implementation facilitation can offer tangible approaches for demystifying the process and inform selection of key community partners (i.e., Champions) to increase the uptake of health-based interventions. The current study sought to: (1) describe development of a novel classification approach for types of end users and (2) apply the approach to identify implementation champions in an early care and education (ECE) nutrition promotion trial focused on the We Inspire Smart Eating (WISE) curriculum.

**Methods:** Expanding on Diffusions of Innovation, three key factors (attitude, fidelity, influence) were identified and used to develop the Fidelity, Attitudes, and Influence Typologies (FAIT). (1) Development of FAIT occurred initially in a small-scale, cluster randomized Hybrid Type III implementation trial conducted in 38 early care and education classrooms implementing WISE. External facilitators (N=3) and a data collection supervisor used a modified Rapid Assessment Procedure Informed Clinical Ethnography to complete immersive observations and thematic content analyses of interviews to identify characteristics of teachers' behavior at varying levels of implementation fidelity. (2) For application of FAIT constructs to identify ECE Champions, teachers' (N=89) attitude and influence were measured on self-report surveys using Likert scales at baseline of an implementation trial (attitude=14 items; influence=3 items); 82% of teachers invited to be champions agreed and were trained.

**Results:** (1) FAIT includes 8 typologies delineated by combinations of characteristics: (a) achieving *fidelity* targets or not (i.e., Adopting vs. Non-Adopting), (b) valence of *attitudes* toward the innovation (i.e., Supporter vs. Resister), and (c) *influence* in the context (i.e., Active vs. Passive). Potential Champions were identified after the WISE training based on their attitude toward WISE and their self-reported organizational and/or peer influence. (2) A total combined attitude and influence score was calculated (N=89,  $M=69.35$ ,  $SD=9.91$ ), and teachers with higher scores (e.g., more positive attitudes toward WISE and higher influence) were invited to be Champions.

**Conclusions:** FAIT provides a guide to target the efforts of implementation facilitation and identify strong community partner Champions to increase fidelity to evidence-based practices of nutrition interventions.

# Prevalence, Attitudes, and Characteristics of Users of Digital Tools for Physical Activity: Results from Nationwide Surveys in Germany

**Ms. Chen-Chia Pan<sup>1,2,3</sup>**, Dr. Karina Karolina De Santis<sup>1,2</sup>, Dr. Saskia Müllmann<sup>1,2</sup>, Prof. Hajo Zeeb<sup>1,2,4</sup>

<sup>1</sup>Leibniz ScienceCampus Digital Public Health Bremen, Bremen, Germany, <sup>2</sup>Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, <sup>3</sup>Institute for Public Health and Nursing Research, University of Bremen, Bremen, Germany, <sup>4</sup>Health Sciences Bremen, University of Bremen, Bremen, Germany

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Interest in digital technologies and health apps has rapidly increased in research, clinical practice, and consumer markets. Digital tools that support physical activity (PA), such as fitness trackers and smartwatches, have great potential to be incorporated into behavior change interventions. However, there is a knowledge gap in epidemiological research on the use of digital tools for PA in the real world. This study investigated the prevalence, attitudes, and characteristics of users of digital tools for PA in Germany.

**Methods:** Two cross-sectional telephone-interview surveys were conducted in October 2020 and November 2022. Nationwide panels of 1000 internet users selected from the general population living in Germany reported their sociodemographic characteristics, perceived eHealth literacy (on the eHEALS scale), and their use of and attitudes toward digital technologies for health promotion. The responses on each item were analyzed in IBM-SPSS24 and summarized using relative frequencies.

**Results:** The participants in the first survey were 1014 internet users, 52% were female, with an average age of 45 years, and 61% completed up to secondary education. Most participants were employed and lived in 1-2 person, urban households with a country-average income. Only 21% (n=220) of participants reported using digital media or software to support PA. The majority (85%) agreed that using such digital tools for PA is easy for them. Most (77%) believed digital tools could assist them in being active, and 64% reported using digital tools for PA at least once a week. Although over 80% reported high perceived eHealth literacy, 57% felt confident using information from the internet to make health decisions. Once the second survey data are available, we aim to compare the pattern of use and attitudes toward digital tools for PA between both surveys.

**Conclusions:** Internet users in Germany perceive digital tools are useful for PA and easy to use. However, the actual use of such technologies was low in 2020. Digital interventions aiming at behavior change in PA should be tailored toward the general population. Future studies should evaluate if using digital tools improves PA outcomes in the real world.

# Packaging of a Family Healthy Weight Program

**Dr. Bryce Abbey<sup>1</sup>**, Dr. Kate Heelan<sup>1</sup>, Dr. Jennie Hill<sup>2</sup>, Dr. R. Todd Bartee<sup>1</sup>, Mrs. Ali Malmkar<sup>1</sup>, Dr. Paul Eastabrooks<sup>2</sup>

<sup>1</sup>University of Nebraska at Kearney , Kearney , USA, <sup>2</sup>University of Utah , Salt Lake City, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Building Healthy Families (BHF), a Family Healthy Weight Program (FHWP) that is an adaptation of Epstein's Traffic Light Diet (TLD) and has been implemented in a Midwestern micropolitan city and successfully achieved clinically and statistically significant reductions in child BMIz scores. FHWP's reduce child weight status, but for families living in micropolitan cities (<50,000) and rural areas, the availability of inter-disciplinary healthcare teams recommended to deliver FHWP is low—so adapted interventions with well packaged materials and training resources are necessary to fit the needs of families, and organizations interested in reducing obesity in these regions. The purpose of this project is to describe the development of BHF Online Training and Resource Program package for implementation in micropolitan/rural communities.

**Methods:** We packaged a FHWP for “turn -key” implementation by creating the BHF Online Training Resources and Program package by incorporating several instructional design features and adoption and implementation strategies to focus on effectiveness across all user groups. Online training modules were created for each implementation team role including; program coordinator and nutrition, physical activity, lifestyle and recruitment coordinators. These modules use instructional design focused on ensuring the content elements of the FHWP are followed. Additionally, the packaged program includes presentation materials, handouts, and lesson plans that increase the likelihood that the delivery of the program will be consistent across communities. Finally, a data portal was built to allow users to track local program effectiveness.

**Results:** The result is an Online Training Resources and Program package that includes a modular approach providing training modules for program facilitators, knowledge checks to ensure mastery of program components, recruitment resources for community, school and clinical settings, all delivery materials, embedded fidelity assessments for quality assurance, and a data portal to track participant success.

**Conclusion:** The development of the FHWP resources was the result of focusing on the prioritized outcomes of multiple end users. The resources and program package allows users to implement a FHWP in their communities without the need for expert implementation teams. The Online Training Resources and Program package allows for broad dissemination of FHWP in micropolitan/rural communities.

# From healthy eating to prepubertal anorexia nervosa in children: what is the impact of nutrition ?

Mrs. Apolline Coen<sup>1</sup>, **Prof. Isabelle Thibault**<sup>1</sup>, Dr. Caroline Pesant<sup>1</sup>

<sup>1</sup>Université de Sherbrooke, Sherbrooke, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The objective of this study is to examine whether risk factors, especially the body mass index (BMI), predict if the subjects belong to the disordered eating (DE) group or to the prepubertal anorexia nervosa (PAN) group. To our knowledge, this is the first study which addresses the question for better understand the continuum of eating attitudes and behaviors, especially in children. This is important, because this developmental stage is a key period to prevent eating disorders.

**Methods:** Data was collected from a sample of 222 children (mean age : 11.1; s.d. : 1.3) who took part of two longitudinal studies which used the same measures. One of the studies was conducted in specialized care program for eating disorders. The other study aimed to examine the risk factors of DE in children. For this study, the participants were divided into 3 groups: the no DE/PAN group, the at risk of DE group, and the PAN group. ChEAT and EDI were used to assess DE group. The PAN group was diagnosed based on DSM-5 and Tanner criteria. Multinomial logistic regression analyses was used to predict the groupings (no DE/PAN, at risk of DE, PAN) from measures (percentile BMI, EDI-3, CDI, MASC) related to some risk factors (depression, anxiety, feeling of ineffectiveness, etc.).

**Results:** In univariate models, depressive and anxious symptoms, inefficacy, affective and interpersonal problems and need to control are risk factors which significantly ( $p \leq 0,05$ ) increase the risk (OR between 1.03 to 1.21) of DE or PAN. But, in the adjusted models for percentile BMI, the groups at risk of DE and PAN were not differentiated on the majority of risk factors. More important, it seems that BMI percentile was the principal factor which influence the groupings.

**Conclusions:** This study contribute to emphasize the importance of nutrition (and BMI) like risk factors to make the distinction between DE and PAN. Our results show that the percentile BMI explains in part the effect of psychosocial risk factors. These results are coherent with the fact that starvation increases the depression or anxiety in anorexia nervosa.

# Do boys differentiate from girls in disordered eating ?

Ms. Evan Marchand<sup>1</sup>, **Prof. Isabelle Thibault<sup>1</sup>**, Prof. Anne-Marie Tougas<sup>1</sup>, Dr. Caroline Pesant<sup>1</sup>

<sup>1</sup>Université de Sherbrooke, Sherbrooke, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Little is known about disordered eating (DE) in children but results of some research shows that it is almost as prevalent in boys as girls. Moreover, actual studies do not focus on other differences between boys and girls, except for the fact that boys do more compulsive exercise than girls to control their appearance. The first aim of this study is to examine the distinctions between boys and girls with symptoms of DE, especially with physical activity. The second objective is to analyze the distinctions between the sexes concerning risk factors of DE in children.

**Methods:** The sample is composed of 201 children: 94 boys (mean age : 11.8, s.d. 0.9) and 107 girls (mean age : 11.6, s.d. 1.0). Children were recruited in elementary schools with their parent's consent to the research. The children complete a series of questionnaires (EDI-3, CDI, MASC) with research auxiliaries. Anova and binary logistic regression was performed to test the difference between sex and examined the risk factors which explained the risk for DE in each sex.

**Results:** For the first objective, results showed that for children who present DE, the drive for thinness and body dissatisfaction was the most important symptoms of DE in boys and girls. No distinctions were discovered between sexes for muscle dysmorphia. These results showed that boys and girls exhibited similar symptoms of DE and this emphasized that physical activity to control their appearance is not only present in boys. The results of the second objective showed that feelings of ineffectiveness and overcontrol were the most important risk factors of DE in boys (20.9% of variance). For girls, the principal risk factors were overcontrol and anxiety (45.6% of variance).

**Conclusions:** These results demonstrated that risk factors are quite different according to sex, and that little is known for risk factors of DE in boys. Also, future studies should focus on the role of physical exercise in DE.

# Baseline assessment of restaurant sugary beverage intake among children and caregiver attitudes prior to city-level healthy default beverage ordinance in New Orleans, LA

**Dr. Melissa Fuster<sup>1</sup>**, Dr. Megan Knapp<sup>2</sup>, Ms. Hannah Smith<sup>1</sup>

<sup>1</sup>Tulane University School of Public Health and Tropical Medicine, New Orleans, LA, USA, <sup>2</sup>Xavier University of Louisiana, New Orleans, LA, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** In January 2022, New Orleans, LA (NOLA) became the first city in Southern United States (US) to pass an ordinance requiring restaurants to offer healthy default beverages (HDB) with children's meals, to curb SSB consumption in this high-risk population for obesity and related conditions. This study is a baseline assessment of sugary beverage intake among NOLA children 2-12 years of age, caregiver attitudes, and associated demographic characteristics prior to the implementation of the ordinance in January 2023.

**Methods:** Data were collected via surveys administered through an online panel in September 2022 among NOLA caregivers of children between the ages of 2-12 who eat restaurant meals (eat-in, delivery, or take-out) at least once a month (n=516). This preliminary analysis applied bivariate procedures (Chi-squared, Spearman correlation) to examine the associations between child SSB intake, frequency of restaurant meals, parent/caregiver demographic characteristics (gender, income, race/ethnicity, and education), and attitudes associated with SSB intake and restaurant regulation. Further multivariate analysis will incorporate child demographics (age, sex).

**Results:** Most children consumed SSBs on a weekly basis (11% 1/week, 24% 2-3/week, 14% 4-6/week), with a higher frequency of SSB consumption associated with a higher occurrence of restaurant meal consumption, lower income, and lower education ( $p<0.05$ ). More than half of the caregivers (53.6%) reported children consumed restaurant meals on a weekly basis (1-3/week), with higher frequencies associated with being a male parent/caregiver and having higher income and education ( $p<0.05$ ). One-fifth of the respondents (21%) agreed that SSBs are an important part of family meals and 24% agreed that restaurants should not offer SSBs with children's meals. Perceptions of SSB importance in family meals and disagreement about restaurant restrictions in SSB provisions with children's meals were associated with a higher frequency of SSB intake.

**Conclusions:** Our results found a high frequency of SSB consumption among children and significant associations between SSB consumption and restaurant meals. These findings support the need for HDB regulations in restaurants to decrease the frequency of SSB consumption among children, especially in areas where rates of childhood obesity and overweight are high, as in the case of Louisiana and the Southern US.

# Association between muscle function and bone health in Indian children and adolescents: The need for physical fitness and nutrition programming

**Dr. Anuradha Khadilkar**<sup>1,2</sup>, Ms. Sonal Kasture<sup>1</sup>, Dr. Rubina Mandlik<sup>1</sup>, Assistant Professor Jasmin Bhawra<sup>3</sup>, Associate Professor Tarun Reddy Katapally<sup>4</sup>

<sup>1</sup>Department of Growth and Endocrinology, Hirabai Cowasji Jehangir Medical Research Institute, Jehangir Hospital, Pune, India, <sup>2</sup>School of Health Sciences, Savitribai Phule Pune University, Pune, India, <sup>3</sup>Toronto Metropolitan University, Toronto, Canada, <sup>4</sup>Western University, Ontario, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Muscle function (MF), which is closely linked with physical fitness, is crucial to promoting bone health and preventing osteoporosis and sarcopenia – two major contributors to global non-communicable disease burden. However, the association of MF and body composition on bone health has not been investigated in Indian children and adolescents. This study aims to assess the relationship between MF measured by Jumping Mechanography (JM) and key indicators of bone health measured by Dual energy X-ray Absorptiometry (DXA).

**Methods:** A cross-sectional study was conducted in Pune, India with 717 (360 boys; 357 girls) urban students aged between 5 – 19 years. Students were recruited from 2 schools belonging to similar socioeconomic strata, with parental consent. Objective data on the following measures were collected by trained research staff: MF parameters (maximum power [Pmax], maximum voluntary force [Fmax]), anthropometry (height, weight), bone health indicators (bone mineral content, bone area, bone mass and areal bone mineral density), and body composition parameters (lean mass, fat mass, fat-free mass, total mass). To determine the association between MF and bone health, Pearson's correlation analyses and hierarchical linear regression were performed using IBM SPSS (version 26.0.0).

**Results:** Mean age of the group was  $12.4 \pm 3.9$  years. Mean height, weight and body mass index (Z score) were  $144.6 \pm 17.8$ cm ( $-0.1 \pm 0.9$ ),  $38.7 \pm 15$  kg ( $-0.2 \pm 0.9$ ) and  $17.7 \pm 3.7$  kg/m<sup>2</sup> ( $-0.2 \pm 1$ ), respectively. Positive association of Pmax and Fmax was observed with all bone parameters ( $p < 0.01$ ). Significant factors associated with bone health also included age, height, lean mass and Fmax ( $p < 0.05$  for all).

**Conclusions:** MF was consistently associated with bone health as measured by a range of objective indicators. MF in children and adolescents needs to be improved by physical activity and nutrition that promotes physical fitness. To optimize bone health by facilitating MF of Indian children, research and policy needs to shift its focus towards equitable physical activity and nutrition programming in schools.

# Examining Parents' Experiences and Challenges of Feeding Preschool Children with Avid Eating Behaviour

**Dr. Katie Edwards<sup>1</sup>**, Prof. Jacqueline Blissett<sup>1</sup>, Dr. Helen Croker<sup>2</sup>, Prof. Claire Farrow<sup>1</sup>, Dr. Moritz Herle<sup>3</sup>, Dr. Alice Kininmonth<sup>4</sup>, Dr. Clare Llewellyn<sup>4</sup>, Dr. Abigail Pickard<sup>1</sup>, Prof. Emma Haycraft<sup>5</sup>

<sup>1</sup>Aston University, Birmingham, United Kingdom, <sup>2</sup>World Cancer Research Fund, London, United Kingdom,

<sup>3</sup>King's College London, London, United Kingdom, <sup>4</sup>University College London, London, United Kingdom,

<sup>5</sup>Loughborough University, Loughborough, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Current public health advice regarding children's eating is generic and does not tackle the considerable variability in children's appetite traits and eating behaviour. Behaviours that characterise avid eating have been linked to child overweight and obesity (e.g., greater enjoyment of, and responsiveness to, food). Parent feeding practices are modifiable components of a child's food environment and thus may be key levers for behaviour change in tailored interventions to support the development of children's healthy eating. This qualitative study aimed to explore primary caregivers' experiences of feeding children with avid eating behaviour and to understand any challenges that caregivers experience in this context.

**Method:** Fifteen semi-structured interviews were conducted with primary caregivers of a preschool child (3-5 years) who was identified by responses on a questionnaire as having avid eating behaviour. Interviews explored how children's avid eating manifests and any challenges that caregivers face when feeding their child. Interviews also examined which feeding strategies caregivers use to limit their child's food intake, and whether they perceive these strategies to be effective.

**Results:** Interview data has been collected and transcribed, and results will be discussed. Due to the novelty of qualitative research in this area, analysis will focus on understanding the core concepts and themes which are present in the data and will illuminate the experiences and challenges of parenting a child with avid eating behaviour.

**Conclusion:** This study will provide an in-depth understanding of caregivers' experiences of feeding children with avid eating behaviour. These findings will help to determine targets for the development of tailored interventions to support caregivers with children who are at greater risk of the development of obesity in food abundant environments.

# Effectiveness of the Healthy Online Parental Education (HOPE) on child fruit and vegetable intakes and parental feeding practices in low-income families: a pilot randomized controlled trial

**Dr. Hyunjung Lee**<sup>1,2</sup>, Prof. Wilna Oldewage-Theron<sup>2,4</sup>, Assistant Professor John Dawson<sup>2,3</sup>

<sup>1</sup>Texas A&M University, College Station, USA, <sup>2</sup>Texas Tech University, Lubbock, USA, <sup>3</sup>New Mexico State University, Las Cruces, USA, <sup>4</sup>University of the Free State, Bloemfontein, South Africa

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** This study was to evaluate a theory-based eHealth intervention, called Healthy Online Parental Education (HOPE), aimed at improving child fruit and vegetable intakes and parental feeding practices in families with low-income backgrounds in West Texas, USA.

**Methods:** An 8-week randomized control and intervention pilot study was conducted among 73 parents with young children (12-36 months) between October 2021 and February 2022. The HOPE intervention was informed by the Social Cognitive Theory and utilized multicomponent strategies. The intervention group ( $n = 37$ ) received weekly educational videos and text messages and completed three online cooking activities. The control group ( $n = 36$ ) received printed materials about general dietary recommendations for children. Child consumption of fruit and vegetables (servings/day) was captured by an electronic 24-hour dietary record. Parental feeding practices were assessed using the Comprehensive Feeding Practices Questionnaire. Linear models were performed to assess mean changes in the study outcomes from baseline to post intervention using R version 4.1.1.

**Results:** At post intervention, children in the intervention group significantly increased their mean fruit (from 0.57 to 1.47,  $p = 0.0000000006$ ) and vegetable (from 0.45 to 0.98,  $p = 0.00005$ ) intakes than baseline. There were no changes in daily fruit (from 0.47 to 0.46,  $p = 0.92$ ) and vegetable (from 0.44 to 0.27,  $p = 0.17$ ) intakes in the control group. Children in the intervention group showed greater increases in the mean changes of daily fruit ( $p = 0.00057$ ) and vegetable ( $p = 0.0037$ ) intakes than the control group. Parents in the intervention group showed significantly greater improvements in comprehensive feeding practices than the control group ( $p = 0.0069$ ). At post intervention, parents in the intervention group reported higher parent modeling ( $p = 0.00005$ ) and lower overt control practices, such as use of food as a reward ( $p = 0.0013$ ), pressure-to-eat ( $p = 0.0016$ ), and food restriction ( $p = 0.00053$ ) than baseline.

**Conclusions:** Empowering families through eHealth interventions is a promising approach for increasing child fruit and vegetable consumption and changing parental feeding practices. Further testing in a full-scale trial is needed to determine whether behavior changes are sustainable over time.

# Health cues and visibility enhancements fail to change food choices determined by preferences and habits

**Ms. Eeva Rantala**<sup>1,2,3</sup>, Dr. Elina Järvelä-Reijonen<sup>2</sup>, Dr. Kati Pettersson<sup>1</sup>, Dr. Janne Laine<sup>1</sup>, Ms. Paula Vartiainen<sup>2</sup>, Dr. Johanna Närväinen<sup>1</sup>, Prof. Jussi Pihlajamäki<sup>2,4</sup>, Prof. Kaisa Poutanen<sup>1</sup>, Prof. Pilvikki Absetz<sup>5</sup>, Dr. Leila Karhunen<sup>2</sup>

<sup>1</sup>VTT Technical Research Centre of Finland, Espoo, Finland, <sup>2</sup>Institute of Public Health and Clinical Nutrition, University of Eastern Finland, Kuopio, Finland, <sup>3</sup>Finnish Institute for Health and Welfare, Helsinki, Finland,

<sup>4</sup>Department of Medicine, Endocrinology and Clinical Nutrition, Kuopio University Hospital, Kuopio, Finland,

<sup>5</sup>Faculty of Social Sciences, Tampere University, Tampere, Finland

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Easier recognition and enhanced visibility of healthy options supposedly increase healthy choices, but real-world evidence remains scarce. Addressing this knowledge gap, we promoted healthy foods in a workplace cafeteria with three choice architectural strategies—priming posters, point-of-choice nutrition labels, and improved product placement—and assessed effects on visual attention and food choices.

**Methods:** Following a quasi-experimental pre–post design, the study comprised 5-day control and intervention conditions with identical menus. We monitored visual attention (i.e., the number and duration of fixations on posters/labels, healthy foods, and less healthy foods) and food choices (i.e., the number of total, healthy, and less healthy items chosen) with mobile eye tracking, interviewed customers about perceived influences on food choices, and weighed cafeteria-level food consumption (i.e., the amount of total, healthy, and less healthy foods taken from the serving line). Individual-level data represents 22 control participants (*M* 43 years, 64% men) and 19 intervention participants (*M* 46 years, 53% men) recruited at the cafeteria entrance. Cafeteria-level data represents 556/589 meals sold over the study conditions. As the samples included partly same and partly different individuals, we examined between-condition differences in visual attention and food choices with partially overlapping samples *t*-test and its non-parametric counterpart. The consumption analysis compared total, % healthy, and % less healthy food consumption between study conditions. Perceived influences on food choices were analysed with deductive qualitative content analysis informed by the Food Choice Questionnaire.

**Results:** Posters/labels captured participants' visual attention (~13% of fixations on defined areas of interest before food choices), but the intervention had insignificant effects on visual attention to foods and on food choices (*ps* > .05). Similarly, cafeteria-level consumption remained unchanged. Interviews revealed 17 perceived influences on food choices, the most common being sensory appeal, familiarity, and healthiness. Healthiness, however, often was an unspecified motive that could lose to competing influences.

**Conclusions:** the intervention proved capable of attracting visual attention, yet ineffective in increasing healthier choices among working age consumers who prioritised sensory appeal and familiar foods. The work contributes with a unique, mixed-methods approach and a real-world setting that enabled a multi-dimensional effects evaluation with high external validity.

# Determinants of Discontinuance of Active Participation in Sports Activities: A Life Course Perspective

**Ms. Xiaoyue Chen<sup>1</sup>**, Associate Professor Astrid Kemperman<sup>1</sup>, Prof. Harry Timmermans<sup>1</sup>

<sup>1</sup>Eindhoven University of Technology, Eindhoven, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Physical inactivity remains a global public health challenge today. Determining why people stop habitually participating in sports is significant to develop targeted intervention strategies for sports promotion and healthy living. However, most previous studies on sports dropout are cross-sectional in nature and focus on adolescents. As sports participation is dynamic throughout life, a life-course perspective is needed to provide a more comprehensive understanding. This study adopts a life-course perspective to explore the determinants that trigger the transition from active participation in sports to becoming inactive.

**Method:** An online survey was developed to collect retrospective longitudinal data on life trajectories and habitual sports behaviours in the Netherlands. Participants were 629 adult panellists from an existing representative panel of the Dutch population. Based on previous sports participation theories and life-course approaches, 26 determinants in 4 categories, including socio-demographics, sports motivations, life events, and neighbourhood characteristics, were identified as potential explanatory variables. A two-level binary logistic regression model was estimated to capture the effects of these determinants on sport dropout.

**Results:** Results show that dropout from sports is age-specific, with those aged 13-23 more likely to stop sporting. Also, individuals who are less educated or who work less than 20h/w are more likely to quit sports. Another finding is that people are less likely to discontinue sports participation when they have health and weight loss goals. Life events have different effects. Stop living with physically active people appears the most important event to make people stop sporting, followed by having a baby, and then owning the first car. Compared with education-related events, work-related events are more likely to cause people to stop sporting. Moreover, the probability of dropout from sports may increase with the unsafe feeling of doing physical activities in the neighbourhood and decrease with the lack of green spaces.

**Conclusions:** Determinants from socio-demographics, sports motivations, life events, and neighbourhood characteristics appear to play differential roles in sports discontinuance over the life course. The findings have implications for supporting sports participants to continue exercising by addressing the barriers.

# Understanding Correlates of Physical Activity Identity in Cancer Survivors

**Ms. Golnaz Ghazinour**, Ms. Allyson Tabaczynski, Ms. Natalie Cuda, Dr. Linda Trinh

<sup>1</sup>University of Toronto, Toronto, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Physical activity (PA) is becoming recognized as an essential component of supportive care for cancer survivors given that it mitigates the effects of cancer treatment. However, many cancer survivors do not meet PA guidelines ( $\geq 150$  minutes/week of moderate-to-vigorous PA [MVPA]). PA identity is an important predictor of long-term PA maintenance as it helps to buffer against environmental and self-regulation challenges to PA. Nevertheless, little is known about the contributors to strong PA identity in cancer survivors. Accordingly, the purpose of this study was to understand the demographic, medical, and social cognitive correlates of PA identity in cancer survivors.

**Methods:** An online, cross-sectional survey was administered to cancer survivors worldwide. Questionnaires were used to assess demographic and medical information; PA using a modified version of Godin Leisure-Time Exercise Questionnaire; and M-PAC processes for instrumental attitudes, affective judgements, perceived capability and opportunity, self-regulation, habit, and identity. Using four identity statements scaled 1 (strongly disagree) – 5 (strongly agree) with an identity score of 12 as the mid-point, cancer survivors were classified as having 'high PA identity' (i.e., score  $>12$ ) or 'low PA identity' (i.e., score  $<12$ ). Binary logistic regression analysis was used to examine demographic, medical, and social cognitive correlates of PA identity across high and low PA identity classifications while controlling for MVPA participation.

**Results:** Cancer survivors ( $N=318$ ;  $M_{age}= 48.90 \pm 15.92$  years) were mainly female (69.2%), White (89.9%), had some higher education (82.7%), diagnosed with breast cancer (28.0%), and had completed treatment (79.9%). Controlling for meeting MVPA guidelines, higher PA identity was significantly associated with higher positive affective judgement ( $OR=1.13$ , 95%  $CI=1.02-1.25$ ,  $p=0.03$ ), higher PA intention ( $OR=1.49$ , 95%  $CI=1.19-1.87$ ,  $p<0.001$ ), better self-regulation ( $OR=1.08$ , 95%  $CI= 1.02-1.15$ ,  $p=0.009$ ), and greater PA habit ( $OR=1.28$ , 95%  $CI=1.17-1.40$ ,  $p<0.001$ ).

**Conclusion:** Social cognitive processes (i.e., affective judgment), self-regulation (e.g., planning), PA intention, and habit were significant predictors of higher PA identity. Future research is needed to investigate the reflexive and regulatory mechanisms through which PA identity contributes to long-term PA maintenance. Interventions should target these M-PAC processes and strengthen PA intention and habit to enhance PA identity and participation in cancer survivors.

# Barriers and facilitators for participation in community-based physical activity interventions among patients with cardiovascular diseases: A scoping review

Mrs. Joanne Palsma<sup>1</sup>, Dr. Judith Jelsma<sup>2,3,4</sup>, Prof. Rienk Dekker<sup>1</sup>, Dr. Inge van den Akker-Scheek<sup>5</sup>, **Dr. Joyce Vrijsen<sup>5</sup>**

<sup>1</sup>University of Groningen, University Medical Center Groningen, Department of Rehabilitation, Groningen, Netherlands, <sup>2</sup>Amsterdam UMC location Vrije Universiteit Amsterdam, Department of Public and Occupational Health, Amsterdam, Netherlands, <sup>3</sup>Amsterdam Public Health Research Institute, Health Behaviors & Chronic Diseases, Amsterdam, Netherlands, <sup>4</sup>Amsterdam Public Health Research Institute, Quality of Care, Amsterdam, Netherlands, <sup>5</sup>University of Groningen, University Medical Center Groningen, Department of Orthopedics, Groningen, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Community-based physical activity interventions are beneficial for patients suffering from cardiovascular diseases (CVDs). However, the implementation of these interventions remains a challenge. Therefore, the aim of this scoping review is to explore the barriers and facilitators for participation in community-based PA interventions among patients suffering from CVDs.

**Methods:** An electronic search was performed in PubMed and Cochrane for all studies published up to July 1st, 2021. Articles with a quantitative or qualitative design were eligible for inclusion if: (a) patients with CVDs were included; (b) the intervention included community-based PA; and (c) the article reported information on barriers and facilitators for (non-)participation and/or adherence. Articles not published in English were excluded. Subsequently, identified barriers and facilitators were categorized into five levels, using the social-ecological framework (SEF).

**Results:** Thirteen studies were included, of which 3 qualitative and 10 quantitative studies. These studies identified various barriers and facilitators related to participation at multiple levels of the SEF: (a) intrapersonal (e.g., personal factors, employment, psychological factors, body functions), (b) interpersonal (e.g., social support), (c) institutional (e.g., program factors), and (d) policy (e.g., transportation, costs).

**Conclusions:** This scoping review provides a comprehensive overview of barriers and facilitators for participation in community-based PA interventions among patients suffering from CVDs. This overview is useful to guide clinicians and researchers in future development and implementation of community-based PA intervention specifically for patients with CVDs. Strategies to improve participation and adherence to community-based physical activity interventions in this group should start with more education and proper instructions to improve knowledge and self-efficacy. Additionally, interventions could be improved by for example providing a tailored approach or group-based interventions in the own neighborhood of the patient. Finally, costs of interventions should be lowered or reimbursed to increase participation and adherence.

# Exploration of Youth Experiences with a School-based, Comprehensive Food Education Program: Short and Long-term Impact

**Ms. Christine St. Pierre<sup>1</sup>**, Ms. April Sokalsky<sup>1</sup>, Dr. Jennifer M. Sacheck<sup>1</sup>

<sup>1</sup>The George Washington University Milken Institute School of Public Health, Washington, DC, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** School-based food education programs are an increasingly common strategy to promote fruit and vegetable (FV) intake among children and shape dietary habits that persist into adulthood. Evidence points to modest program influence on children's FV intake in the short-term, but little is known about effects on broader dietary habits through adolescence. We therefore sought to understand current and alumni participant perspectives on 1) their experiences with a food education program in elementary school, 2) translation of the program to their home environment, and 3) program impact on dietary habits over time.

**Methods:** We used an instrumental case study approach, with the program serving as the unit of case analysis, illustrating the experience of participation in a comprehensive food education program over multiple years. We conducted semi-structured focus groups with current elementary students and alumni participants now in secondary school or university, recruited through purposive and network sampling. Focus groups were audio-recorded, transcribed verbatim, manually coded, iteratively analyzed, and distilled into nine emergent themes supported by analysis of class observations, informal interviews with program staff, and field notes.

**Results:** Nine focus groups were held with n=39 current participants (9.6 ± 1.1 years, 41% female) and n=39 program alumni (14.4 ± 2.5 years, 56% female) from urban settings. Three emergent themes were identified in each of three time periods of program impact: immediate, medium-term, and long-term. Participant perceptions of immediate program impact were characterized by *enjoyment*, *experiential learning*, and *fostering community*. In the medium term, participants attributed program participation to *changes in individual and family food intake*, *involvement in household food practices*, and *desire for more fresh food options at school*. Among alumni participants, the following enduring themes emerged: *appreciation for fresh, homemade food*, *openness to trying new foods*, and *confidence to make informed food choices*.

**Conclusions:** Our findings provide deeper understanding of how participants in a school-based food education program view their experience and a first look into salient program influences that endure into adolescence. Many themes closely align with the domains of food literacy, indicating opportunities for developing assessment tools to quantitatively capture near and long-term program impact.

# Barriers and facilitators for discussing lifestyle in clinical practice among hospital healthcare professionals

**Dr. Joyce Vrijsen<sup>1</sup>**, Ms. Marlinde van Dijk<sup>2,3,4</sup>, Ms. Sanne Westerveld<sup>1</sup>, Mrs. Leonie te Loo<sup>2,3,5</sup>, Prof. Rienk Dekker<sup>6</sup>, Dr. Judith Jelsma<sup>2,3,4</sup>, Dr. Inge van den Akker-Scheek<sup>1</sup>

<sup>1</sup>University of Groningen, University Medical Center Groningen, Department of Orthopedics, Groningen, Netherlands, <sup>2</sup>Amsterdam UMC location Vrije Universiteit Amsterdam, Department of Public and Occupational Health, Amsterdam, Netherlands, <sup>3</sup>Amsterdam Public Health Research Institute, Health Behaviors & Chronic Diseases, Amsterdam, Netherlands, <sup>4</sup>Amsterdam Public Health Research Institute, Quality of Care, Amsterdam, Netherlands, <sup>5</sup>Inholland University of Applied Sciences, Faculty of Health, Sports and Social Work, Haarlem, Netherlands, <sup>6</sup>University of Groningen, University Medical Center Groningen, Department of Rehabilitation, Groningen, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Despite the proven advantages of a healthy lifestyle, discussing lifestyle is currently not implemented in routine clinical practice in hospitals. Therefore, the aims of this study were twofold: 1) to get insight in the current practice of discussing lifestyle by healthcare professionals in two Dutch university medical centers and 2) to identify barriers and facilitators for discussing lifestyle in routine clinical practice among healthcare professionals.

**Methods:** Semi-structured interviews were conducted with healthcare professionals (i.e. physicians (in training), dieticians, physiotherapist, (specialized) nurses) from different departments (Orthopedics, Internal Medicine, Cardiology and Nephrology) of two Dutch university medical centers. Interviews were audio recorded and transcribed. An inductive thematic analysis was conducted by three researchers independently to identify the barriers and facilitators for discussing lifestyle.

**Results:** Thirty-three healthcare professionals were interviewed. The findings show that majority of healthcare professionals have a positive attitude towards discussing lifestyle. A variety in methods exists in approaching and motivating patients, but also in discussing lifestyle with patients which they try to tailor to the knowledge, preferences and medical issues of the patients. Barriers and facilitators were categorized into three themes: 1) patient-related factors (e.g., knowledge and skills, motivation, previous experiences, financial factors), 2) healthcare professional-related factors (e.g., knowledge and skills, motivation, collaboration referral options, feedback after referral, responsibility, time, previous experiences, necessity lifestyle change) and 3) hospital related factors (e.g., general attitude, organizational structure).

**Conclusions:** This study showed that the majority of healthcare professionals have a positive attitude towards discussing lifestyle in clinical practice. However, this is not yet routinely done and a variety of methods exists in how this is conducted. In order for healthcare professionals to discuss lifestyle more routinely in clinical practice, strategies should focus on educating healthcare professionals in discussing lifestyle with patients with different backgrounds, setting up collaborations with referral options, and imbedding lifestyle medicine in hospital care.

# Determinants of long-term physical activity participation in New Zealand adolescents across sociodemographic groups: a descriptive study

**Mr. Tom Bergen**<sup>1,2</sup>, Dr. Alice Kim<sup>1</sup>, Dr. Anja Mizdrak<sup>1</sup>, Prof. Louise Signal<sup>1</sup>, Associate Professor Geoff Kira<sup>2,3</sup>, Associate Professor Justin Richards<sup>2,3</sup>

<sup>1</sup>University of Otago, Wellington, New Zealand, <sup>2</sup>Sport New Zealand (Ihi Aotearoa), Wellington, New Zealand,

<sup>3</sup>Victoria University of Wellington, Wellington, New Zealand

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** The purpose of this study was to describe the nature of physical activity participation in Aotearoa New Zealand (NZ) adolescents by exploring relevant variables that are determinants of long-term physical activity across different sociodemographic groups.

**Methods:** Data was collected on from the Active NZ Young People's survey which uses a complex survey design utilising household clusters and stratification by region, ethnicity, and age groups. Sociodemographic characteristics (age, gender, ethnicity, deprivation, physical disability status) were assessed in samples of adolescents (12-17 years old) between 2017 and 2020 in Aotearoa, New Zealand. The determinants chosen for analysis were total weekly time spent physically active, physical literacy, social support levels, number of settings participated in, number of physical activity participations and physical activity accessibility levels. All variables were weighted to create national estimates with 95% confidence intervals. Numeric determinants for each sociodemographic group were summarised as mean values and categorical determinants were summarised into population proportions.

**Results:** As age increased, physical activity participation levels decreased alongside all other determinants of long-term physical activity. Māori and Pacific populations scored consistently higher in each determinant category than European, Asian, and other ethnicities. Determinant values were on average lower than the population mean in those that were aged 15-17 years, Female or Gender Diverse, Asian, living with medium to high deprivation levels or physical disabilities.

**Conclusions:** This study reveals that determinants of long-term physical activity vary greatly across all adolescents and that certain sociodemographic groups have much lower levels than the average. Tailoring future public health interventions towards enhancing a wide range of these determinants simultaneously, especially for those in late adolescence, may prove influential to enhancing nationwide physical activity participation and wellbeing across the lifespan.

**Keywords:** Physical activity, behaviour, trajectory, predictors, adolescent, wellbeing.

# Social Media: A Potential Health Communication Tool to Get More People Active Outside?

**Miss Amanda Folk<sup>1</sup>**, Dr. Dunja Antunovic<sup>1</sup>, Dr. Chelsey Thul<sup>1</sup>, Dr. Daheia Barr-Anderson<sup>1</sup>

<sup>1</sup>University of Minnesota Twin Cities, Minneapolis, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Green physical activity (GPA), or any physical activity that takes place among natural elements, is a leisure-time activity with myriad benefits (e.g., physical health, mental health and wellbeing, active citizenship). Less than half of U.S. individuals participated in GPA in the last year—with knowledge and social support as common barriers. Social media (SM) is widely used and a potential health communication tool that may act as a way to remove these barriers, increase self-efficacy for GPA and, perhaps, increase GPA itself. Describe SM use in a sample of U.S. adults interested in or currently participating in GPA and explore associations between SM use and GPA.

**Methods:** A survey queried participants who follow GPA-related SM (N=179) on sociodemographics, SM use (hours/week), SM importance (via Social Media Use Integration Scale), GPA-specific self-efficacy (via Outdoor Recreation Self-Efficacy Scale), and GPA (via Godin-Shepherd Leisure Time Exercise Questionnaire modified for GPA [i.e., “exercise” was replaced with “green physical activity”]). Using SAS 9.4, sociodemographic and SM variables were summarized. Multiple linear regression models were used to examine associations between SM use and GPA while controlling for gender, sexual identity, race, education, and employment.

**Results:** Average SM use across the sample (age=33.0 ± 8.8; 86.0% non-cis-gender male) was 13.6±8.6 hours/week, while average total GPA was 5.4±4.1 hours/week. The sample had a high overall self-efficacy score for GPA (156.9±20.3, out of a possible 187) and a moderate SM importance score (36.4±9.5, out of a possible 60). There was an association between SM use and GPA self-efficacy (p=0.001). Additionally, for every hour of SM use per week is, on average, associated with almost 7 more minutes of GPA per week (p<0.01).

**Conclusion:** Seven minutes of GPA over the course of a week is a small effect and, for this sample who engages in a high level of GPA, not clinically significant. However, general SM use was measured instead of GPA-specific SM, due to the lack of a reliable way to measure topic-specific exposure. The statistically significant results indicate further examination of GPA-specific content on SM and its effect on GPA self-efficacy and GPA is warranted.

# Mapping digital food environment on social media

**Mr. Kaiyang Qin**<sup>1</sup>, Assistant Professor Saar Mollen<sup>1</sup>, Associate Professor Eline Smit<sup>1</sup>, Assistant Professor Wilma Waterlander<sup>2</sup>

<sup>1</sup>Department of Communication Science University of Amsterdam, AMSTERDAM, Netherlands, <sup>2</sup>Department of Public and Occupational Health University of Amsterdam, AMSTERDAM, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** The digital food environment represents a growing exposure to unhealthy food. The present study aims to map the digital food environment on social media by exploring users' characteristics and interactions with two sources of (unhealthy) food content: food advertisements (ads) and food posts. The following questions will be investigated: How do users' interactions with food content relate to the frequency of unhealthy food content exposure, and whether food companies play a role in it? Are people with specific characteristics more likely to be exposed to unhealthy food content?

**Methods:** We will implement a survey study combined with a novel data donation approach, which allows participants to download their social media data and share it for research purposes. Participants will donate their YouTube data regarding video ads and posts viewing, likes, searches, subscribed channels, and a company list showing which food companies users are targeted as potential customers. Participants will also complete questionnaires regarding their (social) media algorithm awareness, perception of food norms, experience with personalized ads, and demographics. We will recruit 300 participants, and the results will be ready around May 2023. We will code the videos as healthy or not healthy, and the likes, searches, channels, and companies on the list as food-relevant or not food-relevant. We will perform correlation analyses among the interactions (e.g., frequency of the likes), unhealthy food video exposure (i.e., the viewings), the number of food companies that targeted users as customers, and the score of questionnaires and follow-up regression analyses for answering the first question. We will do a latent class analysis to reveal groups with specific characteristics that may be more likely to be targeted by food companies and exposed to the food content.

**Conclusion:** The implications of the present study are twofold. First, it may provide insight into the characteristics of the digital food environment on social media. These insights may be important for regulations of food content, such as Ads from food companies. Second, it may shed light on how researchers can utilize social media data based on the data donation approach to investigate food-relevant topics.

# Behavior mechanisms to increase objectively-measured physical activity among Hispanic women: A systematic review

**Dr. Elizabeth Lorenzo<sup>1</sup>**, Ms. Jeni Page<sup>1</sup>, Ms. Anne Howard<sup>1</sup>, Dr. Rebeca Wong<sup>1</sup>, Dr. Blake Rasmussen<sup>1</sup>, Dr. Elizabeth Lyons<sup>1</sup>

<sup>1</sup>University of Texas Medical Branch, Galveston, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Effective interventions to increase and sustain Hispanic women's objectively-measured physical activity (PA) are lacking. This review synthesizes existing literature to determine the behavior mechanisms that drive Hispanic women's PA, which is critical for intervention development.

**Methods:** Searches were conducted in January/February 2022 using terms related to Hispanic AND female AND (exercise OR physical activity) in PubMed, CINAHL, SSCI, Cochrane Library and PsychINFO databases. Studies with 100% Hispanic women and an intervention to increase objectively-measured PA published in English in peer-reviewed journals were included without date limitations. Studies with pregnant women and/or chronic conditions were excluded.

**Results:** Searches resulted in 4,374 records after 3,567 duplicates were removed. Seventy-three full-text studies were assessed for eligibility after titles were screened, and one study was identified via reference lists. Thirteen studies met inclusion criteria; however, 9 were unique and 4 provided additional findings (i.e., short-term, long-term, mediation). Sample sizes totaled 2,303 Hispanic women with mean ages ranging 28.4-44.6 years. Most studies included a wide age range for inclusion (18-65 years) and only two limited the range (i.e., 18-40, 35-64 years). Seven studies (78%) included author-specified behavior mechanisms targeted by the intervention and 4 studies (44%) measured and tested for change in 11 different behavior mechanisms. Two studies included mediation analyses (22%) to determine if family participation, family rewards and punishments, friend participation, social support (combined family and friend support), self-efficacy, behavior processes, cognitive processes, and PA enjoyment mediated an increase in PA at 6-months. Family participation, family rewards and punishments, and friend participation were tested again at 12-months. None of the behavior mechanisms included in a mediation analysis were in >1 study. Only family participation and self-efficacy mediated PA at 6-months ( $p<.05$ ) and none mediated PA at 12-months.

**Conclusions:** There was limited evidence that family participation and self-efficacy may mediate short-term improvements in PA among Hispanic women. Future PA interventions should be designed to target, measure, and test behavior mechanisms to determine which mediate short-and long-term improvements in PA. Otherwise, it is impossible to optimize PA interventions to include only the critical intervention components necessary to effectively increase Hispanic women's PA.

# Psychological Needs Satisfaction, self-determined motivation and physical activity in Chinese college athlete: comparison across gender and competition level

**Dr. Yan Liang, Dr. Yan Liang**

<sup>1</sup>East of China Normal University, Shanghai, China, <sup>2</sup>Université Rennes 2, Rennes, France

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** This study applies self-determination theory to test the relationships amongst basic psychological needs, level of self-determined motivations and physical activity in Chinese college athletes.

**Methods:** A total of 301 Chinese college athletes aged between 18 to 25 completed a test battery on motivational aspect based on self-determination theory. International physical activity questionnaire was used to measure the physical activity in leisure-time and exercise training. The Exercise Regulation Questionnaire-2 and the Psychological Needs Satisfaction Scale are completed to access exercise motivations and three basic psychological needs in sports context.

**Results:** Structural Equation Model analyse results indicate that self-determined motivations mediate the relationships between basic psychological needs satisfaction and physical activity. For leisure-time physical activity, autonomy ( $\beta=0.056$ ,  $p=0.019$ ; Bootstrap 95% CI = 0.012—0.102), competence ( $\beta=0.043$ ,  $p=0.019$ ; Bootstrap 95% CI = 0.005—0.098) and relatedness ( $\beta=0.029$ ,  $p=0.019$ ; Bootstrap 95% CI = 0.005—0.061) positively predict physical activity in leisure time through autonomous motivation. For training exercise, autonomy ( $\beta=0.043$ ,  $p=0.004$ ; Bootstrap 95% CI = 0.013—0.082) positively predicts physical activity in training exercise through controlled motivation, and competence ( $\beta= -0.025$ ,  $p=0.049$ ; Bootstrap 95% CI = -0.063—0) and relatedness ( $\beta= -0.043$ ,  $p=0.004$ ; Bootstrap 95% CI = -0.078—-0.012) negatively predict physical activity in training exercise through controlled motivation. Moreover, multi-group analysis results reveal that relationship between autonomous motivation to leisure-time physical activity ( $\Delta\chi^2=3.877$ ,  $df=2$ ,  $p=0.049$ ) is stronger for male college athlete ( $\beta=0.179$ ,  $P<0.05$ ) than female college students ( $\beta= -0.038$ ,  $P>0.05$ ), and the relationship between relatedness to controlled motivation ( $\Delta\chi^2=3.2947$ ,  $df=4$ ,  $p=0.007$ ) is stronger for low competition level college athletes ( $\beta=0.197$ ,  $P<0.01$ ) than high competition level athletes ( $\beta=0.136$ ,  $P>0.05$ ).

**Conclusions:** Our findings support the applicability of SDT in understanding the physical activity in Chinese college athletes, and further distinguish the different SDT process in physical activity between leisure-time and training contexts. Gender and competition level difference also moderated mechanisms among SDT process. Future recommendations are related to the further examination of potential differences in various sports contexts, as well as the different mechanism on the other demographic characteristics.

# Food as a way of learning and integration: the experience of the "Healthy Start" initiative in Oslo

Associate Professor Laura Terragni<sup>1</sup>, Associate Professor Gun Roos<sup>1</sup>

<sup>1</sup>OsloMet, Oslo, Norway

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Food is an important part of our everyday life, identity, and wellbeing. Food can create social ties and enhance belonging to a new place. Immigrant populations often encounter social and health challenges in their resettlement process. Promoting food related initiatives among immigrant populations may facilitate integration and adoption of healthier diets in a new food environment. The aim of this project was to use the "Healthy Start" food and nutrition communication in a Norwegian as second language course for immigrants population striving to enter the labor market to improve language skills and familiarity with nutrition recommendations.

**Methods:** A class consisting of 11 women and 1 man, aged 19-55 years participated in a 5-week nutrition education programme, divided of 10 classes. In addition to using theoretical parts of the Healthy Start education material we invited the class to share recipes of dishes that common in their homes and to participate in creating a recipe booklet in Norwegian. We used participant observation and qualitative interviews in the Healthy Start to evaluate outcomes of participating in the course.

**Results:** Food was a topic that all participants could relate to and sharing their experiences with food enhanced participation and learning. By sharing their food and recipes the participants seemed to strengthen their language and communication skills. "Healthier adaptation" of their original recipes and awareness about use of healthier alternatives emerged. Sharing their own food culture with others created stronger networks between the participants to the course.

**Conclusions:** Combining nutrition and language education can enhance language skills awareness on healthy eating. Replicating and scaling up this or similar initiatives may contribute to build capacity in a supportive learning environment and facilitate intercultural communication and integration.

# Digital Solutions to Improve Healthy Food Access in Food Pantries

Dr. Joel Gittelsohn<sup>1</sup>, Dr. Daniel Barnett<sup>1</sup>, Ms. Samantha Sundermeir<sup>1</sup>, Dr. Nina Martin<sup>2</sup>, **Ms. Emma Lewis<sup>1</sup>**, Ms. Bengucan Gunen<sup>3</sup>, Dr. Melissa Reznar<sup>4</sup>, Ms. Lisa Poirier<sup>1</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA, <sup>2</sup>Johns Hopkins Applied Physics Laboratory, Laurel, USA, <sup>3</sup>Drexel University Dornsife School of Public Health, Philadelphia, USA, <sup>4</sup>Oakland University School of Health Sciences, Oakland, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Food pantries play a key role in addressing food insecurity and food access challenges in the United States. The covid-19 pandemic exacerbated many limitations of the charitable food system, including the need to offer safer means of food distribution, vulnerability of older pantry volunteers, and key gaps in situational awareness by emergency managers. We sought to identify: (1) what forms of support food pantry workers need in order to safely and effectively do their jobs; (2) what digital strategies food pantry directors currently use for pantry management; and (3) what mobile app features would support food pantries, and address other food supply chain/donor challenges?

**Methods:** We report on three interrelated activities: (1) a food pantry intervention conducted mostly pre-COVID-19 (Fresh Shelves, Healthy Pantries (FSHP)) in Baltimore; (2) a scoping review that explored the current status of digital applications for food pantries; and (3) a recently funded intervention trial to develop a mobile app for food pantries. Within each phase of the 3-part RCT FSHP intervention (n=7 pantries), a combination of multi-modal change strategies focusing on the target food group for the phase was implemented, including policy, staff education and engagement, and client education and environmental changes. We followed up with a scoping review of digital strategies used to support food assistance programs. Finally, we were recently funded to develop and pilot an app to support food pantries in management of volunteers, client needs, and communications with emergency management officials.

**Results:** FSHP demonstrated feasibility; mean healthfulness scores for intervention client bags significantly increased from 58.2 to 74.9 ( $p<0.001$ ). Our review identified 19 desirable digital features; the most popular feature was online shopping (n=14), followed by inventory management, and client tracking. We have been funded to develop a mobile app and to pilot and evaluate its feasibility and impact on food pantry staff preparedness, stocking, and client uptake of healthful foods and beverages, in 20 food pantries and 360 pantry clients in a RCT.

**Conclusion:** The work of our team with food pantries will support improvements in the charitable food system, potentially leading to improved dietary quality and reduced food insecurity.

# The association between evening physical activity and sleep quality among physically active youth aged 12-17 years from the FLASHE study.

**Ms. Karen Sauve<sup>1,2</sup>**, Dr. Olivia De-Jongh González<sup>1,2</sup>, Dr. Louise C. Mâsse<sup>1,2</sup>

<sup>1</sup>School of Population and Public Health, University of British Columbia, Vancouver, Canada, <sup>2</sup>BC Children's Hospital Research Institute, Vancouver, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Current sleep hygiene recommendations advise against engagement in moderate-vigorous physical activity (MVPA) in the evening; however, few studies have examined how engagement in MVPA in the evening relates to sleep among youth. This study examined whether participation in MVPA in the evening (6-10pm) had an effect on sleep quality among 12-17-year-olds who met daily MVPA guidelines (accumulate at least 60 minutes of daily MVPA).

**Methods:** This cross-sectional study is a secondary analysis of data from the FLASHE(1) study. Web-based survey data regarding sleep quality and MVPA timing were collected from 1661 US youth. The analytical sample (N=1416) retained the youth who met the daily MVPA guidelines and the group was split into those who engaged in MVPA in the evening at least 1 night/week versus those who did not. Sleep quality, classified as good or poor, measured whether youth typically slept through the night or were awake for part of the night, respectively. Covariate-adjusted logistic regression models with multiple imputation were used to determine the effect of engaging in MVPA in the evening on sleep quality. Sensitivity analysis examined whether the number of nights youth engaged in MVPA in the evening had a differential impact on sleep quality.

**Results:** The majority (77%) of youth reported participating in evening MVPA at least 1 evening/week and 87% typically experienced good sleep quality. The evening MVPA group included more males ( $p=0.006$ ) and a greater proportion of youth with "almost none or a little" reported sedentary behavior ( $p<0.001$ ). Sleep quality did not significantly differ among those who reported engaging in MVPA at least 1 night/week versus those who did not do any MVPA in the evening. The results did not differ when the number of nights youth reported engaging in MVPA at night was varied (2, 3, 4+ evening MVPA).

**Conclusions:** Our study did not find evidence to restrict opportunities for youth to engage in MVPA to specific times of day. Further work is required to understand the effects of evening MVPA on other objective and subjective sleep attributes in youth and to determine specific behavioural interventions to improve sleep in this population.

# Implementing school meals in Australia: understanding public attitudes

**Prof. Danielle Gallegos**<sup>1,2</sup>, Ms. Emma Esdaile<sup>1,2</sup>, Ms. Alexandra C. Manson<sup>3</sup>, Dr. Brittany Johnson<sup>3</sup>, Prof. Rebecca Golley<sup>3</sup>

<sup>1</sup>School of Exercise and Nutrition Sciences, Queensland University of Technology, Brisbane, Australia,

<sup>2</sup>Woolworths Centre for Childhood Nutrition Research, Queensland University of Technology, Brisbane,

Australia, <sup>3</sup>Caring Futures Institute, College of Nursing and Health Sciences, Flinders University, Adelaide, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Australia is one of only a few high-income countries that has not implemented comprehensive, universal school meals. Historically the issue is divisive but as concerns over the growth and wellbeing of children and young people continue, school meals are being viewed as an opportunity to support both health and education outcomes. Creating a paradigm shift in policy approaches requires an understanding of public attitudes. This research explores the discourses circulating on online media sites in response to increasing calls to provide school meals in Australia.

**Methods:** Reader comments on 'comment boards' attached to school meal relevant articles published on Australian news and current affairs websites, and their reposting on social media, were analysed for public discourses. The primary question was "How do readers represent the 'solution' of school meals?" and "Are school meals encouraged or rejected?". Articles were reviewed from January 2017 to December 2022. Analysis included preliminary coding of comments for major themes using the Framework method. These themes were further analysed using critical discourse analysis and interpretive affective-discursive analysis for the presence of emotion.

**Results:** Preliminary findings indicate predominant themes related to "shifting responsibility for feeding children from parents to state"; "impacts on children"; and "protecting child, parent and teacher agency". Like school food in general, the implementation of school meals in Australia remains divisive.

**Conclusions:** Transformational policy change faces many barriers, not least the elusive synergy between public and political will. This research highlights the need to understand the underpinning public discourse and to specifically address these when promoting national debate regarding school meals. For school meals in Australia to be implemented the concerns of the public, including students, parents, teachers, tax-payers need to be taken into consideration.

# The effect of sport on health in people aged 60+: a systematic review and meta-analysis

Dr. Juliana Oliveira<sup>1,2</sup>, Dr. Stephen Gilbert<sup>1,2</sup>, Dr. Marina B Pinheiro<sup>1,2</sup>, **Prof. Anne Tiedemann<sup>1,2</sup>**, Dr. Liane B Macedo<sup>3</sup>, Miss Laisa B Maia<sup>4</sup>, Miss Wing S Kwok<sup>1,2</sup>, Associate Professor Leanne Hassett<sup>1,5</sup>, Prof. Cathie Sherrington<sup>1,2</sup>

<sup>1</sup>Institute for Musculoskeletal Health, The University of Sydney and Sydney Local Health District, Sydney, Australia, <sup>2</sup>Sydney School of Public Health, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia, <sup>3</sup>Faculty of Health Sciences of Trairi, Universidade Federal do Rio Grande do Norte, Santa Cruz, Brazil, <sup>4</sup>Department of Physiotherapy, Universidade Federal dos Vales do Jequitinhonha e Mucuri, Diamantina, Brazil, <sup>5</sup>Sydney School of Health Sciences, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** To summarise the evidence of benefits of sport for health among people aged 60+.

**Methods:** We conducted a systematic review and meta-analysis of randomised controlled trials (RCTs). Data Sources included Medline, CINAHL, SPORTDiscus, the Physiotherapy Evidence Database from inception to April 2021. Studies were selected for inclusion if they were RCTs investigating the effect of any type of sport on health-related outcomes in people aged 60+ compared to non-active control, no intervention or usual care. The outcomes of interest included physical activity, social functioning (participation), physical functioning, cognitive and emotional functioning, well-being and quality of life. We calculated pooled effect sizes using random-effects models. Standardised mean differences (SMD) and mean difference (MD) were calculated. The GRADE system was used to assess the certainty of the evidence for analyses with  $\geq 3$  studies.

**Results:** Nine trials (628 participants) reported in 15 articles were included. Participation in sport improved cardiorespiratory fitness ( $n=5$  trials; MD=2.07ml.kg/min, 95% CI 0.89ml.kg/min to 3.25ml.kg/min; low certainty evidence), physical function ( $n=4$ ; SMD=0.62, 95% CI 0.05 to 1.18; very low certainty evidence), fat mass ( $n=6$ ; MD=0.99kg, 95% CI 0.30kg to 1.39kg; low certainty evidence) and mental health ( $n=2$ ; SMD=0.28, 95% CI 0.06 to 0.51) among older people. We found no significant effects of sport on overall physical activity participation, strength, balance, lean mass, and bone mineral density (BMD). One study investigating quality of life reported a positive, but non-significant effect of sport. No studies investigated social functioning as an outcome. Three trials reported no adverse events (AEs), but most trials reported AEs and sport injuries (67% trials), and the average incidence was 249 injuries per 1000 hours of exposure, which is high but expected for older population.

**Conclusions:** Sport may have a positive impact on health outcomes in people aged 60+. There was uncertainty on the effect of sport on strength, balance, lean mass and BMD. Further research is needed to investigate the optimal type and dose of sport to maximise the long-term benefits among older people. Sport organisations should take into consideration appropriate injury prevention strategies when promoting sport participation among older people.

# Is parenting confidence associated with child physical activity, self-regulation and temperament in young children?

**Ms. Cynthia Smith<sup>1</sup>**, Dr. Susan Paudel<sup>1</sup>, Dr. Jill Hnatiuk<sup>1,3</sup>, Dr. Sharinne Crawford<sup>2</sup>, Dr. Kylie Hesketh<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition, Deakin University, Burwood, Australia, <sup>2</sup>Judith Lumley Centre, La Trobe University, Bundoora, Australia, <sup>3</sup>Manitoba Centre for Health Policy, University of Manitoba, Winnipeg, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Previous research suggests that confident parents utilise more positive parenting practices, and may have more active children. However, there is limited evidence on how child characteristics may be related to parents' general and physical activity-specific parenting confidence. This study investigated associations between child characteristics and physical activity (PA) levels, and mothers' general, and PA-specific parenting confidence.

**Methods:** Baseline data from 909 mothers of 2-year-old children in the Let's Grow randomised controlled trial were utilised (collected Feb 2021-May 2022). Children's PA was measured using both parent-report (time spent in active play) and device-assessed (ActiGraph GT3X+ accelerometers worn for  $\geq 4$  days) methods. Child self-regulation (SR) was measured using a four-item scale adapted from the Fast Track Project; child temperament was measured with two questions adapted from the Child Temperament Project. Higher scores for SR and temperament indicated fewer problematic traits. General parenting confidence was assessed using the 16-item Me-as-a-Parent scale. PA-specific parenting confidence was assessed using a previously developed four-item scale. Higher scores on both scales indicated greater confidence. Linear regression adjusted for mothers' age, education and other siblings assessed associations for device-assessed and self-reported activity.

**Results:** Total weekly child PA was 218 ( $\pm 33.47$ ) minutes and 919.60 ( $\pm 315.78$ ) minutes for device-assessed and parent-report respectively. Device-assessed activity was positively associated with PA-specific parenting confidence ( $\beta=0.01$ , CI95=0.00,0.10), but not general parenting confidence. For every ten-minute increase in parent-reported child PA there was a small but significant increase in both general parenting confidence ( $\beta=0.01$ , CI95=0.00,0.03) and PA-specific parenting confidence ( $\beta=0.03$ , CI95=0.02,0.04). Child SR was positively associated with general ( $\beta=1.89$ , CI95=1.62,2.15) and PA-specific parenting confidence ( $\beta=0.27$ , CI95=0.14,0.40). Child temperament was also positively associated with general parenting confidence ( $\beta=2.29$ , CI95=1.94,2.63) and PA-specific parenting confidence ( $\beta=0.17$ , CI95=0.11,0.34).

**Conclusions:** This study suggests that child characteristics and PA levels may have an impact on both general and PA-specific parenting confidence among mothers. Higher self-regulation abilities in children may result in more confident mothers who are able to utilise more positive parenting practices, and promote more PA for their children, however, longitudinal or intervention designs are required to confirm this.

# Changes in nutrition knowledge, eating behaviors and sedentary activities among World Trade Center Responders with PTSD Participating in a Nutrition Intervention

**Dr. CHRISA ARCAN<sup>1</sup>**, Dr. Wei Hou<sup>2</sup>, Ms. Xiaohua Yang<sup>2</sup>, Ms. Kathryn Hughes<sup>2</sup>, Ms. Amanda Reichardt<sup>2</sup>, Dr. Sean A. P. Clouston<sup>2</sup>, Dr. Benjamin J. Luft

<sup>1</sup>Virginia Commonwealth University, RICHMOND, USA, <sup>2</sup>Stony Brook University, Stony Brook, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Responders to the 9/11 World Trade Center (WTC) disaster suffer from overweight/obesity and high levels of post-traumatic stress disorder (PTSD). This study examines participant reported changes in nutrition knowledge, home food availability, sedentary behaviors, and physical activity among WTC responders in the WTC-Nutrition intervention with physical activity education.

**Methods:** Longitudinal analysis of data from the WTC Nutrition study, a 10-week pilot randomized controlled trial (MedDiet n=31 vs. Control usual counseling n=31), among WTC responders (age 45-65 years) with PTSD and overweight or obesity (N=62; males: 87%). Data were collected at baseline, post-intervention, and 3-month follow up. Participants completed an online survey assessing multiple psychosocial factors and 14-item Mediterranean diet survey; height/weight and waist circumference were measured and body mass index (BMI) was calculated. For continuous outcomes, between-group comparisons were conducted using nonparametric Wilcoxon rank sum tests, and pre-post within-group comparisons were conducted using Wilcoxon signed rank tests.

**Results:** Both groups experienced significant increase in median Mediterranean Diet score and improvements in waist circumference and body mass index. At baseline, only about one third of participants were knowledgeable about the recommended intake of trans fats or saturated fats and only 6% about fruits and vegetables. The largest improvement from baseline to post-intervention was knowledge about recommended unsaturated fat consumption (14% to 20%). Only 20% and 15% responded correctly on MyPlate recommendations for starchy foods and fruits and vegetables, respectively. At baseline, participants reported spending 6.5 hours/day watching TV with a decrease of 1.5 hours at post intervention. Participants reported spending on average 180 minutes/week engaging in moderate exercise with an increase of 60 minutes/week at follow up.

**Conclusion:** The WTC-HP Nutrition study involved a high-dose remote communication/education coupled with personal counseling targeting nutrition-related personal, behavioral, and home environmental factors including physical activity tips. Both groups showed improvements in their MedDiet score, waist circumference, BMI, nutrition knowledge, healthy food availability at home, and time watching TV and engaging in moderate exercise. A larger study is needed to confirm the findings and examine potential moderating factors.

# Women's empowerment four-years after completing a holistic health program

**Dr. Victoria Chinn<sup>1</sup>**, Ms. Jessica Shaw<sup>2</sup>

<sup>1</sup>Te Herenga Waka/Victoria University of Wellington, Wellington, New Zealand, <sup>2</sup>Te Whatu Hauora/Health New Zealand, Wellington, New Zealand

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** This study explores women's experience of empowerment four years after completing Next Level Health (NLH), a 6-month holistic health program that worked in partnership with women to develop small health-promoting behaviours across the areas of physical activity, sleep, nutrition, eating behaviour, self-care and stress management. Findings from this study respond to the global agenda for women's empowerment and lacking evidence regarding holistic health programs designed for women.

**Methods:** Past participants of NLH (n=55) were contacted 4-years post-intervention and invited to participate in the follow-up study. Participants completed a series of questions as either an online survey (Qualtrics) or interview (Zoom) and received a \$40.00 NZD voucher of their choosing for their time. The questionnaire included 15 open-ended questions that addressed four topics: health, wellbeing and related behaviours; empowerment over health; evaluation of NLH; and any current barriers/needs regarding their health. Women's responses were analysed by thematic analysis guided by the research question, "How have women experienced health-related empowerment since completing NLH?". The survey responses were first reviewed and coded (Nvivo) to identify preliminary themes. The preliminary themes were then further deepened and refined upon reviewing and coding the interview transcripts. This study was approved by the Victoria University of Wellington Human Ethics Committee (#28812).

**Results:** 44 women participated in the follow up study including 34 survey respondents and 10 interviewees. Three themes emerged regarding women's experience of empowerment after NLH: *Strengthening their support networks, ongoing development of health literacy, and constructing their own definition of health.*

**Conclusions:** The resulting themes highlight the importance of women's active role in designing behavioural goals and applying a holistic health perspective. The findings from this study contribute to a small pool of evidence that reports on the long-term impacts of empowering health programmes for women.

# Behavior change for sustainable development through experiential learning approach – getting aware of facilitators and barriers

**Associate Professor Beatrix Alгурén**

<sup>1</sup>University of Gothenburg, Gothenburg, Sweden

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Sustainable development and transformational change have become more critical than ever. Higher education for sustainable development (ESD) aims to achieve that students not only understand sustainability problems but find solutions for them. The purpose of the present study was to increase knowledge on facilitators and barriers of pro-environmental behavior and the impact on experiential learning activity (ELA) for ESD on students learning.

**Methods:** Reports from 39 students on their two-weeks behavior change for SD project were analyzed by the means of thematic content-analysis.

**Results:** Four main areas of behavior change were identified: increased physical activity (connected to less car driving), saving resources (e.g. recycling or less consumptions), sustainable food (e.g. ecological products or less meat consumption) and less screen time. Barriers and facilitators could be internal or external factors and were behavior specific. While *lack of alternatives* was most common barrier for changing food behavior (27%), *sickness* and *weather* were most common barrier for increasing physical activity (27%).

*Strategy/thoughtful planning* was important facilitators for all behavior but mostly named in relation to physical activity and food behavior change (27 and 30%). *Social* factors (e.g. friends, families) could be both facilitating and hindering for almost all behaviors.

**Conclusions:** Through experiential learning with a two-weeks individual behavior change project, students got novel insight and understanding on their individual behavior not only in relation to SD, but also understanding facilitators and barriers for making behavior change happens. This experiential learning project stimulated especially the development of self-awareness competency and not only capacity for change but the actually performance of change.

# Designing physical activity interventions for women aged 50+: a qualitative study of participant perspectives

Ms. Geraldine Wallbank<sup>1,2</sup>, **Dr. Abby Haynes<sup>1,2</sup>**, Prof. Anne Tiedemann<sup>1,2</sup>, Prof. Catherine Sherrington<sup>1,2</sup>, Associate Professor Anne C. Grunseit<sup>3,4</sup>

<sup>1</sup>School of Public Health, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia,

<sup>2</sup>Institute for Musculoskeletal Health, The University of Sydney and Sydney Local Health District, Sydney, Australia, <sup>3</sup>School of Public Health, Faculty of Health, University of Technology, Sydney, Australia, <sup>4</sup>Prevention Research Collaboration, Sydney School of Public Health, The University of Sydney, Sydney, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** This study sought to analyse the perspectives of participants on physical activity in general and the *Active Women over 50* information and support program to optimise the design of physical activity interventions for this demographic.

**Methods:** Twenty women who completed the *Active Women over 50* trial were purposively recruited for maximum variation in age, employment, carer responsibility, medical conditions and physical activity. Individual semi-structured interviews explored their perspectives on physical activity, program components and suggestions for future iterations of Active Women over 50. Data were analysed thematically.

**Results:** Our analysis found that participants' capacity to be physically active was shaped by an interplay of factors operating at individual, social and systemic levels. Four themes relating to physical activity in general and to the program were identified: Age and gender matters, Physical activity is social, Strategising for physical activity and the Self-responsibility discourse. Taking these themes together it seems at this midlife stage, physical activity and program participation was challenged by personal, life-stage, cultural factors and the tension between those factors and a self-responsibility discourse. Social support and finding a suitable strategy for generating and sustaining motivation were deemed integral aspects of being active. Physical activity programs for women aged 50+ need to adopt an integrative approach to promote physical activity as part of overall health and life.

**Conclusions:** A range of strategies is key to supporting women over 50 to be more physically active reflecting the variety of circumstances and levels of agency experienced. Programs could address the diversity of individual circumstances and motivators for physical activity by offering a range of flexible strategies and options, facilitating physical activity social networks, and building in accountability and feedback for being active. Sensitive program framing is critical to engage women supportively in addressing contextual challenges and taking responsibility that avoids self-blame. Such strategies do not need to be resource-intensive but could be incorporated into a scaled program.

# Development and psychometric evaluation of a measure assessing sustainability determinants of evidence-based public health interventions in the early childcare setting

**Mr. Adam Shoesmith<sup>1,2,3</sup>**, Dr. Alix Hall<sup>1,2,3</sup>, Prof. Luke Wolfenden<sup>1,2,3</sup>, Associate Professor Rachel C. Shelton<sup>4</sup>, Associate Professor Serene Yoong<sup>5</sup>, Dr. Cassandra Lane<sup>1,2,3</sup>, Dr. Nicole Nathan<sup>1,2,3</sup>  
<sup>1</sup>University of Newcastle, Callaghan, Australia, <sup>2</sup>Hunter New England Population Health, Wallsend, Australia, <sup>3</sup>Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>4</sup>Columbia University, New York, USA, <sup>5</sup>Deakin University, Burwood, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To develop and psychometrically evaluate a self-report measure of determinants influencing sustainment of evidence-based public health interventions in the early childcare setting from the executive perspective.

**Methods:** The measure was developed across two phases: (1) item development, face and content validity; and (2) psychometric evaluation:

*Phase 1:* Measure domains were informed by constructs from the Integrated Sustainability Framework. The initial item pool was based on review evidence and an iterative process involving eight content experts in the fields of implementation science, psychometrics and education. Item reduction occurred until a comprehensive item list covering relevant framework domains was achieved. Ten content experts, independent of those involved in developing the initial item list assessed content validity. Face validity was assessed by five service delivery experts responsible for implementing public health programs in educational settings, four educators and two educational executives. Items underwent pre-testing by five representatives of the target population to minimise misunderstanding and measurement error through ensuring item clarity, comprehensibility and relevance to the target population.

*Phase 2:* A cross-sectional, national Computer Assisted Telephone Interview survey was conducted with managers or executive staff from early childcare centres across Australia. Participants answered the 29-item measure using a five-point Likert scale, with response options ranging from 1="Completely disagree" to 5="Completely agree". Structural validity, concurrent validity, known groups validity, internal reliability, and floor and ceiling effects will be assessed.

## **Results:**

*Phase 1 (complete):* The initial measure contained 29 items covering four domains of the Integrated Sustainability Framework. Average Scale Content Validity Index was 0.91 indicating high content validity.

*Phase 2 (in progress):* We obtained 482 completed surveys. Full completion of items was 84% (n=405). Preliminary descriptive data found that the lowest scoring domains were Processes (mean=3.8 [0.86]); and Outer Contextual Factors (mean=3.90 [0.96]). Inner Contextual Factors (mean=4.1 [0.77]), and Characteristics of the Intervention (mean=4.2 [0.62]) ranked the highest. Psychometric testing is currently underway.

**Conclusions:** This measure will facilitate more accurate assessment of factors influencing sustainment of interventions in early childcare settings. Such data is essential for developing sustainment strategies and monitoring possible influences of intervention sustainment.

# “Trying to find something that I can stick to”: older people’s perspectives on physical activity and its promotion by health professionals

**Ms. Kate Purcell**<sup>1,2</sup>, Ms. Roslyn Savage<sup>1,2</sup>, Ms. Kerry West<sup>1,2,3</sup>, Prof. Anne Tiedemann<sup>1,2</sup>, Associate Professor Leanne Hassett<sup>1,2</sup>, Dr. Abby Haynes<sup>1,2</sup>, Prof. Cathie Sherrington<sup>1,2</sup>

<sup>1</sup>Institute for Musculoskeletal Health, Sydney Local Health District, Camperdown, Australia, <sup>2</sup>School of Public Health, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia, <sup>3</sup>Physiotherapy Department, The Children’s Hospital at Westmead, Sydney Children’s Hospitals Network, Westmead, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Despite the well-known benefits of physical activity, participation is low and declines with age. Promotion of physical activity by health professionals is effective in increasing participation. We sought to inform the development of implementation strategies to support person-centred physical activity promotion by health professionals. This was achieved by exploring older people’s views and experiences of participation in physical activity, and its promotion by health professionals.

**Methods:** We conducted telephone or video interviews with 14 people aged 50+ years. Participants were recruited from rheumatology departments at two hospitals in Sydney, Australia and from a consumer panel at the University of Sydney. Interviews were recorded and transcribed. Thematic analysis involved three authors developing codes independently, then working to agree on a framework which was used to code all transcripts. Themes were developed collaboratively between authors by reviewing codes and discussing overarching concepts.

**Results:** Five main themes were identified: 1) staying active to maintain a healthy body and mind; 2) searching for suitable options in the face of deteriorating health; 3) enjoyment and social aspects of activity as motivators; 4) staying active - motivation, routine and accessibility; and 5) COVID-19 impacts. All participants agreed that health professionals should routinely promote physical activity to their clients but several queried whether this was feasible given they were overburdened and short of time. Some participants reported advice about physical activity was regularly provided and highly valued, others felt that it was unnecessary because they were already active. Some reported that advice focused only on specific exercises, rather than holistic advice about incorporating physical activity in their daily lives. Preferred strategies to enhance promotion of physical activity by health professionals included better listening skills, collaborative goal setting and better knowledge of and connections to local, age-appropriate physical activity opportunities.

**Conclusion:** Positive health outcomes, enjoyment, social interaction, motivation, routine and accessibility were critical influences to physical activity participation over time. Promotion of physical activity by health professionals was valued. Health professionals could enhance physical activity in older people by employing person-centred behaviour change approaches and providing information and referral to suitable local opportunities.

# Mediating Effect of Health Literacy on the Relationships of Cognitive and Physical Functions with Health-related Quality of Life in Older Adults

**Prof. Bik Chu Chow**<sup>1,3</sup>, Dr. Tuyen V. DUONG<sup>2,6</sup>, Dr. Jojo JIAO<sup>3</sup>, Dr. Holger HASSEL<sup>4</sup>, Prof. Timothy C. Y. KWOK<sup>5</sup>

<sup>1</sup>Department of Sport, Physical Education and Health, Hong Kong Baptist University, HONG KONG, Hong Kong, <sup>2</sup>School of Nutrition and Health Sciences, Taipei Medical University, Taipei, Taiwan, <sup>3</sup>Dr. Stephen Hui Research Centre for Physical Recreation and Wellness, Hong Kong Baptist University, Hong Kong, Hong Kong, <sup>4</sup>Institute of Applied Health Sciences, Coburg University of Applied Sciences and Arts, Coburg, Germany, <sup>5</sup>Department of Medicine & Therapeutic and School of Public Health, The Chinese University of Hong Kong, Hong Kong, Hong Kong, <sup>6</sup>International PhD Program in Medicine, College of Medicine, Taipei Medical University, Taipei, Taiwan

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** In this research, a model of the relationships of cognitive and physical function with health literacy that contributes to the health-related quality of life of older adults in Hong Kong was developed. The hypothesis that health literacy (HL) may act as a partial mediator between cognitive function (CF) together with physical functions (PF) and health-related quality of life (HRQoL) was tested.

**Methods:** Subjects were older adults, between the age of 50 and 80 years, who were recruited through local community centers and social media forum from March to July 2021. Totally, 490 older adults completed the survey. Four survey instruments included the 12-item Short-Form Health Literacy Survey Questionnaire (HLS-SF12) for HL assessment; Montreal Cognitive Assessment (MoCA) for CF; the Senior Fitness Test (SFT) for PF; and the 12-item Short Form Health Survey version 2 (SF-12v2) for HRQoL. Path analysis was conducted to test for the mediating effects of HL on the relationship of CF and PF towards HRQoL, based on the proposed theoretical model.

**Results:** Results indicated that three significant direct effects, including CF predicting PF ( $\beta=.115$ ,  $SE=.012$ ,  $p<.001$ ), PF predicting HL ( $\beta=.101$ ,  $SE=.022$ ,  $p<.001$ ), and HL predicting HRQoL ( $\beta=.457$ ,  $SE=.049$ ,  $p<.001$ ), were observed. Meanwhile, the direct effect of PF for predicting HRQoL ( $\beta=.150$ ,  $SE=.025$ ,  $p<.001$ ) as well as its indirect effect for predicting CL ( $\beta=.046$ , 95% CI [.028, .067]) were significant.

**Conclusion:** In conclusion, the hypothesized mediational model highlighted the effect of health literacy on improving older adults' health-related quality of life under the influences of both cognitive and physical functions together was supported. Further empirical research and health promotion intervention programs that aim to improve health literacy that leads to better quality of life for the elderly population are viable.

# Population health survey findings of childhood overweight and obesity, and child and family healthy lifestyle behaviours, in a disadvantaged multi-cultural community in Sydney, Australia: data to inform the 'Growing Healthy Kids in South West Sydney (SWS)' intervention

**Dr. Margaret Thomas**<sup>1</sup>, Ms. Michelle Camilleri<sup>2</sup>, Dr. Shanley Chong<sup>4</sup>, Dr. Vilas Kovai<sup>3</sup>, Prof. Bin Jalaludin<sup>3</sup>, Ms. Mandy Williams<sup>3</sup>

<sup>1</sup>The University of Sydney, Sydney, Australia, <sup>2</sup>Nepean Blue Mountains Local Health District, Sydney, Australia, <sup>3</sup>South Western Sydney Local Health District, Sydney, Australia, <sup>4</sup>Western Sydney Local Health District, Sydney, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** South West Sydney (SWS) with around 900,000 people has many migrant and refugee families and high socioeconomic (SE) disadvantage. With no reliable, comprehensive information available, a population-based cross-sectional telephone survey of parents/carers of children 5-16 years gathered data on overweight and obesity, child and family healthy lifestyle behaviours, perceptions and attitudes, to inform an eight-year community-based intervention.

**Methods:** The survey identified SWS families with children 5-16 years using a randomly generated mobile telephone sample frame. 1815 parents/carers answered 70 questions, and 692 of these 30 additional questions about: child's weight and height, demographics, child and family lifestyle behaviours, perceptions and attitudes. Descriptive analyses using SAS examined associations of BMI and demographic factors with attitudes, perceptions and behaviours. Data were weighted to the SWS population.

**Findings:** Overweight was 19.7%, obesity 17.6%, and combined 37.3%, significantly higher than the NSW average (23%). 51.1% of children were a healthy weight. Low SE status was associated with higher obesity, and overweight and obesity combined: 53% in lowest income household, 32.7% for highest income (95% CI: 27.3-38%). No SES differences were found for overweight.

88% of parents reported their child's diet as healthy but 39% of children ate packaged snack foods  $\geq 1$  per day and 18% drank  $\geq 1$  cup discretionary drinks per day, higher for low SES children. Obese children were more likely to be offered snacks as a reward and their parents more likely to report intending to reduce child's snacks and drinks. 50% of parents of obese children reported that the child was a healthy weight.

76% of children did not meet physical activity guidelines and overweight children were the least active. 79% met screen guidelines but data may be limited by parent self-report. Only 12% of obese and 9% of overweight children had attended an appointment for weight issues.

**Conclusions:** Rates of overweight and obesity, and unhealthy lifestyle behaviours are high, particularly among low SES SWS children and families. The results have informed the 'Growing Healthy Kids in SWS' intervention, designed to provide more support for parents and work with communities to improve children's healthy eating and physical activity behaviours.

# A comparison of the lower gut microbiota of physically active vs physically inactive community dwelling older adults

**Miss Catarina Ramos**<sup>1</sup>, Dr. Daniele Magistro<sup>1</sup>, Miss Nicola Camp<sup>1</sup>, Miss Anya Whitham<sup>1</sup>, Dr. Will Kinnear<sup>1</sup>, Dr. Kirsty Hunter<sup>1</sup>

<sup>1</sup>Sport, Health and Performance Enhancement (SHAPE) Research Centre, Department of Sport Science, Nottingham Trent University, Nottingham, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** The gut microbiota (the trillions of microorganisms present in the digestive tract) has the ability to shape metabolism, influence other organs and affect several physiological processes. Its composition and functionality change throughout the lifespan and, as the host ages into older adulthood, its composition deviates towards a less healthy one, with higher abundance of pathogens and reduced abundance of health-related bacteria (dysbiosis). Previous studies have shown that physical activity (PA)/exercise can alter the gut microbiome composition towards a healthier one, however, little is known about its effects in older adults, healthy or otherwise. Therefore, the aim of this study was to compare the gut microbiome of physically active vs physically inactive healthy older adults and to observe if there are any associations between body composition, active lifestyle and the gut microbiome composition.

**Methods:** This observational, cross-sectional study involved 100 healthy, community dwelling, UK older adults aged between 65- 85 years. Participants completed two questionnaires: a health questionnaire and a Food Frequency Questionnaire (FFQ). They then visited the laboratory and a series of tests were undertaken: a fasted fingerprick blood sample was taken to analyse the plasma lipidic profile, C-Reactive Protein, and glucose homeostasis; a faecal sample to assess the lower gut microbiota composition using 16s rRNA sequencing; several functional tests and a 6-minute walking test to assess physical function, mobility and cardiorespiratory fitness. Participants then wore an accelerometer for 7 days to monitor their physical activity levels and sedentary time.

**Results:** Data analysis is underway and will be presented at the conference.

**Conclusions:** The results of this study will add to our understanding of whether an active lifestyle is associated with the gut microbiota composition of older adults. The ultimate aim of this research theme is to determine if we can use PA as a tool to promote healthy ageing via the gut microbiome, therefore improving the quality of life of this population.

# Developing and pilot-testing an intergenerational, cognitively enriched lifestyle intervention for MCI-patients and their (grand)children

**Dr. Julie Latomme<sup>1</sup>**, Dr. Tim Van Langenhove<sup>2</sup>, Prof. Greet Cardon<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Ghent University Hospital, Ghent, Belgium

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** In 2018, 50 million people were affected with dementia and this is forecasted to triple by 2050. An important way to “curb this tidal wave of dementia” is to prevent cognitive decline in high-risk groups such as older adults with mild cognitive impairment (MCI). Recent work has shown that the combination of PA and cognitive activity may have beneficial effects on older adults’ cognitive health, but studying new and effective ways to do so in MCI-patients is needed in dementia prevention. An intergenerational program (IGP) involving old and young generations together in one program might be an innovative and effective strategy. Only a few IGPs have been used to promote PA and most of them lack a theoretical basis or do not sufficiently meet the target groups’ needs. This study aims to develop and pilot-test a novel IGP for MCI-patients to improve their cognitive, physical and psychosocial health.

**Methods:** The IGP will be developed using a theoretical framework in combination with a co-creation approach, actively involving MCI-patients in the intervention development. More specifically, ten interviews will be conducted with MCI-patients in which two existing interventions will be presented and evaluated: (1) an intergenerational PA lifestyle intervention for grandparents (65+) and their grandchildren, (2) a cognitively enriched walking intervention for older adults. Based on the information gathered in these interviews, one of these two interventions (or a combination of both) will be adapted to MCI-patients, using the ADAPT guidance as the theoretical framework. Qualitative data-analysis in NVivo will be conducted to evaluate the interviews. Thereafter, the program will be pilot-tested which will provide in depth information on its feasibility and acceptability. In this way, the program can be further fine-tuned and optimized before conducting an RCT.

**Results:** No results are available yet, as the development and pilot-testing of the intervention will take place in February-March 2023 and May-June 2023, respectively. The first results will be available in April 2023.

**Conclusion:** This study aims to develop and pilot-test an intervention that aims to improve cognitive, physical and psychosocial health in MCI-patients which might have important implications for future research.

# Reaching and Engaging Parents with Parental Feeding and Child Nutrition Information on Facebook: A Retrospective Content Analysis

**Dr. Maria Henström**<sup>1,2</sup>, Ms. Tayla Esplin<sup>3</sup>, Ms. Emma Schwartzkoff<sup>2,4</sup>, Dr. Kerith Duncanson<sup>2</sup>, Dr. Gordana Popovic<sup>3</sup>, Mr. Richard Ball<sup>2,4</sup>

<sup>1</sup>Karolinska Institutet, Huddinge, Sweden, <sup>2</sup>University of Newcastle, Callaghan, Australia, <sup>3</sup>University of New South Wales Sydney, Sydney, Australia, <sup>4</sup>Mid North Coast Local Health District, Port Macquarie, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Online social platforms are potentially useful for disseminating public health interventions, especially to parents who seek child nutrition information online. However, to optimise social media interventions, health professionals need to understand how to reach and engage the target audience. The Parents in Child Nutrition Informing Community (PICNIC) peer-education nutrition program uses social media to educate parents/carers of young children (0-2 years) about feeding practices that influence children's eating behaviours. Four or five posts per week are shared on the PICNIC Facebook page (>2'000 followers in Apr-2022). This study aimed to describe PICNIC's social media post characteristics, and identify features that determine post performance in terms of organic (non-paid) reach and engagement.

**Methods:** Post performance data were exported from the PICNIC Facebook page for posts uploaded from Jan-2020 to Apr-2022. Intervention posts (n=436) were evaluated in an iterative coding process using an eleven-domain social media coding framework adapted from existing frameworks/tools to fit PICNIC's content and strategies. Associations between coded post characteristics and organic reach (number of users reached) and engagement (comments/shares/reactions/clicks) were explored using the Least Absolute Shrinkage and Selection Operator (LASSO) regression method in R. Page followers at time of posting were included in the analyses to account for program growth over time.

**Results:** Photo format posts reached more users than video posts, but video posts drew 36% more silent engagement (clicks) than photo posts. Posts based on original content had higher reach than re-posted or re-shared posts. Posts linking to the PICNIC website were associated with lower reach. Post characteristics that were independent positive predictors of user engagement included original posts, instructive communication techniques, and feeding messages about food restriction or fussy eating. Instructive posts (using illustrative 'how-to' messages) had 22% higher total engagement compared to informative posts.

**Conclusion:** This study identified that parents in an online child feeding program engaged more with social media posts that were instructive or in video-format, with content relating to food restriction or fussy eating. Social media platforms evolve constantly, so eHealth interventions utilizing these platforms require continuous post performance evaluation to optimise reach and engagement with the target audience.

# Early years practitioners' perspectives on the use of interactive electronic technology in young children: a qualitative study

**Dr. Liane B. Azevedo<sup>1</sup>**, Miss Megan Downes<sup>1</sup>, Dr. Sara Eastburn<sup>1</sup>, Prof. Paul Bissel<sup>2</sup>

<sup>1</sup>University of Huddersfield, Huddersfield, United Kingdom, <sup>2</sup>University of Chester, Chester, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Interactive electronic devices (IEDs), such as tablets and smartphones, are standard in young children's lives. Evidence on the benefits and adverse impact of IEDs amongst young children is inconsistent. A positive association with literacy development, problem-solving, and self-efficacy has been reported in young children, mainly when the content is co-viewed with parents. However, the evidence on socio-emotional, self-regulatory, and behavioural problems is inconclusive. The aim of this study is to understand and contrast the views of early years practitioners working from nurseries in low and high-income areas on the use of IEDs.

**Methods:** We conducted semi-structured interviews with four early years practitioners (EYP) from two nurseries located in low (n=2) and high (n=2) income areas in the Northwest of England. Managers and EYPs with more than 20 years of teaching experience took part in the interview. The data were analysed thematically using a framework approach.

**Results:** EYPs from both nurseries agreed that interactive electronic devices could be a valuable resource for early years learning to improve vocabulary, particularly for children with special education needs, and to illustrate learning. However, they argued that it should not be used in isolation and requires interaction with humans.

EYPs, particularly from the nursery in the low-income area, felt that interactions between parents and children are "not as high quality" as they used to be, as parents are constantly on their phones. An EYP stated that children learn from parents and the environment, and the lack of interconnection could affect their development. They were concerned that IEDs are used as a "babysitter" when children are distressed rather than "talking through" an emotion. Other concerns were the impact on school readiness and sleep. They highlighted the need for understanding the effect of IEDs on early years development and training for EYPs and parents.

**Conclusion:** EYPs suggest that although IEDs might benefit some areas of children's learning, frequent parent use of these devices and lack of interaction with the world might affect children's social and emotional development. Further studies should focus on understanding IEDs on development outcomes in the early years.

# Dance On: A Mixed-method Study into the Feasibility and Effectiveness of a Dance Programme to Increase Physical Activity in Adults and Older Adults

## activity levels and wellbeing in adults and older adults

**Dr. Sarah Astill**, Dr. Laura Britten, Dr. Ilaria Pina, Dr. Camilla Nykjaer

<sup>1</sup>University of Leeds, Leeds, United Kingdom

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** A. Ageing

**Purpose:** Physical activity (PA) has beneficial effects on physical and mental health outcomes in older adults. However, a consistent decline in PA participation has been noted with increasing age, with older adults consistently being reported as the least physically active population. Previous evidence showed that dance is an appropriate form of PA in older adults as it integrates body's movement with physical, cognitive, and social elements. This study investigated the feasibility and efficacy of a weekly dance programme over a 12-month period on PA levels and wellbeing.

**Methods:** A mixed-method intervention design was used. Community-dwelling older adults aged 55+ years were recruited from local community groups in Yorkshire (UK). The programme comprised of a 60-minute mixed genre dance class per week. Changes with carried forward data in self-reported measures of PA (min/week) and wellbeing with EuroQol visual analogue scale (EQ VAS) across four different time points (baseline, 3, 6 and 12 months) were assessed using the Friedman test. Feasibility was also assessed through class attendance and focus groups (N=6-9) with participants. A thematic analysis of qualitative data was conducted.

**Results:** A total of 685 participants (589-89.1% females and 72-10.9% males) took part in the study. The mean age was  $75 \pm 10$  years, and 38% of the participants were classed as highly deprived as per the index of multiple deprivation. There was a statistically significant increase in both PA ( $X^2(3) = 192.42$ ,  $P < 0.001$ ) and EQ VAS scores across the four time points ( $X^2(3) = 19.66$ ,  $P < 0.001$ ). The mean adherence rate was consistent across the 12-month period of intervention (70%). Themes from the focus groups included reasons for participating in the programme, perceptions of how the dance programme affected the participants, and facilitators to participation in the programme.

**Conclusions:** The good adherence and favourability indicate that the dance programme is feasible as an intervention in community-dwelling participants from socially economically diverse communities. The dance intervention showed a positive effect on PA levels and wellbeing. A randomised-controlled trial with a control group is required to test this intervention further.

# Investigating the impact of an activity-enabling uniform intervention on primary school-aged children's subjective well-being and health-related quality of life: a cluster randomised controlled trial

Dr. Emma Pollock<sup>1,2</sup>, Dr. Nicole Nathan<sup>1,2,3,4</sup>, Dr. Alix Hall<sup>1,2,3,4</sup>, **Ms. Nicole McCarthy<sup>1,2,3</sup>**, Prof. Luke Wolfenden<sup>1,2,3,4</sup>

<sup>1</sup>Hunter New England Population Health, Hunter New England Local Health District, Wallsend, Australia,

<sup>2</sup>Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>3</sup>School of Medicine and Public Health, The University of Newcastle, Newcastle, Australia, <sup>4</sup>Priority Research Centre for Health Behaviour, The University of Newcastle, Newcastle, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Physical activity may improve children's mental health and well-being. However, globally, 81% of youth are not meeting the recommended 60 minutes of moderate-to-vigorous physical activity per day. Despite schools being an ideal setting to improve children's physical activity, many children are forced to wear traditional school uniforms (e.g., dresses, black leather shoes) that may limit their opportunities to be physically active at school. The aim of this study was to explore the impact of an activity-enabling uniform intervention on primary school-aged children's subjective well-being and Health-Related Quality of Life (HRQoL).

**Methods:** A cluster randomised controlled trial was conducted in 13 primary schools in New South Wales, Australia with children in grades 4-6. Schools were allocated to either intervention or control groups (i.e., usual practice) following baseline data collection. Children from intervention schools were asked to wear their existing sports uniform each day at school. Children's self-report subjective well-being was assessed using the 5-item World Health Organisation (WHO) Five Well-Being Index. Raw scores range from 0 (i.e., absence of well-being) to 25 (i.e., maximal well-being), which are converted into a percentage scale. Children's self-report HRQoL was measured using the Child Health Utility 9D (CHU9D), whereby generated scores range from full health=1 to dead=0. Linear mixed models will be used to compare children's subjective well-being and HRQoL between intervention and control groups. Analyses will be performed following intention-to-treat principles. Data is scheduled to be analysed on completion of final data collection (December 2022).

**Results:** Baseline data were collected from 684 children from 13 schools; 637 of which completed data for the well-being and 581 for the quality of life outcomes. The mean age of children (SD) was 9.83 (0.77). At baseline, the mean (SD) score for children's subjective well-being and HRQoL was 65.96 (20.46) and 0.72 (0.22), respectively. Planned analyses will demonstrate differences in subjective well-being and HRQoL between the intervention and control schools at follow-up.

**Conclusions:** Activity-enabling school uniforms is a simple approach that may lead to important benefits for children's school-day physical activity levels as well as broader well-being and HRQoL outcomes.

# The interaction between goal types and goal motives and the subsequent effect on performance and related outcomes.

**Miss Katie Garstang**<sup>1</sup>, Dr. Laura Healy<sup>1</sup>, Dr. Daniele Magistro<sup>1</sup>, Dr. Simon Cooper<sup>1</sup>, Dr. Patricia Jackman<sup>2</sup>  
<sup>1</sup>Nottingham Trent University, Nottingham, United Kingdom, <sup>2</sup>University of Lincoln, Lincoln, United Kingdom

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** While goal setting research has traditionally suggested that challenging and specific goals are beneficial for performance, contemporary evidence has suggested that other goal types might be advantageous under some conditions, such as when pursuing goals related to new, complex tasks. Furthermore, the motivation underpinning goal pursuit (i.e., autonomous and controlled goal motives) has consistently been related to different outcomes relating to goal pursuit. The present study addresses a gap in existing research by examining the interaction between goal types and goal motives, in relation to outcomes such as performance outcomes during a simple and complex task.

**Methods:** Using a between-within (goal type: specific, open, learning x task complexity: simple vs complex) study design, participants, ( $n = \sim 90$ ), will complete the Corsi Block Tapping test (CBT) and the Walking Corsi test (WalCT). The CBT will be completed first to establish a baseline performance score to be pursued during the WalCT. Participants will subsequently be randomly allocated to a specific, open, or learning goal to be pursued in the WalCT, in which they will complete both simple and complex conditions in a counterbalanced order. Before each attempt at the task, participants will report their motives for their goal, perceptions of goal difficulty, importance, efficacy, and expected goal attainment. Following each trial will be completed measures relating to challenge/threat appraisal, future interest to participate, and perceived complexity.

**Results:** Data collection is ongoing. The data will be analysed using a MANOVA to assess the effects of goal types and motives on WalCT performance, future interest to participate, challenge/threat appraisal, and an ANOVA repeated measures, within-between interaction to assess the effect during the simple and complex condition.

**Conclusions:** As one of the first studies to examine goal types in relation to goal motives, the outcomes of this study will enhance how to better performance through effective goal setting. Additionally, the assessment of the interaction between goal types and goal motives under a simple and complex condition offers novel insight into how the context of a task influences goal attainment and one's belief in themselves to complete the task.

# Understanding drop-out from an office-based standing desk intervention: an exploratory investigation

Associate Prof. Philippe Gradidge<sup>1</sup>, **Mrs Merling Phaswana**<sup>1</sup>

<sup>1</sup>University of the Witwatersrand, Johannesburg, South Africa

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The aim of this exploratory study, which has not yet been conducted, is to investigate the perceptions and experiences of a group of standing desk intervention participants that dropped out of the trial.

**Methods:** The site of study will be the University of the Witwatersrand, South Africa. The participants will be convenient sample of adult office workers recruited from the standing desk trial underway at the University of the Witwatersrand, as and when they withdraw from the study. We assume that at least ~40 participants would have dropped out of the intervention arm in the next 6-months. A final sample of 40 would be sufficient to gain insight into the reasons for drop-out from the standing desk intervention. The study has been approved by the Human Research Ethics Committee (Medical), University of the Witwatersrand (ethics certificate number: M190224). The in-depth interviews will be conducted in the early quarter of 2023. Participants will be invited to participate in the in-depth interviews by telephone and email invitation. The researchers will inform the participants of the study's purpose during the telephonic recruitment. We will record the number of participants that are recruited and those participants that are not interested in contributing. During the in-depth interviews, participants will be encouraged to think about facilitators and barriers to participating in the standing desk intervention in their place of employment. A series of interviews will take place until sufficient participant perceptions have been recorded. All in-depth interviews will be recorded with verbal and written consent of the participants on a portable recorder. Transcribed documents will be analysed using Atlas.ti 9, applying the revised coding framework. Codes will be allocated to the transcripts, while the text will be read and reviewed line-by-line for interpretation.

**Conclusions:** We intend to use the data to inform the development of strategies that will more effectively increase the adherence to standing desk interventions and thereby address the problem of prolonged sitting in the South African workplace.

# Effects of a school-based intervention on cognitive functions and mental health in Swedish adolescents - a pilot study

**Dr. Gisela Nyberg**<sup>1,2</sup>, Dr. Susanne Andermo<sup>1,2</sup>, Dr. Lisette Farias<sup>2</sup>, Dr. Björg Helgadóttir<sup>1</sup>

<sup>1</sup>The Swedish School of Sport and Health Sciences, Stockholm, Sweden, <sup>2</sup>Karolinska Institutet, Stockholm, Sweden

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** G. Children and families

**Purpose:** Effective methods are needed to promote mental well-being, prevent mental health problems and to improve cognition in schools. Therefore, the aim of this study was to evaluate the effects of a school-based intervention on cognitive functions and mental health in Swedish adolescents.

**Methods:** This cluster-randomised controlled pilot trial included adolescents aged 14-15 years from six schools (2 intervention/4 control) around Stockholm, Sweden with a variation in socioeconomic background. The intervention was performed during an extended school day, 60 minutes three times per week, during one school year and included: a) physical activities, b) homework support with activity breaks and c) walking and listening to audiobooks. Outcomes were measured at baseline in the autumn 2021 (n=193) and after the intervention in the spring 2022 (n=172). The mental health outcomes, health-related quality of life (HRQoL) and psychosomatic health were measured with questionnaires (KIDSCREEN-27 and Psychosomatic Problems Scale). Cognitive functions (working memory, episodic memory and perceptual speed) were measured by a computer-based test battery. Group differences were analysed with ANOVA analysis, adjusted for baseline values.

**Results:** There was a significant difference between the intervention and control group in perceptual speed for the whole group ( $p=0.036$ , mean difference (MD)=18.8,  $n=171$ ) and for boys ( $p=0.049$  MD=35.2,  $n=83$ ) after the intervention. There were no significant differences between groups in mental health outcomes for the whole group, after the intervention. However, for boys there was a significant difference between groups in psychosomatic health problems ( $p=0.02$ , MD=-2.3,  $n=76$ ). There were no significant differences between groups in the other variables.

**Conclusions:** This pilot study shows positive intervention effects on perceptual speed and psychosomatic health, in particular among boys. A larger randomised study is needed in order to evaluate intervention effects further. Also, the intervention components need to be adapted to better suit girls' needs and preferences.

# Motivational and community approach to physical activity in oncology: creation of a digital platform for patients, professionals and sport partners

**Mr. Rodolf Mongondry<sup>1</sup>, Mrs. Olivia Perol<sup>1</sup>, Mrs. Solène Poirey<sup>1</sup>**

<sup>1</sup>Centre Léon Bérard, Lyon, France

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** The Centre Léon Bérard (CLB), a member of the UNICANCER federation, has created a digital platform dedicated to Adapted Physical Activity (APA), with the main objective of facilitating the follow-up of patients throughout their care and putting them in touch with other patients and the establishment's sports partners in order to develop a community and motivational approach to physical activity.

**Methods:** To carry out this project, we set up three groups of users of the future platform: patients, CLB professionals and sports partners.

We then carried out brainstorming sessions with each group to gather their expectations and needs with regard to the platform. Then, two scoping workshops were set up with digital health experts, motivation experts and representatives of each user group to prioritise the needs.

- → Patients: to have a better visibility on their APA programme, to carry out exercises in autonomy (videos, games, challenges, ...) and to be able to interact with each other, with CLB professionals and partners
- → CLB professionals: develop a tool to facilitate the follow-up and personalisation of the patient's APA programme
- → Partners: to facilitate the transition from hospital to city in the management of the patient, with better communication with CLB professionals and to be more visible to patients

## **Results:**

The launch of the platform is planned for January 2023.

- → Patients will have more resources to be actors of their APA pathway and they will also have the possibility to exchange with their peers according to their needs.
- → For CLB professionals, this tool will facilitate the coordination of the patient's pathway. It will also be a way to encourage patients to practice.
- → Partnerships will be more visible to patients and will have access to patients' previous activity data

The platform will improve the follow-up of patients over time, with a patient file fed directly by the patient and by external partners.

This platform is supported by the Ministry of Health and Sports and will be used by the 17 other UNICANCER establishments.

**Conclusions:** This was developed with an inclusive approach, involving the different users, and opens a new era of digital support in cancer care.

# physical activity patterns and sedentary time in primary schools situated in a low socio-economic status neighborhood in Amsterdam – The Netherlands.

**Dr. Joske Nauta**, Mrs. Mandy Schweitzer, Mrs. Ilse Kat, Mrs. Kirsten Moll, Mr. Kick Koenders, Dr. Mirka Janssen

<sup>1</sup>Amsterdam University of Applied Sciences, Amsterdam, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** In Amsterdam – the Netherlands – we know that children living in low-income households have a lower health status and report lower physical activity levels than their peers in middle- or high-income households. Seven primary schools located in neighborhoods with a low social-economic status are currently developing their own active school using the 'Creating Active Schools Framework'.

This study was conducted to assess the current physical activity and sedentary behavior patterns during and after school of the pupils in these seven primary schools.

**Methods:** In this cross-sectional study, we collect data in seven schools located within an Amsterdam neighborhood with a low social economic status score. Within each school, 4 classes are eligible for participation. Children wear an accelerometer from Monday morning until Friday afternoon to assess physical activity levels. Parents of participating children are asked to complete a questionnaire on baseline characteristics, wellbeing and out of school physical activity behaviors. The mean sedentary time (ST), low physical activity (LPA) time and Moderate to Vigorous physical activity (MVPA) time will be calculated. The association between the outcomes of the accelerometer data and gender and health related outcomes reported by parents will be assessed.

**Results:** The data will be collected between March and May 2023. We will present the average LPA and MVPA during and after school time. The duration of the ST bouts during and after schooltime. And associations between ST, LPA and MVPA and gender and health related outcomes.

**Conclusions:** The results of this study will be used to support local school teams in the development and implementation of local action plans towards a school day that involves less sitting and more physical activity.

# Design and development of a digital mHealth service to support the prevention of overweight and obesity in the first 2000 days.

**Dr. Rachel Sutherland**<sup>1,2,3,4</sup>, Mrs. Nayerra Hudson<sup>2</sup>, Mrs. Tessa Delaney<sup>1,2</sup>, Mrs. Jessica Pinfold<sup>2</sup>, Mrs. Lynda Davies<sup>2</sup>, Mr. Daniel Groombridge<sup>2</sup>, Prof. Luke Wolfenden<sup>1,2,3,4</sup>, Prof. John Wiggers<sup>1,2,3,4</sup>, Dr. Paul Craven<sup>2</sup>, Mrs. Sinead Redman<sup>2</sup>

<sup>1</sup>University Of Newcastle, Newcastle, Australia, <sup>2</sup>Hunter New England Population Health, Newcastle, Australia,

<sup>3</sup>National Centre for Implementation Science, Newcastle, Australia, <sup>4</sup>Hunter Medical Research Institute, Newcastle, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Universal provision of preventive health services for families is a key to optimise health outcomes and prevent the onset of overweight and obesity in the first 2000 days of a child life. Whilst services such as Child and Family Health Nursing Services (CFHNS) are available to support young children's development, ongoing engagement with face-to-face services declines significantly over time. Interventions delivered direct to parent/carer mobile phones (mHealth) presents a significant opportunity to supplement usual face-to-face care and revolutionise delivery of health care at a population level. Despite this, there are currently no mHealth interventions targeting child health and development covering the first 2000 days, implemented as part of routine care in Australia. This presentation outlines the development of an mHealth initiative being delivered universally to parents/carers to support the prevention of overweight and obesity across the first 2000 days. Phase 1 seeks to evaluate the acceptability, feasibility, appropriateness and cost of a highly scalable mHealth service from the perspective of clinicians and parents/carers when delivered as a service embedded within a health organisation.

**Methods:** Designed using the COM-B model of behaviour change, an mHealth (text-message) service has been co-designed by a multidisciplinary team to support parents/carers to make informed health choices aligned to age and stage milestones and consistent with best practice and policy guidelines. The intervention currently supports sustained breastfeeding, introduction of solids, sleep behaviours, developmental and immunization reminders and maternal wellbeing (0-6month phase).

**Results:** Commencing in 2021 as a pilot in five CFHNS the program has been delivered to ~2000 families, capturing 96% of parents/carers of newborn infants. Semi-structured interviews (clinicians) and cross-sectional phone surveys (parents/carers) are in progress to evaluate implementation. Preliminary data indicates high acceptability from a clinician and parent perspective

**Conclusions:** Following formal evaluation the service will be scaled-up at a regional level and expanded to address multiple key health and development outcomes to prevent overweight and obesity from birth to 5 years, with significant potential to tailor content and support screening/early intervention via the mHealth service.

# Perceived barriers and enablers to physical activity behaviour in overweight and obese adolescents: a qualitative analysis informed by the Theoretical Domains Framework and COM-B model

**Dr. Puteri Shanaz Jahn Kassim**<sup>1</sup>, Associate Professor Noor Azimah Muhammad<sup>2</sup>, Prof. Sherina Mohd Sidik<sup>1</sup>, Prof. Cecilia Essau<sup>3</sup>, Prof. Shamsul Azhar Shah<sup>2</sup>

<sup>1</sup>Universiti Putra Malaysia, Serdang, Malaysia, <sup>2</sup>Universiti Kebangsaan Malaysia, Cheras, Malaysia, <sup>3</sup>University of Roehampton, London, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Obesity in adolescence is associated with increased risk of obesity in adulthood and many other adverse health consequences. Physical activity is a modifiable lifestyle behaviour towards prevention of these complications. However, many overweight and obese adolescents are physically inactive due to various personal, social and environmental factors. While there are numerous interventions targeting physical activity in adolescents, few were grounded by underlying behavioural change mechanisms which could determine their effectiveness. Behavioural tools such as the Theoretical Domains Framework (TDF) and COM-B model have been used to understand behaviours for intervention development in order to increase its effectiveness. This study aimed to identify perceived barriers and enablers to physical activity in overweight and obese adolescents using these behaviour change strategies.

**Methods:** Semi-structured interviews were conducted with a purposive sample of thirteen overweight and obese adolescents recruited through social media platforms. Interviews were recorded and transcribed into Atlas.Ti software. Thematic analysis and framework approach were used for data analysis, in which the key themes identified were deductively mapped to the TDF domains and the COM-B constructs.

**Results:** Ten out of fourteen domains of the TDF were found to influence physical activity behaviour in overweight and obese adolescents. Within these domains, important barriers to engage in physical activity behaviour were lack of energy due to excess weight, perceived lack of competence in physical activity, competing interests such as preoccupation with digital devices, lack of family and peer support, lack of motivation to be physically active and environmental influences which limits their participation in physical activity. Important factors reported to enable engagement with physical activity behaviours were having social opportunity to engage in physical activity, enjoyment towards physical activity, having goals and motivation to be physically active and prioritizing time for exercise.

**Conclusion:** Overweight and obese adolescent's capability, motivation and opportunity to engage in physical activity were influenced by a wide range of barriers and enablers, with "social influences" being the most often reported barrier. This study provides a theoretical evidence base towards informing the development of a theory-informed behaviour change intervention to improve physical activity levels among overweight and obese adolescents.

# Applying an Implementation Science Lens to a Women's, Infant, & Children (WIC) Feeding Program Telehealth Intervention: Early Phase Implementation Insights

Mr. Daniel Schultz, MS, RD<sup>1</sup>, Assistant Professor Lauren Au, PhD, RDN<sup>2</sup>, Associate Professor Lisa Gualtieri, PhD, ScM<sup>4</sup>, Prof. Elizabeth Anne Krupinski, PhD, FSIIM, FATA, FSPIE, FAIMBE<sup>3</sup>, Mrs. Danielle Louder, BS<sup>5</sup>, **Assistant Professor Erin Hennessy, PhD, MPH<sup>1</sup>**

<sup>1</sup>Tufts University Friedman School of Nutrition Science and Policy, Boston, USA, <sup>2</sup>University of California, Davis, Davis, USA, <sup>3</sup>Emory University, Atlanta, USA, <sup>4</sup>Tufts University School of Medicine, Boston, USA,

<sup>5</sup>Northeast Telehealth Resource Center, Augusta, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The implementation science field continues to advance; however, limited research has utilized implementation science frameworks to assess Special Supplemental Nutrition Program for Women, Infants, and Children Feeding Program (WIC) interventions. The USDA/Tufts Telehealth Intervention Strategies for WIC (THIS-WIC) applied implementation science frameworks to a collaborative evaluation of seven WIC State Agencies implementing public health telehealth interventions in the U.S.

**Methods:** THIS-WIC worked collaboratively with participating State Agencies to adapt current implementation science frameworks to the WIC program context. Frameworks leveraged included the Consolidated Framework for Implementation Research (CFIR), Expert Recommendation for Implementation Research (ERIC), and Reach, Effectiveness, Adoption, Implementation, and Maintenance (RE-AIM). During the project startup period, seven WIC State Agencies completed an implementation strategies menu tool that provided 46 different implementation strategies from ERIC. WIC State Agencies indicated which, if any, of these 46 strategies they already implemented, planned to implement, did not intend to implement, or needed further discussion with the project team. Each State Agency also created an implementation tracking tool to assess progress by local agency directors and staff.

**Results:** Common ERIC implementation strategies across the seven State Agencies included assessing readiness and identifying barriers and facilitators, conducting local needs assessments, and identifying and preparing champions. During the early phase of the project, common implementation barriers involved low uptake of innovation use, competing priorities for telehealth implementation, and technology-related challenges. Implementation strategies recommended to address barriers included default use of innovation, capturing and sharing local knowledge, and 'reducing friction' to access the telehealth solution to support utilization.

**Conclusions:** The THIS-WIC project adds to the limited implementation science literature in the context of the WIC program. Findings from the early phase of the project can inform WIC and similar maternal and child nutrition programs about potential telehealth implementation barriers and recommend implementation strategies to address these obstacles.

# Associations between functional nutrition knowledge and dietary intake in youth from six countries: findings from the International Food Policy Study

**Ms. Liza Boyar (corresponding author)<sup>1</sup>**, Ms. Christine White<sup>1</sup>, Dr. Lana Vanderlee<sup>2</sup>, Dr. Jasmin Bhawra<sup>3</sup>, Dr. David Hammond<sup>1</sup>

<sup>1</sup>University of Waterloo, Waterloo, Canada, <sup>2</sup>Université Laval, Quebec, Canada, <sup>3</sup>Toronto Metropolitan University, Toronto, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Greater nutrition knowledge is associated with healthier dietary intake. Yet, few studies have employed objective measures of nutrition knowledge to understand patterns among youth, including little cross-country comparisons. Using a simple, functional measure of nutrition knowledge based on level of food processing, this study investigated associations between objective and self-reported measures of nutrition knowledge and indicators of dietary intake among youth in six countries.

**Methods:** National surveys were conducted in 2020 with 12,489 youth aged 10-17 in Canada, Australia, United Kingdom, United States (US), Mexico, and Chile. Participants were shown two products in random order, corresponding to “minimally processed” (apple) and “ultra-processed” (apple-flavoured fruit drink) foods under NOVA classification system, and asked to rate the healthiness of each. Respondents who rated the apple higher than the fruit drink were assigned a “correct” score. Binary regression models examined differences in “correct” responses between countries, and associations with perceived nutrition knowledge, perceived diet healthiness, fruit/vegetable and less healthy (e.g., sugary cereal) food intake.

**Results:** Mexican (96.5%) and Chilean (94.3%) youth were most likely to correctly identify minimally processed food items as “healthier”; whereas correct responses were lower among US (79.6%) youth compared to all other countries ( $p < .001$  for all contrasts). Differences in correct responses were also observed by sex, income adequacy, and BMI ( $p < 0.01$ ). Across countries, perceived nutrition knowledge was inversely associated with correct scores ( $F 83.10$ ,  $p < 0.001$ ). Similarly, respondents at the highest (AOR 0.43  $p < 0.001$ ) and lowest (AOR 0.57  $p < 0.05$ ) ends of perceived diet healthiness had lower odds of obtaining correct scores than those in the middle. Higher intake of less healthy foods (AOR 0.70,  $p < 0.001$ ) and fruits/vegetables (AOR 0.87  $p < 0.001$ ) were likewise associated with lower odds of correct scores.

**Conclusions:** In a simple, functional test, substantial proportions of youth were unable to identify a minimally processed apple as healthier than an ultra-processed apple drink, with notable differences across countries and sociodemographic groups. The observed dissonance between perceived and objective measures highlights the poor reliability of self-reported nutrition knowledge, warranting further refinement of simple objective measures to investigate the complex interplay of nutrition knowledge and dietary behavior.

# Sport participation and accelerometer-measured 24-h movement behaviours among children of rural Northeastern Ontario

**Dr. Bruno da Costa<sup>1</sup>**, Dr. Brenda Bruner<sup>1</sup>, Dr. Graydon Raymer<sup>1</sup>, Dr. Barbi Law<sup>1</sup>  
<sup>1</sup>School of Physical and Health Education, Nipissing University, North Bay, Canada

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** G. Children and families

**Purpose:** When children engage in adequate levels of physical activity (PA) and limit sedentary behaviour (SED), they are likely to experience many health-enhancing benefits. Sports can promote higher levels of PA and can displace SED, promote positive youth development and other social and psychological benefits, while also being fun for children. Children can play sport at different levels, with higher competitive levels being associated with higher training loads and expectations of performance, yet, it is unclear if sport level is associated with higher PA levels and lower SED levels. We explored the associations between the level of sport engagement and accelerometer-measured PA and SED of children from Northeastern Ontario.

**Methods:** 169 students (50.9% male,  $M_{age} = 9.25$  years old) wore GENEActiv accelerometers for 7 days on their non-dominant wrist. They reported the level of sport they engaged in (parent-reported for children in Grade 5 or younger). SED, moderate and vigorous PA (MVPA), and sleep duration were estimated using GGIR. Associations were tested with linear regressions.

**Results:** Participants engaged, on average,  $77.8 \pm 30.6$  min/day in MVPA,  $216.0 \pm 42.0$  min/day in LPA, and  $602.0 \pm 83.8$  min/day in SED. 16.6% reported not participating in sports, 43.8% participated in school intramurals or recreational sports, 11.2% were part of schools sport team, and 16.6% were part of provincial or club competitive teams, with 11.8% reporting engaging in other non-sport PA. Being on a school sports team ( $\beta = 25.4$ , 95%CI 9.0; 41.8) and school intramurals or recreational sports ( $\beta = 15.0$ , 95%CI 2.6; 27.4) was associated with higher MVPA and lower SED ( $\beta = -66.6$ , 95%CI -104.1; -29.2; and  $\beta = -38.5$ , 95%CI -67.0; -10.1, respectively) compared to not engaging in sports. LPA was higher among those who participated in school intramurals or recreational sports, participated on schools sports team, and those in provincial or club competitive levels compared to not engaging in sports.

**Conclusions:** Sports are an important way to promote PA and limit SED among children. Even at a recreational level, the levels of MVPA are as high as more competitive sports levels.

# 'Fear of raising the problem without a solution': why conversations and support for physical activity may not be routinely integrated into cancer care

**Dr. Kajal Gokal<sup>1</sup>**, Dr. Claire Madigan<sup>1</sup>, Prof. Amanda J Daley<sup>1</sup>

<sup>1</sup>Loughborough University, Leicestershire, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** The benefits of physical activity across the cancer continuum for many adult cancers are well established. Previous advice for patients to rest during cancer treatment is now redundant and physical activity during and after treatment has been endorsed by the World Health Organisation. However, physical activity is yet to be routinely implemented into cancer care in many health services around the world. This study explored patients' and healthcare professionals' views about integrating conversations and support for physical activity into routine care during treatment for cancer.

**Methods:** Using semi-structured interviews this study explored the perceptions and practicalities of integrating the routine promotion of physical activity by healthcare professionals within cancer care. Healthcare professionals including oncologists, surgeons and cancer nurses, and patients living with or beyond breast cancer, were invited to take part in online interviews. Snowballing sampling methods were used to recruit both healthcare professionals and patients across the UK. The study was advertised via social media, cancer support groups and newsletters. Data were analysed using inductive thematic analysis.

**Findings:** Four themes captured current practice, perspectives and barriers to integrating conversations and support for physical activity among 12 health care professionals and 15 patients. These were: (1) healthcare professionals feared discussing physical inactivity with all patients without having evidence based resources and knowledge for a solution to the problem; (2) physical activity is only discussed if physically active patients are seeking approval to continue; (3) healthcare professionals and patients had concerns regarding the logistics and practicalities of attending in-person physical activity sessions during cancer treatment; (4) physical activity was perceived as a lifestyle change, rather than having an impact on cancer treatment related outcomes and the potential to reduce risk of recurrence.

**Conclusion:** Many healthcare professionals who offer cancer care are reluctant to raise the topic of participation in physical activity with their patients. Providing healthcare professionals with education regarding the ability of physical activity to reduce the risk of recurrence, along with evidence based, low-cost, remote interventions would allow them to more readily integrate conversations about physical activity within routine cancer care for all patients.

# Exploring Social Media Preferences for Healthy Weight Management Interventions among Adolescents of Color: A Mixed-Methods Pilot Study

Ms. Selenne Alatorre<sup>1</sup>, Ms. Aviva Schwarz<sup>1</sup>, Dr. Kelsey Egan<sup>2</sup>, Ms. Amanda Feldman<sup>1</sup>, **Dr. Monica Wang<sup>1,3</sup>**

<sup>1</sup>Boston University School of Public Health, Boston, USA, <sup>2</sup>Boston University School of Medicine, Boston, USA,

<sup>3</sup>Boston University Center for Antiracist Research, Boston, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Social media holds promise as an intervention platform to engage youth in healthy weight management and target racial inequities in obesity. This pilot study aimed to examine social media habits, preferences, and obesity-related behaviors (e.g., diet, physical) among adolescents of color and identify their preferences for a healthy weight management intervention delivered via social media.

**Methods:** This mixed-methods pilot study comprised of a cross-sectional online survey and a series of virtual focus groups. Study participants (English-speaking youth of color ages 14-18 years) were recruited from high schools and youth-based community settings in Massachusetts and California. For surveys, participants were invited to complete an anonymous online survey assessing self-reported sociodemographics, social media habits and preferences, health behaviors (diet, physical activity, sleep, and screen time), and height and weight. For focus groups, participants were invited to participate in 45-60 minute virtual group discussions assessing social media habits, preferred social media platform, and preferences for physical activity and nutrition intervention content and delivery. Survey data were analyzed descriptively; focus group transcripts were analyzed using a directed content analysis approach.

**Results:** A total of 101 adolescents completed the survey and N=20 adolescents participated in a total of 3 focus groups. Participants reported most frequently using TikTok, followed by Instagram, Snapchat, and Twitter; preference for platform varied by purpose of use (e.g., content consumption, connection, or communication). TikTok emerged as the platform of choice as an engaging way to learn about various topics, including desired health information on physical fitness and diet.

**Conclusions:** Findings from this pilot study suggest that social media platforms can be an engaging way to reach adolescents of color. Data will inform future social media-based interventions to engage adolescents of color in healthy weight management content and test intervention efficacy.

# A six-month mHealth behavior change program increases physical activity and fruit intake, and improves sleep in adults over the age of 18 years

**Associate Prof. Jamie Baum<sup>1</sup>**, Associate Professor Erin Howie Hickey<sup>2</sup>

<sup>1</sup>Center for Human Nutrition, University of Arkansas System Division of Agriculture, Fayetteville, USA,

<sup>2</sup>University of Arkansas, Fayetteville, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** The objective of this study was to determine the effectiveness of a 6-month mHealth behavior change program on healthy diet, physical activity, and sleep in adults over 18 years of age.

**Methods:** This was a Quasi-experimental, repeated measures, mHealth study conducted over six months. All adults over the age of 18 years were eligible to participate. Key components of the study included: 1) direct access to experts in nutrition and exercise sciences, 2) a focus on physical activity and behavior change, 3) personalization to the individual/community, 4) social support through virtual interactions and weekly challenges, and 5) multimedia format to increase accessibility and usability of information. The program was based on Self-Determination Theory (SDT), goal setting theory and the socioecological model. All participants completed an online survey at baseline, 3 and 6 months. The questionnaire was administered via Qualtrics and included previously validated questionnaires on diet (adapted FFQ), physical activity (iPAQ), and sleep (PSQI). To assess the change in behaviors mixed models to account for multiple assessments within individuals were used.

**Results:** 60 people signed up to participate and 21 completed the full study (age  $44.3 \pm 15.8$ ; Sex (F) 17 (81%); BMI  $30 \pm 7.2$ ; number of preexisting health conditions  $2.5 \pm 1.9$ ). Of those completing the full study, 20 participants reported they were ready to make changes in eating and physical activity behaviors at the start of the study. Participants completing the study increased self-reported physical activity (total metmin/week) from  $4,479.4 \pm 1,669.4$  at baseline to  $6,394.6 \pm 2,590.6$  at 6 months, although not significant ( $p=0.680$ ). Fruit intake (servings/day) increased from baseline ( $0.24 \pm 0.09$ ) to 6 months ( $0.57 \pm 0.11$ ;  $p<0.05$ ). However, there was no change in vegetable and junk food intake. Self-reported sleep also improved from baseline ( $5.8 \pm 0.7$ ) to 6 months ( $4.4 \pm 0.7$ ;  $p<0.05$ ) with higher scores indicating poorer sleep quality.

**Conclusions:** Multi-media mHealth programs have potential to change behavior to improve dietary patterns, physical activity, and sleep. Additional research is needed to ensure engagement of participants in long-term behavior change programs. Future research will focus on healthy habits throughout the lifespan.

# Barriers and facilitators of physical activity maintenance: As perceived by adolescents

**Mr. Timothy Houtman**<sup>1</sup>, Assistant Professor Amy Van Grieken<sup>2</sup>, Associate Professor Froukje Sleswijk Visser<sup>1</sup>, Associate Professor Valentijn Visch<sup>1</sup>

<sup>1</sup>Delft University of Technology, Delft, Netherlands, <sup>2</sup>Erasmus Medical Centre, Rotterdam, Netherlands

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Interventions to increase physical activity (PA) in adolescence face major challenges. In addition to the difficulty of influencing PA behavior of adolescents due to increasing autonomy, PA behavior is often not maintained for a long period of time. The aim of this study is to understand the variation and dynamics of lived experiences of adolescents around the barriers and facilitators of maintained PA. This study is a first step in moving beyond one-size-fits-all interventions towards more tailored approaches.

**Methods:** Thirty high school students, aged 14 – 18, were recruited for interviews in Rotterdam, The Netherlands. Based on Q methodology, participants were asked to sort and rank two decks of cards according to personal relevance for a physical activity that they had maintained for longer. Each deck represented barriers or facilitators of adolescent PA behavior, based on previous interviews and systematic reviews. After ranking the items, participants were interviewed about how the items had changed and influenced their PA behavior over time. Next to thematic analysis of the interviews, the ranked items were analyzed using inverted factor analysis to explore the barriers and facilitator clusters.

**Results:** Our preliminary results show that adolescents have common and divergent barriers and facilitators to maintain their PA behaviors. For example, 'having fun', 'being able to be yourself' are recurring facilitators, while life factors such as 'other responsibilities', 'having too many things on my mind' were recurring barriers in the sample. Using inverted factor analysis, we also explore the variety of barriers and facilitators of PA by identifying clusters of barriers and facilitators of adolescents who share similarities. The initial results suggest that the barrier and facilitator clusters are distinct and focus on different domains such as performance, social environment, personal development, and health reasons.

**Conclusions:** The initial findings suggest that some facilitators and barriers for maintaining PA are more universal between adolescents, but others are only relevant to specific groups. The results of this study will be used to design a tailored PA intervention for adolescents. Data analysis is ongoing and the final results will be presented during the event.

# Examining Associations Between Facilitating Health Beliefs, Meeting Vegetable Consumption Guidelines, and Continued Program Participation among Participants in a Produce Prescription Program at a Multi-Site Federally Qualified Health Center in Waco, TX

**Assistant Professor Kathryn Janda**<sup>1</sup>, Ms. Wendy Cox<sup>2</sup>, Dr. Burritt Hess<sup>2</sup>, Dr. Matt Rafalski<sup>2</sup>, Dr. John Gill<sup>2</sup>, Ms. Katie Walter<sup>3</sup>, Ms. Catherine Kaliszewski<sup>1</sup>, Associate Professor Kelly Ylitalo<sup>1</sup>  
<sup>1</sup>Baylor University, Waco, USA, <sup>2</sup>Waco Family Medicine, Waco, USA, <sup>3</sup>World Hunger Farm, Waco, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** There has been strong theory-driven and empirical literature demonstrating the association between facilitating health beliefs and vegetable consumption. However, these associations have been rarely explored simultaneously with program participation in interventions such as produce prescription programs. The purpose of this study was to examine if theory-informed facilitating health beliefs were associated with meeting vegetable consumption recommendations and/or continued program participation in a produce prescription program.

**Methods:** This study was a cross-sectional data analysis of baseline survey and refill data among participants in a produce prescription program at a federally qualified health center in Waco, Texas in 2019 (n=1,679). The baseline survey included seven questions regarding facilitating health beliefs (informed by the Theory of Planned Behavior) of vegetable consumption that were averaged to develop a composite measure. Vegetable consumption was self-reported, and a binary variable was created for meeting United States dietary guideline recommendations. Age, language, and whether the participant obtained refills were also collected. Summary statistics and logistic regression models were used to examine the associations between: 1) facilitating health beliefs and meeting vegetable consumption guidelines; 2) facilitating health beliefs, meeting vegetable consumption guidelines, and obtaining a refill.

**Results:** Participants were, on average, aged 49.66 years (S.D.=19.32), predominantly only English speaking (89.34%), 28.53% met vegetable consumption guidelines, and 11.20% obtained a refill. Individuals with high facilitating health beliefs had greater odds of meeting vegetable consumption guidelines at baseline (aOR:1.43, CI:1.21-1.69,  $p<0.001$ ). Participants who met vegetable consumption guidelines had greater odds of obtaining a refill (aOR:1.85, CI:1.34-2.54,  $p<0.001$ ) than those who did not meet vegetable consumption guidelines. There was no statistically significant association between facilitating health beliefs at baseline and obtaining a refill. Additionally, participants who spoke a language other than English had an indirect association with meeting vegetable consumption guidelines (aOR:0.55, CI:0.37-0.81,  $p=0.003$ ), but a direct association with obtaining a refill (aOR:1.79, CI:1.16-2.77,  $p=0.009$ ) when compared to solely English-speaking participants.

**Conclusions:** This study highlights that dietary interventions, such as produce prescription programs, should be mindful of theory-informed facilitating health beliefs as potential antecedents for nutritional behaviors of interest and sustained program participation.

# Adolescents with ADHD and their encounters with food, meals and physical activity – a qualitative photo-elicitation interview study

**Miss Aleksandra Oravsky Sandström**<sup>1</sup>, Dr. Karin Grahn<sup>1</sup>, Associate Professor Andreas Fröberg<sup>1</sup>, Prof. Christel Larsson<sup>1</sup>

<sup>1</sup>Department of Food and Nutrition, and Sport Science, University of Gothenburg, Gothenburg, Sweden

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Previous studies suggest that adolescents with ADHD may have unhealthy food habits and that they engage in insufficient physical activity. The thoughts and experiences of adolescents with ADHD are of great importance in search of knowledge essential for promotion of healthy lifestyle habits, but their perspectives are absent from the scientific literature. The aim is to explore how adolescents with ADHD experience their daily encounters with food, meals and physical activity, and to identify challenges and positive aspects related to these areas.

**Method:** A purposeful sample of 10 adolescents aged 11-15 with ADHD in Sweden participated in an exploratory, child-centred, photo-elicitation interview study. Participants provided photographs of their encounters with food, meals and physical activity for two days which were used subsequently in 45 minute-interview sessions to facilitate their communication. A background questionnaire completed by the adolescent's caregiver, provided a descriptive layer of information on food, meals and physical activity in the adolescents' daily lives.

The analysis was two-levelled and focused on positive aspects and challenges on intrapersonal, interpersonal, institutional, community and public policy levels. Each interview was regarded as a case of its own on which a within-case analysis was performed separately to allow an in-depth exploration. Thereafter, a joint-case analysis followed where patterns were searched for between the different cases, to identify which experiences cases have in common, as well as what attributes are unique. A qualitative thematic analysis was used to generate themes and patterns within the data, and the socio-ecological model was applied as the guiding framework.

**(Anticipated) Results:** The presentation will focus on the perspectives of the adolescents and their everyday encounters with food, meals and physical activity. Specifically, positive experiences and challenges will be presented. We exemplify how adolescents' experiences of food, meals and physical activity are influenced by many diverse factors and there for suggest that a comprehensive approach is suitable from a health promotion perspective.

**Conclusions:** Drawing on the result of this study, the perspectives of adolescents with ADHD on daily encounters with food, meals and physical activity can help to better inform meaningful health promoting strategies on multiple levels.

# To capture the child's interest- Nurses experiences of Saga Stories in health talks

Ms. Camilla Collan<sup>1</sup>, Ms. Lina Dahl<sup>1</sup>, Dr. Maria Henström<sup>2</sup>, Associate Professor Christine Delisle Nyström<sup>2</sup>, Prof. Marie Löff<sup>2</sup>, **Assistant Professor Susanne Andermo<sup>1,3</sup>**

<sup>1</sup>Department of Neurobiology, Care Sciences and Society, Division of Nursing, Karolinska Institutet, Huddinge, Sweden, <sup>2</sup>Department of Biosciences and Nutrition, Karolinska Institutet, Huddinge, Sweden,

<sup>3</sup>Department of Physical Activity and Health, The Swedish School of Sport and Health Sciences, Stockholm, Sweden

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** As unhealthy lifestyle habits have been found to be established early in life and often track into adulthood, early preventive initiatives are important. Saga Stories is a newly developed material that is intended to be used as a support for nurses at child health care (CHC) centers in their health conversations with children and parents. The aim of this pilot study is to explore how CHC nurses experience the usability of the 'Saga Stories in health talks' material.

**Methods:** This study used a qualitative design. The material Saga Stories in health talks was pilot- tested by 33 nurses working in 11 centers in three regions in Sweden. All nurses were invited to participate in the interviews and 17 agreed. The interviews were transcribed and analysed using content analysis.

**Results:** Three themes and eight sub-themes emerged. The themes were: 1) A focus on healthy living habits directed to children and their families, 2) The health conversations: to capture the child's interest and involve the parents and 3) Challenging structures. Saga Stories was experienced by the nurses as a relevant and sought-after initiative by the nurses, since it had a focus on healthy lifestyle habits. The nurses described the material as well- designed as it helped them to capture the child's interest and increase children's participation in the health talks. In the health talks, the nurses intended to capture the child's interest and involve the parents. Support from colleagues, the researchers, and managers were seen as important facilitators. Challenges included structural factors such as how and when to best use the material, especially concerning that the 4-year visit contained many other mandatory parts.

**Conclusions:** This pilot-study highlights how the material Saga Stories facilitated the health talks with families in CHC with a focus on the children's participation. To use the material at the 5- year routine visit could be as a better option to overcome some identified challenges.

# Physical activity profiles from pre-COVID-19 through the pandemic and their correlates among older adults in Finland

**Dr. Kirsi E. Keskinen**<sup>1,2</sup>, Dr. Katja Pynnönen<sup>1</sup>, Ms. Katja Lindeman<sup>1</sup>, Ms. Essi-Mari Tuomola<sup>1</sup>, Prof. Taina Rantanen<sup>1</sup>, Associate Professor Erja Portegijs<sup>3</sup>

<sup>1</sup>Faculty of Sport and Health Sciences and Gerontology Research Center, University of Jyväskylä, Jyväskylä, Finland, <sup>2</sup>School of Resource Wisdom, University of Jyväskylä, Jyväskylä, Finland, <sup>3</sup>Center for Human Movement Sciences, University Medical Center Groningen, University of Groningen, Groningen, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** The aim is to define developmental physical activity (PA) profiles and their correlates in older adults from pre-COVID-19 through the pandemic. The research questions are: 1) What kind of PA profiles exist, and 2) which individual and environmental characteristics relate to PA profiles? No previous reports on these exist.

**Methods:** Participants were from population-based sample of 75, 80, and 85-year-old community-dwelling people (n=773, mean 78.6 years, 58% women) living in a medium-sized city in Finland. Time in vigorous physical activity (VPA) [min/day] and leisure walking (LW) [min/day] were calculated from self-report Yale Physical Activity Survey pre-COVID-19 (2017-2018), during the Emergency Powers Act (EPA) at-COVID-19 (05-06/2020), and after the EPA (2021-2022). Pre-COVID-19 individual characteristics were collected from registers (age, sex), interviews (number of diseases, depression symptoms (CES-D)) and measurements (lower extremity performance (SPPB)). Environmental characteristics were defined at home location (urban area type (walking/public transport/car-dependent)) or within 1000 meters (residential density) using geospatial datasets. Latent profile analysis generated PA profiles based on combination of VPA and LW in the three successive time-points. Equality of means or probability of categories in the correlates pre-COVID-19 were tested across PA profiles using the modified Bolck-Croon-Hagenaars approach.

**Results:** We found five distinctive PA profiles covering the time-period from pre-COVID-19 through the pandemic: P1 sedentary (46% of participants), P2 walker (9%), P3 moderately active (24%), P4 exerciser (9%), and P5 active (12%) people. PA profiles P3,P4,P5 had a peak value in VPA and P2,P3,P5 in LW during the EPA at-COVID-19. PA profiles with middle/high VPA (P3,P4,P5) had fewer depression symptoms than profiles with low VPA (P1,P2) (overall  $p < .001$ ). SPPB scores were the highest with high VPA (P4,P5) and the lowest in P1 (overall  $p < .001$ ) with more diseases (overall  $p < .001$ ). Of participants with low VPA profiles (P1,P2), P2 (high LW) lived in higher residential density, more walkable, and less car-dependent areas than P1 (low LW) (both  $p < .05$ ).

**Conclusions:** During the EPA at-COVID-19 in Finland, older adults with higher physical capability and fewer depression symptoms reported temporarily higher VPA. Older adults with poorer physical capability accumulated more LW when living in area with more walking supportive infrastructure.

# Food access and dietary quality of low-middle income Chilean children during COVID-19 pandemic. ¿Relevance of personal food environments?

**Ms. Isabel Pemjean<sup>1</sup>**, Dr. Camila Corvalán<sup>1</sup>, Dr. Fernanda Mediano<sup>1</sup>

<sup>1</sup>Universidad de Chile, Santiago, Chile

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** G. Children and families

**Purpose:** We studied the association between external food access and intake quality of middle and low-income children living in similar external food environments in Santiago during the Covid-19 lockdown and how characteristics of their domestic environment affected this relationship. To better understand relations between diet quality and food access, we must consider how people experience their food environments. Could intra-household dynamics (food management, gender and time) be affecting these relationships?

**Methods:** This was a longitudinal study. 999 households from two longitudinal cohorts participated in online surveys during two periods of the Covid-19 pandemic. External food access profiles were developed by Latent Class Analysis. Their domestic environments were characterized by logistical multinomial regressions with food management and routine modifications (produced by Covid-19) variables. The association of food access profiles with children's intake was estimated using logistic and linear regressions adjusted by children's sex and age. These models were adjusted by significant food management and routine modification variables to assess a possible effect of the domestic environment on these relationships. The effects of the crude and adjusted regressions were compared.

**Results:** We identified three external food access profiles: Classic, Multiple, and Supermarket. Compare with the Classic profile, the Multiple profile gathered female heads household's (RRR=1.51; p:0.058) and the Supermarket profile higher income household's (RRR=12.30; p: 0.001) and concentrated the diet protective variables from the domestic environment. The profile's routines were impacted by the Covid-19 lockdown. Children presented poor diet quality (high daily UPFs consumption (mean=4.4), and low compliance with national DGA recommendations (mean=1.2)). The food access profiles were poorly associated with children's diet quality (only to the Supermarket profile compared to the Classic profile, for fish consumption (OR=1.77; p:0.048), and marginally with the overall compliance of DGA (coef.=0.17; p:0.109)). When adjusting the regressions by the routine modification variables we observed that in the Supermarket profile the likelihood of compliance with the DGA increased (overall: coef.=0.22; p:0.049 and fish: OR=1.96; p:0.024).

**Conclusions:** The external food environment cannot explain the quality of children's diets. To better understand barriers to healthy eating, we must consider intra-household behaviors, particularly addressing time issues from a gender perspective.

# Identifying latent classes of physical activity behaviours over time among adolescents in Canada

**Ms. Claire Buchan**<sup>1</sup>, Dr. Sarah Richmond<sup>2,3</sup>, Dr. Kelly Skinner<sup>1</sup>, Dr. Scott Leatherdale<sup>1</sup>

<sup>1</sup>School of Public Health Sciences, University of Waterloo, Waterloo, Canada, <sup>2</sup>Dalla Lana School of Public Health, University of Toronto, Toronto, Canada, <sup>3</sup>Public Health Ontario, Toronto, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** High school physical education (PE) in Canada, is optional after grade 9, however little research has examined how PE participation impacts physical activity behaviours over time. This study aimed to identify the patterns of physical activity behaviours among high school aged youth in Canada.

**Methods:** Using data from the COMPASS Study, a school-based prospective cohort study of adolescents in Canada, Ontario youth who participated in grade 9 PE in 2015-16 were analysed through to 2018-19 ( $n = 1,917$ ) using a repeated measures latent class analysis. Physical activity behaviours which defined the latent classes included PE participation, guideline adherence ( $\geq 60$  minutes/day of moderate to vigorous activity over the last 7 days), and sport participation (varsity, community, and/or intramural). Multinomial logistic regression models were used to examine associations between latent class membership and student characteristics.

**Results:** Three distinct latent classes were identified for females, and four were identified for males. These classes were: 1) Guidelines (defined by high probability of guideline adherence; females: 44%; males: 16%), 2) PE & Sports (defined by high probability of PE and sport participation; females: 33%; males: 43%), 3) Guideline & Sports (defined by high probability of guideline adherence and sport participation; females: 23%; males: 23%), and 4) Inactive (defined by low probability of all physical activity behaviours; males: 18%). Strength training, sleep, and English grade were associated with class membership among females. Ethnicity, weekly spending money, strength training, and English and math grades were associated with class membership among males.

**Conclusions:** These findings suggest that latent class patterns of physical activity behaviours differ by sex. Guideline adherence was the most common class among females, indicating high levels of independent physical activity, whereas PE & Sports was the most common class among males, indicating greater tendency towards organized activities. Additionally, a substantial number of male students were not engaging in any physical activity. Participation in both PE and sports did not necessarily lead to meeting physical activity guidelines, highlighting that these activities alone may not be providing sufficient levels of physical activity that aligns with current recommendations for Canadian youth.

# Healthcare professionals' perspectives on barriers and facilitators to referral and recruitment to diabetes prevention programmes: a systematic review protocol

**Ms. clair Haseldine**<sup>1</sup>, Prof. Patricia M Kearney<sup>1,2</sup>, Dr. Grainne O'Donoghue<sup>3</sup>, Dr. Fiona Riordan<sup>1</sup>, Dr. Sheena McHugh<sup>1</sup>

<sup>1</sup>University College Cork, Cork, Ireland, <sup>2</sup>Health Service Executive, Cork, Ireland, <sup>3</sup>University College Dublin, Dublin, Ireland

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** International guidelines recommend identification, screening, and referral to behavioural programmes for those at high risk of developing diabetes. Despite evidence that type 2 diabetes can be prevented or delayed in those at high risk, many eligible participants are not referred to, or do not participate in diabetes prevention programmes (DPPs). Healthcare professionals (HCPs) can influence a person's decision to participate in DPPs and are pivotal to the referral and recruitment processes. The purpose of this study is to identify, appraise and synthesise the evidence on barriers and facilitators to referral and recruitment to DPPs from the perspective of HCPs.

**Methods:** A 'best fit' framework synthesis method will be used to synthesise qualitative, quantitative, and mixed methods evidence on factors that affect HCPs referral and recruitment to DPPs, with the Theoretical Domains Framework (TDF) as the a priori framework. Peer reviewed publications will be searched for in MEDLINE, EMBASE, CINAHL, PsychINFO, Web of Science and Scopus. Reference lists and citation searches will be performed. Eligible are studies published in English that focus on the HCP perspective of their experiences of referral or recruitment to DPPs. Year of publication will be restricted to the last 25 years (1997 – 2022) when the first of the landmark diabetes prevention studies was published. Quality will be assessed using the Mixed Methods Appraisal Tool. One author will screen, extract, appraise and synthesise the literature while a second author will independently verify a 20% sample at each stage. A third author will be consulted if consensus is required. A mix of deductive coding using the TDF and inductive coding of data that does not fit the TDF will be synthesised into themes representing the whole dataset. The relationships between the final set of themes will be explored to create a new model to understand HCP perspectives on referral and recruitment in DPPs. Sensitivity analysis will be carried out on the conceptual model that is developed.

**Conclusion:** Participation in DPPs is key for programme impact. Understanding the HCPs' perspectives of the barriers and facilitators to identifying, screening, referring and recruiting will inform future implementation of DPPs.

# Evaluating the longitudinal impact of participation in school-based physical education classes on physical activity levels among adolescents in Canada

**Ms. Claire Buchan<sup>1</sup>**, Dr. Sarah Richmond<sup>2,3</sup>, Dr. Kelly Skinner<sup>1</sup>, Dr. Scott Leatherdale<sup>1</sup>

<sup>1</sup>School of Public Health Sciences, University of Waterloo, Waterloo, Canada, <sup>2</sup>Dalla Lana School of Public Health, University of Toronto, Toronto, Canada, <sup>3</sup>Public Health Ontario, Toronto, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The purpose of this study was to evaluate the longitudinal impact that physical education (PE) participation had on moderate-to-vigorous physical activity (MVPA) levels among high school students in Canada, controlling for differences in observed individual characteristics using propensity scores.

**Methods:** This study utilized linked longitudinal data from grade 10-12 students in Ontario over three waves of the COMPASS study. COMPASS is a school-based prospective cohort study (2012-2021) of youth in Canada. Linear mixed models were used to examine associations between PE participation and minutes of MVPA over time, stratified by sex. Models were adjusted using doubly robust propensity score methodology accounting for observed covariates known, or suspected, to influence PE participation. Propensity scores were applied as weights, through inverse probability of treatment weighting. Standardized mean differences were used to assess covariate balance before and after weighting.

**Results:** Overall, 988 female and 872 male students were included. Female and male students who participated in PE during the semester of data collection reported on average 27 (95% confidence interval (CI): 21 to 34) and 36 (95% CI: 29 to 43) additional minutes of MVPA per day, respectively, compared to those who did not participate in PE that year. Female and male students who participated in PE during the opposite semester of data collection report, on average, 10 (95% CI: 3 to 17) and 15 (95% CI: 7 to 22) additional minutes of MVPA per day, respectively, than students who did not participate in PE that year. Female and male students in grade 12 report on average 6 (95% CI: -11 to -1) and 10 (95% CI: -15 to -4) fewer minutes of MVPA per day, respectively, than grade 10 students.

**Conclusions:** Findings suggest that PE participation in high school has a significant impact on MVPA levels over time. Effects appear to be more pronounced among male youth and are greatest during the semester of PE participation. However, effects are still present even when PE participation is not concurrent with data collection. Canadian schools should consider mandating annual PE courses throughout high school to improve physical activity levels among youth.

# Introducing outdoor office work to reduce stress among office workers in Sweden

**Dr. Feben Javan Abraham<sup>1</sup>**, Dr. Per Andreasson<sup>1</sup>, Prof. Abby King<sup>3,4</sup>, Prof. Katarina Bälter<sup>1,2</sup>, Prof. Susanna Toivanen<sup>1</sup>

<sup>1</sup>Division of Public Health Sciences, Mälardalens University, Västerås, Sweden, <sup>2</sup>Department of Medical Epidemiology and Biostatistics, Karolinska Institutet, Stockholm, Sweden, <sup>3</sup>Department of Epidemiology and Population Health, Stanford University School of Medicine, California, USA, <sup>4</sup>Stanford Prevention Research Center, Department of Medicine, Stanford University School of Medicine, California, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Being outdoors has potential to reduce stress and outdoor office work (OOW) may be an innovative way to decrease workplace stress and offices' sedentary behaviour. This study aims to assess stress among office workers that are working in their normal indoor office and then starts practicing OOW. Additionally, study participants identified facilitators and barriers for doing OOW.

**Methods:** In a feasibility study conducted in October 2022, nine office workers were instructed to do usual indoors work during the first week and then work outdoors for at least 30 minutes per day during the second week. They wore a Heart Rate Variability (HRV) monitor called FirstBeat BG3 (HRV-FB) for two weeks while at work to assess objective stress. Subjective stress was assessed by sending short daily surveys throughout the 2 weeks of the intervention, using a Likert scale of 1 to 10 from "not stressed at all" to "extremely stressed". Also, they were instructed to use the app "Stanford Healthy Neighborhood Discovery Tool" to take photos of facilitators or barriers to practicing OOW.

Self-reported stress data was analysed using paired sample t-test in SPSS 28, whereas analysis of HRV time and frequency parameters are currently being undertaken. The photos were categorised into themes.

**Results:** Preliminary findings show that daily self-reported stress decreased on group level when comparing week 1 to week 2 when OOW was performed.

Categories from picture analysis included themes related to "convenience", "comfort", equipment/facilities", "urban" and "weather" in identified barriers. Out of 76 pictures almost all those themed "nature", both indoor and outdoor, were marked as positive experiences.

**Conclusions:** Reduction in self-reported stress from week 1 to week 2 suggests OOW could potentially be a useful method to reduce work-related stress. Furthermore, by walking outdoor, the office workers increase their physical activity as compared to being sedentary indoors, which adds another health aspect to OOW. Picture analysis suggests, to ensure a healthier milieu for office workers, conditions conducive to OOW such as outdoor work facilities in tandem with green spaces in offices' vicinity may need to be facilitated by employers.

# Concordance of dietary behaviours between parents and children: A cross sectional study

**Ms. Celeste C. Bouchaud<sup>1</sup>**, Ms. Margarita Trujillo Florez<sup>2</sup>, Dr. Ana Carolina Barco Leme<sup>3</sup>, Dr. Hugues Plourde<sup>2</sup>, Dr. Tamara R. Cohen<sup>1,3</sup>

<sup>1</sup>PERFORM Centre, Concordia University, Montreal, Canada, <sup>2</sup>School of Human Nutrition, Faculty of Agricultural and Environmental Sciences, McGill University, Montreal, Canada, <sup>3</sup>Faculty of Land and Food Systems, The University of British Columbia, Vancouver, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Parent's eating behaviours and feeding styles shape how their child eats but there is a lack of data on the associations between parent and child eating behaviours. We aimed to examine concordance between parental appetitive traits and intuitive eating with children's appetitive traits.

**Methods:** Canadian parents (n=154, 37.9±5.5 years, 97% female) of children aged 5 to 11 (7.1 ±1.9 years) completed a cross-sectional survey with validated questionnaires. The Adult Eating Behavior Questionnaire and Child Eating Behavior Questionnaire were used to describe appetitive traits with the constructs and subscales: "Food Approach" (Food Responsiveness, Enjoyment of Food, Emotional Overeating and Desire to Drink for children and Hunger for adults) and "Food Avoidance" (Satiety Responsiveness, Slowness of Eating, Emotional Undereating and Food Fussiness). Parental intuitive eating was surveyed using the Intuitive Eating Scale 2 with subscales: Unconditional Permission to Eat, Eating for Physical Rather than Emotional Reasons, Reliance on Hunger and Satiety Cues and Body-Food Choice Congruence. Pearson correlations were conducted between adult and child eating behavior subscales and between child eating behavior and parent intuitive eating subscales.

**Results:** Concordance between appetitive traits were significantly correlated for Enjoyment of Food ( $r=0.23$ ;  $p < .01$ ), Emotional Overeating ( $r=0.27$ ;  $p < .001$ ), Emotional Undereating ( $r=0.36$ ;  $p < .001$ ), and Food Responsiveness ( $r=0.16$ ;  $p < .05$ ) as were parents' Emotional Overeating with child Emotional Undereating ( $r=-0.16$ ;  $p < .05$ ). In parents, the intuitive eating construct, Unconditional Permission to Eat, was correlated with children's Emotional Overeating ( $r=-0.26$ ;  $p < .01$ ) and Food Responsiveness ( $r=-0.17$ ;  $p < .05$ ). Parental Eating for Physical rather than Emotional Reasons and child Emotional Overeating ( $r=-0.16$ ;  $p < .05$ ) were also correlated. Reliance on Hunger and Satiety Cues in parents was correlated with child Enjoyment of Food ( $r=0.16$ ;  $p < .05$ ) whereas Body-Food Choice Congruence was correlated with child's Slowness in Eating ( $r=-0.20$ ;  $p < .05$ ) and Food Fussiness ( $r=-0.19$ ;  $p < .05$ ).

**Conclusions:** This study found that self-reported parental eating behavior constructs are correlated to similar constructs in children. Thus, parental eating behaviors should be accounted for when addressing child eating behaviors. Larger studies should explore how these factors are moderated.

# Differences between obese and severely obese children on food intake, physical activity, and parenting practices: A cross-sectional study with a clinical sample

**Mr. Marco Silva-Martins<sup>1</sup>**, Dr. Catarina Canário<sup>1</sup>, Prof. Susana Vale<sup>2</sup>, Dr. Clarice Martins<sup>3</sup>, Assistant Professor Sanne Gerards<sup>4</sup>, Associate Professor Orlanda Cruz<sup>1</sup>

<sup>1</sup>Faculty of Psychology and Education Sciences of the University of Porto, Porto, Portugal, <sup>2</sup>Porto School of Education (ESE), Polytechnic Institute of Porto (IPP), Porto, Portugal, <sup>3</sup>Faculty of Sport of the University of Porto, Porto, Portugal, <sup>4</sup>Faculty of Health, Medicine & Life Sciences of the Maastricht University, Maastricht, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The purpose of the current cross-sectional study was to investigate differences between obese, and severely obese children, with regard to food intake, physical activity level, lifestyle-related problems, their parents' confidence, and feeding and physical activity parenting practices.

**Methods:** Participants were 76 parents (92% mothers) of obese (BMI z-score > 2, n = 48) and severely obese (BMI z-score > 3, n = 28) children (58% girls) aged 5-11 years, attending an outpatient pediatric care unit in a Portuguese University Hospital. All participants were enrolled in a longitudinal trial on the efficacy of a parenting intervention targeting childhood overweight and obesity. The current study presents baseline data. Pediatricians collected children's anthropometric data during hospital appointments. Parents completed the following measures: Food Intake Diary, Food Frequency Questionnaire, Physical Activity Parenting Practices Questionnaire, Comprehensive Feeding Practices Questionnaire, and the Lifestyle Behavior Checklist. Children used an accelerometer for five days. To compare differences across groups T-Student tests were performed.

**Results:** 24% of the children achieved the recommended daily levels of vegetable and fruit consumption ( $\geq 400\text{gr/day}$ ) and moderate to vigorous physical activity ( $\geq 60\text{min/day}$ ), whereas 18% ate more than four grams of salt. No differences were found regarding physical activity or food intake between the two groups, except that parents of severely obese children reported lower levels of children's daily consumption of salty snacks ( $p = .029$ ), cakes and sweets ( $p = .002$ ), and higher levels of light physical activity ( $p = .048$ ). Parents of severely obese children also reported higher use of food as reward ( $p = .007$ ), and less confidence to address overeating ( $p = .038$ ). All effect sizes were medium, except for the consumption of cakes and sweets, which had a large effect size.

**Conclusions:** These findings inform research and practice on childhood obesity as they contribute to a better understanding of the specific characteristics and needs of obese children and their parents. Although no differences were found regarding children's lifestyle-related problems, severely obese children were found to have different food intake and physical activity characteristics, with their parents reporting different parenting practices than those of obese children.

# Identification of barriers to healthy eating according to a newly developed COM-B questionnaire

**Dr. Sofie van Rongen<sup>1</sup>**, Dr. Jacqueline Langius<sup>1</sup>, Dr. Sanne de Vries<sup>1</sup>

<sup>1</sup>The Hague University of Applied Sciences, The Hague, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** The COM-B model is being used extensively to inform behaviour change intervention design, but it is not yet used in dietetic care practice. The aim of this research is twofold: To develop a new self-evaluation questionnaire of drivers and barriers for healthier eating, and to evaluate what barriers are generally relevant for individuals in the inaction versus action stages of change.

**Methods:** The 33-item questionnaire was based on 1) the original self-evaluation of behaviour questionnaire of Michie, Atkins and West (2014), 2) a COM-B questionnaire for physical activity of Ellis, Pears and Sutton (2019), and 3) a leading review of key psychological factors influencing healthy eating (Ridder, Kroese, Evers, Adriaanse & Gillebaart, 2017). In a pilot study, 82 Dutch students (human resource management) completed paper versions of the questionnaire on a scale from 1 (disagree) to 7 (agree). Overall mean and SDs were calculated to determine importance of the items. T-tests were run to identify barriers that differentiated those that are inactive from those that active in eating healthier, as assessed with an item on the current stage of change with respect to healthier eating.

**Results:** On average, participants evaluated knowing what to do, ease to get healthy food, less expensive healthy food, feeling healthy eating would do well, developing a habit, and having a plan as important barriers to healthier eating ( $M > 4.5$ ). Those who are currently eating healthier identified higher barriers than those who are not yet changing their eating ( $p < .05$ ): a better understanding as to why it is important ( $M = 3.82$ ,  $SD = 2.22$  versus  $M = 2.94$ ,  $SD = 1.59$ ) keeping track of food intake ( $M = 4.58$ ,  $SD = 1.75$  versus  $M = 3.34$ ,  $SD = 1.76$ ), feeling healthy eating would do well ( $M = 5.27$ ,  $SD = 1.55$  versus  $M = 4.55$ ,  $SD = 1.40$ ), and developing a habit ( $M = 5.70$ ,  $SD = 1.43$  versus  $M = 4.68$ ,  $SD = 1.81$ ).

**Conclusions:** Individuals who are in the process of adopting a healthier eating style appear to face specific barriers. These results, though preliminary, stimulate considering different stages of change in further research on intervention design research. Follow-up research is planned to determine how this questionnaire can aid dieticians in barrier identification in individual clients, ultimately to provide more efficient and personalized dietetic treatment.

# The Role of Parental Feeding Practices in Child Health Promotion

**Associate Professor Kristi Sidney Annerstedt<sup>1</sup>**, Ms. Zoë Morris<sup>1</sup>, Associate Professor Emma Patterson<sup>1,2</sup>, Associate Professor Åsa Norman<sup>1</sup>, Prof. Liselotte Schäfer Elinder<sup>1,3</sup>

<sup>1</sup>Karolinska Institutet, Solna, Sweden, <sup>2</sup>Swedish Food Agency, Uppsala, Sweden, <sup>3</sup>Centre for Epidemiology and Social Medicine, Region Stockholm, Stockholm, Sweden

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Childhood obesity caused partially by unhealthy diet is a growing public health concern in Sweden and globally. Since children adopt many of their parents' attitudes and behaviors towards food, parent-child interactions, and parental feeding practices shape children's health-related behaviors. Therefore, parental feeding practices are useful targets for childhood obesity prevention interventions. We investigated parental feeding practices and associations with parent's sex, education and children's weight status.

**Methods:** Data are from the baseline of the Healthy School Start Plus (HSSP) intervention study from 2017 to 2019, a cluster-randomized control trial in 17 schools in the region of Stockholm, Sweden, where the proportion of parents with university education was less than 50 percent. Parents completed the Comprehensive Feeding Practices Questionnaire (CFPQ) regarding parental behaviors at mealtimes and behaviors related to their child's food intake. Validation of the scale in the Swedish context resulted in five factors: monitoring, pressure to eat, restriction for health and weight, emotional regulation, and healthy eating guidance. Wilcoxon rank sum test were used to investigate associations between parental feeding practices and parental sex, education, and child's weight status.

**Results:** The study included 263 parents (154 mothers) with 173 individual children. Monitoring of food intake was higher among mothers compared to fathers ( $p=0.05$ ). No significant differences were found for the other factors or different education levels. Pressure to eat and restriction for health and weight were significantly different between parents of children who were overweight or obese versus normal or underweight ( $p<0.001$ ). Pressure to eat was higher in parents of children with normal or underweight. Restriction for health and weight was higher in parents of children with overweight or obesity. No other parental feeding practices were significantly different between parents of children differing in weight status.

**Conclusion:** The parental feeding practices differed between children with different weight status in the expected direction. It could suggest that parental feeding practices are responsive to the child's weight status. Understanding the direction of the association could help guide future interventions. Further research is needed to examine potential causal relationships and mediating factors.

# Walking difficulties and activity destinations among older adults

**Ms. Essi-Mari Tuomola<sup>1</sup>**, Dr. Kirsi Keskinen<sup>1</sup>, Prof. Taina Rantanen<sup>1</sup>, Associate Professor Erja Portegijs<sup>2</sup>

<sup>1</sup>Faculty of Sport and Health Sciences and Gerontology Research Center, University of Jyväskylä, Jyväskylä, Finland, <sup>2</sup>Center for Human Movement Sciences, University Medical Center Groningen, University of Groningen, Groningen, Netherlands

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** A. Ageing

**Purpose.** Walking limitations and declining physical capacity may reduce outdoor mobility and opportunities to reach activity destinations. However, walking modifications, such as slower pace, resting in the middle, or using a walking aid, may help individuals reach important destinations despite declined physical capacity. Our purpose was to study whether walking difficulties is associated with the visited activity destinations among older adults.

**Methods.** Community-dwelling 75-, 80-, and 85-year-old people living in Jyväskylä (N=901) reported whether they perceived no difficulties, used walking modifications, or perceived difficulties walking 2 km. Participants located on a digital map activity destinations for physical exercise (outdoor and indoor sports facilities and outdoor recreational areas), destinations facilitating one's outdoor mobility (e.g. nature, lakeside, services and events), and destinations for other activities (e.g. grocery stores, other shops, health services, social visits), which they had visited several times in the past month. The number of activity destinations was calculated. Analyses were adjusted for age, sex, years of education, number of chronic diseases, MMSE score.

**Results.** Poisson loglinear regression showed that participants with intact walking ( $b=0.346$ ,  $s.e.=0.055$ ,  $p<0.001$ ) or modifications ( $b=0.181$ ,  $s.e.=0.066$ ,  $p=0.006$ ) reported higher number of physical exercise destinations than participants with walking difficulty. In addition, those with intact walking ( $b=0.18$ ,  $s.e.=0.069$ ,  $p=0.009$ ) reported higher number of destinations facilitating outdoor mobility than those with walking difficulty. Walking difficulties were not associated with reporting destinations for other destinations.

**Conclusions.** Participants with better physical capacity reported more physical exercise destinations and destinations facilitating outdoor mobility. Destinations for daily chores and social visits, i.e., other destinations, may encourage older people to go outdoors and visit these destinations regardless of walking difficulties.

# Perspectives of intermediaries towards implementing and using gamification to promote physical activity in the neighborhood

**Dr. Ayla Schwarz<sup>1</sup>**, Associate Professor Kirsten Verkooijen<sup>1</sup>, Prof. Emely de Vet<sup>1</sup>, Associate Professor Monique Simons<sup>1</sup>

<sup>1</sup>Wageningen University, Wageningen, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Gamification can be effective in promoting physical activity and can be applied in different forms, ranging from physical adaptations in the environment to virtual mobile health interventions. In the Netherlands, intermediaries -such as neighborhood sport coaches –play an important role in promoting physical activity in the neighborhood. They are responsible for executing local sport agreements by coordinating and executing activities that promote physical activity in the neighborhood. So far, gamified activities are still limited implemented by these intermediaries. This study aimed to assess the beliefs, including perceived barriers and facilitators, of intermediaries working in the Netherlands towards using gamification in their daily work to promote physical activity in the neighborhood.

**Methods:** Twenty-two semi-structured interviews were conducted with intermediaries, defined as neighborhood sport coaches working in the Netherlands. The interviews were audiotaped, transcribed, and analyzed by means of thematic analysis using Atlas.ti 22 software (Scientific Software Development GmbH, Berlin, Germany). The analysis was informed by the Capability, Opportunity, Motivation–Behaviour (COM-B) model and the Theoretical Domains Framework.

**Results:** Applying gamification to existing or new activities of intermediaries to stimulate physical activity in the neighborhood was highly valued by intermediaries. Factors that influence the capability of intermediaries included the cognitive capability of having sufficient knowledge, knowing how to find gamified activities, and one's level of technical proficiency. Financial subsidies, time, availability of material, marketing, and support and leadership of employer's organization influenced opportunity. The professional identity of intermediaries, interest and positive reactions of different target groups, and reinforcement within the intermediaries' network influenced motivation. Differences in beliefs towards applying physical or virtual forms of gamification were identified and could be linked to facilitating and inhibiting factors.

**Conclusions:** In general, intermediaries have a positive attitude toward applying gamification in their daily work. However, gamification practices are currently not strategically implemented in the work of intermediaries. A better understanding of inhibiting and facilitating factors can help to further implement gamification strategically in the work of intermediaries.

# The Association between Perceived Physical Literacy and Physical Activity in Primary School Children in England

**Dr. Mhairi MacDonald<sup>1</sup>**, Miss Caitlin Miller<sup>1</sup>, Prof. Lisa Barnett<sup>2</sup>, Prof. Stuart Fairclough<sup>1</sup>, Dr. Richard Tyler<sup>1</sup>  
<sup>1</sup>Edge Hill University, Ormskirk, United Kingdom, <sup>2</sup>Deakin University, Melbourne, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Physical literacy (PL) is a multi-dimensional concept that provides a holistic understanding of movement behaviours under four core domains (physical, psychological, social and cognitive) and is viewed as a critical precursor to physical activity (PA). Thus, the promotion of PL in children is fundamental for physical activity and its associated health and wellbeing benefits. However, there is limited literature which addresses the composite nature of Physical Literacy. Therefore, the purpose of this study was to examine the associations between perceived composite PL scores PA and in school children in England.

**Methods:** Primary School Children (n=310; aged 9.95±0.8 years; 46.5% girls; 95% white British) self-reported Physical Literacy using The Physical Literacy in Children Questionnaire (PL-C Quest). Physical Activity was measured using wrist worn accelerometers for 24-hours over 7 consecutive days. Associations between perceived composite PL scores and PA (Total PA, LPA, MPA, MVPA and VPA) were determined using linear mixed model. Analysis accounted for school-level clustering and adjusted for sex, socioeconomic status, maturity offset, and BMI z-score.

**Results:** There was no significant difference in perceived PL scores, Boys spent significantly more time in moderate ( $p < .001$ ) and vigorous PA ( $p = .002$ ) than girls. MVPA and VPA were positively associated with perceived composite PL scores ( $B = 0.07$   $p = .002$ ;  $B = 0.06$   $p = .01$ ) respectively. However, there was no significant association between total PA, MPA and LPA ( $B = 0.01$   $p = .18$ ;  $B = 0.04$   $p = .21$ ;  $B = 0.00$   $p = .83$ )

**Conclusion:** This study contributes to the evidence of the link between composite PL and PA. Results suggest that intensity of activity has stronger associations with perceived composite PL scores.

# How to select interventions for promoting physical activity in primary schools? Combining preferences of stakeholders and scientists using a Delphi study.

Dr. Mirko Brandes<sup>1</sup>, Dr. Berit Brandes<sup>1</sup>, Dr. Jennifer Sacheck<sup>2</sup>, Prof. Mai Chin A Paw<sup>3</sup>, Prof. David Lubans<sup>4</sup>, Prof. Alexander Woll<sup>5</sup>, Prof. Jasper Schipperijn<sup>6</sup>, Prof. Russ Jago<sup>7, 8</sup>, Prof. Hajo Zeeb<sup>1</sup>, **Dr. Heide Busse<sup>1</sup>**

<sup>1</sup>Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, <sup>2</sup>Milken Institute School of Public Health, The George Washington University, Washington D.C., USA, <sup>3</sup>Amsterdam UMC, location Vrije Universiteit Amsterdam, Public and Occupational Health, Amsterdam Public Health Research Institute, Amsterdam, Netherlands, <sup>4</sup>University of Newcastle, Newcastle, Australia, <sup>5</sup>Karlsruhe Institute of Technology, Karlsruhe, Germany, <sup>6</sup>University of Southern Denmark, Odense, Denmark, <sup>7</sup>School for Policy Studies, University of Bristol, Bristol, United Kingdom, <sup>8</sup>Bristol Medical School, University of Bristol, Bristol, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The failure of physical activity (PA) interventions in the implementation and scale-up in the real world, previously found effective under controlled conditions, may be attributed to the different priorities of stakeholders and scientists. Therefore, the aim of our study was to understand the priorities and criteria for selecting suitable PA interventions among scientists and local stakeholders.

**Methods:** We conducted a three-round repeated Delphi study with local stakeholders (n=7) and international scientific PA experts (n=6). Independently for both panels, two rounds were utilized to develop a list of criteria and the definitions of criteria, followed by a prioritization of the criteria in the third round. For each panel, a narrative analysis was used to rank-order unique criteria, list the number of scores for the unique criteria and synthesize criteria into overarching categories.

**Results:** The stakeholders developed a list of 53 unique criteria, synthesized into 11 categories with top-ranked criteria for selecting PA interventions being 'free of costs', 'longevity' and 'integration into everyday school life'. The scientists listed 35 unique criteria, synthesized into 7 categories with the top-ranked criteria being 'efficacy', 'potential for reach' and 'feasibility'. The top-ranked unique criteria in the stakeholder panel were distributed over many categories, whereas four out of the top six criteria in the scientist panel were related to 'evidence'. Synthesizing the priorities and rankings of both groups, we propose the following set of seven key criteria for the selection process of PA interventions in primary school children: cost, sustainability, feasibility, potential for reach, efficacy, acceptability and social development.

**Conclusions:** Stakeholders and scientists demonstrated a fair overlap of criteria when selecting PA interventions, however, they substantially differed in their characterization and ranking which limited the agreement between both groups. PA interventions that incorporate a focus on the social development of children, that are low cost, feasible and acceptable, that are evidence-based with potential to reach many children and to be sustainable are most likely to be chosen by scientists and stakeholders. Keeping in mind these seven key criteria established will ensure that PA interventions are fit-for-purpose and potentially being implemented long-term in the real world.

# Examining the Associations Between Parental Weight Bias and Adolescent Girls' Body Image Experiences and Dysfunctional Eating Behaviors

**Miss Rosalie Lacerte<sup>1</sup>**, Dr. Geneviève Lavigne<sup>1</sup>, Prof. Noémie Carbonneau<sup>1</sup>

<sup>1</sup>Université du Québec à Trois-Rivières, Trois-Rivières, Canada

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** G. Children and families

**Purpose:** The Tripartite Influence Model of body dissatisfaction and eating disturbance (Shroff & Thompson, 2006) proposes that peers, parents, and the media all influence body image and eating disturbance. However, the literature remains unclear regarding the unique impact of the two parents' attitudes and beliefs on their adolescents' body image and eating behaviors. In addition, no study to date has tested whether both parents' weight bias (i.e., negative attitudes or judgments toward people of higher weight) relates to their adolescents' eating dysfunction. The present study aims at examining whether perceptions of parental weight bias relate to three different dimensions of adolescent girls' dysfunctional eating habits, namely cognitive restraint, emotional eating and uncontrolled eating. The study also examines whether adolescents' perceptions of body-related pressures from their family and internalization of the thin ideal mediate the associations between perceived parental weight bias and dysfunctional eating behaviors.

**Methods:** Participants were 348 French-Canadian girls aged between 14 and 17 years. They completed validated self-report questionnaires including the Antifat Attitudes Questionnaire (Crandall, 1994), the Sociocultural Attitudes Towards Appearance Scale-4 (Schaefer et al., 2015), and the Three-Factor Eating Questionnaire (Karlsson et al., 2000).

**Results:** Structural equation modeling analyses were conducted. Globally, participants' perceptions of their mother's and father's weight bias were independently associated with higher levels of body-related pressures from the family (respectively  $B = .225$ ,  $p < .05$ , and  $B = .175$ ,  $p < .05$ ), and higher internalization of the thin ideal (respectively  $B = .177$ ,  $p < .05$ , and  $B = .125$ ,  $p < .05$ ). In turn, perceived body-related pressures were significantly and positively related to all three indicators of dysfunctional eating behaviors: cognitive restraint ( $B = .227$ ,  $p < .05$ ), emotional eating ( $B = .242$ ,  $p < .05$ ), and uncontrolled eating ( $B = .210$ ,  $p < .05$ ). Internalization of the thin ideal was also positively related to cognitive restraint ( $B = .452$ ,  $p < .05$ ).

**Conclusions:** Overall, the results affirm the importance of considering parents' negative attitudes toward people of higher weight in order to better understand their daughters' body image experiences and dysfunctional eating behaviors.

# The relationships between sociocultural body-related pressures and eating behaviors in adolescent girls: A person-centered approach

**Miss Carolanne Tanguay (Corresponding author)<sup>1</sup>**, Dr. Geneviève Lavigne (Corresponding author)<sup>1</sup>, Prof. Noémie Carbonneau (Corresponding author)<sup>1</sup>

<sup>1</sup>Université du Québec à Trois-Rivières, Trois-Rivières, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Disordered eating behaviors in adolescents have skyrocketed since the COVID pandemic, making it important to better understand their determinants. Sociocultural pressures about body image represent one of these determinants. The purpose of the present study is to examine the relationships between perceived body-related pressures from four sociocultural agents (i.e., mother, father, peers, and media) and adolescent girls' eating behaviors, using a person-centered approach. This type of approach enables the identification of subgroups of individuals with distinct sociocultural pressure profiles. To our knowledge, this study is the first to examine how combined sources of sociocultural pressures are associated with adolescent girls' eating behaviors.

**Methods:** Participants are 388 French-Canadian girls aged between 14 and 17 years. Participants completed self-reported validated measures assessing their perceptions of the pressure about body image exerted by their parents, media and peers, as well as their bulimia symptoms and intuitive eating. The study design is correlational. Latent profile analyses (LPA) and MANOVAS/LSD post hocs were conducted.

**Results:** First, three profiles emerged from the LPA: (1) *High Pressure Profile* (high levels of the four types of pressure); (2) *Low Pressure Profile* (low levels of the four types of pressure); and (3) *High Media Pressure Profile* (high level of media pressure, and low levels of the other types). Second, MANOVA/LSD post hoc results showed that participants in the *High Pressure Profile* reported more problematic eating behaviors (i.e., more bulimia symptoms,  $M = 2.87$  [ $SD = 1.15$ ],  $p < 0.001$ , and less intuitive eating,  $M = 2.93$  [ $SD = .53$ ],  $p < 0.001$ ) than did participants in the *High Media Pressure Profile*, who, in turn, reported more problematic eating behaviors (i.e., more bulimia symptoms,  $M = 2.17$  [ $SD = .96$ ],  $p < 0.001$ , and less intuitive eating,  $M = 3.33$  [ $SD = .64$ ],  $p < 0.001$ ) than did participants in the *Low Pressure Profile* ( $M = 1.70$  [ $SD = .70$ ];  $M = 3.74$  [ $SD = .60$ ]).

**Conclusions:** These results are important for the field of behavioral nutrition and provide insight into how different sources of sociocultural pressure combine across adolescents.

# Experiences and Perceptions of School Nurses' Motivational Interviewing Competence: A Convergent Mixed-Methods Study

**Dr. Marianna Moberg<sup>1</sup>**, Dr. Helena Lindqvist<sup>1</sup>, Dr. Susanne Andermo<sup>1</sup>, Associate Professor Åsa Norman<sup>1</sup>  
<sup>1</sup>Karolinska Institutet, Stockholm, Sweden

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** In this convergent mixed-methods study, the aim was to explore how objective and subjective quality ratings of school nurses' motivational interviewing (MI) correlate whilst also considering the perceptions of delivering and participating in the same MI sessions.

**Methods:** Quantitative and qualitative data were derived from seven intervention schools participating in the Healthy School Start Plus parenting support intervention. School nurses were trained in MI and conducted an MI session with parents of 6–7-year-old children to discuss children's physical health and development. Quantitative data comprised objective ratings of school nurses' MI competence using the Motivational Interviewing Treatment Integrity 4.2 [MITI-4] protocol, as well as parents' and school nurses' subjective ratings of the MI sessions. Qualitative data comprised semi-structured interviews with parents and school nurses about their perceptions of the MI sessions. First, quantitative data were analysed using Spearman's rank correlation, and qualitative data were analysed using content analysis. Next, quantitative and qualitative findings were merged.

**Results:** Our findings suggest that school nurses' MI performances were rated and perceived as valuable and family-centred by both school nurses and parents who had left the meeting feeling motivated and empowered to promote their children's healthy behaviours. Nonetheless, school nurses were critical to their own MI technical performance, and they found that reflections were easier to deliver and to self-rate.

**Conclusion:** Overall, MITI ratings were the lowest and parents' ratings were the highest. Future studies should focus on relating clients' subjective ratings of MI with clients' behavioural outcomes.

# Implementing the first school-based movement behaviours surveillance system in Mexico: the Mexican Movement Observatory pilot study protocol

**Dr. Gabriela Argumedo<sup>1</sup>**, Dr. Silvia González<sup>1,2</sup>, Mr. Jesús Garcés<sup>1</sup>, Mr. Daniel Velázquez<sup>1</sup>, Dr. Catalina Medina<sup>1</sup>, Prof. Simón Barquera<sup>3</sup>, Dr. Alejandra Jáuregui<sup>1</sup>

<sup>1</sup>Department of Physical Activity and Healthy Lifestyle, Center for Research in Nutrition and Health, National Institute of Public Health, Morelos, Mexico, <sup>2</sup>Universidad de los Andes, Bogotá, Colombia, <sup>3</sup>Center for Research in Nutrition and Health, National Institute of Public Health, Morelos, Mexico

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** There is limited surveillance of the 24 hours movement behaviours in Mexico among children under 10 years of age. Monitoring these behaviours is necessary for evidence-based decision-making for the promotion of healthy lifestyles. This study aims to implement the Mexican Movement Observatory (OMM), a system for monitoring children's physical activity, sleep, and sedentary time through primary schools in Mexico. This work reports the pilot study protocol and preliminary results.

**Methods:** The study comprises two phases: 1) A pilot study to assess the feasibility of the OMM within a diverse sample of schools, and 2) Improvement and upscaling at the national level. For phase 1, a cross-sectional study will be conducted on 12 public primary schools in central regions of Mexico. Children from grades 1 to 6 along with their caretakers will be asked to answer a self-completed short online survey on the child's movement behaviours. Head teachers will be asked to report the school's social and built environments conducive to physical activity. Data from these questionnaires will be mapped and openly available through the OMM website. An international board of experts on movement behaviours and population surveillance systems will guide the decisions about the Observatory.

**Results:** Preliminary results on the percentage of children meeting movement behaviour guidelines will be presented. Information regarding the barriers and facilitators for implementing the OMM will also be presented, along with the required adaptations of the instruments and procedures for the following feasibility study and national scaling up.

**Conclusions:** Through the Observatory, it is expected to generate evidence at the regional and/or national level on the movement behaviours of school-age children. Lessons learned from this pilot study will provide evidence to improve the OMM and facilitate its upscaling process and may provide relevant information for school-based observatories on other places sharing socio-contextual conditions.

# Using a toolbox of tailored evidence-based physical activity interventions to improve children's physical activity and cardiorespiratory fitness at primary schools: Results of the ACTIPROS feasibility study

Dr. Berit Brandes<sup>1</sup>, Dr. Christoph Buck<sup>1</sup>, Miss Louisa Sell<sup>1</sup>, **Dr. Heide Busse<sup>1</sup>**, Prof. Hajo Zeeb<sup>1</sup>, Dr. Mirko Brandes<sup>1</sup>

<sup>1</sup>Leibniz Institute for Prevention Research and Epidemiology – BIPS, Bremen, Germany

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Usually, school-based PA promotion is conducted by providing one specific intervention to schools. In contrast, the ACTivity PROMotion via Schools (ACTIPROS) approach provides a set of 12 evidence-based PA interventions (the ACTIPROS toolbox) where schools can select interventions according to their prerequisites and have the option to replace unsuitable interventions within the school year. In this study, we tested the feasibility and acceptability of the toolbox approach at primary schools.

**Methods:** A two-arm cluster-controlled feasibility trial at primary schools (n=5 intervention schools, n=5 control schools) located in a city of Northern Germany was conducted. Children's habitual PA (GENEActiv, Activinsights Ltd.) and motor skills (Deutscher Motorik Test; DMT) were measured at the beginning (t0: Sept and Oct 2021) and at the end of the school year (t1: June and July 2022). Between Nov 2021 and July 2022, the ACTIPROS toolbox was implemented at intervention schools. Action teams within intervention schools, consisting of children and teachers, were free to choose interventions from the toolbox. Teachers documented intervention choices and implementation within a short questionnaire (SIQ) at t1.

**Results:** In total, 20 classes (N=429 students) were recruited to take part in the study. The mean consent rate was 75.1% (n=322). At t0 and t1, n=304 (94.4%) and n=256 (79.3%) of consented children took part in the DMT, respectively. Half of the participating classes received accelerometers (t0: n= 166 students; t1: n=151 students). At t0, n=133 (80.1%) and n=106 (70.2%) valid records could be retrieved, respectively. Intervention schools successfully implemented at least one intervention, whereby two schools replaced the intervention during the school year. 7/10 intervention classes completed the SIQ. Intervention classes tended to choose similar interventions but implementation frequency was highly different. In intervention schools, accelerometry indicated a mean increase of 15.5min (95%CI: 4.5,26.6) in MVPA compared to controls.

**Conclusions:** All intervention classes were able to implement at least one intervention from the toolbox, and unsuitable interventions were successfully replaced in a timely manner. We achieved good response rates for accelerometer and motor skills data. The remarkable trend towards an increase in MVPA will be tested in a subsequent randomized controlled trial.

# SnackTrack – an app-based tool to assess the influence of digital and physical environments on snack choice

Miss Eva Valenčič<sup>1,3,4,5</sup>, Dr. Emma Becket<sup>2,5</sup>, Prof. Barbara Koroušić Seljak<sup>3,4</sup>, Prof. Clare Collins<sup>1,5</sup>, **Associate Prof. Tamara Bucher<sup>2,5</sup>**

<sup>1</sup>University of Newcastle, School of Health Sciences, College of Health, Medicine and Wellbeing, Newcastle, NSW, Australia, <sup>2</sup>University of Newcastle, School of Environmental and Life Sciences, College of Engineering, Science and Environment, Newcastle, NSW, Australia, <sup>3</sup>Jožef Stefan Institute, Computer Systems Department, Ljubljana, Slovenia, <sup>4</sup>Jožef Stefan International Postgraduate School, Ljubljana, Slovenia, <sup>5</sup>Hunter Medical Research Institute, Food and Nutrition Program, Newcastle, NSW, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Environmental factors have great influence on consumer behaviour, including food choices. Therefore, focusing not only on individual's behaviours, but also on the food choice and eating environment should be considered when trying to improve dietary behaviours. In the recent years, consumers' everyday food choice environments shifted, with food choices frequently conducted in digital settings, such as in online grocery stores, pre-ordering systems or food delivery services. Food choices are often influenced by environmental cues which are processed unconsciously. Thus, strategically changing cues in the physical and the digital environment, might help promoting healthier food choices. The aim of this study was to develop a novel tool to investigate the influence of physical and digital environments on consumer's food choices.

**Methods:** This feasibility study developed and tested a mobile app, called SnackTrack. The app was used to collect data on the snack choices of 188 app users in real-life settings between February and April 2022. It asked users to take a photo of the food they were planning to consume, and to provide additional information regarding the physical environment and context in which the food was consumed. The app also exposed users to different user interface designs, which were implemented as mobile app backgrounds. Participants were randomised in 4 intervention conditions (background of either fruits, vegetables, salty snacks or sweets), or a control condition (grey-coloured background).

**Results:** During the intervention participants from Australia and Slovenia submitted a total of 1,763 photos. The majority of snacks (76.1%) was obtained at the moment of consumption, purchased by participant themselves (66.3%), and consumed when participants were alone (74.9%). Most snacks consumed by Australian participants were eaten at the working desk (35%), while Slovenian participants consumed most snacks at the dining table (31.8%). Results suggest that time of snack obtainment did not have a significant effect on the healthfulness of snacks chosen. However, findings suggest that 'unhealthy' background images encouraged healthier snack choices.

**Conclusions:** Despite consumers having the knowledge about the impact of diet on health, environmental stimuli can influence their food choices. SnackTrack is a novel tool to investigate environmental and digital nudging impacts on food choices.

# A social network analysis of self-efficacy and social connection among CrossFitters.

**Ms. christina amo**<sup>1</sup>, Dr. Meg Patterson<sup>1</sup>, Dr. Tyler Prochnow<sup>1</sup>, Dr. Katie Heinrich<sup>2</sup>, Ms. Allison Francis N.<sup>1</sup>

<sup>1</sup>Texas A&M University, COLLEGE STATION, USA, <sup>2</sup>Kansas State University, Manhattan, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Physical activity (PA) adherence and retention rates continue to decrease. Self-efficacy (SE) is a key factor of PA participation; increasing exercise SE increases one's likelihood of PA adherence and retention. Likewise, social support and connectedness also improve PA behavior. Studies suggest social networks and social connections are associated with individual-level SE, however less is understood about whether SE drives people to connect with one another in group-exercise settings. CrossFit is one type of group-exercise with a particularly strong sense of community. Therefore, the purpose of this study was to examine the relationship between SE and social connection among a network of CrossFitters.

**Methods:** All members of a CrossFit gym were invited to complete surveys assessing exercise SE, sense of community, PA frequency, CrossFit competition participation, and the class time that they primarily attended. Respondents then used a roster of all network members to nominate those that they regularly workout with or see at the gym. Nearly two thirds of the gym (60.8%, n=66, 71% female, 98% white, 34.4+/- 9.67 years) completed surveys. Exponential random graph modeling (ERGM) was used to determine if SE was associated with social connections between CrossFitters in this network.

**Results:** ERGMs indicated that those with higher SE ( $PE = 0.16$ ,  $p < 0.01$ ) were significantly more likely to create social connections than would be expected by chance. Additionally, connections existed more between people with similar PA frequency scores ( $PE = 0.10$ ,  $p < 0.001$ ), those who attended class at the same time ( $PE = 0.94$ ,  $p < 0.001$ ), those that participated in CrossFit competitions ( $PE = 0.25$ ,  $p < 0.001$ ), and those that reported a higher sense of community ( $PE = 0.01$ ,  $p < 0.001$ ).

**Conclusion:** Coaches and fitness instructors may use these results to encourage social connection among participants. Strategically placing members into classes based on SE, PA frequency, CrossFit competition participation, and sense of community may increase social connection and, therefore, enhance their PA experience. Future studies could determine if improved social connectedness ultimately leads to increased PA adherence and retention rates.

# Internet-connected exercise equipment supports physical activity among persons with a history of insufficient activity

**Dr. Margaret Schneider<sup>1</sup>**, Ms. Amanda Woodworth<sup>1</sup>

<sup>1</sup>University of California, Irvine, Irvine, USA

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** The majority of U.S. adults do not meet physical activity (PA) public health guidelines. Recent advances in technology have introduced a new generation of home exercise equipment that is enhanced via internet with live and on-demand classes. There is a dearth of information, however, about whether internet-connected fitness equipment holds the potential to benefit only persons who have a history of engaging in regular PA.

**Methods:** In winter 2022, we recruited 880 Peloton bike owners (92% female, 6% Hispanic, 88% non-Hispanic White; age range 22-70+) from 38 Facebook sites with a Peloton theme. Study participants completed a survey assessing their past and present PA participation and reasons for purchasing a Peloton.

**Results:** Following the criteria of the Godin Leisure-Time Exercise Questionnaire, 30% of survey respondents were insufficiently active in their teens, 30% were insufficiently active in their twenties, and 5% were insufficiently active currently. Those insufficiently active both in their teens and in their twenties comprised 20% of the total sample (N = 93). Regardless of past PA history, respondents were equally motivated to purchase their Peloton by the convenience of exercising at home (~90%), the variety in classes and instructors (~54%), and the beliefs that it would help with meeting exercise goals (~75%), improve well-being (~54%), and help with stress coping (~50%). Those with a history of insufficient activity were less likely to report being motivated by expecting to enjoy it (48% vs. 58%) but more likely to be motivated by the belief that the Peloton would help them feel more connected with others (30% vs 20%).

**Conclusions:** Internet-connected home exercise equipment may support regular PA even among adults with a history of insufficient PA, although motivations may differ between persons with and without a history of regular PA. Home-based exercise equipment that is enhanced with an internet connection to provide on-demand and live classes may be an effective tool for promoting physical activity, even among individuals who were insufficiently active in their teens and young-adulthood.

# Training experiences and intervention preferences of recreational youth soccer coaches

**Dr. Jorge Banda<sup>1</sup>**, Mr. Ivan Mendoza<sup>1</sup>, Dr. Yumary Ruiz<sup>1</sup>

<sup>1</sup>Department of Public Health, College of Health and Human Sciences, Purdue University, West Lafayette, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Team sports coaches can have a tremendous impact on child health and development. Despite their potential, coaches have been mostly overlooked in public health intervention research. The purpose of this study was to determine youth sports coach training experiences and coaches' interest and preferences for a coach training program.

**Methods:** This study was conducted in a recreational youth soccer organization in a mid-sized city in the Midwestern part of the U.S. The organization offered co-ed (U5-U6), girls (U7-U14 and U18), and boys (U7-U14 and U18) soccer. Coaches aged  $\geq 18$  years were eligible to participate in this study. Participants were asked to complete an online survey to assess coach demographic characteristics, coaching experience, soccer playing experience, coach training experience, soccer knowledge (rules, skills, and tactics), and interest and preferences for a coach training program (including content, mode of delivery, and program timing, frequency, and duration).

**Results:** 58 coaches (mean age =  $39.5 \pm 6.6$  years, 76% male) participated in this study. Although 88% of participants had previous team sports coaching experience (mean team sports coaching experience =  $5.3 \pm 5.9$  years), 86% had not earned a coaching certification, 74% had not participated in a coach training program, and 35% had never played on an organized soccer team. Participants rated their knowledge of soccer rules, skills, and tactics as  $6.8 \pm 2.3$  on a scale of 1 (poor) to 10 (excellent). When asked what they would like to learn in a coach training program, a majority selected soccer skills and tactics (92%), effective motivational techniques (60%), and physical fitness and conditioning (54%). Between coaches of younger and older age group teams, differences were found in coaching experience, coach training experience, and preferences in a coach training program. For example, more U10-U18 coaches than U5-U9 coaches selected healthy eating and nutrition as an area they would like to learn in a coach training program (16% vs 4%).

**Conclusions:** Although most participants have prior coaching experience, few have participated in a coach training program. Results from this study have important implications for the development of youth sports coach training programs.

# Mama Latina: Exploring Sociocultural Determinants of Hispanic Immigrants' Diets in the U.S.

**Ms. Grace Moore<sup>1</sup>**, Ms. Victoria Perez<sup>1</sup>, Dr. Maria Romo-Palafox, Ph.D., RD<sup>1</sup>

<sup>1</sup>Saint Louis University, St. Louis, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Hispanic immigrants seemingly experience better health outcomes than their white, non-immigrant counterparts in the U.S., an observation known as the Hispanic Paradox. Yet despite greater socioeconomic and educational assimilation, subsequent generations of Hispanics seemingly experience worse health outcomes than their parents and grandparents. The purpose of Mama Latina, an ongoing formative, qualitative study, is to identify the sociocultural determinants of maternal eating and feeding behaviors in Hispanic immigrants in the U.S.

**Methods:** Bilingual researchers performed a preliminary thematic analysis on five 60-minute focus groups (2021-2022) with Hispanic immigrant mothers of children ≤18 years who shared their experiences with making food choices after immigrating to the U.S.

**Results:** Twelve Hispanic mothers who immigrated to the U.S. between the ages of 17 and 46 participated in five focus groups. Countries of origin included Mexico, Colombia, Honduras, Peru, and Costa Rica. Every group expressed frustration regarding perceived inferior taste and texture of fruits and vegetables and the lack of accessibility and availability of fresh produce. Every group also emphasized that they believe that their health and the health of their family have been negatively impacted by the types of food they consume in the U.S., although they all mentioned ongoing efforts to adhere to the healthy aspects of their original culture (e.g., cooking and eating at home without distractions).

**Conclusions:** Failing to acknowledge the process wherein immigrants adopt the dietary practices of a host culture (i.e., dietary acculturation) may lead to misleading conclusions about Hispanic's diets. Preference for fresh produce was evident; therefore, the lack of palatability compared to that of the produce in Latin America and the accessibility and availability barriers they experience in the U.S. explain why U.S. data on Hispanics suggests that they consume fewer fruits and vegetables than their non-Hispanic White counterparts. Preliminary themes from the ongoing study draw attention to sociocultural determinants of eating and feeding in Hispanic immigrant mothers that are expected to be associated with the adoption of maladaptive U.S. diet patterns. Understanding these determinants will provide the basis for specific interventions that delay the acquisition of maladaptive dietary behaviors and preserve healthy cultural habits.

# Maintenance Isn't Easy (But It Sure Is Hard Enough): Perceived Need for Maintenance Programming in Graduates of a Pediatric Obesity Lifestyle Management Program

**Dr. Madelaine Gierc**<sup>1</sup>, Ms. Sundip Khosa<sup>2</sup>, Ms. Serena Bring<sup>2</sup>, Ms. Kiran Kalkat<sup>1</sup>, Ms. Arlene Cristall<sup>1</sup>

<sup>1</sup>Shapedown BC, BC Children's Hospital, Vancouver, Canada, <sup>2</sup>YMCA of Greater Vancouver, Vancouver, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Overweight/obesity affects approximately one third of children in Canada. Shapedown BC is a family-based lifestyle intervention that aims to provide patients and families with the knowledge and skills to support health behaviours. However, even with increased capacity, it can be hard for families to sustain health behaviours over the long-term. The purpose of the current study was to investigate the perceived need for maintenance support in Shapedown BC graduates.

**Methods:** The current study followed a cross-sectional mixed-methods design. To address barriers to participation, a flexible data collection procedure was utilized with families invited to complete either a focus group, telephone interview, online questionnaire, or pen-and-paper questionnaire. Items examined experiences with Shapedown BC, programming preferences, and social cognitions surrounding maintenance programming. Quantitative items were rated on a 5-point scale, with higher values indicating more favourable perceptions.

**Results:** Forty-five families provided feedback from across British Columbia. Families spoke positively of their program experience, with particular focus on health education and skills development. Families were moderately confident ( $M = 3.50$ ,  $SD = 0.87$ ) in their ability to engage in health behaviour post-intervention. There was widespread interest in maintenance, with families ( $N = 21$ ) reporting that they want maintenance programming ( $M = 4.05$ ,  $SD = 0.97$ ); that maintenance programming would help them reach their health goals ( $M = 4.28$ ,  $SD = 0.85$ ); and that they would be likely to attend programming ( $M = 4.48$ ,  $SD = 0.87$ ). Confidence was weakly associated with perceptions of maintenance programming ( $r_s = -0.15$  to  $0.17$ ,  $p_s > 0.05$ ). Families identified that they would like programming offered at least once per month, for approximately 1 year after completing the 10-week program. There was interest in a range of activities, particularly applied activities like cooking classes and physical activity.

**Conclusion:** Though families reported positive experiences with Shapedown BC, they also identified the need for long-term health behaviour support. There was consistent interest in maintenance programming, with a preference for regular (i.e., monthly) activities. Findings suggest there is a need for pediatric lifestyle programs to support families beyond the end of the intervention.

# Improving the usability of online resources to support implementation research and practice: The RE-AIM website use case

**Mrs. Emiliane L. Pereira<sup>1</sup>**, Mr. Thomas E Strayer<sup>5</sup>, Mrs. Samantha Harden<sup>4</sup>, Mrs. Christina Studts<sup>2</sup>, Mrs. Tzeyu Michaud<sup>1</sup>, Mr. Paul Estabrooks<sup>3</sup>, Mr. Russell Glasgow<sup>2</sup>, Mrs. Amy Huebschmann<sup>2</sup>

<sup>1</sup>University of Nebraska Medical Center, Omaha, USA, <sup>2</sup>University of Colorado Anschutz Medical Campus, Aurora, USA, <sup>3</sup>University of Utah, Salt Lake City, USA, <sup>4</sup>Virginia Tech Carilion School of Medicine, Blacksburg, USA, <sup>5</sup>Vanderbilt University Medical Center, Nashville, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The objectives of this project were: 1) systematically conduct need and priority assessments of the RE-AIM website (re-aim.org) usability; 2) iteratively improve the RE-AIM website structure based on testing input, and guidance from end-users and RE-AIM experts; and 3) compare RE-AIM website usability before and after modifications.

**Methods:** We applied a mixed-methods approach to obtain user feedback on the RE-AIM website among dissemination and implementation (D&I) science researchers and practitioners. Through survey questionnaires, we assessed usability (i.e., System Usability Scales [SUS]) and interactivity (i.e., Interactivity Scale) in a convenience sample of 24 participants at baseline and after two iterative rounds of website modifications (i.e., Round 1, Round 2). Qualitative assessments of usability through participant interviews were also at baseline, Round 1 and Round 2. We examined the changes in the SUS (0-100 scale, higher is better) and Interactivity scales from baseline (pre assessment) to Round 1 and Round 2 (post assessment) using a t-test.

**Results:** We found significant improvements on system usability score (pre mean= 64.1, post mean =81.5,  $p<0.05$ ) and interactivity (pre mean=3.5, post mean =4.0,  $p<0.05$ ) from pre to post assessment.

**Conclusion:** A mixed methods, iterative approach led to significantly increased usability and interactivity. Primary qualitative findings from baseline and Round 1 included: the need to simplify the accessibility of information; to provide concrete guidance on RE-AIM framework for planning, implementation, and evaluation; and to clarify how contextual factors related to RE-AIM constructs. These findings resulted in online modifications including a new webpage with a tour guide, welcome video, new interactive planning tool, and a video introduction of contextual factors that influence RE-AIM outcomes. Round 2 qualitative results suggested that the user experience was improved, the website contained useful information, and it was easy to use and navigate. While the update of the REAIM website is continuous, the key domains (i.e., homepage, grant writing resources, and resources and tool sections) realized from the present project may be salient to others seeking to build implementation science capacity through online resources.

# Improving the reach evidence-based, lifestyle interventions: Patient and provider co-production of tools to promote access and utilization.

**Prof. Paul Estabrooks<sup>1</sup>**, Dr. Amy Locke<sup>1</sup>, Ms. Megan Miller<sup>1</sup>, Ms. Linnea Horvath<sup>1</sup>, Ms. Ellen Mussler Maxfield<sup>1</sup>

<sup>1</sup>University of Utah, Salt Lake City, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The proliferation of clinically available, evidence-based interventions (EBIs) that effectively help people eat better, move more, lose weight, and prevent chronic disease has increased the challenges, from patient and provider perspectives, in determining the best fit of an intervention for a given patient. We conducted a co-production strategy to facilitate the mapping of patient and provider needs to characteristics of research tested recruitment strategies with a goal of developing a prototype tool to promote access to, and utilization of, available lifestyle EBIs.

**Methods:** A Comprehensive Participatory Planning and Evaluation (CPPE) strategy was implemented across a sequence of 3 collaborative meetings each with primary care providers (n=8) and patients (n=15). The meetings included (1) the development of user-centered causal maps of facilitators and barriers to enrollment in lifestyle EBIs, (2) a review, prioritization, and adaptation of research-tested strategies to increase patient enrollment based on the causal maps, and (3) prototype development for recruitment strategy implementation in primary care settings. Qualitative data was interpreted collaboratively by the providers, patients, and researchers.

**Results:** Causal maps included shared and unique barriers and facilitators for patients and providers. Key factors to address were a lack of awareness of available EBIs, provider time to refer, and that patients expressed a strong interest in personalized referrals from providers, while providers felt overwhelmed with the number of potential referrals. Population health management (PHM), community wide, and mass media marketing strategies were assessed for degree of fit with patient and provider causal maps. PHM that leveraged automation within the electronic health record, gave providers autonomy, and allowed flexibility in how patients received personalized referrals was acceptable to patients and providers. Community-wide strategies were also positively reviewed, but that it may cast too wide a net and increase clinical workload fielding self-referrals. Prototype materials for both the population health management and community wide recruitment strategies were developed, revised, finalized, and approved by patient and provider groups.

**Conclusions:** The CPPE process resulted in the development a prototype recruitment system that addressed patient and provider concerns and preferences and has strong potential to improve access to, and utilization of, lifestyle EBIs.

# Feasibility of a Family-Based Program to Strengthening Latinx Youth Mental Wellbeing by Promoting Nutrition and Physical Activity: The Familias Activas Experience

**Assistant Prof. Ghaffar Hurtado Choque<sup>1</sup>**, Dr. Hilda Garcia Cosavalente<sup>1</sup>, Dr. Alexander Chan<sup>1</sup>, Dr. Matthew Rodriguez<sup>2</sup>

<sup>1</sup>University of Maryland, College Park, USA, <sup>2</sup>University of California, Roseville, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** This study examines the feasibility of Familias Activas(FA) developed following participative research principles. Obesity and overweight is a major public-health concern among US. Latino youth. Healthy eating and physical activity can prevent obesity, and its benefits extend to youth mental health, a growing concern that has disproportionately impacted youth in recent years. Latino families face an increased risk for depressive symptoms compared to white youth. Sports are also linked to psychosocial and behavioral concerns, that can improve mental wellbeing. FA is a community-university collaboration, the program includes three interrelated components: 1) Parent - Healthy parenting practices; 2) Youth - Positive Youth Development (PYD) to promote mental health; and 3) Youth Physical Activity (PA) soccer practices. The resulting intervention includes eight (1.5 hrs.) sessions. Youth focused on PYD and soccer practices.

**Methods** One-group pretest-posttest. Participating families included Latinx parents (n=16) of adolescents aged 10 to 14 years (youth n=30). Parent sessions were led by trained parent educators in Spanish, and youth session focused on PYD and soccer practices (PA), mostly in English led by certified soccer coaches, trained in Youth Mental Health (MHFA). Feasibility measures included, retention rates, program appropriateness (interest, relevance, comfort level, and satisfaction), and program quality. Parenting outcomes included: acceptance and involvement (and others), youth resilience, life skills, among others.

**Results:** Feasibility was assessed with descriptive statistics. Paired t-tests measured changes in parenting outcomes. Adjusted multiple regression models were conducted for change in each outcome. Program appropriateness and group interaction scores were positive Parents attended an average of seven sessions; 76% attended seven to eight sessions. Mean scores averaged across all sessions were similar for interest, relevance, comfort level, and satisfaction (M = 2.90, 2.94, 2.90, 2.90 on 3-point scale). Improvements was noted for the parenting outcomes. Youth increased motivation in engaging soccer practices, PA, and self-efficacy.

**Conclusions:** This FA intervention is feasible by high levels of program acceptability and retention through the majority sessions and may influence healthy parenting contributors to youth wellbeing. Participating youth were motivated to attend the fun soccer practices, reminding their parents to attend the FA program.

# CANcer BEhavioural Nutrition and Exercise Feasibility Trial: lessons learned and early results

**Dr. Cindy Forbes<sup>1</sup>**, Mr. Jordan Smith<sup>1</sup>, Dr. Alex Bullock<sup>1</sup>, Dr. Angela Darby<sup>3</sup>, Prof. Michael Lind<sup>2</sup>, Dr. Flavia Swan<sup>1</sup>, Prof. Miriam Johnson<sup>1</sup>

<sup>1</sup>University of Hull, Hull, United Kingdom, <sup>2</sup>Queen's Centre for Oncology and Haematology, Cottingham, United Kingdom, <sup>3</sup>York Teaching Hospital, York, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Older adults with lung cancers are often frail and unfit, negatively affecting treatment tolerance and quality of life (QoL); more than younger counterparts. Lifestyle behaviours, like physical activity (PA) and healthy nutrition, significantly improve QoL among people with cancer. They may also positively impact treatment completion rates, potentially improving survival. However, older, frailer lung cancer populations are typically excluded from research as, assumed to be too high risk. Following our previous development research, our aim was to investigate the feasibility and acceptability of conducting a large RCT of a tailored wellbeing programme for older adults with lung cancers.

**Methods:** Clinical teams identify older adults ( $\geq 60$  years) with stage III/IV lung cancer or mesothelioma who are offered new (first/subsequent) systemic anti-cancer treatment (chemotherapy, radiotherapy, and/or immunotherapy). The primary outcome is feasibility assessed by recruitment/retention rates, data collection/quality, and programme adherence/acceptability. Secondary measures include PA, frailty, performance status, physical function, body composition, grip strength, nutritional status, symptom burden, treatment tolerance, QoL, and health service usage. Participants receive a tailored home-based PA and nutrition programme (resistance bands, Fitbit, handheld fan, tailored educational materials) with initial consultation sessions with a qualified physiotherapist and a dietitian. Participants are followed over 12 weeks with check-in calls. Measures are collected at mid-point (6 weeks – survey only), post-study (12 weeks) and, at 24 weeks. At 12 weeks, in-depth interviews are conducted with participants to explore acceptability further.

**Results:** Recruitment closes 28 February 2023. Recruitment rate is currently ~27% (6 consented). Therefore, we changed from a 2-group RCT to a 1-group trial. Participants have completed all intended measures and 90% of check-in appointments. Changes in measures will be reported, but so far, interviews show increased confidence for other activities (e.g., going out, walking more, visiting family more), feeling stronger overall, and positive views about the tailored, adaptable programme.

**Conclusions:** Though a challenging time for clinic-based recruitment, those recruited to date, have felt it helpful and worthwhile. We will use the interviews and feasibility data to understand how best to further evaluate this potentially beneficial programme for this overlooked group of people with cancer.

# The Association of parents' obesity and lifestyle factors with the excessive body weight of children: PICCAH study

**Dr. Grazyna Badowski<sup>1</sup>, Mr. Nico Valencia<sup>1</sup>**, Dr. Tanisha Aflague<sup>1</sup>, Dr. Margaret Hattori-Uchima<sup>1</sup>, Dr. Kathryn Wood<sup>1</sup>, Dr. Rachael Leon Guerrero<sup>1</sup>

<sup>1</sup>University of Guam, Mangilao, Guam

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** To examine the associations of parents' weight, physical activity (PA), sedentary behavior (SB), screen time (ST), and parental support for children's physical activity and nutrition with body weight in their children participating in the Pacific Island's Cohort for Cardiometabolic Health (PICCAH) study, conducted in Guam 2017-2022.

**Methods:** The preliminary data from the cross-sectional study in Guam included 481 parent-child dyads (458/32 mother/father, parent aged 21-50y, child aged 3-9y) with complete data on body weight categories and who completed lifestyle surveys. Binary logistic regression, adjusted for age and gender of children, was used to identify which of parents' lifestyle indicators were associated with the weight status of their children.

**Results:** The majority of parents (81.5%) and 26.6% of children were overweight or obese (OWOB). Adults in this study did not meet physical activity (55.5%), sleep (56.5%), or sedentary behavior (61.1%) recommendations. Children did not meet screen time (73.1%), and sleep (54.5%) recommendation. Adults with obesity significantly increased their child's odds of OWOB (OR=3.05, 95% CI: 1.88-4.94). For family eating activity practices, eating "often" or "very often" at fast food restaurants, as reported by adults, was associated with higher rates of the OWOB in children (OR=1.56, 95% CI: 1.01-2.44); and limiting screentime by parents was associated with lower levels OWOB in their children (OR=.18, 95% CI: 0.05-0.62).

**Conclusions:** Family-based lifestyle interventions could prevent the development of OWOB in the children in Guam.

Funding Source: NIH/NIMHD (1U24MD011201-01)

# Physical activity has a stronger correlation with arterial stiffness than grip strength, balance, or BMI in the elderly

Ms. Hannah Hill<sup>1</sup>, **Dr. Catherine Elliot<sup>1</sup>**, Dr. Catherine Lizamore<sup>2</sup>

<sup>1</sup>Lincoln University, Christchurch, New Zealand, <sup>2</sup>Ara Institute of Canterbury, Christchurch, New Zealand

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Arterial stiffness (AS) is associated with an array of debilitating health conditions, worsening with age. This cross-sectional study aimed to investigate the relationship between balance, grip strength, cardiovascular fitness and physical activity with AS (using pulse wave velocity (PWV)) in older adults.

**Methods:** Eighty-one retirement-village residents (24 males, 57 females, age:  $78.2 \pm 6.4$  years, weight:  $69.4 \pm 12.5$  kg, height:  $162.9 \pm 8.5$  cm, BMI:  $26.1 \pm 4$ ) completed the Yale Physical Activity Survey, PWV (applanation tonometry), 30-second sit-to-stand leg strength test, hand grip strength assessment, 4-stage balance test, and a 6-minute walk fitness test. Pearson's correlations were used to assess the relationship between PWV with health and fitness parameters. A linear regression then assessed the variables with the highest correlations with PWV.

**Results:** The number of cardiovascular risk factors ( $r = 0.57$ ,  $p < 0.01$ ), age ( $r = 0.51$ ,  $p < 0.01$ ) and systolic blood pressure ( $r = 0.50$ ,  $p < 0.01$ ) had strong, harmful associations with PWV. Total physical activity minutes/week ( $r = -0.1$ ,  $p = 0.01$ ), total Kcal/week ( $r = -0.30$ ,  $p = 0.01$ ), and the 6-minute walk test ( $r = -0.29$ ,  $p = 0.01$ ) had a moderate, beneficial association with PWV, whereby sit-to-stand ( $r = -0.27$ ,  $p = 0.02$ ) and balance ( $r = -0.27$ ,  $p = 0.01$ ) had a weak, beneficial association with PWV. Grip strength had a non-significant relationship with PWV ( $r = -0.02$ ,  $p = 0.94$ ). Body mass index had no significant association with PWV ( $r = -0.04$ ,  $p = 0.75$ ).

**Conclusions:** Having an increased number of risk factors, increased age, and a higher systolic blood pressure had negative correlations on arterial stiffness in an elderly population. Physical activity had the highest positive association with AS. Older adults living in retirement homes should be encouraged to engage in higher physical activity levels to reduce arterial stiffness.

# Distilling causality between physical (in)activity and obesity

Dr. Zhe Wang<sup>1</sup>, Prof. George Davey Smith<sup>2,3</sup>, Prof. Ruth Loos<sup>1,4</sup>, Dr. Marcel Den Hoed<sup>5</sup>, **Dr. Hannah Brooke**<sup>1</sup>.  
<sup>1</sup>The Charles Bronfman Institute for Personalized Medicine, Icahn School of Medicine at Mount Sinai, New York, New York, USA, <sup>2</sup>MRC Integrative Epidemiology Unit, University of Bristol and NIHR Bristol Biomedical Research Center, Bristol, United Kingdom, <sup>3</sup>Population Health Science, Bristol Medical School, University of Bristol and NIHR Bristol Biomedical Research Center, Bristol, United Kingdom, <sup>4</sup>Novo Nordisk Foundation Center for Basic Metabolic Research, Faculty of Health and Medical Sciences, University of Copenhagen, Copenhagen, Denmark, <sup>5</sup>The Beijer Laboratory and Department of Immunology, Genetics and Pathology, Uppsala University and SciLifeLab, Uppsala, Sweden

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** To what extent obesity is a cause and/or a consequence of low physical activity levels and more time spent being sedentary has still not yet been fully elucidated. Observational studies and genetic correlations suggest that higher education is associated with more physical activity and lower risk of obesity.

**Methods:** Leveraging results from our recent genome-wide association study for moderate-to-vigorous intensity (MV) physical activity and leisure screen time (screen time), we here disentangle the causal relationships between these two traits, education – defined by years of schooling – and obesity, measured by body mass index (BMI) using multiple univariate and multivariate Mendelian Randomization (MR) approaches.

**Results:** Univariate MR analyses show bidirectional causal effects between physical (in)activity traits and BMI. However, when taking years of schooling into account, multivariate MR analyses show that more MV physical activity causes a lower BMI, and a higher BMI causes more screen time, but not the other way around. In addition, more years of schooling causes higher levels of MV physical activity, less screen time, and lower BMI.

**Conclusion:** In conclusion, results from multivariate MR analyses highlight beneficial effects of education and suggest that more physical activity leads to lower adiposity, while time spent sedentary per se is a consequence but not a cause of obesity.

# Examining the Use of Digital Technology for Nutrition Training in the ECE Setting Amid the COVID-19 Pandemic

**Dr. Lucine Francis<sup>1</sup>**, Dr. Chelsea Kracht<sup>2</sup>, Ms. Wenyi Chen<sup>1</sup>, Dr. Alison Tovar<sup>3</sup>, Dr. Kim Gans<sup>4</sup>, Dr. Nancy Perrin<sup>1</sup>

<sup>1</sup>Johns Hopkins University School of Nursing, Baltimore, USA, <sup>2</sup>Pennington Biomedical Research Center, Baton Rouge, USA, <sup>3</sup>Brown University School of Public Health, Providence, USA, <sup>4</sup>Department of Human Development and Family Sciences, University of Connecticut, Storrs, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** During the COVID-19 pandemic, many states implemented stay-at-home orders, disrupting the availability of in-person nutrition training for early care and education (ECE) providers. Nutrition training is critical to ensure providers have the latest nutrition information to support children's health. COVID-19-related nutrition policies for the ECE setting emerged, making nutrition training crucial during the pandemic. The Child and Adult Care Food Program (CACFP), a federal subsidy program to help provide healthy foods, offers training to ECE providers. Digital technology can connect providers to online training and reduce participation barriers. Little is known about how ECE providers leverage digital technology to support training. This study examines the use and barriers to using digital technology for nutrition training in the ECE setting amid the pandemic.

**Methods:** Data were collected using a self-administered online survey informed by the Technology Acceptance Model. We recruited a convenience sample of ECE providers via state agency listservs and social media posts, including CACFP. Descriptive statistics describe participants' demographic characteristics. A chi-square test examined the relationship between digital use and selected demographic factors.

**Results:** 143 participants from center-based (n=91) and Family Child Care Homes (FCCHs, n=52) were represented across all regions of the US. Participants were 50.4% ECE administrators, 61.5% non-Hispanic White, 52.5% ages 40-59, 62.9% with a college degree, and 81.1% enrolled in the CACFP. Regarding general digital technology use, over 97.9% of providers had access to high-speed internet, and 95.1% used electronic devices, primarily tablets (70%). Nearly 85% report being confident about using digital technology. Most ECE providers (83.2%) received nutrition training since the start of the pandemic in March 2020, with CACFP being the largest training source (49%). Digital Use is significantly associated with CACFP as the source of training ( $p=0.007$ ). Over half the sample (53.2%) received nutrition training via virtual platforms. However, only 18-30% of the trainings contained information regarding COVID-19-related changes in feeding practices in the ECE setting.

**Conclusion:** Digital technology can support the continuity of training in the face of significant disruptions due to the pandemic and has the potential to reach more providers than in-person trainings.

# Examining the Routine Use of Digital Technology to Create Opportunities for Active Play in the ECE Setting

**Dr. Lucine Francis<sup>1</sup>**, Dr. Chelsea Kracht<sup>2</sup>, Dr. Alison Tovar<sup>3</sup>, Ms. Grace Chen<sup>1</sup>, Dr. Nancy Perrin<sup>1</sup>, Dr. Kim Gans<sup>4</sup>

<sup>1</sup>Johns Hopkins University School of Nursing, Baltimore, USA, <sup>2</sup>Pennington Biomedical Research Center, Baton Rouge, USA, <sup>3</sup>Brown University School of Public Health, Providence, USA, <sup>4</sup>Department of Human Development and Family Sciences, University of Connecticut, Storrs, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Since many working families rely on the early care and education (ECE) setting for their childcare needs, this setting is a prime space to promote active play. Digital technology can assist providers in supporting active play in the ECE setting. We know little about how ECE providers leverage digital technology to create opportunities for active play. The study aims to examine ECE providers' routine use of digital technology to create opportunities for active play for the children in their care.

**Methods:** Data were collected using a self-administered, online survey developed with the guidance of the Technology Acceptance Model. We recruited a convenience sample of ECE providers via state agency listservs and social media posts. Pearson's chi-square tests assessed the association between digital use and selected variables.

**Results:** A total of 143 participants from center-based (n=91) and Family Child Care Homes (FCCHs) (n=52) were represented across all regions of the US. Participants were 50.4% ECE administrators, 61.5% non-Hispanic White, 52.5% ages 40-59, 62.9% with a college degree, and 81.1% enrolled in the CACFP. Regarding technology use, over 97% of providers had access to high-speed internet, and 95% used electronic devices, primarily iPads (70%). Over half of the providers (65.7%) use digital technology to create opportunities for active play. Digital use is significantly associated with the participants' race/ethnicity (p-value <0.05) and age group of children (p-value <0.01). Participants perceived challenges to be the lack of technology equipment (28%), lack of knowledge of digital enrichment (25.2%), and the perceived high cost of digital active play/physical activity programs (26.6%). Finally, about 14% of participants who do not use digital technology for active play report that they intend to use it in the future.

**Conclusion:** Most ECE providers use digital technology to create opportunities for active play. Educating ECE providers on inexpensive and developmentally appropriate digital active play programs could help overcome providers' perceived challenges.

# Depression and positive affect in women newly diagnosed with breast cancer: Cross-sectional associations with device-measured physical activity and sedentary time

**Prof. Jeff Vallance**<sup>1</sup>, Dr. Christine Friedenreich<sup>2</sup>, Dr. Qinggang Wang<sup>2</sup>, Dr. Charles Matthews<sup>3</sup>, Dr. Lin Yang<sup>2</sup>, Prof. Margaret McNeely<sup>4</sup>, Prof. Nicole Culos-Reed<sup>5</sup>, Prof. Gordon Bell<sup>4</sup>, Dr. Jessica McNeil<sup>6</sup>, Ms. Leanne Dickau<sup>2</sup>, Prof. Kerry Courneya<sup>4</sup>

<sup>1</sup>Athabasca University, Athabasca, Canada, <sup>2</sup>Alberta Health Services, Calgary, Canada, <sup>3</sup>National Cancer Institute, Bethesda, USA, <sup>4</sup>University of Alberta, Edmonton, Canada, <sup>5</sup>University of Calgary, Calgary, Canada, <sup>6</sup>University of North Carolina Greensboro, Greensboro, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Few studies have examined depression after a cancer diagnosis and before initiating adjuvant or neoadjuvant systemic treatments. In this study, we present baseline data on device-measured physical activity, sedentary behaviour, depression, and positive affect in newly diagnosed breast cancer survivors. To examine associations of accelerometer-assessed physical activity and sedentary time with depression symptom severity and depression prevalence.

**Methods:** Shortly after diagnosis, 1,425 participants completed depression, happiness, and satisfaction with life measures and wore an ActiGraph® device and the activPAL™ inclinometer on their thigh for seven days to measure sedentary time (sitting/lying) and steps (1,384 completed both device measures). ActiGraph® data were analyzed using a hybrid machine learning method (R Sojourn package, Soj3x), and activPAL™ data using activPAL™ algorithms (PAL Software version 8). We used linear and logistic regression to examine associations of physical activity and sedentary time with depression symptom severity and depression prevalence, happiness, and satisfaction with life. For logistic regression analysis, we compared participants with none-minimal depression (n=895) to participants with some depression [i.e., mild, moderate, moderately-severe, or severe depression (n=530)].

**Results:** Mean depression symptom severity score was 4.3 (SD=4.1), mean satisfaction with life score was 25.7 (SD=7.2), and mean happiness score was 70 (SD=21.8). Depression symptom severity was negatively associated with moderate-to-vigorous physical activity (MVPA) ( $\beta=-0.51$ , 95% CI: -0.88 to -0.14,  $p=0.007$ ). MVPA was associated with a significantly reduced odds of at least mild or worse depression [Odds Ratio (OR) =0.78, 95% CI: 0.63 to 0.97,  $p=0.026$ ]. Depression symptom severity was also negatively associated with average daily steps ( $\beta=-0.17$ , 95% CI: -0.24 to -0.10,  $p<0.001$ ). Perceptions of happiness was significantly associated with MVPA ( $\beta=2.17$ , 95% CI: 0.18 to 4.17,  $p=0.033$ ) and steps per day ( $\beta=0.50$ , 95% CI: 0.13 to 0.87,  $p=0.008$ ). Sedentary time was not associated with depression but was inversely associated with perceptions of happiness ( $\beta=-0.79$ , 95% CI: -1.48 to -0.11,  $p=0.024$ ).

**Conclusions:** Physical activity was inversely associated with depression symptom severity and odds of having mild or worse depression. Sedentary time was not associated with depression symptom severity or odds of having depression, but was inversely associated with perceptions of happiness.

# Exploring factors predicting Canadian early childhood educators' physical activity, sedentary behaviour, and outdoor play-related self-efficacy, behavioural intention, and perceived behavioural control

**Dr. Brianne Bruijns**, Dr. Matthew Bourke, Ms. Tanya Nguyen, Dr. Patricia Tucker

<sup>1</sup>Western University, London, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Early childhood educators (ECEs) can have substantial influence on young children's movement behaviors in childcare and psychosocial factors have been found to influence their teaching practices in this setting. The purpose of this study was to determine which personal characteristics predicted ECEs' self-efficacy, behavioral intention, and perceived behavioral control (PBC) to promote active childcare settings.

**Methods:** Canadian ECEs (n = 390) completed an online survey to collect demographic information (10 items) and ratings of their physical activity, sedentary behaviour, and outdoor play-related self-efficacy (30 items), behavioral intention (28 items), and PBC (28 items); composite scores were calculated. Latent profile analysis was conducted to identify subgroups of participants based on self-efficacy, behavioral intention, and PBC. Univariate differences in independent variables among profiles were explored and multinomial logistic regression was used to determine multivariate predictors of profile membership.

**Results:** In general, ECEs rated their self-efficacy, behavioural intention, and PBC similarly, except for one item related to engaging children in their care in 120 minutes of physical activity each day, where ECEs reported lower behavioural intention and PBC ratings compared to self-efficacy ratings. Most ECEs fit into profiles with high to very high ratings across all psychosocial variables. Being female, employed in centre-based childcare, not having a bachelor's degree, having completed an outdoor play professional development course, and achieving the adult physical activity guideline were associated with being in profiles with the highest ratings across all psychosocial variables.

**Conclusion:** Knowing which factors predict ECEs' confidence, intentions, and PBC to promote healthy active childcare environments will help researchers and practitioners develop resources and provide support for ECEs in such endeavours. Future research is needed to determine if ECEs' self-efficacy, behavioural intention, and PBC directly influence their teaching practices or their children's movement behaviours in childcare settings.

# A new tool to measure early childhood educators' physical activity, sedentary behaviour, and outdoor play-related behavioural intention and perceived behavioural control

**Dr. Brianne Bruijns<sup>1</sup>**, Dr. Andrew Johnson<sup>1</sup>, Dr. Shauna Burke<sup>1</sup>, Dr. Patricia Tucker<sup>1</sup>

<sup>1</sup>Western University, London, Canada

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Early childhood educators (ECEs) play a valuable role in childcare settings with respect to promoting physical activity and outdoor play and minimizing sedentary behaviour among young children. Assessing psychosocial variables among ECEs, such as their behavioural intention and perceived behavioral control (PBC), is one way to explore their motivation and ability to support these health behaviours. The ECE Movement Behavioural Intention and Perceived Control (ECE-MBIPC) questionnaire (n = 56 items) was developed via expert consensus to fill the noted gap in tools available to measure these constructs among ECEs in the context of physical activity, sedentary behaviour, and outdoor play.

**Methods:** A test-retest approach, via an online survey administered twice (one-week apart) was adopted to evaluate the reliability and factorial validity of the questionnaire with ECEs in Canada (n = 165). Seven behaviours (3 relating to physical activity, 2 relating to sedentary behaviour, and 2 relating to outdoor play) were included in the questionnaire, with 4 items used to assess intention and PBC for each of the 7 behaviours, respectively. Cronbach's alpha and test-retest statistics were used to assess reliability, while exploratory factor analysis (EFA) was used to examine factorial validity.

**Results:** The ECE-MBIPC questionnaire demonstrated high internal consistency (Cronbach's alpha > 0.85 across behaviour category subscales) and acceptable temporal stability (r > 0.70). A 7-factor solution was proposed by the EFA, with each of the 7 behaviours loading onto their own factor; this solution explained 71% of the variability in the data.

**Conclusion:** As the first reliable and valid tool to measure ECEs' behavioural intention and PBC to promote physical activity and outdoor play and to minimize sedentary behaviour in childcare, the ECE-MBIPC questionnaire will help to standardize how these psychosocial variables are measured in early years research. Standardizing the measurement of these important variables will enable comparisons across studies to provide a more fulsome understanding of how behavioural intention and PBC may influence ECEs' teaching practices and children's movement behaviours in childcare.

# Alignment of Early Learning Service Menus to Healthy Food, Drink and Choking Guidance in New Zealand

Ms. Olivia Hall<sup>1</sup>, Prof. Ajmol Ali<sup>1</sup>, **Prof. Carol Wham<sup>1</sup>**

<sup>1</sup>School of Sport, Exercise and Nutrition, Massey University, Auckland, New Zealand

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Healthy Active Learning (HAL) is a government programme that delivers education and health outcomes for children and youth across Aotearoa New Zealand and includes food and nutrition guidance for education settings such as early learning services (ELS). The programme seeks to assist ELS to develop policies and practices to promote healthy foods and drinks and support the development of healthy eating habits in childhood. As part of the baseline evaluation of HAL this study aimed to assess alignment of food and drinks served to NZ children in ELS with the Ministry of Health (MoH) *Healthy Food and Drink* and *Choking* Guidance.

**Methods:** Menus (n=271) collected remotely from 148 ELS between November 2020-March 2021 were analysed for their nutritional quality (percentage of 'green', 'amber', and 'red' menu items) using a scoring system based on the MoH guidance. Points were awarded based on the availability of healthy (green) menu items and the exclusion of unhealthy (red) menu items.

**Results:** Overall, of all menus 2.6% met the MoH *Healthy Food and Drink* Guidance and a fifth (18.5%) met the MoH *Choking* guidance. Menus for over two-year-olds (over-2s) scored, on average, 12% higher than menus for under two-year-olds (under-2s;  $p<0.01$ ). Services with a Heart Foundation *Healthy Heart Award* provided more green items to over-2s ( $p=0.04$ ) and under-2s ( $p=0.01$ ), and less red items to over-2s ( $p=0.04$ ). Providing more green menu items was inversely correlated with providing less high choking risk foods ( $p<0.01$ ). Menu scores did not vary by service location, neighbourhood socioeconomic deprivation or type (services operating independently versus those part of an education group chain).

**Conclusions:** Alignment of menus with MoH nutritional guidance was low, particularly in ELS caring for very young children (under-2s). The low compliance of ELS menus with the MoH guidance in this sample suggests that children's healthy eating exposures are lacking, whilst exposure to energy-dense, nutrient-poor foods and drinks is excessive. ELS who provided more healthy foods and beverages also provided less high-choking-risk foods may be more aware of the MOH Guidance. Greater uptake of the *Healthy Heart Awards* scheme could assist ELS to provide healthier food and drinks.

# Food Intake and Psychosomatic Symptoms in Adolescents<sup>6/15</sup>

**Mrs. Maria Tell<sup>1</sup>**, Prof. Katarina Hedin<sup>1,2</sup>, Dr. Mats Nilsson<sup>1</sup>, Associate Professor Marie Golsäter<sup>1,3</sup>, Dr. Hans Lingfors<sup>1</sup>

<sup>1</sup>Futurum, Region Jönköping County, and Department of Health, Medicine and Caring Sciences, Linköping University, Jönköping, Sweden, <sup>2</sup>Department of Clinical Sciences in Malmö, Family Medicine, Lund University, Lund, Sweden, <sup>3</sup>Child Research Group, Department of Nursing, School of Health and Welfare, Jönköping University, Jönköping, Sweden

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Increasing rates of psychosomatic symptoms among adolescents have been reported. Few studies have examined the relation between food intake and psychosomatic symptoms. The aim was to study the association between food intake and psychosomatic symptoms.

**Methods:** In this cross-sectional study, we used data from 6 248 girls and 7 153 boys, who turned 16 during the academic years 2009/2010 up to 2015/2016 and answered a questionnaire at School Health Services in south-east Sweden. Descriptive statistics and Chi2-test were used. A  $p$ -value  $< 0.05$  was considered as statistically significant. Odds Ratio (95% Confidence Limits) for the association between an overall healthy food intake and a low score for psychosomatic symptoms was calculated when stratifying for lifestyle habits and gender.

**Results:** An overall healthy food intake was associated with a low psychosomatic symptom score ( $p = < 0.0001$ ), regardless of other lifestyle habits and gender. An overall healthy food intake was also related to a low frequency of the specific psychosomatic symptoms concentration difficulties, sleep difficulties, a poor appetite or dizziness ( $p < 0.0001$ ). Some healthy intakes of specific foods were associated with a low frequency of specific psychosomatic symptoms ( $p = 0.001$ ).

**Conclusions:** A healthy diet seems to be associated with less psychosomatic symptoms among adolescents. Deeper knowledge is needed whether a change from an unhealthy to a healthier diet may reduce the psychosomatic symptoms and improve mental health.

# Translating exercise interventions online: Considerations for real-world impact

Dr. Samantha Harden<sup>1</sup>, **Ms. MC Frazier<sup>1</sup>**, Mr. Md Shafiqul Islam<sup>1</sup>, Ms. Rachel Kaplan<sup>1</sup>, Dr. Sol Lim<sup>1</sup>  
<sup>1</sup>Virginia Tech, Blacksburg, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** To explore delivery personnel barriers and facilitators when translating an evidence-based physical activity intervention that was previously tested through in-person, synchronous delivery.

**Methods:** A learning collaborative consisting of human factors engineering and ergonomists, behavioral psychologist, exercise scientists, and LIFT instructors engaged in three iterative trials to answer distinct research aims: 1) LIFT delivered online was pilot tested ( $n = 88$ ) for participant adherence and self-report physical activity; 2) qualitative data were collected via one-on-one interviews with instructors ( $n = 10$ ) to determine barriers and facilitators; and 3) sensor data was collected on a subsample of older adults ( $n = 3$ ) to determine compliance and acceptability of wearables.

**Results:** In 2021, 88 older adults (95% female; 44% non-White;  $71 \pm 9$  years of age; average BMI  $30.36(+6.4)$  kg/m<sup>2</sup>) participated in LIFT online across Arkansas, North Carolina, and Virginia who had significant improvements in lower body and upper body strength, upper body flexibility and aerobic endurance ( $p < 0.05$ ). Agility, lower body flexibility, and balance improved, but not significantly ( $p > 0.05$ ). One participant shared, "The best part of LIFT was being able to exercise safely during the pandemic and winter weather." Instructors shared challenges in facilitating social connection in the virtual space and concerns about ease of technology use, "Zoom is better than nothing....You know, in-person is, to me, the- the best form." Finally, to inform gesture-based interfaces that can simplify instructor-participant communication without the need to share the camera feed, wearable inertial measurement unit (IMU) data were collected in one cohort of LIFT. Some participants shared difficulties in understanding the sensor interface and how to use the sensors correctly for data recording with written instructions. However, after providing a live video demonstration of the sensor data recording process, errors in data recording had a downward trend.

**Conclusions:** Virtual exercise programs can be safe and feasible. Instructors need ongoing training and support for prompting virtual programming. This includes, but is not limited to: orientation calls to help guide participants with audio/visual best practices and adapting the objective functional fitness protocol to the virtual space.

# Leisure time physical activities and active ageing status among older adults in Bangladesh

**Mr. Palash Karmakar<sup>1</sup>**, Associate Professor Wendy Yajun Huang<sup>1</sup>

<sup>1</sup>Hong Kong Baptist University, Kowloon Tong, Hong Kong

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Leisure time physical activity (LTPA) has numerous health and social benefits for older adults. The aim of this study was to assess the relationship between different LTPAs and active ageing status (AAS) among older adults in Bangladesh, as well as the moderating role of socioeconomic factors in that relationship.

**Methods:** A cross-sectional survey was conducted among 348 older adults (73.9% males) aged 65 years and above from February to October 2021. LTPA and AAS were assessed using the Physical Activity Scale for the Elderly (PASE) and the University of Jyväskylä Active Ageing Scale (UJACAS), respectively. Hierarchical multiple regressions were performed to determine the relationships between different types of LTPA and AAS, while adjusting for household and work-related activities. A moderation test was also performed using SPSS PROCESS (Version 4).

**Results:** Over half of the older adults aged 65-69 years (52.6%), lived in rural areas (51.7%), had a normal body weight (56.9%), were unemployed or homemaker (62.6%), had a lower level of education (55.5%) and had other sources of income or financial support (54.9%). AAS significantly differed according to sex, age, weight status, education level, employment status, and other sources of income or financial support among older adults. LTPAs, including walking outside of the home ( $\beta=0.24$ ; 95% CI: 0.13, 0.35), light ( $\beta=0.20$ ; 95% CI: 0.10, 0.30), moderate ( $\beta=0.10$ ; 95% CI: 0.00, 0.20), and strenuous ( $\beta=0.14$ ; 95% CI: 0.04, 0.24) sport or recreational activities, were positively associated with a higher score of AAS. Activities other than LTPAs, i.e., home repairs ( $\beta=0.14$ ; 95% CI: 0.01, 0.27) and caring for another person ( $\beta=0.14$ ; 95% CI: 0.03, 0.25), were positively, while paid or voluntary work ( $\beta=-0.10$ ; 95% CI: -0.20, 0.00) was negatively, associated with AAS. Employment status moderated the relationship between LTPAs and AAS.

**Conclusions:** Higher levels of LTPAs were related to better AAS. Regular participation in the optimum level of LTPAs is highly advisable for older adults in Bangladesh in order to stay active, healthy, and have a better quality of life at a later stage.

# Evaluation of the Active Together multi-modal cancer rehabilitation service embedded within clinical care.

**Dr. Michael Thelwell<sup>1</sup>**, Dr. Anna Myers<sup>1</sup>, Dr. Liam Humphreys<sup>1</sup>, Ms. Gabbi Frith<sup>1</sup>, Dr. Katie Pickering<sup>1</sup>, Ms. Gail Phillips<sup>1</sup>, Mrs. Carol Keen<sup>2</sup>, Prof. Rob Copeland<sup>1</sup>

<sup>1</sup>Sheffield Hallam University, Sheffield, United Kingdom, <sup>2</sup>Sheffield Teaching Hospitals NHS Foundation Trust, Sheffield, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Active Together is an evidence-based multi-modal rehabilitation service for patients with a cancer diagnosis in Sheffield, embedded within the clinical care pathway, providing support to help patients prepare both physically and psychologically before treatment and to recover well after treatment. The purpose of the evaluation is to determine the impact of this multi-modal rehabilitation service on patients' physical and psychological state, as well as their clinical treatment outcomes and economic benefits to the wider healthcare system.

**Methods:** The outcome evaluation comprises a single group, longitudinal design to determine the impact of the Active Together service on patient outcomes measured throughout the service pathway, including physical capacity, psychological state and dietetic need. A one-way repeated measures (within-group) analysis of variance will be used to determine both the statistical and clinical significance of changes in patient outcome measures throughout the service pathway. Health resource usage and clinical treatment outcomes for patients that have received support from the Active Together service, will be compared to patients who previously underwent treatment for cancer without receiving rehabilitation support, to assess the impact of the service from an economic perspective.

**Results:** To date, 145 male patients and 104 female patients have received support from the Active Together service during their cancer treatment. Preliminary data shows that patients exhibit clinically significant improvements in measures of physical capacity (6-minute walk test and 30 second sit-to-stand), psychological state (quality of life, depression, anxiety) and levels of dietetic need, both during prehabilitation before starting treatment and during rehabilitation following treatment. Patients have improved outcomes from their treatment, leading to a reduction in mean hospital length of stay and reduced overall cost to the healthcare system compared to patients that did not receive rehabilitation.

**Conclusions:** Evidence to support the role of multi-modal rehabilitation for patients at all stages of their cancer treatment journey is growing. The translation of that evidence into practice is less advanced. The results of this evaluation will contribute to the growing evidence base of the real-world effectiveness of cancer rehabilitation on both patient outcomes and the health economic landscape.

# Associations of neighbourhood environmental attributes and socio-economic status with health-related quality of life in urban mid-aged and older adults: mediation by physical activity and sedentary behaviour

**Associate Professor Anthony Barnett**<sup>1</sup>, Prof. Jonathan E. Shaw<sup>2</sup>, Ms. Erika Martino<sup>3</sup>, Associate Professor Luke D. Knibbs<sup>4</sup>, Dr. Govinda Poudel<sup>1</sup>, Prof. Neville Owen<sup>2</sup>, Prof. Ester Cerin<sup>1,2</sup>

<sup>1</sup>Australian Catholic University, Melbourne, Australia, <sup>2</sup>Baker Heart and Diabetes Institute, Melbourne, Australia, <sup>3</sup>The University of Melbourne, Melbourne, Australia, <sup>4</sup>The University of Sydney, Sydney, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** This study of middle-aged and older adults examined the associations between objectively-assessed features of the neighbourhood environment and physical and mental aspects of health-related quality of life (HRQoL), and the mediating effects of physical activity and sedentary behaviours in the associations.

**Methods:** We used data from the third wave of the Australian Diabetes, Obesity and Lifestyle survey (conducted in 2011-12) with relevant environmental exposures. Attributes of the built and natural environment were assessed using Geographic Information Systems data for 1-km residential buffers, while annual average concentrations of air pollutants were estimated using satellite-based land use regression models. Neighbourhood socio-economic status (SES) was obtained from census data. Physical activity (walking for different purposes, gardening and resistance training) and sedentary behaviours (leisure-time and transport sitting) were self-reported. HRQoL was measured using the SF-36. Generalised linear mixed models informed by directed acyclic graphs were used to estimate associations between environmental, behavioural and outcome variables.

**Results:** Neighbourhood SES (positively) and annual average concentrations of PM<sub>2.5</sub> (negatively) were the only attributes associated significantly with HRQoL in the total- and direct-effect models. All neighbourhood environmental attributes were indirectly related to the physical and mental components of HRQoL via physical activity behaviours and leisure-time sitting. Indirect effects of most environmental features on HRQoL were inconsistent, i.e., positive through some behavioural pathways and negative through others.

**Conclusions:** Neighbourhood SES appears to have beneficial effects on HRQoL. Walkability-related built environment attributes appear to have beneficial associations with HRQoL via walking and resistance training which may displace some leisure-time sitting. However, some of these attributes may also contribute to more sitting by limiting mid-aged and older adults' opportunities for household and gardening activities. Access to natural features may also provide support some activities (e.g., resistance training, less sitting) but limit opportunities for others (gardening). These findings highlight the importance of further examining the potential role of the neighbourhood environment in HRQoL through mediation analyses encompassing key inter-related neighbourhood environmental attributes and a variety of lifestyle behaviours theoretically linked to specific environmental features and HRQoL.

# Health determinants of physical literacy for older adults: A mixed-method systematic review

**Ms. Kai-ling Ou<sup>1</sup>**, Dr. Wendy Yajun Huang<sup>1,2</sup>, Dr. Ming Yu Claudia Wong<sup>3</sup>

<sup>1</sup>Department of Sport, Physical Education and Health, Hong Kong Baptist University, Hong Kong, China, <sup>2</sup>Dr. Stephen Hui Research Centre for Physical Recreation and Wellness, Hong Kong Baptist University, Hong Kong, China, <sup>3</sup>Department of Health and Physical Education, The Education University of Hong Kong, Hong Kong, China

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** This mixed-method systematic review aimed to identify the conceptualization and assessment of physical literacy, and summarize the potential health determinants across the multiple domains of physical literacy (physical, affective, cognitive and behavioural) for older adults aged 60 years and above.

**Method:** Six scientific databases, MEDLINE (Ovid), PsycINFO (ProQuest), Scopus, PubMed, Web of Science, and EMBASE(Ovid) were searched on 17 November 2022. Critical appraisal was conducted using Joanna Briggs Institute's Critical Appraisal tools and the Mixed Method Appraisal Tool. Inductive thematic analysis was used to synthesize health determinants related to physical literacy.

**Results:** 12 articles, including 2,106 participants from 6 countries and districts, were included. Physical literacy was assessed either qualitatively by using interviews, open-end questions, and observation, or quantitatively using psychometric scales for different physical literacy domains. Most of the studies measured the affective domain (67%; motivation, and confidence), followed by the physical domain (50%; physical competence, motor skill competence, fundamental movement skills, purposeful physical pursuit), cognitive domain (33%; knowledge and understanding of activities, knowledge and understanding of healthy and active lifestyles, and value and take responsibility for physical activity), behaviour domain (17%; physical activity engagement), and general physical literacy (25%). Five health determinants have been investigated in their relationships with physical literacy domains: (1) individual characteristics and behaviours: physical well-being, previous exercises experience, staying active and diet, (2) health services: physical activity program, (3) education: instructor, education attainment, knowledge and awareness of the physical activity and pedagogical strategies, (4) social support network: social engagement, and (5) gender.

**Conclusion:** A comprehensive assessment of physical literacy for older adults is lacking. There was some evidence showing that intrapersonal factors and participating in physical activity programs were positively associated with physical literacy in older adults. Future studies should examine a wide range of health determinants of multiple domains of physical literacy in older adults.

# Benefits and barriers to spending a longer time in the kitchen among older women with frailty

**Ms. Sayaka Nagao-Sato<sup>1</sup>**, Dr. Rie Akamatsu<sup>1</sup>, Dr. Sakiko Yamamoto<sup>1</sup>, Dr. Etsuko Saito<sup>1</sup>

<sup>1</sup>Ochanomizu University, Tokyo, Japan

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose** Cooking is a physical activity that declined at the beginning of frailty. Poorer cooking status may contribute to unhealthy eating, leading to the progress of frailty status. This study aimed to examine the associations between spending time in the kitchen, healthy diet intake, and frailty status, and barriers to kitchen use were also explored among older women.

**Methods** An online cross-sectional survey was conducted with 600 community-dwelling older Japanese women aged  $\geq 65$  years in January 2023. Frailty status was assessed using the Kihon Check List. Healthy diet intake was assessed using the balanced-meal intake frequency, asking the days of having  $\geq 2$  meals including a staple, a main, and a side dishes in a week. Kitchen use was evaluated using the weekly frequency of using the kitchen and time spent in the kitchen a day. Barriers to kitchen use were identified by asking about inconvenient things in the kitchen with 16 options. Kruskal-Wallis and Fisher's exact tests were used to examine associations of frailty status with demographic characteristics, balanced-meal intake, kitchen use, and barriers to kitchen use. Moderation analysis was used to test the conditional effect of time spent in the kitchen on frailty status and balanced-meal intake.

**Results:** The prevalence of pre-frailty and frailty were 34.0% and 21.1%, respectively, and 95% used their kitchen every day. Participants with frailty were older ( $p < 0.001$ ), had larger BMI ( $p = 0.010$ ), and were more likely to have lower household income ( $p = 0.002$ ) and receive caregiving ( $p < 0.001$ ), compared to robust participants. While participants who spent a longer time in the kitchen consumed more balanced-meals in each frailty status, the conditional effect of time spent in the kitchen on balanced-meal intake was stronger among those with pre-frailty or frailty, compared to robust participants ( $p = 0.012$ ). Participants with frailty were more likely to report three inconveniences: a strain in their low back ( $p < 0.001$ ), a strain on their neck ( $p = 0.017$ ), and a distant storage yard for garbage and dish soap ( $p < 0.001$ ).

**Conclusions:** These findings support that kitchens should be redesigned for older women with frailty, which may contribute to spending longer time in the kitchen and improving their diet.

# Effect of staff professional development on preschooler`s fundamental motor skills and physical fitness: The ACTNOW cluster-randomized controlled trial

**Miss Elisabeth Straume Haugland<sup>1</sup>**, Prof. Eivind Aadland<sup>1</sup>, Dr. Ada Kristine Ofrim Nilsen<sup>1</sup>

<sup>1</sup>Western Norway University of Applied Sciences, SOGNDAL, Norway

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Being physically active at moderate-to-vigorous intensity is favorably associated with several health indicators in early childhood, including improved motor development (FMS) and physical fitness (FIT). However, children's lack of physical activity (PA), and thus suboptimal levels of FMS and FIT, is a global public health concern. The Active Learning Norwegian Preschool(er)s (ACTNOW) study investigated the effects of an 18-month cluster randomized controlled preschool-based trial with staff professional development on FMS, FIT, and PA in 3-5-year-old preschoolers.

**Methods:** A total of 1265 preschoolers (4.3 yr, 52% boys) from preschools in Sogn og Fjordane County were cluster-randomized by preschool to either an intervention (n=23) or a control group (n=23). Intervention preschools participated in a PA intervention in 2019-2022 delivered by preschool staff, consisting of four core components: moderate-to-vigorous PA, motor-challenging PA, cognitively engaging PA, and physically active learning. PA was measured with accelerometry (ActiGraph GT3X+). FMS was evaluated by a process-oriented test battery (9 items) across three domains: locomotor, object control, and balance skills. FIT was assessed through motor fitness, handgrip strength, and standing long jump. Data from baseline, 7-months, and 18-month follow-up were analyzed using a linear mixed model with child and preschool as random effects. Effect estimates were derived from testing the main effect of group on change in FMS, FIT, and PA.

**Results:** During preschool hours, findings showed significant improvements in vigorous PA at 7- (ES=0.15; p=0.041) and 18 months (ES=0.16; p=0.015) and a significant reduction in sedentary time at 7 months (ES=-0.12; p=0.031) and light PA at 18 months (ES=-0.14; p=0.026) in favor of the intervention group. Significant increases were found for the intervention group in locomotor skills at 18 months (ES; 0.22; p<0.001) and object control skills at 7 months (ES; 0.17; p=0.006). Significant reductions were found for balance skills (ES=-0.15; p=0.003) and handgrip strength (ES=-0.3; p=0.01).

**Conclusion:** The ACTNOW intervention increased vigorous PA, locomotor-, and object control skills and reduced sedentary time in preschool children. However, further research is needed to investigate how to stimulate balance skills and fitness in early childhood. These findings show that PA promotion in early childhood can benefit child development.

# Self-rated health and physical activity during retirement transition – a multi-trajectory analysis of concurrent changes

**Mrs. Roosa Lintuaho**<sup>1,2</sup>, Prof. Mikhail Saltychev<sup>2</sup>, Mrs. Jaana Pentti<sup>3,4,5</sup>, Prof. Jussi Vahtera<sup>3,4</sup>, Prof. Sari Stenholm<sup>3,4</sup>

<sup>1</sup>Department of Emergency Medicine, Turku University Hospital, Turku, Finland, <sup>2</sup>Department of Physical and Rehabilitation Medicine, Turku University hospital and the University of Turku, Turku, Finland, <sup>3</sup>Department of Public Health, University of Turku and Turku University Hospital, Turku, Finland, <sup>4</sup>Centre for Population Health Research, University of Turku and Turku University Hospital, Turku, Finland, <sup>5</sup>Clinicum, Faculty of Medicine, University of Helsinki, Helsinki, Finland

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Previous studies have reported changes in physical activity and self-rated health during retirement transition, but the results have been inconclusive, and these two variables have not been studied simultaneously. The aim of the study was to evaluate concurrent changes in physical activity and self-rated health during retirement transition by multivariate trajectory analysis and to examine, whether sociodemographic and lifestyle factors predict the probability of being classified to a certain subgroup of observed changes.

**Methods:** 3,550 participants of the ongoing Finnish Retirement and Aging (FIREA) study answered annual surveys prior to and after retirement, in five possible study waves. Participants were asked to estimate weekly hours spent on different types of activities, then converted to MET-h/week. Self-rated health was assessed on a 5-point Likert-like scale from poor to excellent and dichotomized as suboptimal and optimal. Multivariate trajectory analysis was used to distinguish different subgroups of trajectories of concurrent changes in physical activity and self-rated health. Multinomial regression analysis was used to describe the associations between covariates and the probability of being classified to a certain trajectory group.

**Results:** Three trajectory groups were identified, all displaying increasing activity during retirement transition with a simultaneous decrease in perceived suboptimal health. The improvement was temporary for most participants, except for 9% of participants who had high physical activity which only increased during follow-up, with low percentage of suboptimal health. Male gender, professional occupation, being married or co-habiting, normal or overweight, not smoking and using alcohol below risk levels were associated with higher activity and better self-rated health.

**Conclusion:** Changes in physical activity and perceived health during retirement transition were found to be interconnected. Both were improved during retirement transition, but the change was temporary. Longer follow-up studies are required to further assess the changes over longer period of time after retirement.

# Lifestyle factors influencing body weight and body composition trajectories as women go through menopause: A systematic review.

**Miss Mozghan Esmailpour**<sup>1</sup>, Associate Professor Jennifer Miles-Chan<sup>1</sup>, Associate Professor Beatrix Jones<sup>2</sup>, Dr. Kathryn Bradbury<sup>3</sup>, Prof. Berit Lilienthal Heitmann<sup>4,5</sup>

<sup>1</sup>Human Nutrition Unit, School of Biological Sciences, The University of Auckland, Auckland, New Zealand,

<sup>2</sup>Department of Statistics, Faculty of Science, The University of Auckland, Auckland, New Zealand, <sup>3</sup>National Institute for Health Innovation, School of Population Health, Faculty of Medical and Health Sciences, The University of Auckland, Auckland, New Zealand, <sup>4</sup>Frederiksberg Hospital, Department of Public Health Sciences and The Parker Institute, The University of Copenhagen, Copenhagen, Denmark, <sup>5</sup>The Boden Institute, Faculty of Medicine and Health Sciences, The University of Sydney, Sydney, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** This study aimed to systematically review all available evidence on lifestyle factors influencing body weight and body composition trajectories as women go through menopause, including both experimental and observational studies that measured outcomes at least twice.

**Method:** A search strategy was developed and adapted based on Jull et al.'s (2014) systematic review of lifestyle interventions for menopausal weight change. Database searches were conducted, including Scopus, Cochrane, Embase, PubMed (Ovid), and CINAHL Plus, as well as hand-searching. Eligible studies were longitudinal interventions, including randomized, non-randomized, and cross-over trials, as well as observational studies (cohorts and cross-sectional) that investigated lifestyle factors' effect on body weight and/or body composition changes. Studies had to target women across their menopausal age, specifically those who transitioned from pre- or peri-menopausal to peri- or post-menopausal, or remained perimenopausal throughout the study period. Additionally, studies needed to measure variables related to body weight and/or body composition at two or more time points. Data collection and quality assessment were conducted using a standardized form, the revised Cochrane Risk-of-Bias (RoB2) tool, and the Newcastle-Ottawa scale for experimental and observational studies, respectively.

**Results:** Of 12,260 articles after deduplication, twenty-four studies were included in this review, comprising 10 controlled trials, 13 cohorts, and one cross-sectional study (including retrospective body weight data). Because of the heterogeneity in intervention/exposures and outcome details, conducting a meta-analysis was not feasible, and a descriptive analysis was conducted. The findings of four out of ten interventional studies demonstrated that study groups following an aerobic and resistant exercise intervention, a low-fat, high-carbohydrate dietary intervention, a healthy lifestyle educational intervention, or a combined dietary and exercise intervention had significant, favourable differences in changes in weight, BMI, gynoid, and/or android fat mass. Nine of 14 observational studies identified statistically significant relationships between longitudinal adiposity measurements and factors such as diet quality, smoking cessation, sitting time, physical activity level, and consumption of full-fat milk products (milk, sour milk, or cheese).

**Conclusion:** While further research is needed, the present findings suggest that lifestyle and behavioural modifications could be a useful strategy for preventing weight gain and adiposity in women transitioning through Menopause.

# Sleep problems at younger ages mediate the relationship between chronotype and socioemotional problems in school-aged children

**Mr. Derric ZH Eng<sup>1</sup>**, Dr. Elaine KH Tham<sup>1</sup>, Prof. Yung Seng Lee<sup>1,2</sup>, Associate Professor Daniel YT Goh<sup>2</sup>, Prof. Lynette PC Shek<sup>1,2</sup>, Associate Professor Oon-Hoe Teoh<sup>3</sup>, Dr. Fabian Yap<sup>3</sup>, Prof. Kok Hian Tan<sup>4,5</sup>, Associate Professor Joshua J Gooley<sup>6</sup>, Prof. Yap Seng Chong<sup>1,7</sup>, Prof. Michael J Meaney<sup>1,2,8</sup>, Dr. Shirong Cai<sup>1,9</sup>, Associate Professor Birit FP Broekman<sup>1,10</sup>

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Evening-chronotype, which refers to an innate preference for later periods of the day, has been found to pose as a risk factor for socioemotional problems in children. Research has also shown that children with evening-chronotype are more prone to sleep problems compared to peers with morning-chronotype. Evidence from studies in school-aged children suggest that sleep problems lie on the pathway between chronotype and socioemotional problems. However, it remains unknown whether sleep problems during earlier stages of childhood may mediate the relationship between chronotype and socioemotional problems at school-age. It is important to identify the mechanisms underlying the development of socioemotional problems at early ages as they may escalate into more severe behavioral and emotional problems later in life. Hence, we conducted mediation analyses with longitudinal models to investigate how sleep problems earlier at preschool-age may mediate the relationship between chronotype and socioemotional problems at school-age.

**Methods:** We included 587 typically-developing children from the Growing Up in Singapore Towards healthy Outcomes (GUSTO) birth cohort study. Children's diurnal preferences were identified with the Children's Chronotype Questionnaire and corroborated by objective actigraphy at 4.5 years of age, while sleep problems were assessed using the Children's Sleep Habits Questionnaire when they were 4.5 and 6 years old. Children's socioemotional problems were evaluated with the Child Behavioral Checklist when they were 7 years old. All questionnaires administered were caregiver-reported.

**Results:** After controlling for potential confounders, greater eveningness in children was significantly associated with increased sleep problems at 4.5 and 6 years of age, as well as greater internalizing, externalizing and total behavioral problems at 7 years old. Further mediation analyses revealed that sleep problems at both 4.5 and 6 years of age significantly mediated the association between chronotype and later internalizing, externalizing and total behavioral problems at 7 years old.

**Conclusions:** Our study is amongst the first to demonstrate the mediating effects of sleep problems at earlier ages on the relationship between chronotype and socioemotional problems at school-age. An important implication of our results is that sleep problems in preschool serve as targets for early interventions for socioemotional problems, especially among evening-chronotype children.

# Joint associations of physical activity and sleep duration with cognitive ageing: longitudinal analysis of an English cohort study

**Dr. Mikaela Bloomberg<sup>1</sup>**, Dr. Laura Brocklebank<sup>1</sup>, Prof. Mark Hamer<sup>2</sup>, Prof. Andrew Steptoe<sup>1</sup>

<sup>1</sup>Department of Behavioural Science and Health, University College London, London, United Kingdom,

<sup>2</sup>Division of Surgery and Interventional Science, University College London, London, United Kingdom

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** As there is currently no effective treatment for dementia, it is important to identify contributors to cognitive decline from midlife to delay onset of clinical symptoms. Low physical activity (PA) and nightly sleep duration outside 6-8 hours are two interrelated factors thought to contribute to cognitive decline and dementia risk. Nonetheless, how PA and sleep combine to influence trajectories of cognitive ageing is still not well-explored. To investigate this, we examined longitudinal associations of different combinations of PA and sleep duration with 10-year cognitive trajectories.

**Methods:** Linear mixed models were used to examine independent and joint associations of PA (low, high) and sleep duration (short [ $<6$  hours], optimal [6-8 hours], long [ $>8$  hours]) with cognitive performance at baseline, 10 years, and cognitive decline in cognitively healthy adults aged  $\geq 50$  years from the English Longitudinal Study of Ageing (N=8991). Models were adjusted for sociodemographic and socioeconomic covariates, health behaviour indicators, chronic conditions, and depressive symptoms.

**Results:** Low PA was independently associated with worse cognitive performance at baseline ( $p<0.001$ ), while short sleep was independently associated with faster cognitive decline ( $p=0.04$ ). At baseline, high PA/optimal sleepers had higher cognitive scores than all sleep categories in the low PA category (e.g. difference high PA/optimal-low PA/optimal at age 50=0.10 [0.06, 0.15] standard deviations), while there was no difference in cognitive performance between sleep categories within the high PA category. Differences remained consistent over 10 years of follow-up, except high PA/short sleepers who declined faster than high PA/optimal sleepers, such that their cognitive scores at 10 years were commensurate with those in the low PA category (difference high PA/optimal-high PA/short=0.20 [0.05, 0.34]; high PA/optimal-low PA/short=0.28 [0.15, 0.41]).

**Conclusions:** PA and sleep duration combine in complex ways to influence cognitive trajectories from middle age; for example, the cognitive benefit at baseline provided by high PA was insufficient to blunt the rapid cognitive decline associated with short sleep. While WHO already identify PA as a target for maintaining cognitive function, effective PA interventions should also consider sleep habits to maximise potential benefits of PA for cognitive health and delay onset of dementia.

# Process evaluation of a preschool-based intervention to promote an ECEC teacher-parent partnership regarding healthy eating, physical (in)activity and sleeping behaviours in young children.

**Mrs. Nicole Toussaint<sup>1</sup>**, Dr. Martinette T. Streppel<sup>1</sup>, Mrs. Sandra Mul<sup>1</sup>, Miss Meryem Gündüz<sup>1</sup>, Dr. Marloes D.A. van Verseveld<sup>2</sup>, Dr. Mirka Janssen<sup>1</sup>, Prof. Peter J.M. Weijs<sup>1,3</sup>, Prof. Ruben G. Fekkink<sup>1,4</sup>

<sup>1</sup>Amsterdam University of Applied Sciences, Amsterdam, Netherlands, <sup>2</sup>University of Science and Technology, Trondheim, Norway, <sup>3</sup>VU University, Amsterdam, Netherlands, <sup>4</sup>University of Amsterdam, Amsterdam, Netherlands

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose** Early Childhood Education and Care (ECEC) teachers at urban preschools are potential key figures to promote healthy behaviours in disadvantaged young children and to engage parents in lifestyle-related topics. An ECEC teacher-parent partnership regarding healthy behaviours may support parents and stimulate their children's development. A preschool-based intervention (CO-HEALTHY) was developed to promote an ECEC teacher-parent partnership regarding healthy eating, physical (in)activity and sleeping behaviours in young children. The intervention consists of a toolkit with parent-child activities and an associated training for ECEC teachers. The activities were composed using the Intervention Mapping protocol. Intervention materials were accessible for families with different sociocultural and socioeconomic backgrounds (e.g. simple vocabulary and cultural sensitive images). This study describes the process evaluation of the intervention.

**Methods** Semi-structured interviews with ECEC teachers (n=16) and parents (n=16), and a questionnaire for ECEC teachers (n=33) served as input for the process evaluation of the intervention. The process evaluation addressed topics like the reach of the intervention and experience of participants with the intervention. Interviews were transcribed non-verbatim and thematically analysed in MAXQDA. Questionnaires were distributed via the survey software Qualtrics and descriptive statistics were calculated using IBM SPSS Statistics.

**Results** The intervention was carried out at n=20 preschools in Amsterdam, the Netherlands. ECEC teachers said that the toolkit was fun and accessible as it were activities that children and parents could do during the standard walk-in play time at preschool. The activities were a good opportunity to start a conversation about the lifestyle-related topics. Parents indicated that it was fun and informative to do the activities together with their child. Most of the ECEC teachers thought that the intervention materials were convenient for their group of parents/children, also for less linguistic parents. The intervention materials were also received positively by parents (e.g. the use colourful A5 information cards). The ECEC teachers evaluated the intervention with an average score of 7.8 (scale 1-10) in establishing a teacher-parent partnership.

**Conclusions** The intervention was positively received. A majority of the participants thinks the toolkit benefits the ECEC teacher-parent partnership regarding healthy eating, physical (in)activity and sleeping behaviours in young children.

# Stand When You Can: Feasibility of a sedentary behaviour intervention in assisted living

**Ms. Milena Zdjelar<sup>1</sup>**, Ms. Irmina Klicnik<sup>2</sup>, Ms. Brianna Leadbetter<sup>3</sup>, Dr. Danielle R. Bouchard<sup>3</sup>, Dr. Shilpa Dogra<sup>2</sup>, Ms. Haley A. Dennis<sup>1</sup>, Dr. Jennifer L. Copeland<sup>1</sup>

<sup>1</sup>University of Lethbridge, Lethbridge, Canada, <sup>2</sup>Ontario Tech University, Oshawa, Canada, <sup>3</sup>University of New Brunswick, Fredericton, Canada

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** A. Ageing

**Purpose:** Prolonged sedentary time poses health risks for older adults. Older adults in assisted living spend more time sedentary than community dwelling peers and reducing passive sedentary time could be beneficial. The purpose of this study was to examine the feasibility of Stand When You Can (SWYC), a sedentary behaviour intervention based on the social ecological model, for assisted living.

**Methods:** SWYC aims to reduce sedentary time through individual behaviour change and modifications to the social and physical environment. A toolkit is provided to staff and residents so the intervention can be implemented without researcher involvement. SWYC was tested in four assisted living residences in three Canadian provinces. Each site had a staff person identified as a “SWYC Ambassador”; residents ( $n = 68$ ,  $84.9 \pm 6.5$  years; 81% women) volunteered for pre- and post-intervention testing. Before and 12 weeks after SWYC was introduced, participants wore activPAL<sup>TM</sup> inclinometers for seven days to measure sedentary time. Lower body function and quality of life were assessed with repeated chair stands and the EQ-5D, respectively. Changes were analyzed using paired sample t-tests. Onsite observations and checklists at 6 weeks were used to examine intervention fidelity.

**Results:** Observations revealed substantial variability in implementation, with only one site demonstrating good intervention fidelity. There was significant participant attrition ( $>50\%$ ) at 12 weeks. Sedentary time increased from pre- to post-intervention ( $681 \pm 129$  vs  $721 \pm 142$  min/day;  $p=0.016$ ). There was no significant difference ( $p > 0.05$ ) in time spent in sedentary bouts ( $173 \pm 85$  vs  $183 \pm 73$  min/day), sit-to-stand transitions ( $50 \pm 14$  vs  $51 \pm 14$ ), or standing time ( $196 \pm 78$  vs  $190 \pm 77$  min/day). There were no significant changes in quality of life or lower body function.

**Conclusions:** Developing strategies to reduce sedentary time and maintain function among residents of assisted living is a priority. SWYC is a novel, evidence-informed intervention, however it may not be feasible for most assisted living residences. It is unknown what role COVID-19 measures played in poor intervention fidelity and participant attrition, but it was clear that staff engagement is crucial to intervention success.

# Walking football for Health- physiological response to playing and characteristics of the players

Dr. Helena Andersson<sup>2</sup>, **Dr. Andreas Caspers**<sup>1</sup>, Mr. Manne Godhe<sup>3</sup>, Mr. Torbjörn Helge<sup>3</sup>, Ms. Julia Eriksen, Dr. Dan Fransson<sup>1</sup>, Prof. Mats Börjesson<sup>4</sup>, Dr. Elin Ekblom-Bak<sup>3</sup>

<sup>1</sup>University of Gothenburg, Gothenburg, Sweden, <sup>2</sup>Umeå University, Umeå, Sweden, <sup>3</sup>The Swedish School of Sport and Health Sciences, Stockholm, Sweden, <sup>4</sup>Sahlgrenska Academy, Gothenburg, Sweden

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** A. Ageing

**Purpose:** Walking Football (WF) is one type of recreational football increasing in popularity, targeting older adults. Further knowledge on the intensity and physical workload of WF, characteristics of the players, the social context, and reasons for playing WF is needed. Thus, the aim of the study was to characterize the individuals that regularly play WF and their experience of WF, and the physiological characteristics of the sport.

**Methods:** Sixty-three players from three clubs taking part in organised WF in Sweden were included. The players underwent performance tests consisting of a balance test, estimation of cardiorespiratory fitness, strength, and a vertical jump test as well as answering a written questionnaire regarding sociodemographic, health experiences, physical activity habits and experiences of WF. The included players participated in up to four WF-games wearing a GPS-unit and heart rate monitor.

**Results:** The participants mean age was 70.9 years, ranging from 63 to 85 years with 71% (n=27) of the men and 68% (n=13) of the women having a BMI >25. Fifty-one percent (n=27) of the players had hypertension, and 73 % (n=39) regularly used prescription drugs due to illness. During WF, the players covered on average 2409 meters (2509 m for men and 2205 m for women). Expressed in percentage of their age-estimated maximal heart rate, mean heart rate represented  $80 \pm 9$  and  $80 \pm 8\%$  of max for men, and  $78 \pm 9$  and  $79 \pm 9\%$  of max for women in the first and second half, respectively, hence WF can be considered a moderate intensity activity for older adults.

**Conclusions:** Individuals regularly playing WF show similar cardiovascular risk profile as the general population but show somewhat better physical fitness profile. The main reason for WF participation were linked to socializing with others and having fun. WF includes a considerable number of accelerations and decelerations, which makes the sport more energetically and mechanically demanding than e.g., walking or running. As our results show that WF mainly is a moderate intensity aerobic activity, it may be a relevant alternative in physical activity prescription for health in clinical practice

# On-Cancer: how to improve cancer survivors motivation and engagement to physical activity practice - a qualitative pilot study

**Dr. Jordi Vilaró<sup>1,2</sup>, Dr. Paula Jakszyn<sup>1,4</sup>, Dr. Olga Canet<sup>1,3</sup>, Miss Andrea Fuente<sup>4,5</sup>, Mr. Jordi Mascarell<sup>6</sup>, Mrs. Sandra Ruiz<sup>6</sup>**

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** cancer survivors (CS) present low levels of physical activity (PA), and high levels of sedentary behavior and cancer related-fatigue. Commonly there are no programmed interventions to empower them towards a more active lifestyle. The aim of this study was to test different methods that engage CS to PA in a community setting. Also, we aimed to know needs, barriers and facilitators for the practice of PA.

**Methods:** 20 CS were recruited from the Institut Català d'Oncologia (ICO, L'Hospitalet, Spain). A 4 weekly program with active meetings were conducted combining talks on educational concepts related to PA and active sessions using different community resources such as parks, public sports facilities or walking city tracks. Every meeting a weekly PA challenge was established and agreed with the participants. CS used a private whatsapp group to share their achievements. A photo elicitation was also carried on by the participants to detect the barriers and facilitators perceived when doing community PA.

**Results:** finally 17 (80% women, aged 45-64 years), mostly breast, ovarian, prostate and lung CS finished. A video recorded their impressions about the conducted actions (<https://www.youtube.com/watch?v=0VthnV3y7wq>). The general response was very positive to the interventions and the challenges. They feel more energy, good mood. They have the possibility to achieve the challenges, to share the same feelings and limitations with pairs, the feeling of belonging to a group with similar problems. They look for similar solutions, the freedom to practice PA elsewhere and without an established time and program, etc.

Regarding 1) barriers to exercise: fear, pain, cancer related-fatigue, lack of social support; lack of facilities or knowledge about the type of recommended activities. 2) facilitators to exercise: availability of green spaces, professional support, group activities with other CS. The main demand was to get the opportunity of more community PA programs that consider their particularities and needs as CS.

**Conclusions:** This pilot study provides relevant information regarding CS perspectives in relation to PA practice. Including a patient centered approach in the design of PA interventions will be necessary to increase adherence and engagement.

# Sleep Characteristics and Associations with Dietary Behaviors in Racially/Ethnically Diverse Children

**Dr. Amy Noser<sup>1</sup>**, Dr. Allan Tate<sup>2</sup>, Ms. Yasemin Inceoglu<sup>2</sup>, Dr. Snigdha Pusalavidyasagar<sup>1</sup>, Dr. Chinar Singhal<sup>1</sup>, Dr. Jerica Berge<sup>1</sup>

<sup>1</sup>University of Minnesota, Minneapolis, USA, <sup>2</sup>University of Georgia, Georgia, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** To examine the relationship between sleep characteristics (i.e., duration, onset, and variability) and dietary behaviors in a sample of racially and ethnically diverse school-aged children. This study extends the pediatric sleep literature by: (1) examining novel sleep patterns (i.e., variation in sleep onset and duration); (2) describing differences in sleep patterns among six racial/ethnic groups; and (3) examining the association between these sleep patterns and dietary behaviors.

**Methods:** Parent-youth dyads ( $N = 555$ ) from 6 racial and/or ethnic groups (*non-Hispanic Black, Hispanic, Native American, Hmong, Somali, and non-Hispanic White*) were recruited through primary care clinics in the Minneapolis/St. Paul, MN metropolitan area. Parents/caregivers completed eight days of ecological momentary assessment (EMA) surveys about child sleep characteristics and dietary intake. Previous night sleep characteristics (duration, onset, and variability) were operationalized as predictors of next evening dietary intake. Descriptive statistics were computed to examine racial/ethnic differences in sleep patterns. Generalized estimating equations were used to model the longitudinal relationships between sleep and dietary intake after controlling for sociodemographic and time-varying covariates (e.g., weekends).

**Results:** Significant racial/ethnic differences emerged for sleep duration and onset, with White children having the longest duration and earliest onset ( $p$ 's  $< 0.001$ ). Later sleep onset was associated with higher consumption of salty snacks, sugar sweetened beverages, and refined grains and lower consumption of vegetables ( $p$ 's  $< 0.01$ ). Within-child variation in sleep onset was associated with higher consumption of salty snacks, sugar sweetened beverages, and fruit, and lower consumption of vegetables ( $p$ 's  $< 0.001$ ). Variation in sleep duration was associated with lower consumption of salty snacks, sugar sweetened beverages, refined grains, and vegetables ( $p$ 's  $< 0.05$ ).

**Conclusions:** Study findings highlight sleep disparities in racial/ethnic minority children and suggest that variation in children's bedtimes and duration of nightly sleep influence their dietary intake. Future research is needed to identify modifiable causes of sleep disparities in racial/ethnic subpopulations and indicate a need for interventions that minimize sleep disparities and their impact on dietary behaviors.

# The Occurrence of Frailty with Continued Group Exercise among Japanese Older Adults: A Follow-up Study during COVID-19

✉ **Kento Tabira**<sup>1</sup>, Mr. Yoshinobu Saito<sup>2</sup>, Mr. Takayuki Tajima<sup>3</sup>, Mr. Haruhiko Imamura<sup>4</sup>, Ms. Yuko Oguma<sup>1</sup>

<sup>1</sup>Keio University, Kanagawa, Japan, <sup>2</sup>Nippon Sport Science University, Kanagawa, Japan, <sup>3</sup>Tokyo Metropolitan University, Tokyo, Japan, <sup>4</sup>The University of Nagano, Nagano, Japan

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** The Occurrence of Frailty in Continued Group Exercise among Japanese Elderly People: A Follow-up Study during COVID-19 The purpose of this study was to clarify the association between continued group exercise and the development of frailty among elderly Japanese before and during the COVID-19 epidemic.

**Methods:** From August to November 2018 (Baseline [BL]), 4102 community-dwelling older adults participating in a senior club in Fujisawa, Kanagawa, Japan participated in a mailed survey. Of these, 2,283 participated in a mailed survey from September to November 2020 (follow-up [FL]) during the COVID-19 pandemic. 1,241 of the elderly who were not frail in the BL and had no missing data for analysis were included in the analysis. Frailty scores were assessed with the Kihon checklist (KCL). Group exercise continuation was questioned in BL and FL, and the subjects were divided into 4 groups according to continuation status: continuation group (n = 474), discontinuation group (n = 164), initiation group (n = 118), and non-initiation group (n = 485). In univariate and multivariate analyses, descriptive statistics were used to characterize each group, and logistic regression models were used to estimate odds ratios (ORs) and 95% confidence intervals (CIs) between the four groups and new onset of frailty.

**Results:** Of the elderly who were not frail in 2018, 249 (20.1%) had developed frailty in 2020. 64 (13.5%) in the continuation group, 49 (29.9%) in the discontinuation group, 19 (16.1%) in the initiation group, and 117 (24.1%) in the non-initiation group developed new frailty, with the discontinuation group having the highest rate of frailty development compared to other groups.

Analysis showed that the discontinuation group had a significantly higher rate of new onset of frailty compared to the continuation group (OR: 1.73 [95%CI 1.16-2.6]). The initiation and non-implementation groups showed no significant difference in the rate of new onset of frailty compared to the continuation group (OR: 0.88 [95%CI 0.57-1.36], OR: 1.25 [95%CI 0.93-1.69]).

**Conclusion:** Continuation of group exercise was associated with the onset of frailty, suggesting that continuation of group exercise without discontinuation may prevent frailty.

# Changes in older adults' food choices – a 10-year follow-up study

**Mrs. Ida Synnøve Grini<sup>1</sup>**, Associate Professor Laura Terragni<sup>2</sup>, Dr. Øydis Ueland<sup>1</sup>

<sup>1</sup>Nofima, Ås, Norway, <sup>2</sup>Oslo Metropolitan University, Oslo, Norway

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** The aim of this qualitative longitudinal study was to investigate changes in food intake when one ages and identify opportunities for healthy aging. Food is essential to older adults' quality of life, and adequate nutrition is necessary for healthy aging. Staying healthy longer and being able to live at home is an overarching aim for both society and older adults. In our experience, there are no longitudinal studies showing the development and changes in older adults' diets focusing on the foods and food products they consume.

**Methods:** The study used a phenomenological research design to gain deeper insights into the experience with food among older adults. The data collection was carried out in 2011 and 2020/21 using semi-structured interviews. The interview guide developed in 2011 was updated in 2020 to capture a longitudinal perspective. The age to participate in the first study was 67 – 84 years. Efforts were made to recontact all previous participants for the second study. Out of 15 participants from 2011, nine of the older adults were willing to participate in a follow-up interview. The data were analyzed using a thematic approach. By combining and analyzing the data from 2011 and 2021, we will present the data and results from the study.

**Results:** The findings show both continuity and changes. Meals and eating habits were linked to both eating healthfully and enjoying the food. Overall, the changes observed were related to a more health-focused approach to the respondents' food intake. A main finding was how the older adults coped with their changing life situation. Food habits and food context will be presented.

**Conclusions:** The importance of food as a health factor is a discourse that has existed for a long time, and the food eaten should also be healthy. A focus on food behavior with recommendations particularly aimed at older adults' lives in their own homes could contribute to healthy, active, and social aging. It will also contribute to more knowledge for governments and stakeholders from a public health perspective, about what older adults need when it comes to food behavior and healthy eating.

# Post-prandial CGM responses are inversely associated with positive mood states in healthy college students.

**Ms. Samantha Fessler<sup>1</sup>**, Mr. Asifur Arefeen<sup>1</sup>, Prof. Carol S. Johnston<sup>1</sup>, Prof. Hassan Ghasemzadeh<sup>1</sup>

<sup>1</sup>Arizona State University, Phoenix, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Evidence suggests that fluctuations in blood glucose may influence mood, though research in healthy volunteers has yielded inconsistent results. The dynamics between glucose excursions and variations in mood may be obscured by the examination of average glucose and mood measures. Therefore, this report aimed to examine the relationships between first-meal post-prandial glucose (PPG) responses from continuous glucose monitoring (CGM) and ecological momentary assessment of mood in healthy adults under controlled and free-living conditions.

**Methods:** This report utilized data from an ongoing trial examining nutrient intake and CGM responses in healthy adults. This study consists of laboratory monitoring days and home monitoring days. During three non-consecutive days of laboratory monitoring, participants received customized meal plans with consistent macronutrient profiles that were either hypercaloric, eucaloric, or hypocaloric based on calculated energy requirements. Glucose was monitored using CGM devices and participants recorded mood states using a mobile app every 30 minutes over the 10-hour visit. During the four free-living days, CGM and mood state reporting were similar to control days, but participants tracked 24-hour unrestricted dietary intake using food diaries. Pearson's correlations were used to examine associations between PPG (e.g., area under the curve [AUC]) and corresponding mood scores for the first meal of the day under both controlled and free-living conditions.

**Results:** First-meal CGM and corresponding mood data are from 4 participants (26.3±3.4 y) covering both laboratory (3) and free-living (4) days with viable CGM and mood data. Analysis of laboratory monitoring days suggested a higher AUC for the first-meal CGM peak was associated with more negative composite mood scores ( $r=-.49$ ,  $P=.062$ ). Similarly, an association between the first-meal AUC from the CGM peak and more negative mood states was observed on free-living days ( $r=-.42$ ,  $P=.069$ ). Although these outcomes did not reach statistical significance, likely due to the small sample size, the large effect sizes suggest a strong relationship between the degree of glycemia and negative mood state.

**Conclusion:** The observed associations between blood glucose excursions and a negative mood state in healthy young adults suggest that steep blood glucose excursions could have important health implications even for individuals with normal glucose control.

# Facilitators and barriers related to the implementation of a digital “healthy eating” resource to support Early childhood education and care (ECEC) staff: A qualitative interview-study with teachers

**Dr. Sissel Helland<sup>1</sup>**, Dr. Tormod Bjørkkjær<sup>1</sup>, Dr. Kristine Vejrup<sup>2</sup>, Prof. Nina Øverby<sup>1</sup>

<sup>1</sup>University Of Agder, Kristiansand, Norway, <sup>2</sup>Norwegian Armed Forces Joint Medical Services, Institute of Military Epidemiology , Oslo, Norway

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Efficacious interventions that improve children's eating habits are desirable to implement in real-world settings and in a larger scale. Core components required for effective implementation is end-user involvement and adapting the interventions to the users' needs. Previously we have evaluated a digital “healthy eating” resource for ECEC staff. The purpose of the current qualitative study was to explore perception of needs of such a resource, and to identify facilitators and barriers related to implementation of the resource in staff.

**Methods:** Twelve individual semi-structured interviews and two focus group interviews were conducted with ECEC teachers in a selected municipality in Norway. Focus group interviews were conducted to stimulate teachers to reflect on preliminary results from the individual interviews. Data were transcribed verbatim and subjected to thematic analysis, to summarise the subjective experiences and sense-making of the teachers.

**Results:** Perceptions of needs from a digital “healthy eating” resource in ECEC included: 1) *Recipe bank and menus*; 2) *Ideas for educational food activities with children*; 3) *Link to the national curriculum for ECEC and highlighting research*, 4) *Access for, and training of parents and facilitator for implementing* was 5) *Newsletter with seasonal tips*. Barriers included: 1) *Lack of tradition for using information from the internet at work*; 2) *Lack of intentions to use since a new web resource is primarily associated with cooking* 3) *Likely short time use*; 4) *Knowledge-based feeding style and practices, a blind spot* and 5) *Different organizational cultures for training and meetings*.

**Conclusions:** This study provided information on how to adapt a digital expert-led “healthy eating” intervention to be more relevant for the ECEC staff, by e.g., providing links to national curriculum for ECEC and research. We also identified barriers (e.g., lack of tradition in use of digital resources) and facilitators for implementation (e.g., newsletter prompts), that will be used in an upcoming scaling of the digital intervention.

# The association between device-measured physical activity and performance-based physical function outcomes in adults: a systematic review and meta-analysis

**Mr. Joshua Culverhouse<sup>1</sup>**, Associate Professor Melvyn Hillsdon<sup>1</sup>, Dr. Brad Metcalf<sup>1</sup>, Dr. Michael Nunns<sup>1</sup>, Miss Rebecca Lear<sup>1</sup>, Dr. Gemma Brailey<sup>1</sup>, Dr. Richard Pulsford<sup>1</sup>

<sup>1</sup>University of Exeter, Exeter, United Kingdom

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** A. Ageing

**Purpose:** Changes in physical function (PF) are an important aspect of ageing. A range of laboratory /clinic-based performance measures of PF are predictive of adverse future health outcomes in older adults. Remote health monitoring, through wearable devices, may allow the detection of declines in PF, earlier in the life course, before people perceive changes, and before presentation in clinic. If so, there is evidence that structured physical activity (PA) interventions can improve or delay losses in PF. Nevertheless, the strength of the association between wearable device-measured features of PA and performance-based measures of PF is unclear. This review examines the association between device-measured PA and performance-based measures of (PF) in adults.

**Methods:** A systematic review of observational studies reporting cross-sectional or prospective associations between wearable device-measured PA and PF outcomes in non-clinical adults. Meta-analyses were performed on included studies where a standardised regression coefficient was available or could be calculated.

**Results:** Forty-two studies with a pooled sample of 27276 participants were eligible, with 34 studies reporting a standardised regression coefficient ( $\beta$ ) between at least one of four PA measures and one of six PF outcomes. All measures of PA were positively associated with all measures of PF, except for step count with grip strength. Strongest associations were seen with lower-body PF tests; gait speed ( $\beta$ s = 0.11 to 0.27), walk tests ( $\beta$ s = 0.18 to 0.43), chair-rise test ( $\beta$ s = 0.10 to 0.26), balance ( $\beta$ s = 0.07 to 0.25) and timed up-and-go ( $\beta$ s = 0.10 to 0.24) all  $p < 0.01$ . Weak or no association was seen with PA grip strength ( $\beta$ s = 0.02 to 0.07).

**Conclusion:** In observational studies of general adult populations, there were associations between multiple dimensions of PA and a broad range of PF measures. The findings provide provisional support for the use of device-measures of movement to remotely monitor declines in PF in community-dwelling adults in mid-life/early old age. Prospective designs are needed to determine the direction of the relationship and future studies should also explore a broader range of PA metrics, including postural transitions and the temporal distribution of activity.

# The challenge of participatory projects for physical activity promotion: What to scale and how to scale?

**Miss Raluca Sommer**<sup>1</sup>, Dr. Maike Till<sup>1</sup>, Dr. Alexandra Sauter<sup>2</sup>, Dr. Karim Abu-Omar<sup>1</sup>, Dr. Peter Gelius<sup>1</sup>

<sup>1</sup>Friedrich-Alexander-Universität Erlangen-Nürnberg, Erlangen, Germany, <sup>2</sup>University of Regensburg, Regensburg, Germany

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Effective pilot interventions for physical activity (PA) promotion should be scaled up, i.e. transferred to broader contexts while permanently integrating them into policies or systems (WHO, 2010). This study explores the scale-up strategies of four German projects that developed actions for PA promotion based on a participatory approach (Gelius et al., 2021), highlighting the challenges encountered while transferring the participatory approach to other contexts and reaching other population groups.

**Methods:** We conducted a qualitative study based on document analysis and 15 semi-structured focus group interviews with each of the four projects' research teams. The ExpandNet framework (WHO, 2010) was used to retrospectively analyze the various scale-up strategies as well as key elements (i.e., innovation, user organization, environment etc.) utilized in the projects.

**Results:** The four projects succeeded in transferring effective pilot interventions to a total of 16 new sites ("horizontal" scale-up). At some sites, the process ran smoothly, while at others, the employed scale-up strategies differed from the initial plan. As a result, some projects scaled the participatory component, while others focused on specific actions previously developed in the initial project. Also, in some projects, political support and other favorable circumstances allowed for institutionalizing PA promotion actions on a higher organizational level ("vertical" scale-up).

**Conclusions:** When participatory approaches are used as mechanisms to co-create an agenda for PA promotion jointly with researchers, population groups, and relevant stakeholders, it seems that multiple strategies may be employed for scale-up. Participatory projects can be scaled-up horizontally or vertically, i.e. by focusing either on the participatory approach as a whole or on specific actions developed using the participatory approach in a previous pilot project. There is a need to develop novel theoretical concepts of scalability that capture the diversity of approaches observed in our study.

# Pain, quality of life and physical function among breast cancer survivors undergoing hormonal therapy with aromatase inhibitors

Ms. Inês Nobre<sup>1</sup>, Ms. Sofia Franco<sup>2,3</sup>, Mr. Bruno Rodrigues<sup>3,4</sup>, Mr. Flávio Jerónimo<sup>2</sup>, Mr. Vítor Ilharco<sup>2</sup>, Ms. Andreia Dias<sup>2</sup>, **Prof. António Palmeira<sup>2</sup>**, Dr. Marlene N. Silva<sup>2,3</sup>, Dr. Eliana Carraça<sup>2</sup>

<sup>1</sup>Faculdade de Motricidade Humana, Universidade de Lisboa, Lisbon, Portugal, <sup>2</sup>CIDEFES, Faculdade de Educação Física e Desporto, Universidade Lusófona, Lisbon, Portugal, <sup>3</sup>Programa Nacional para a Promoção da Atividade Física, Direção-Geral da Saúde, Portugal, <sup>4</sup>Faculdade de Desporto, Universidade do Porto (Centro de Investigação em Atividade Física, Saúde e Lazer), Porto, Portugal

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** About 75% of breast cancer diagnoses are hormone-receptor-positive (HRP). After active treatment, breast cancer survivors (BCS) with HRP undergo 5–10 years of hormonal therapy (HT). One of the most used HT regimens is blocking estrogen biosynthesis with aromatase inhibitors (AIs).

Although HT improves disease-free survival rates, treatments are often related to several adverse side effects, which can adversely affect BCS's quality of life (QoL). One side effect that has been consistently reported in the literature is chronic pain, especially arthralgia. Ultimately this can lead to premature therapy discontinuation, and eventually, lower treatment efficacy and increased mortality.

The improvement of physical function (PF), through physical activity (PA), has been shown to significantly ameliorate pain in most chronic pain diseases. However, there is limited evidence regarding this approach as a part of pain treatment among BCS.

Therefore, the aim is to characterize pain and PA and analyze the associations between pain, QoL and PF in this population.

**Methods:** A group of BCS doing HT with AIs ( $n = 75$ , mean age  $56.2 \text{ years} \pm 7.7$ ) completed pain measures using the Brief Pain Inventory and the Pain Disability Index, QoL measures with EORTC, PA assessed with the International Physical Activity Questionnaire short form and PF assessed with time up and go (TUG), strength (handgrip and 10 RM) and flexibility (ROM) tests.

**Results:** 92% reported usual pain and 50% did not meet PA adult recommendations for aerobic exercise. Bivariate correlation analysis adjusted for BMI and time on AIs revealed negative and significant correlations with pain and PF (TUG, strength and flexibility; all  $p_s < 0,05$ ) and several QoL dimensions (Global Health, Physical Functioning, Role Functioning, Social Functioning, Fatigue, Insomnia, Financial Difficulties, Body Image, Systemic Therapy Side Effects, Arm Symptoms and Musculoskeletal Symptoms; all  $p_s < 0,01$ ).

**Conclusions:** These findings confirm the detrimental association between pain and QoL and are aligned with previous research regarding the potential benefit of PF in pain. Nevertheless, further pain management investigation involving different methods for improving PF, namely PA interventions, is needed in this population.

# A community-engaged model for the NUEVA app/website: Nutrition for Underserved Elders Via Application

**Dr. Lesli Biediger-Friedman**, Dr. Cassandra M Johnson

<sup>1</sup>Texas State University, San Marcos, USA

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Describe a new community-engaged model for innovating senior nutrition programs through technology with the NUEVA project (Nutrition for Underserved Elders Via Application). Older adults (60 years+) have unique needs related to food and nutrition to ensure food security and support socialization, but the existing U.S. Senior Nutrition Program has had limited reach and effectiveness with congregate sites and home delivered meal programs.

**Methods:** A socioecological framework and principles from community-engaged research and user-centered design (UCD), informed development of multifunctional app/website. The prototype includes four modules: sign-up, referral, meal selection (for home delivered meals), and assessment. The team solicited feedback from stakeholders (Advisory Board and community partners) during concept generation, iterative development, and prototype testing. Stakeholders provided in-depth consultation of processes to sign-up, program qualification, meal selection, and initial program participant assessment. Validated measures were selected for the assessment module (e.g., food security and loneliness scales). All findings were applied to build the prototype.

**Results:** A new model was created to facilitate the PSE (policy, system, or environmental) changes including pathways linking community meal providers, food security partners, and health/ social service providers, Area Agencies on Aging, older adults, and their families. Twenty-four community stakeholders, representing 11 organizations have engaged in the development phases NUEVA. Stakeholders have shared strengths of the NUEVA app including providing connection between the program, older adults and their family, and meal delivery personnel. Stakeholders have been excited to discuss opportunities to automate and optimize the program and empower the volunteer workforce to provide observational data to improve outcomes. Concerns have included technology acceptance, intention to use long-term, and reading level/ functional limitations. Threats have included cyber security concerns, access to technology (devices, data-plans, broad band), and competing priorities for meal and service providers.

**Conclusions:** Preliminary results have highlighted benefits of a community engaged and UCD approach, such as designing features to reflect sociocultural values and existing community assets. Findings will inform prototype modification, including the addition of new modules (e.g., nutrition education, grocery delivery), and subsequent testing in collaboration with stakeholder groups. Ongoing research will identify opportunities to maximize impact of senior nutrition programs.

# Outcome domains measured in randomized controlled trials of physical activity for older adults: A rapid review

Associate Professor Dawn Mackey<sup>1</sup>, **Dr. Christina Ekegren<sup>2</sup>**, Dr. Claire Baldwin<sup>3</sup>, Mr. Peter Young<sup>1</sup>, Dr. Samantha Gray<sup>1</sup>, Mr. Alex Ciok<sup>1</sup>, Ms. Angela Wong<sup>1</sup>

<sup>1</sup>Simon Fraser University, Burnaby, Canada, <sup>2</sup>Monash University, Melbourne, Australia, <sup>3</sup>Flinders University, Bedford Park, Australia

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** A. Ageing

**Purpose:** Toward development of a core outcome set for randomized controlled trials (RCTs) of physical activity (PA) interventions for older adults, the purpose of this study was to identify outcome domains and subdomains ('what' was measured) in previously published RCTs of PA for older adults.

**Methods:** We conducted a rapid review and searched Ovid MEDLINE for recently published (2015-2021), English-language, RCTs of PA interventions for older adults (mean age 60+ yrs). We limited to articles published in Web of Science top-10 journals in general and internal medicine, geriatrics and gerontology, rehabilitation, and sports science. Two reviewers independently completed eligibility screening; two other reviewers abstracted trial descriptors and study outcomes. We classified study outcomes according to the standard outcome classification taxonomy endorsed by the Core Outcome Measures in Effectiveness Trials Initiative.

**Results:** Our search yielded 548 articles; 67 articles were eligible to be included. Of these, 82% were efficacy/effectiveness trials, 85% included both male and female participants, and 84% recruited community-dwelling older adults. Forty percent of articles reported on interventions that involved a combination of group and individual PAs, and 60% involved a combination of PA modes (e.g., aerobic, resistance). Trial sample size ranged from 14 to 2157 participants, with median (IQR) of 94 (57-517); 28,649 participants were included across all trials. We identified 21 unique outcome domains, spanning 4/5 possible core areas (physiological/clinical; life impact; resource use; adverse events). The five most commonly reported outcome domains were physical functioning (included in n=51 articles), musculoskeletal and connective tissue (n=30), general (n=26), cognitive functioning (n=16), and emotional functioning/wellbeing (n=14). Under these five outcome domains, we further identified 10 unique outcome subdomains (e.g., fall-related; body composition; quality of life). No outcome domains or subdomains were reported consistently in all RCTs.

**Conclusions:** We found extensive variability in outcome domains and subdomains used in RCTs of PA for older adults, reflecting the broad range of potential health benefits derived from PA and also investigator interest to monitor a range of safety parameters related to adverse events. This study will inform development of a core outcome set to improve outcome reporting consistency and evidence quality.

# The Exercise Right for Active Ageing study: Participation in community-based exercise classes by older Australians during the COVID-19 pandemic

**Dr. Christina Ekegren<sup>1</sup>**, Dr. Darshini Ayton<sup>1</sup>, Prof. Helen Skouteris<sup>1</sup>, Dr. Sze-Ee Soh<sup>1</sup>

<sup>1</sup>Monash University, Melbourne, Australia

Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** A. Ageing

**Purpose:** To determine factors associated with participation of older Australians in community-based exercise classes during the COVID-19 pandemic. A secondary aim was to investigate the association between participation in exercise classes and changes in physical activity levels.

**Methods:** This pre-post study included community-dwelling older adults ( $\geq 65$  years) from across Australia. The intervention consisted of 12 low to moderate-intensity exercise classes, delivered weekly by university-trained accredited exercise scientists or physiologists (AESs/AEPs). Negative binomial regression was used to determine factors associated with the primary outcome (number of classes attended/12). Physical activity levels were self-reported using a modified version of the International Physical Activity Questionnaire Short Form. To assess the change in physical activity levels (pre-test to post-test), three outcomes (total weekly MET minutes, active days/week, hours sitting/day) were modelled using mixed-effects linear regression.

**Results:** Of 6,949 participants recruited, 6,626 attended  $\geq 1$  class and were included in the primary analysis (95%). 49% of participants attended all 12 classes. Higher class attendance was associated with yoga/flexibility/mobility classes, attendance at a free trial class (adjusted incidence rate ratio [95% CI]: 1.05 [1.03, 1.08]) and online classes (1.19 [1.11, 1.26]). Lower class attendance was associated with state of residence, living in inner regional areas (0.95 [0.93, 0.98]) and having  $\geq 2$  comorbidities (0.97 [0.95, 0.99]). 3,505 participants were included in secondary analyses (53%). Participants who attended  $\geq 1$  exercise class increased physical activity by 447.0 (95% CI: 417.6, 476.3) METmins/week, were active on 0.9 (0.8, 1.0) additional days/week and reduced their sitting time by 0.5 (-0.6, -0.5) hours/day (pre-test to post-test). For each additional class attended, there was an increase in physical activity of 25.2 (2.4, 48.0) METmins/week.

**Conclusions:** High class attendance suggests the Exercise Right for Active Ageing program was well-received by older Australians, particularly in states less impacted by COVID-19 lockdowns. Classes attendance was associated with a significant increase in self-reported physical activity levels and active days, and a significant decrease in self-reported sitting time, suggesting that group exercise classes played an important role in promoting physical activity in older Australians during the pandemic.

# A participatory action research study with focus on learning in and about education for sustainable development in physical education

**Associate Professor Andreas Fröberg<sup>1</sup>**, Prof. Suzanne Lundvall<sup>1</sup>

<sup>1</sup>Department of Food and Nutrition, and Sport Science, University Of Gothenburg, Gothenburg, Sweden

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** There is a growing internationally research interest in how physical education (PE) and PE teacher education (PETE) may contribute to the education for sustainable development (SD) agenda. Although it has been suggested that some of the contents of PE are related to education for SD, one critical question is that of prioritizing teaching and learning of content and challenge the way it is taught. The overall aim of this participatory action research (PAR) study is to explore what PE teacher (PET) educators perceive to be critical aspects on education for SD in PETE. More specifically, we explore how PET educators perceive and conceptualize SD, and what aspects on education for SD they perceive to be critical to implement in PETE courses, as well as what arguments and support that are put forward in relation to this.

**Methods:** The PAR study draws on the principles of collaborative learning and involves 10 PET educators from one higher education institution in Sweden. They have different employment and academic positions, including adjunct lectures and professors, who together prepare PETs in compulsory and upper secondary schools. The PET educators took part in a series of audio recorded workshops and seminars (6 sessions × 180 minutes) encountering and problematizing the conceptualizing of education for SD. Data was also collected through logbooks. The analytical process is structured in three layers: individual responses and reflection, collegial responses and reflections, and thematical analyses of recordings from workshops and logbooks.

**Conclusion:** The analytical attention is directed towards subjectivities, positionalities, and motivations. Data collection from the first part of the PAR study have been analysed, and preliminary results will be presented from the recorded workshops and seminars, and logbooks. The finalization process of findings and conclusions will focus on what education for SD can mean individually and as part of a collective understanding, and in relation to the individual PET educators' understandings and courses of various character in PETE.

# EX-MED Cancer Sweden: study protocol for a randomised controlled trial of distance-based delivery of exercise for people treated for breast, prostate or colorectal cancer

**Ms. Melissa Kotte**<sup>1</sup>, Dr. Kate Bolam<sup>1,2</sup>, Dr. Sara Mijwel<sup>1,3</sup>, Associate Professor Renske Altena<sup>1,4</sup>, Associate Professor Prue Cormie<sup>5,6</sup>, Prof. Yvonne Wengström<sup>1,4</sup>

<sup>1</sup>Karolinska Institutet, Stockholm, Sweden, <sup>2</sup>The Swedish School of Sport and Health Sciences, Stockholm, Sweden, <sup>3</sup>Norwegian School of Sport Sciences, Oslo, Norway, <sup>4</sup>Karolinska University Hospital, Stockholm, Sweden, <sup>5</sup>Peter MacCallum Cancer Centre, Melbourne, Australia, <sup>6</sup>The University of Melbourne, Melbourne, Australia

**Poster Session #1, June 15, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Robust evidence shows that regular exercise plays an important role in improving the quality of life, physical function, and psychological health, and in managing common cancer-related side effects for cancer survivors. However, the challenge is being able to provide cancer survivors with easily accessible, high-quality exercise support and programs. Consequently, we need to develop easily accessible exercise programs that draw upon the current evidence base that can be delivered to as many as possible and determine if these programs are effective. EX-MED Cancer Sweden is a supervised, distance-based group exercise program providing cancer survivors with access to evidence-based exercise medicine, delivered through community gyms, by upskilled exercise specialists. This study aims to examine the effectiveness of EX-MED Cancer Sweden for survivors of breast, prostate, and colorectal cancer.

**Methods:** Adults that have completed curative treatment for breast, prostate, or colorectal cancer (n = 200) are recruited to participate in a single centre, single-blind, two-armed randomised controlled trial. Participants are randomly allocated to an exercise group or a routine care control group. The exercise group will participate in a supervised, distance-based exercise program delivered by a personal trainer who has undertaken specialised exercise oncology education modules, twice per week for three months. The primary outcome is health-related quality of life assessed at baseline, 3- (end of intervention and primary endpoint) and 6-months post-baseline. Secondary outcomes are physiological (cardiorespiratory fitness, muscle strength, physical function, body composition) and patient-reported outcomes (cancer-related symptoms, fatigue, self-reported physical activity), and self-efficacy of exercise. Furthermore, the study will explore and describe the experiences of participation in the exercise intervention.

**Conclusion:** The EX-MED Cancer Sweden trial will provide evidence regarding the effectiveness of a supervised, distance-based exercise program for survivors of breast, prostate, and colorectal cancer. If successful, it will contribute to the implementation of flexible and effective exercise programs as part of standard of care for people following cancer treatment, which is likely to contribute to a reduction in the burden of cancer on the individual, health care system and society.

# Physical Activity and Visceral Adiposity in Young Adults

**Dr. Claudia Magaly Espinosa Méndez**<sup>1</sup>, Dr. Ciria Salazar Carrillo<sup>2</sup>, Dr. Ixchel Reyes Espejel<sup>1</sup>, Prof. Benjamín Flores Chico<sup>1</sup>, Dr. Sebastian Leonardo San Martín Rodríguez<sup>3</sup>

<sup>1</sup>Meritorious Autonomous University of Puebla, Puebla, Mexico, <sup>2</sup>University of Colima, Colima, Mexico,

<sup>3</sup>Institute of Higher Studies of Educational Engineering, Puebla, Mexico

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Regular physical activity (PA) is a determining factor for maintaining health, its beneficial effects are well known, among which are the maintenance of an adequate weight and the reduction of risks of diseases such as diabetes and cardiovascular diseases, directly related to visceral adiposity. Many people claim to be physically active, but do not know the parameters necessary to maintain health through PA, so the objective of this study is to determine the level of self-reported physical activity by young adults and its relationship with visceral adiposity presented by the evaluated subjects.

**Methods:** Cross-sectional, observational analytical study. The sample consisted of 159 young adults (122 women and 37 men,  $21.35 \pm 1.6$  years). To evaluate the level of physical activity the short version IPAQ questionnaire was applied, and an anthropometric evaluation was carried out, obtaining measurements of height, weight, waist circumference (WC), and abdominal perimeter (AP), the degree of visceral adiposity was determined using the Waist-Height index as a reference. Descriptive and qualitative statistical analysis was performed using chi-square to establish an association between the variables.

**Results:** 74.8% of the participants present elevated visceral adiposity, contradicting the self-reports generated through the survey, which indicate that 66% of the participants perform high-intensity PA, only 15.7% reported doing low-intensity PA, while no one stated that they did not perform PA, without significant associations.

**Conclusions:** The participants report high levels of physical activity, but more than half of the participants presented higher than healthy levels of visceral adiposity, which leads us to think that the sample subjects overestimate the levels of physical activity they perform, so we consider it necessary to create programs to improve the quality of PA and raise awareness among young adults about their health care.

# Characteristics of prenatal yoga in the West: A scoping review

**Miss Kirina Angrish<sup>1</sup>**, Miss Cassie Cassie Copelli<sup>2</sup>, Dr. Kimberley L. Gammage<sup>2</sup>

<sup>1</sup>Brock University, Faculty of Applied Health Science, St. Catharines, Canada, <sup>2</sup>Brock University, Department of Kinesiology, St. Catharines, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Prenatal yoga is a safe form of physical activity recommended for the pregnant population, given its association with improved maternal and fetal health outcomes (e.g., depressive symptoms, fetal heart rate). However, there is significant diversity in how prenatal yoga programs are designed and implemented in Western countries. This scoping review aimed to identify the characteristics of prenatal yoga programs conducted in Western countries (e.g., USA), including the frequency, duration, and type of yoga, as well as key outcomes.

**Methods:** This scoping review followed the established guidelines developed by Arksey and O'Malley (2005) as well as the PRISMA checklist for conducting scoping reviews.

**Results:**  $N = 30$  studies were included in this review. Most included studies investigated women in their second or third trimester; very few had pregnancy-specific inclusion criteria (e.g., singleton pregnancy). Maternal mental health outcomes (e.g., depressive symptoms, pregnancy-related anxiety, perceived stress) were the most studied outcomes, with significant improvements seen upon program completion. Characteristics of the yoga program varied slightly. Typically, yoga programs were 12 weeks, with 75-minute sessions. The majority of the yoga programs did not assess adherence, and details about instructor supervision, setting, and class size were not included in most studies; yoga program characteristics were not outlined in the qualitative studies. Based on observational, qualitative, and mixed method studies, prenatal yoga was perceived as an acceptable form of physical activity by pregnant women, with all participants discussing the positive influence of prenatal yoga on their pregnancy (e.g., easier labour and delivery, back pain relief).

**Conclusion:** Based on the main findings of this scoping review, there is a need for the scientific and health promotion community to develop safe and appropriate prenatal yoga guidelines. Moreover, there is a need to systematically investigate the dose-response relationship between the amount of yoga done and the maternal and fetal benefits. Lastly, future quantitative work should identify the mechanisms of yoga that make it effective in improving maternal well-being in order to create effective prenatal yoga programs.

# Homebuyer, land developer, and real estate professional perceptions of neighbourhood qualities associated with active living.

**Associate Professor Gavin McCormack**<sup>1</sup>, Ms. Autumn Nesdoly<sup>2</sup>, Ms. Dalia Ghoneim<sup>1</sup>, Prof. Tara-Leigh McHugh<sup>2</sup>

<sup>1</sup>University of Calgary, Calgary, Canada, <sup>2</sup>University of Alberta, Edmonton, Canada

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Homebuyers (HBs) demand certain neighbourhood characteristics, land developers (LDs) supply neighbourhoods with particular built characteristics, and real estate professionals (REPs) match HBs with their desired neighbourhoods. 'Walkability', 'healthy', 'bikeability', 'vibrancy', and 'livability' are commonly used to describe neighbourhood qualities that support health and wellbeing. These qualities are communicated in the media and real estate and land development marketing materials, yet little research has explored whether these qualities have common meanings among HBs, LDs, and RE professionals. Our study explored the ways in which HBs, LDs, and RE professionals perceive and understand these neighbourhood qualities.

**Methods:** In 2019 and 2020, we conducted semi-structured telephone interviews with HBs (n=12), LDs (n=12) and REPs (n=19) from three major cities (Calgary, Edmonton, and Lethbridge) in Alberta, Canada. The interview guide consisted of five core questions, each focusing on the neighbourhood qualities of walkability, bikeability, vibrancy, livability, and health. Interview transcripts were analyzed using a process of content analysis, and findings were represented by themes related to each neighbourhood quality.

**Results:** HBs and LDs described 'walkability' as *ease of movement, contextual differences, and connections*; 'bikeability' as *supportive infrastructure, and differing preferences*; "vibrancy" as *matches peoples' values, and supportive built features*; 'livability' as *all encompassing, and safe and friendly*, and; a 'healthy' community as *opportunities for activity, and diversity*. REPs described 'walkability' as *perceived preferences, destinations and amenities, and connections*; 'bikeability' as *bikeability attributes, and controversial*; 'vibrancy' as *community feel, and evidence of life*; 'livability' as *subjective, and preferences and necessities*; and a 'healthy' community as *encourages outdoor activities, and promotes social homogeneity*. Perspectives about these neighbourhood qualities shared by HBs, LDs, and REPs were similar, and congruent with perceptions of these neighbourhood qualities as described in the academic literature. Descriptions of characteristics related to the five neighbourhood qualities overlapped, however, there was a conceptual hierarchy whereby walkability and bikeability were considered necessary for vibrancy, which was required for livability and in turn required for creating health supportive neighbourhoods.

**Conclusions:** This evidence has the potential to inform strategies for educating HBs, LDs, and REPs about the importance of neighbourhood qualities that support health and wellbeing.

# The influence of neighbourhood walkability on the effectiveness of a 12-week pedometer-facilitated physical activity intervention.

**Associate Professor Gavin McCormack**<sup>1</sup>, Prof. John Spence<sup>2</sup>, Prof. Tara-Leigh McHugh<sup>2</sup>, Prof. W. Kerry Mummery<sup>2</sup>

<sup>1</sup>University of Calgary, Calgary, Canada, <sup>2</sup>University of Alberta, Edmonton, Canada

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Pedometer-facilitated interventions encourage physical activity (PA) via the accumulation of steps. Mixed evidence suggests that neighbourhood built characteristics, such as walkability, might influence the effectiveness of PA interventions, including interventions that encourage the use of pedometers. In a previous study, we found that perceived walkability, but not objectively-measured walkability, was positively associated with the accumulation of daily steps during a 12-week pedometer-facilitated PA intervention ('UWALK'). As a follow-up to this previous study, we investigated the moderating effect of objectively-measured neighbourhood walkability on immediate (4-week) and short-term (12-week) changes in self-reported neighbourhood-specific leisure and transportation walking, leisure-based moderate and vigorous-intensity PA, and leisure-based screen time during UWALK. We hypothesized that immediate and short-term changes in self-reported PA during this pedometer-facilitated intervention would be significantly higher among participants residing in more versus less walkable neighbourhoods.

**Methods:** This quasi-experiment undertaken in Calgary (Canada) compared behaviour changes during the 12-week intervention between two neighbourhood groups classified as 'walkable' or 'car dependent' based on an objective measure of walkability (Walk Score®). Between May 2016 and August 2017, adults were recruited to participate in UWALK via newsletters, websites, and social media. Of the 573 volunteers (adults in the contemplation and preparation stages of PA behaviour change), 466 participated in UWALK. Surveys captured sociodemographic characteristics, perceived neighbourhood walkability, neighbourhood preferences, motivation, PA and screen-based leisure. Covariate-adjusted linear mixed models estimated the differences in PA and leisure-based screen time between the neighbourhood walkability groups at baseline, 4-weeks, and 12-weeks.

**Results:** UWALK participants included mostly females (83%) and had an average age of 49.2 years. Weekly minutes of walking for transport inside the neighbourhood was higher ( $p < .001$ ) among participants from 'walkable' versus 'car dependent' neighbourhoods at baseline (42.5 vs. 21.1), 4-weeks (81.2 vs. 48.2), and 12-weeks (87.2 vs. 48.0). Regardless of neighbourhood walkability, all PA outcomes were higher and leisure screen time lower at 4-weeks and 12-weeks compared with baseline. We found no significant neighbourhood walkability group by time interactions.

**Conclusions:** Pedometer-facilitated interventions may be effective for supporting short-term changes in physical activity and sedentary behaviour regardless of whether participants reside in low or high walkable neighbourhoods.

# A systematic review of climate change, 24-hour movement behavior, and health

**Dr Eun-Young Lee<sup>1</sup>**, Ms. Charlotte Lipin<sup>1</sup>, Ms. Yeong-Bae Kim<sup>2</sup>, Ms. Mikyung Lee<sup>1</sup>, Mr. Heejun Lim<sup>1</sup>, Dr. Ian Janssen<sup>1</sup>, Prof. John Spence<sup>2</sup>

<sup>1</sup>Queen's University, Kingston, Canada, <sup>2</sup>University of Alberta, Edmonton, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To examine potential mechanisms between climate change and movement behaviors (i.e., physical activity [PA], sedentary behavior [SB], and sleep), and how they influence human health.

**Methods:** Five databases (i.e., CINAHL, Embase, Global Health, MEDLINE, PsycINFO) were searched for English, peer-reviewed, quantitative studies up to the pre-COVID era (March 2020). To be included, studies must have climate change-related factors (e.g., ambient air pollution/temperature, lack of urban greenness, transportation noise) and at least one of the movement behaviors as either an exposure or a third variable, and health as an outcome. Evidence was summarized by the role (mediator/moderator) that either climate change or movement behavior plays on health.

**Results:** Of 14,601 documents searched, 39 studies were eligible, representing 1,300,277 participants from 19 countries (except for two ecological studies). A total of 11 non-mutually exclusive studies employed mediation and 35 studies employed moderation (quality of evidence score: 9/10). Of 40 observations from 12 studies that examined PA as a mediator, 13 null and 27 negative relationships were observed between climate change and health outcomes with PA partially explaining such relationships. Generally, poorer measures of climate change were associated with lower PA, and worse health outcomes. A total of 164 observations from 35 studies had either climate change or movement behavior as a moderator. Of these, 112 observations had movement behavior (PA: n=108, SB: n=2, sleep: n=2) as a moderator. With PA as a moderator, the relationships between climate change and health were null in 30, positive in 7, and negative in 71 observations, with any dose of PA generally attenuating the negative association between climate change and health. With climate change as a moderator (n=52), 17 null, 33 positive, and two negative associations between PA and health were observed.

**Conclusions:** Generally, the negative relationship between climate change and health was partially mediated by PA. Urban greenness and good air quality were associated with high PA and, in turn, positive health outcomes. PA may also buffer or strengthen the negative association between climate change and health; however, any dose of PA generally showed positive modification on the relationship.

# More than the worksite cafeteria: Workplace food environment clusters in small- and medium sized enterprises in the Netherlands

**Mrs. Lisanne Geboers<sup>1</sup>**, Mrs. Frédérique Rongen<sup>1</sup>, Prof. Emely de Vet<sup>1</sup>, Dr. Maartje Poelman<sup>1</sup>

<sup>1</sup>Wageningen University & Research, Wageningen, Netherlands

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Most characterization of workplace food environments has been conducted on worksite cafeterias. However, many small- and medium sized enterprises (SMEs) do not have a worksite cafeteria and food is offered and consumed in alternative ways. This study aimed to gain better understanding of these food environment of different types of SMEs.

**Methods:** A cross-sectional study was conducted among stakeholders (responsible of food policy/availability) of 315 SMEs. Using an online survey, physical, economic, political and social-cultural aspects of the food environment in SMEs were measured. To identify different type of SMEs, a two-step cluster analysis including two determinants: location of workspace (office/off-site) and presence of worksite cafeteria (yes/no) was conducted. Subsequently, descriptive statistics and Chi<sup>2</sup>-test were conducted to assess differences between clusters.

**Results:** Four SME clusters were identified: '1: SMEs with a company cafeteria and where employees most often work off-site' (11.1%), '2: SMEs with no company cafeteria and where employees most often work off-site' (21.3%), '3: SMEs with a company cafeteria where employees most often work at the office' (13.0%), '4: SMEs with no company cafeteria and where employees work most often at the office' (54.6%). The four clusters were significantly different in specific attributes of the food environment, such as availability of a catered lunch ( $\chi^2= 41.6$ ,  $p<0.001$ ), presence of a soft drink vending machine ( $\chi^2= 39.3$ ,  $p<0.001$ ), presence of a snack vending machine ( $\chi^2= 41.4$ ,  $p<0.001$ ), and a water tap ( $\chi^2= 28.3$ ,  $p<0.001$ ). These attributes of the food environment were significantly more available in cluster 1 and 3 than in cluster 2 and 4. At SME cluster 1, food policy related to consumption of healthy and sustainable foods were more often present than in the other identified clusters. More results will be presented.

**Conclusions:** This study identified the food environment of four different types of SMEs. The results highlight that different SMEs have different food environmental features. Typical guidelines to improve food environments at the worksite (e.g., healthy cafeterias) do not always align with real-life situations. As a next step, these insights can be used to design interventions, tailored at the type of SME.

# Fit4Study: Preliminary findings of a physical activity intervention for mental health and wellbeing in undergraduate university students

**Dr. Sjaan Gomersall<sup>1</sup>**, Mr. Kevin Huang<sup>1</sup>, Dr. Emma Beckman<sup>1</sup>, Dr. Norman Ng<sup>1</sup>, Associate Professor Genevieve Dingle<sup>1</sup>

<sup>1</sup>The University of Queensland, Brisbane, Australia

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Starting university brings many challenges which can result in considerable psychological distress. Studies have shown increasing rates of poor mental health in undergraduate students, with more than 50% of students displaying symptoms of depression and anxiety. While physical activity (PA) is a known correlate of mental health, PA rates in undergraduates are low. The aim of our study is to evaluate the effectiveness of a 4-week PA intervention “Fit4Study” on mental health in undergraduates.

**Methods:** Undergraduate students were recruited via first year psychology courses, online advertisements, and posters. Participants were invited to opt-in to either the “Fit4Study” ( $n = 47$ ) or control group ( $n = 47$ ). The “Fit4Study” group participated in a 4-week behaviour change-informed intervention that provides resources to promote PA engagement. Outcome measures were collected via self-report questionnaires at baseline and at end-intervention, including depression, anxiety, wellbeing, knowledge, and use of PA as a coping strategy, and PA. Control group participants were randomly matched based on age, gender, and international student status. Intervention effects were assessed using 2x2 mixed ANOVAs.

**Results:** Participants were aged an average of 19.8 y (85% female). Participants in the “Fit4Study” group reported a significant increase in using PA as a coping strategy when experiencing negative mental health symptoms, compared to the control at post-intervention (mean proportional change relative to control group of +40%,  $p < 0.05$ ). Within the control group, anxiety symptoms decreased between baseline ( $M = 2.13$ ,  $SD = 1.23$ ) and post-intervention ( $M = 1.72$ ,  $SD = 1.34$ ). There were no other significant outcomes.

**Conclusion:** The “Fit4Study” intervention is effective in increasing students’ use of PA as a coping strategy. These results are in line with available literature which says that perceiving PA as a coping strategy is necessary for PA to be effective in improving mental health. Given the non-significant results and small sample size, the impact of “Fit4Study” and PA on mental health may not be conclusive and further research with increased sample size is recommended.

# Surrounded by sugar: a context mapping study about sugar sweetened beverage consumption among teenagers in Amsterdam, the Netherlands

**Ms. Rian Pepping<sup>1,2</sup>**, Dr. Vincent Busch<sup>1</sup>, Associate Professor Wilma Waterlander<sup>3</sup>, Prof. Arnoud Verhoeff<sup>1</sup>, Prof. Jaap Seidell<sup>2</sup>

<sup>1</sup>Public Health Service of Amsterdam, Amsterdam, Netherlands, <sup>2</sup>VU University, Amsterdam, Netherlands,

<sup>3</sup>Amsterdam UMC, Amsterdam, Netherlands

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Approximately 25% of teenagers in Amsterdam has overweight or obesity. Consumption of sugar-sweetened beverages (SSB) is an important contributor to them developing overweight and obesity. However, it is unclear what underlying factors contribute to SSB consumption among teenagers. Therefore, this study applied a system dynamics perspective to fully understand the (interacting) beliefs, environment and social triggers that shape teenagers' SSB consumption. These results will be used to design system changes that fit teenagers' perspectives.

**Methods:** Context mapping was used to gain insight into the (latent) needs, motives and barriers among teenagers (N=48), age 12-16, with regard to SSB- and water consumption. In addition to an interview in duos, teenagers reflected on their own context through participating in assignments such as creating vlogs, timelines and photos. The interviews were conducted in 2021, some digitally and some live on location. All data was coded and processed in the online application Miro.

**Results:** The data was analyzed for emerging key themes, which were structured by context. First and foremost, teenagers consider SSB consumption as normal and part of everyday life. This theme is applicable to all contexts: SSB is present at home, at school and on social media. Also, SSB is considered cheap and prices will need to be increased significantly to discourage teenagers from buying SSB. In fact, the world teenagers live in seems designed to make them consume SSB (e.g. low prices, marketing exposure and social norms). As a result, the majority consider it normal, harmless and consumes SSB daily.

**Conclusions:** This research shows that the consumption of SSB is more prevalent and more integrated into teenagers' lives than expected. Teenagers are constantly exposed to SSB for instance on social media or around friends. It requires changes on different system levels, meaning changes on the deeper system drivers (i.e. tackling the belief that it is acceptable to market SSBs to children) as well as acting on more visible elements such as specific structures or events, e.g. implementing a SSB tax.

# Leverage points: Moving from theory and into practice

**Dr. James Nobles**

<sup>1</sup>Leeds Beckett University, Leeds, United Kingdom

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Leverage points are modifiable parts of a system, that if altered, may lead to significant changes in how that system works. Much of the work on leverage points has been conceptual. Where efforts have been made to identify leverage points in practice, they have been heavily reliant on the expertise of academic researchers. As such, several research teams have worked with policy-makers, practitioners and the public to create pragmatic tools that may help them to identify points within a system that could change how the system – or elements of the system – function. This presentation aims to: (1) introduce leverage points, (2) discuss the historic challenges faced when implementing models to identify leverage points, and (3) illustrate two pragmatic models for identifying leverage points; the Action Scales Model (ASM) and Public Health 12 (PH12) model.

**Methods:** This talk synthesises a rich history of published research in the fields of systems science and public health, before then going on to explain how the ASM & PH12 have been created to try and improve the translation of systems science tools into policy and practice.

**Results:** There are several other models available for identifying leverage points within a system. These include the initial work of Donella Meadows who published the seminal “places to intervene in a system”, that of Peter Senge’s “Iceberg Model”, and more recently, the “Intervention Level Framework” of Diane Finegood and colleagues. Whilst these models are foundational in our thinking around systems, and how to change how such systems function, they are often noted as abstract, academic, and as such, difficult to implement in practice. The ASM and the PH12 are grounded in the origins of this work but have been carefully designed to enhance their applicability outside of academia, including a focus on understandable and relevant language, visual illustrations, and pertinent examples.

**Conclusions:** Leverage points offer great potential to those interested in systems change. The ASM and PH12 are pragmatic models that can help those working in policy and practice to better understand their systems of interest and collectively identify where it might be possible to intervene.

# Using a participatory approach to identify opportunities for (re)designing occupational physical activity in homecare work to promote homecare workers' health – a study from an urban Norwegian municipality

**Ms. Ingeborg F. Liaset**<sup>1</sup>, Prof. Marius Steiro Fimland<sup>1,2</sup>, Prof. Andreas Holtermann<sup>3</sup>, Prof. Svend Erik Mathiassen<sup>4</sup>, Associate Professor Skender Redzovic<sup>1</sup>

<sup>1</sup>Department of Neuromedicine and Movement Science, Faculty of Medicine and Health Sciences, Norwegian University of Science and Technology, Trondheim, Norway, <sup>2</sup>Unicare Helsefort Rehabilitation Centre, Rissa, Norway, <sup>3</sup>National Research Centre for the Working Environment, Copenhagen, Denmark, <sup>4</sup>Department of Occupational Health Sciences and Psychology, Centre for Musculoskeletal Research, University of Gävle, Gävle, Sweden

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Homecare workers report having physically demanding work that may contribute to a high prevalence of musculoskeletal pain, sick leave, and early retirement. The aim of this presentation is to present a study identifying opportunities for (re)designing occupational physical activity in an urban Norwegian municipality for the purpose of promoting workers' health in accordance with the Goldilocks Work approach.

**Methods:** In collaboration with three urban Norwegian homecare units in the municipality, a modified version of the Intervention Mapping protocol was followed. In step 1 we assessed the current situation, and potential for change through participatory observations of stakeholders (n=6), reviewing the literature and examining findings regarding objectively measured occupational physical activity among homecare workers; and we assessed homecare workers' perception of their health. In addition, homecare workers' estimated Vo2max was assessed. Then we formulated goals for the (re)design. In step 2 we identified potentials for (re)designing homecare work in accordance with the developed goals. Special attention was given to a participatory approach in both steps, by involving relevant stakeholders (n=13) in planning groups and workshops.

**Results:** The assessment revealed a potential for increasing homecare workers musculoskeletal health and cardiorespiratory fitness by, 1) decreasing the large occupational physical activity variations observed between workers, and 2) increasing time in high-intensity physical activity during work. Two organizational-level redesign elements for decreasing variation in physical activity between workers were identified: 1) distribute different transportation options more evenly between homecare workers, and 2) construct daily work lists to become more equal between homecare workers with respect to occupational physical activity. We were, however, not able to identify any opportunities for increasing time in high-intensity physical activity at work.

**Conclusion:** By utilizing a participatory approach we could, to some extent, identify opportunities for increasing homecare workers' health while doing productive work. Further research should assess the acceptability of the planned initiatives among homecare workers, and their potential effects on musculoskeletal health. If proven to be acceptable and effective, and with a successful implementation, the initiatives could potentially decrease the high levels of sick leave in Norwegian homecare and thus provide a more sustainable homecare service.

# An Introduction to Intervention Optimization using The Multiphase Optimization Strategy (MOST)

**Dr. Kate Guastaferro<sup>1</sup>**

<sup>1</sup>New York University, New York, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Historically, interventions designed to change (or modify) behavioral nutrition and/or physical activity have been tested using the two-arm randomized controlled trial (RCT) design wherein the packaged intervention is tested against a suitable control. Though the RCT is well suited to demonstrate effectiveness of an intervention, the experimental design does not provide information about the inner workings of the components – does each component produce a desirable effect on the outcome of interest? how do the components work in the presence/absence of one another? does the contribution of a component offset its cost? In addition to better understanding the effectiveness of the intervention, it is imperative to balance the affordability, scalability, and efficiency of the intervention so that the intervention is translated into practice and has the potential to impact public health. In short, an alternative methodological approach to intervention development is needed.

**Methods:** One alternative is the innovative multiphase optimization strategy (MOST) framework for the development, optimization, and evaluation of multicomponent interventions. Based on principles of engineering, interventions using MOST are designed to produce the best expected outcome obtainable, given key constraints imposed by the need to maximize affordability, scalability, and/or efficiency. The strategic balance of Effectiveness against Affordability, Scalability, and Efficiency, (EASE), is accomplished through a process called optimization.

**Results:** Using alternative rigorous experimental designs, such as the factorial experiment or Sequential Multiple Assignment Randomized Trial (SMART), the scientist is able to empirically examine the contribution (i.e., effect) of intervention components, alone and in combination, on the outcome of interest. Through this experimentation, the scientist empirically examines and potentially modifies intervention components to increase intervention EASE. Ultimately, when the optimized intervention is subjected to an RCT to determine effectiveness, many of the unanswered questions have been addressed.

**Conclusion:** The presentation will provide a brief overview of intervention optimization following the three phases of MOST (preparation, optimization, and evaluation); highlight the construction of a conceptual model; and showcase the utility of the factorial experimental design.

# Our Healthy Community – Development and testing of a new model for health promotion and disease prevention in Danish municipalities

**Prof. Mette Aadahl**<sup>1,2</sup>, Prof. Charlotta Pisinger<sup>1,2</sup>, Associate Professor Henrik Vardinghus-Nielsen<sup>4</sup>, Dr. Paul Bloch<sup>3</sup>, Dr. Mette Kirstine Tørslev<sup>3</sup>, Prof. Ulla Toft<sup>1,2</sup>

<sup>1</sup>Research Centre for Prevention and Health, Frederiksberg, Denmark, <sup>2</sup>University of Copenhagen, Copenhagen, Denmark, <sup>3</sup>Steno Diabetes Center Copenhagen, Herlev, Denmark, <sup>4</sup>Aalborg University, Aalborg, Denmark

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** There is a need for new approaches and strategies to prevent chronic disease and promote health and well-being among citizens. In this presentation, we will describe the development of a new model for prevention and health promotion in Danish municipalities. The model builds on the Supersetting approach, intersectoral collaboration and community engagement and applies a broad concept of health. The overall objective was to develop and implement a new model for coordinated, integrated and evidence-based health promotion and disease prevention in Danish municipalities.

**Methods:** Two Danish municipalities were included in the development and initial implementation of the model from 2019 to 2021. This involved the following steps in each municipality: 1) Analyzing the health status, lifestyles and socio-economy at municipality level. 2) Mobilizing lead municipal administrators and politicians for intersectoral action including jointly defining thematic focus areas and target populations. 3) Mapping community-based stakeholders, physical environments and existing evidence to qualify relevant action 4) Mobilizing professional stakeholders from the public, private and civic sectors for co-creation of intervention ideas and joint action. 5) Co-creating and implementing interventions together with professional stakeholders and citizens.

The strategic model and results from the development process will be presented from the two involved municipalities. In one municipality the administration chose physical activity and well-being among children and young people as key focus area. Community-based stakeholders from non-profit organizations and public institutions, including sports clubs, leisure clubs, primary schools, and public departments jointly developed and implemented specific interventions. One specific intervention aimed to engage more children in local clubs. Coaches from three local sport clubs introduced 1<sup>st</sup> and 4<sup>th</sup> grade students at two schools to their sport (a course of eight times) during students' after-school-club time. Overall, the process fostered broad engagement of stakeholders from the public sector, the private sector, and civil society.

**Conclusion:** The model developed in Our Healthy Community builds on contextual analyses, dialogues, workshops, and co-creation processes with a wide range of stakeholders to promote local relevance, integration and sustainability of developed actions and interventions. The model will be pilot tested in two other Danish municipalities (2022-2025)

# Optimizing Infant Diet: Design Considerations and User Testing in the Growing Healthy Together Study

**Dr. Heather Wasser<sup>1</sup>**, Dr. Carmina Valle<sup>1</sup>, Dr. Brooke Nezami<sup>1</sup>, Dr. Linda Collins<sup>2</sup>, Dr. Deborah Tate<sup>1</sup>

<sup>1</sup>University of North Carolina, Chapel Hill, Chapel Hill, USA, <sup>2</sup>New York University, New York, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** The intake of foods and beverages associated with obesity begins during infancy, increasing precipitously between 6-12 months of age. While the number of obesity prevention trials beginning in the first two years of life have increased over the last 15 years, the consistent use of the randomized controlled trial to test multicomponent prevention packages clouds our knowledge of effective intervention strategies. The purpose of this study is to describe how the Preparation Phase of the Multiphase Optimization Strategy (MOST) was used to design Growing Healthy Together (GHT), an mHealth 2<sup>4</sup> factorial experiment that is systematically testing the individual and interactive effects of 4 intervention components delivered via a web app on infant dietary intake at 12 months.

**Methods:** Specific Preparation Phase activities included 1) a review of preliminary studies and the extant literature to identify determinants of infant dietary intake and an initial set of intervention components, 2) development of a conceptual model that mapped each individual intervention component to a unique, proximal, theoretical mediator, and 3) an iterative user-centered design process that included a) developing user profiles, b) brainstorming and free-sketching the web app interface, c) testing a prototype with end users, and d) revising the prototype and programming the web app.

**Results:** Based on the literature and explication of the conceptual model, four components were chosen for testing in GHT: 1) caregiver diet self-regulation (ON vs OFF), 2) vegetable preparation skills (ON vs OFF), 3) enhanced responsive feeding and care (ON vs OFF), and 4) study partner inclusion (ON vs OFF). The initial architecture of the web app was substantially revised after testing with 5 end users (3 mothers, 1 father, 1 grandmother). The final web app pages (and subpages) include: 1) Home, 2) Learn (Lessons/Resources), 3) My Goals (Feedback/Progress), 4) My Veggies (Feature/GO Veggies), and 5) My Baby (Activity/Journal).

**Conclusions:** The MOST framework outlines a systematic method for optimizing behavioral interventions aimed at early life obesity prevention. GHT provides an example of how to use MOST and user-centered design to inform the build of an mHealth optimization trial aimed at improving infant dietary intake.

# Promoting healthy weight and wellbeing among children: The Generation Healthy Kids project

Prof. Ulla Toft<sup>1,2</sup>, **Dr. Louise Thomsen**<sup>1</sup>, Dr. Tine Buch-Andersen<sup>1</sup>, Dr. Dikke Høeg<sup>1</sup>, Dr. Anders Blædel Gottlieb Hansen<sup>1</sup>

<sup>1</sup>Research Centre for Prevention and Health, Frederiksberg, Denmark, <sup>2</sup>University of Copenhagen, Copenhagen, Denmark

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Many earlier studies have shown no or little effect of lifestyle interventions on overweight measures. Therefore, new approaches are needed to combat “wicked” problems such as the obesity epidemic. Participatory and systems approaches seems promising, but the effect needs to be tested within study designs with a high level of evidence. The Generation Healthy Kids project has an innovative approach as it combines a cluster randomized controlled study design with a participatory approach using systems thinking and the Supersetting Approach. The overall aim of the study is to promote healthy weight development and wellbeing among children aged 6-9 years

**Methods:** The study consists of a pilot study (Jan-Mar 2023) and a 2-year cluster randomized controlled intervention study (Sept 2023-June 2025) that includes 24 local communities (defined as school districts; 12 intervention; 12 control). The target group is children from 1<sup>th</sup> and 2<sup>nd</sup> grade (approx. 6-9 years). The study will include approximately 2500 children.

The intervention will be developed using the Supersetting Approach. A supersetting is made up of multiple settings within a school district (school environments, after school clubs, leisure activity facilities, supermarkets, restaurants/fast food outlets, and the home). A broad range of stakeholders will be involved to develop sustainable approaches to prevent overweight among children. Interventions within each subsetting will be coordinated and integrated to achieve synergistic effects. The intervention will focus both on healthy eating, physical activity, healthy sleep- and screen habits. A standardized process of systems mapping (STICKE) and Community Capacity Building will be used in the 12 intervention areas.

**Results:** The presentation will illustrate methods to do a high-quality quantitative evaluation within a RCT-design combined with a comprehensive formative research which includes tracking implementation within each local community developing a action register, measurement of stakeholder engagement (engagement score), communication log, geographical mapping of actions and a GANTT diagram of actions and engagement.

**Conclusions:** Combining a traditional, high quality RCT approach with innovative participatory approaches such as the Supersetting Approach and systems mapping are possible and can contribute with potential groundbreaking approaches that can increase the impact of the interventions but also the quality of research.

# Optimizing a Nutrition and Physical Activity Intervention for Parents of Preschoolers: Application of the Multiphase Optimization Strategy (MOST)

**Dr. Laura Bellows<sup>1</sup>, Dr. Susan Johnson<sup>2</sup>**

<sup>1</sup>Cornell University, Ithaca, USA, <sup>2</sup>University of Colorado, Anschutz Medical Campus, Aurora, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** The eHEROs (e<sup>l</sup>ectronic H<sup>e</sup>althy E<sup>n</sup>viR<sup>o</sup>nments) study aims to improve eating and physical activity behaviors of preschool-aged children via an m-Health intervention delivered to low-income, rural mothers. In designing multicomponent interventions, it is important to shift from evaluating interventions as a package and move towards understanding which specific intervention components contribute to efficacy, thus optimizing our interventions. The objective of this study is to describe the application process to optimize the eHEROs study design using the Multiphase Optimization Strategy (MOST).

**Methods:** MOST is a framework that aids in developing interventions that produce the best-expected outcomes (i.e., effectiveness), given constraints imposed on affordability, scalability, and efficiency. During the MOST preparation phase candidate intervention components are identified, a conceptual model is created, and an optimization objective is defined. Building from our previous intervention outcomes and formative research, an optimization plan was developed for the eHEROs study.

**Results:** First, 4 eHEROs intervention components were selected. This includes a custom, eHEROs mobile app as a constant component and 3 additional digital intervention components and their levels – coaching (on/off), group meetings (on/off), and nudges (high/low). Next, in the conceptual model, 3 components were linked to theoretical mediators and expected outcomes. Theoretical mediators - goal setting/reinforcement (coaching), social support (group meetings), and behavioral capability (nudges) – influence the behavioral outcomes (offering new foods, family mealtimes, and physical activity) and distal health outcome (child weight status). The development of the optimization objective considers the implementation constraints of participants (e.g., time engaging in program, digital literacy) and researchers (e.g., costs of app development and facilitation of intervention components) collectively with scalability (e.g., feasibility of future high-fidelity delivery) and efficiency (e.g., using only active intervention components). The optimization objective will be defined and specified prior to feasibility testing.

**Conclusions:** Optimizing behavioral and biobehavioral interventions has the potential to enhance public health impact by balancing effectiveness with cost-benefit and other implementation factors. The MOST preparation phase is critically important to building the foundation for the entire optimization process. Application of the MOST preparation phase activities to the eHEROs study provides insights into the optimization process for nutrition and physical activity researchers.

# Children and adolescents' experiences of smartphone applications and wearable activity trackers to monitor physical activity in the UK and Malaysia

**Ms. Nur Izzatun Nasriah Nasruddin<sup>1</sup>**, Dr. Joey Murphy<sup>1</sup>, Dr. Miranda Armstrong<sup>1</sup>

<sup>1</sup>University of Bristol, Bristol, United Kingdom

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** The emerging availability of mobile networks, smartphones and wearable sensors increases the capability to collect real-time data from many participants and allow remote physical activity (PA) monitoring. This study aimed to explore children and adolescents' experiences of smartphone applications (SA) and wearable activity trackers (WAT) to monitor PA in the UK and Malaysia.

**Methods:** A cross-sectional online survey was developed using JISC Online Surveys and administered to children and adolescents aged 5-17 years in both UK and Malaysia. The survey was conducted in English and Malay language with separate surveys developed according to age category: 5-12 years old and 13-17 years old. Older children answered the survey by themselves whilst for younger children, the survey was answered by their parents or carers. The survey consisted of questions related to demographic information, socioeconomic status, SA/WAT usage, behaviour change, motivation for use and practical issues with using SA/WAT. Descriptive statistics were used to understand SA/WAT usage, motivations for use, and practical issues.

**Results:** One hundred forty-nine participants (50.3% children, 49.7% adolescents; mean age =  $11.1 \pm 3.8$ ; 57.7% female; 58.4% Malaysian) responded to the survey. Forty-three percent of participants reported owning a smartphone (65.6% were Malaysian), with fitness or activity tracker applications installed in 12.5% of participant phones. All participants (n=64) primarily used their smartphones for calls and text (100.0%), social media (95.3%) and watching videos (89.1%). Only 16.8% (n=25) owned a WAT, with 48.0% from UK and 52.0% from Malaysia. Most WAT users (60.0%) were adolescents, with Apple Watch (36.0%) and Fitbit (32.0%) most common. Most participants with WAT (60.0%) agreed that they had positive experiences using WAT and used it mostly to measure activities (92.0%) and improve health (72.0%). Most also reported no complaints about their WAT (56.0%).

**Conclusions:** Results suggest that smartphones are commonly used by youth in Malaysia, suggesting their potential use to monitor PA in Malaysian youth. Commercial WAT were less commonly owned by both UK and Malaysian youth. Further research should be done to assess the validity of both smartphone technology and commercial WAT for monitoring PA in children in low- and middle-income countries.

# A Randomized Controlled Trial to Reduce Post-Cessation Weight Gain

**Ms. Kinsey Pebley**<sup>1</sup>, Dr. Zoran Bursac<sup>2</sup>, Dr. Robert Klesges<sup>3</sup>, Dr. Jon Ebbert<sup>4</sup>, Dr. Catherine Womack<sup>5</sup>, Ms. Julia Graber<sup>5</sup>, Dr. Melissa Little<sup>3</sup>, Dr. Karen Derefinko<sup>5</sup>, Dr. Rebecca Krukowski<sup>3</sup>

<sup>1</sup>Medical University of South Carolina, Charleston, USA, <sup>2</sup>Florida International University, Miami, USA,

<sup>3</sup>University of Virginia, Charlottesville, USA, <sup>4</sup>Mayo Clinic, Rochester, USA, <sup>5</sup>University of Tennessee Health Science Center, Memphis, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Weight gain is a barrier to smoking cessation. Previous interventions targeting weight gain while quitting smoking have largely been unsuccessful. The current study was a randomized controlled trial assessing the efficacy of two weight management interventions (focused on stability or weight loss) compared to a low-intensity, self-guided weight management group prior to a smoking cessation attempt.

**Methods:** Adults (N=305; 33.1% men, 43.3% identified as Black, 86.9% had overweight/obesity) interested in quitting smoking were randomized to one of three conditions (i.e., Stability, Loss, and Bibliotherapy) for weight management. After 8 weeks of weight interventions, participants received identical 6-week phone-based smoking cessation interventions with 6 months of varenicline provided. The Stability and Loss groups then had 5 monthly sessions focused on preventing weight regain and smoking relapse. Smoking status over time was measured by self-report and cotinine tests. ANCOVAs were used to determine differences in weight change between groups.

**Results:** Retention was 90.2% at 12-month follow-up. Participants in the Loss group lost weight at 12-months (-2.01 kg,  $SE=1.58$ ) in comparison to individuals in the Bibliotherapy group (+1.08 kg,  $SE=1.49$ ,  $p=0.0004$ ), while weight change in the Stability group (-0.30 kg,  $SE=1.56$ ) was not significantly different from the Bibliotherapy group ( $p=0.17$ ). There were no significant between-group differences in self-reported past 7-day abstinence or biochemically verified abstinence at 12 months, with almost half of participants quitting smoking. There was no differential effect between intervention group and change in weight by smoking status ( $p=0.07$ ). However, participants who quit smoking in the Stability intervention gained 2.04 kg ( $SE=1.70$ ), while Stability participants who continued smoking lost 2.57 kg ( $SE=1.65$ ). Participants who quit smoking in the Loss intervention lost 2.18 kg ( $SE=1.69$ ), and participants who continued smoking also lost 2.81 kg ( $SE=1.66$ ). Those who quit smoking in the Bibliotherapy condition gained 1.55 kg ( $SE=1.55$ ), but those who continued smoking lost 0.17 kg ( $SE=1.71$ ).

**Conclusions:** The Stability and the Loss interventions were effective for preventing post-smoking cessation weight gain, with the Loss group having the benefit of sustained weight loss. These interventions may be helpful to combat weight gain and potentially remove a barrier to smoking cessation.

# Policy Surveillance of State Obesity Legislation in California, USA (1999-2020)

**Dr. Denise Payan<sup>1</sup>**

<sup>1</sup>University of California, Irvine, Irvine, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The COVID-19 pandemic elevated the importance of addressing risk factors for chronic illness and identifying solutions to narrow racial/ethnic obesity disparities. While state obesity policies can have significant impact on population health, little is known about the types of policies introduced and enacted into law over time. Prior work has examined patterns and predictors of obesity, childhood obesity, adult obesity, and physical activity legislation across states. Investigating obesity policy within a state that has been an early adopter of obesity policy can reveal critical information about innovative policy instruments, trends, effectiveness, and the policymaking process. This study's objective is to identify and analyze patterns of obesity legislation in California, USA over a 20-year period.

**Methods:** We systematically searched for obesity prevention and reduction bills introduced in California's legislature between 01/01/1999-12/31/2020. The initial search yielded n=354 bills. Exclusion criteria were applied (e.g., not relevant, civil liability lawsuits, budget acts), leaving n=287 bills. A quantitative codebook was developed to code policy variables for each bill. We use descriptive statistics to examine the types of bills introduced and enacted. Differences in the proportion of enacted policies are compared using Chi-square tests. P values  $\leq 0.05$  are considered statistically significant.

**Results:** Among introduced bills, 45% were related to nutrition, 32% to physical activity, 31% to awareness, 25% to education, and 15% to health care, with the remaining focused on miscellaneous topics (e.g., child abuse, housing insecurity). Between 1999-2020, 46% (n=132) of introduced obesity reduction and prevention bills were enacted, and 6.6% (n=19) were passed by the state legislature but vetoed by the Governor. A high percentage (37%) of enacted bills specifically focused on children as their target population and 27% focused on schools as their primary setting, suggesting that policies framed around improving children's health may be more likely to garner political support.

**Conclusions:** State obesity policies can create healthier communities by improving environmental conditions and increasing access to health-promoting resources. Future research using this database includes examining determinants of state obesity policy and the effectiveness of these policies on population health.

# Confusion in co-production: what 'co'-words are used and how is it done in chronic disease prevention?

**Dr. Bronwyn McGill<sup>1</sup>**, Ms. Lucy Corbett<sup>1</sup>, Associate Professor Anne Grunseit<sup>2</sup>, Dr. Michelle Irving<sup>3</sup>, Dr. Blythe O'Hara<sup>1</sup>

<sup>1</sup>Prevention Research Collaboration, The University of Sydney, Sydney, Australia, <sup>2</sup>University of Technology Sydney, Sydney, Australia, <sup>3</sup>Centre for Evidence and Implementation, Sydney, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** There is mounting interest in the use of co-production in health literature, but confusion about its use in health promotion. Numerous terms (co-design, co-construct, co-create) are used and there is little evidence and guidance for using co-produced chronic disease prevention interventions in the general population. This study investigated how co-production is used for lifestyle-related behaviour change, who is usually involved in co-production for the development and evaluation of chronic disease prevention interventions, and whether (and how) the literature reports on the evaluation of co-produced chronic disease prevention interventions.

**Methods:** We conducted a systematic scoping review to examine the use of co-production in the development and evaluation of primary research studies of behaviour change programs for chronic disease prevention. We searched four electronic databases for studies reporting outcomes of interventions using a co-production approach among populations at risk of chronic disease, in any health promotion setting. Outcomes of interest included physical activity, diet and weight management. Clinically oriented interventions (targeting service delivery, rehabilitation, medication adherence) were excluded. A narrative synthesis was undertaken.

**Results:** In 71 articles that reported using co-production, co-design, co-creation, co-development, and co-construction, these terms were used inter-changeably to refer to a participatory process involving researchers, stakeholders, and end users involved in the development or evaluation of interventions. Overall, studies used co-production as a formative research process, including focus groups and interviews. There were no major differences in methods used based on the 'co-word' employed by the study. Co-produced health promotion interventions were generally not well described or robustly evaluated and tended to report on feasibility and acceptability rather than impact. The public health literature does not currently provide insight into whether co-produced interventions achieve better outcomes than those that are not co-produced.

**Conclusions:** Uniform agreement on the meanings and operationalisation of the various 'co'-words would avoid confusion surrounding their use. This would facilitate the development of guidelines and/or a co-production framework specific to physical activity and nutrition behaviour change interventions. Doing so would allow researchers to develop a shared understanding of the co-production process and how best to evaluate co-produced chronic disease prevention interventions.

# Effect of climate change impact menu labels on ordering choices and perceptions of healthfulness: a nationally representative online randomized controlled trial

**Dr. Julia Wolfson<sup>1</sup>**, Dr. Aviva Musicus<sup>2</sup>, Dr. Cindy Leung<sup>2</sup>, Dr. Ashley Gearhardt<sup>3</sup>, Dr. Jennifer Falbe<sup>4</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA, <sup>2</sup>Harvard T.H. Chan School of Public Health, Boston, USA, <sup>3</sup>University of Michigan, Ann Arbor, USA, <sup>4</sup>University of California Davis, Davis, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** There is growing interest in strategies to encourage more environmentally sustainable food choices in United States (U.S.) restaurants through the use of climate-impact menu labels. Data is lacking on the ideal design of such labels to effectively encourage sustainable choices. The objective of this study was to test the effects of positive and negative climate-impact menu labels compared to a control label on the environmental sustainability and healthfulness of food choices.

**Methods:** We fielded a randomized controlled experiment using a web-based nationally representative survey fielded with the AmeriSpeak panel from March 30-April 13, 2022. Participants (n=5,049) were shown a fast-food menu and prompted to select one item they would like to order for dinner. Participants were randomized to view menus with 1 of 3 label conditions: 1) Quick Response (QR) code label on all items (control); 2) Green “LOW CLIMATE IMPACT” label on chicken/fish/vegetarian items (positive framing); or 3) Red “HIGH CLIMATE IMPACT” label on red meat items (negative framing). The main outcome was an indicator of selecting a sustainable item (i.e., one without red meat). Secondary outcomes included participants’ health perceptions of the selected item, and the Nutrition Profile Index (NPI) score of “healthfulness.”

**Results:** Both climate impact labels were effective at encouraging sustainable selections from the menu. Compared to the control, 23% more participants (95% CI: 13.7%, 34.0%,  $p<0.001$ ) selected a sustainable menu item when menus displayed high-climate-impact labels, and 10% more participants (95% CI: 1.0%, 19.8%;  $p=0.03$ ) selected a sustainable menu item when menus displayed low-climate-impact labels. Across experimental conditions, participants who selected a sustainable item rated their order as healthier than those who selected an unsustainable item. However, only participants in the high-climate-impact condition selected objectively healthier items (based on NPI score).

**Conclusions:** In this randomized controlled experiment, climate-impact menu labels—especially negatively framed labels highlighting high-climate-impact items (i.e. red meat)—were an effective strategy to reduce red meat selections and encouraged more sustainable choices. Future research should investigate different label designs to promote sustainable food choices and evaluate effects on both sustainability and healthfulness of food choices in fast-food restaurants and other settings.

# Consumer Trends in Online Take-Away Purchasing

**Miss Tamara Garcia del Toro**<sup>1,2</sup>, Dr. Francesca Pontin<sup>1,2</sup>, Dr. Stephen Clark<sup>1,2</sup>, Dr. Rachel Oldroyd<sup>1,2</sup>, Prof. Nik Lomax<sup>1,2</sup>

<sup>1</sup>Leeds Institute for Data Analytics, Leeds, United Kingdom, <sup>2</sup>University of Leeds, Leeds, United Kingdom

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Current research in people's diet habits has been very focused in the food environment: the different contexts in which people engage with the food system. Originally, this concept referred to the physical presence of food in a person's surroundings, which affects their ability to access different foods.

The food environment has been transformed in the past decade, with the development of new services such as online grocery and take away delivery services. Alongside a shift towards more out-of-home-food consumption and the unique current historical context (COVID-19 pandemic and the cost-of-living crisis).

To better understand consumer habits around take-away purchasing, and how the growth of online food delivery services has shaped new behaviours, we have partnered with a large online take away delivery platform to use their transaction data in order to shed light on how changing customer habits are shaping the food environment.

**Methods:** Transaction data for online food purchasing was provided by the data partner, a large online food delivery service. The data included anonymised customer reference id, location and order information, as well as food outlet details. Data was accessed through the retailer's own secure platforms. Data analysis was carried out in two phases: different machine learning methods were evaluated and used to produce a classification of customers based on purchase frequency in various categories of food purchases; and an exploration of the locational characteristics of these classifications and distribution across UK geography. Spatial clusters of these classifications of purchasing habits across the UK were characterised using socio-demographic data, matched by consumer postcode information through geospatial analysis. Geodemographic data was sourced from the 2011 and 2021 census at the Output Area Level (Approximately 125 households) and retailer's data was matched using postcode information.

**Conclusion:** Studies to date have shown that areas with higher levels of deprivation have higher access to take-away food outlets, but it remains to be seen whether this higher access translates to higher purchasing in this communities. We are the first team to investigate customer transaction data to go beyond customer access and see what the actual online food ordering trends are.

# An 8-week Peer-Coaching Wellness Program to Improve Physical Activity, Diet, and Sleep among College Students

**Dr. Zi Yan<sup>1</sup>**, Dr. Jessica Peacock<sup>1</sup>, Dr. April Bowling<sup>1</sup>, Dr. Juliana Cohen<sup>1</sup>, Dr. Laura Kurdziel<sup>1</sup>, Dr. Sarah Benes<sup>2</sup>, Dr. Seungbin Oh<sup>3</sup>, Dr. Luis Saenz de Viguera<sup>1</sup>

<sup>1</sup>Merrimack College, North Andover, USA, <sup>2</sup>Southern Connecticut State University, New Haven, USA, <sup>3</sup>Boston University, Boston, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** This study evaluated an 8-week peer-coaching wellness program among college students in the U.S.

**Method:** Participants. A total of 52 college students were recruited and randomized into the coaching or the control group. Design. Each participant in the coaching group met with a trained peer health coach once a week (30-40minutes for each meeting) for 8 weeks to work on self-identified wellness priorities, including physical activity, nutrition, and sleep. Coaches used various coaching techniques including reflective listening, motivational interviewing, and goal setting, etc. The control group received a wellness handbook. Measures. The International Physical Activity Questionnaire (IPAQ)-short form was used to measure physical activity. A 9-item Likert scale was used to measure self-efficacy of eating healthy foods; The Pittsburgh Sleep Quality Index (PSQI) was used with a higher score indicating a poorer sleep quality. Analyses. Repeated MANOVA and ANOVA were used to explore the coaching effect on the goal-specific domain.

**Result:** . Physical Activity. 15 participants (65.21%) identified PA as a coaching goal. The interaction between intervention and group on Vigorous METs was significant  $F(1,32) = 6.42, p = .017$ ; The vigorous METs for PA goal group increased from 1013.33( $SD=1055.12$ ) to 1578.67 ( $SD=1354.09$ ); the control group decreased from 1012.94( $SD=1322.943$ ) to 682.11( $SD=754.89$ ). Diet. 15 participants (65.21%) identified diet related wellness goals. The interaction and main effects between group and intervention were not significant. Self-efficacy of eating healthy food changed from 27.4 ( $SD=8.51$ ) to 28.2 ( $SD=7.03$ ), 25.68 ( $SD=5.73$ ) to 26.47 ( $SD=5.32$ ) for the coaching and control groups, respectively. Sleep. 13 participants (56.52%) identified sleep as a coaching goal. The group differences were significant,  $F(1,28) = 5.18, p < .05$ . The Global PSQI decreased from 6.18 ( $SD=2.35$ ) to 4.36 ( $SD=2.20$ ) among the coaching group; the control group changed from 7.74( $SD=2.76$ ) to 7.26( $SD=3.58$ ).

**Conclusion:** Peer coaching showed a promising effect on improving physical activity and sleep quality among college students.

Table 1. Participants Demographic Characteristics

	Coaching Group	Control Group
Number of Participations	28	24
Gender (female)	22 (78.6%)	20 (83.3%)
Age	18.7(+7.2)	18.8(+7.0)
Race (White)	17 (60.7%)	16 (66.7%)
First Generation Student	7 (25%)	5 (20.8%)
Dropped out	2 (7.1%)	4(16.7)
Completed post-assessment	23(82.1%)	20(83.3%)

# 'Make n Take' for Aboriginal Families

**Ms. Anne Hills<sup>1</sup>**, Dr. Kerith Duncanson<sup>2,3</sup>

<sup>1</sup> College of Health, Medicine and Wellbeing, University of Newcastle, Newcastle, Australia, <sup>2</sup>College of Health and Medicine, University of Newcastle, Newcastle, Australia, <sup>3</sup>Food and Nutrition Research Program, Hunter Medical Research Institute, Newcastle, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Aboriginal Australian mothers are twice as likely have a low birthweight baby and twice as likely to experience gestational diabetes as non-Aboriginal women. Improving maternal dietary quality during pregnancy may be a powerful modifiable risk factor for long-term health of offspring. The aim of this 12-month project was to co-design and deliver a culturally-relevant food and cooking program to improve the health status and birth outcomes in Aboriginal women in reproductive years of life living in regional New South Wales, Australia.

**Methods:** The mixed methods study involved concurrent quantitative and qualitative data collection and analyses. One dietitian and one researcher experienced in Aboriginal nutrition undertook three rounds of community consultation for co-design and recruitment purposes. Quantitative data collection included baseline diet quality (Australian Recommended Food Score) and the Cooking and Food provisioning Action Scale (CAFPAS). Change in food and nutrient intake was assessed for a subset of participants who completed a 24-hour recall pre- and post-program. As bush foods are not universally accessible, contemporary foods with similar nutrient profiles to bush foods were used and the project coordinator gathered native lilli-pilli, warrigal greens and bunya nuts to incorporate into recipes. Elders were invited to share their bush food knowledge in sessions.

**Results:** Eight 5-week programs (n=91) were delivered in 2021/22. Ninety-one women aged 15-77 years participated. The mean diet quality score (n = 29) was 31 (maximum 73) and mean CAFPAS score was 91 (maximum 110), with correlation of 0.41 between these measures. Changes in dietary intake in a subset of participants (n=7) included decreased energy (-1333 calories/day) and sodium (-598mg/day) and increased folate (95mg/day).

Qualitative analyses reinforced quantitative findings with participants reporting increased cooking-related confidence, ability and enjoyment. Cultural aspects of 'Make n Take' were valued, particularly privileging of bush foods and Aboriginal Elders sharing knowledge.

**Conclusions:** 'Make n Take' improved Aboriginal women's dietary intake, diet quality and their knowledge and pride in cultural heritage. Culturally relevant food and cooking programs show potential to improve the health status of Aboriginal women in the reproductive years of life, and positively influence the health of their children and extended families.

# Innovating dietary assessment and support: An update on present efforts within the Dutch setting

**Dr. Elske M. Brouwer-Brolsma<sup>1</sup>**

<sup>1</sup>Division of Human Nutrition and Health, Wageningen University and Research, Wageningen, Netherlands

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

E.M. Brouwer-Brolsma, on behalf of the Pride & Prejudice Consortium

**Purpose:** Diet-related chronic diseases form a major global health concern where, so far, campaigns to promote healthier dietary choices have been of limited success. Thus, there is a need for more individual tailored dietary support instead of 'one-size-fits-all' approaches based on general recommendations.

**Methods:** We established the Dutch Pride & Prejudice consortium; a unique multidisciplinary consortium of researchers in nutrition, human-technology interaction, design, and social sciences. We joined forces to work on technology-based innovations to further improve the accuracy of dietary assessment and support to stimulate individuals towards healthier dietary behaviors

**Results:** To optimally leverage the multidisciplinary of the consortium, we established an overall strategy to further innovate current and develop new dietary assessment and support tools, including the stages of exploration, development, evaluation, and implementation. Up to now, we particularly focused on the first three stages. The explorative stage is characterized by desk-top research providing insight in already available tools and systems and their quality and characteristics, qualitative research exploring wishes and expectations of end-users and stakeholders, journey mapping of potential opportunities and challenges that end-users may experience when implementing the tools in their daily life, and research on how end-users experience the use of the new tools. The developmental phase focusses on the implementation of the results obtained in the exploration phase, i.e., by upgrading existing tools and developing new tools. The evaluation phase particularly focusses on the evaluation of the accuracy of the dietary assessment, perceived burden and motivation of (long-term) use, and the effectiveness of the dietary support system. Ongoing projects now focus on e.g., developing a sensor-based system to assess breastmilk quality and quantity while breastfeeding, dietary support application for pregnant or lactating women and their children, dietary assessment and support application for adolescents, and dietary assessment and support tool for children.

**Conclusion:** We established an interdisciplinary team of experts to make a game-changing contribution to the development, testing, and implementation of dietary assessment and support tools. The work-flow on several of these prototypes can be demonstrated.

# Comparison of omnivores, flexitarians, vegetarians and vegans in relation to their physical activity patterns and dietary behavior

**Mr. Andreas Bscheiden<sup>1</sup>**, Mr. Gerrit Hummel<sup>1</sup>, Ms. Janine Ehret<sup>1</sup>, **Prof. Nanette Ströbele-Benschop<sup>1</sup>**

<sup>1</sup>University of Hohenheim, Stuttgart, Germany

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** N. Other

**Purpose:** Over the last years, alternative diets such as more plant-based diets have become popular. Motives for choosing a more plant-based diet are manifold and behaviours related to dietary choices appear to differ between groups following different diets. This online survey aimed to elaborate on potential differences in dietary behaviours related to the nutrition content as well as to planetary health across different dietary styles.

**Methods:** A total of 943 mainly young participants have been recruited on healthy eating pages on Instagram to take part in the online survey (with experimental component that is not part of this study). They were asked about various topics such as individual dietary behaviour, fitness, lifestyle, and their social demographics. Dietary styles were compared using  $\chi^2$ -, Kruskal-Wallis-Test, and ANOVA.

**Results:** The results show significant differences between gender groups. A higher percentage of male participants indicated an omnivore dietary style, while more female participants eat flexitarian, vegan, or vegetarian. BMI differs significantly between dietary styles with the highest BMI among omnivore participants and the lowest BMI among vegan participants. No differences were found for the frequency of sporting activities and paying attention to physical activity in general. Furthermore, participants showed significant differences between dietary styles in paying attention to avoid food additives and to calories in foods in general, and in preferences regarding cooking yourself as often as possible, and towards the preference of choosing seasonal and organic products.

**Conclusion:** The results suggest that individuals following plant-based diets pay more attention to healthy and ethical food choices whereas no differences are apparent in physical activity. It seems that following a certain dietary style is accompanied by various other food related behaviour that vary across different dietary styles.

# Development of a Teacher Food and Nutrition-Related Health and Wellbeing Questionnaire: An e-Delphi Study

Ms. Tammie Jakstas<sup>1, 4</sup>, **Dr. Tamara Bucher<sup>3, 4</sup>**, Dr. Andrew Miller<sup>2, 5</sup>, Dr. Vanessa Shrewsbury<sup>1, 4</sup>, Prof. Clare Collins<sup>1, 4</sup>

<sup>1</sup>School of Health Sciences, College of Health, Medicine and Wellbeing, The University of Newcastle, Callaghan, NSW, Australia, <sup>2</sup>School of Education, College of Human and Social Futures, The University of Newcastle, Callaghan, NSW, Australia, <sup>3</sup>School of Environmental and Lifestyle Sciences, College of Engineering, Science and Environment, The University of Newcastle, Callaghan, NSW, Australia, <sup>4</sup>Hunter Medical Research Institute, New Lambton Heights, NSW, Australia, <sup>5</sup>Priority Research Centre for Teachers and Teaching, The University of Newcastle, Callaghan, NSW, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Internationally, teaching is a profession where individuals are known to experience high stress and burnout. A teacher's health impacts not only their own wellbeing but that of their students. Previous research on teacher health and wellbeing is limited in its consideration of the impact food and nutrition (FN) factors have on these outcomes. This study aimed to evaluate face validity of a questionnaire to assess key FN-related health and wellbeing factors in teachers.

**Methods:** Two e-Delphi rounds with multidisciplinary experts were implemented using QuestionPro software to evaluate face validity of the questionnaire. Experts were recruited internationally from the disciplines of FN research (n=7), education (n=6), psychology (n=5), and dietetics (n=5), and were blinded to other participant responses. In round one, experts reviewed the proposed eight sub-scales and 19 question-groups across the domains of wellbeing, teaching characteristics, and FN. They were asked to provide qualitative feedback, indicate agreement regarding inclusion, and rank the top three question-groups and/or sub-scales to both include and exclude. In round two, qualitative feedback was collected regarding improvements to phrasing, appropriateness of question scales used and questionnaire order. A 75% consensus vote across experts was the threshold for inclusion with final revisions considering expert feedback.

**Results:** Twenty-three experts participated in round one from Australia (n=15), Switzerland (n=3), the UK (n=2), Canada (n=1), the US (n=1) and New Zealand (n=1) with 78% having previous experience with questionnaire development. Round two included 19 (83%) experts from round one. After round one, five question groups and four sub-scales were removed with four being revised into new groups. In round two, 79% of experts (n=15) agreed with the order, and feedback indicated only minor adjustments were necessary.

**Conclusion:** This e-Delphi study established face validity of a questionnaire to measure the complexity of FN-related health and wellbeing in teachers. Future testing will evaluate construct validity and test-re-test reliability ahead of developing future FN education and support interventions for teachers.

# Bridging the gap - combine implementation and policy research for implementation evaluation of governmental actions in the field of physical activity and nutrition

**Dr. Sarah Forberger**<sup>1</sup>, Prof. Lucia Reisch<sup>2</sup>, Dr. Biljana Meshkovska<sup>3</sup>, Ms. Karolina Lobczowska<sup>4</sup>, Dr. Anna Banik<sup>4</sup>, Ms. Janine Wendt<sup>5</sup>, Dr. Annabel S. Mueller-Stierlin<sup>5</sup>, Prof. Jürgen Michael Steinacker<sup>5</sup>, Prof. Aleksandra Luszczynska<sup>4,6</sup>, Prof. Hajo Zeeb<sup>1,7</sup>

<sup>1</sup>Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, <sup>2</sup>El-Erian Professor of Behavioural Economics and Policy, University of Cambridge, Cambridge, United Kingdom, <sup>3</sup>Institute of Basic Medical Sciences, University of Oslo, Oslo, Norway, <sup>4</sup>Department of Psychology in Wroclaw, SWPS University of Social Sciences and Humanities, Wroclaw, Poland, <sup>5</sup>Department of Internal Medicine, Division of Sports and Rehabilitation Medicine, Ulm University Medical Center, Ulm, Germany, <sup>6</sup>Melbourne Centre for Behavior Change, Melbourne School of Psychological Sciences, University of Melbourne, Melbourne, Australia, <sup>7</sup>Health Sciences Bremen, University of Bremen, Bremen, Germany

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Tackling obesity or increasing physical activity are complex challenges that require a multi-faceted approach, considering different levels and actors where governmental actions can have a considerable influence in triggering a change in how we live. Furthermore, considering individual and structural determinates, the requirements for evaluating implementation (processes, outcomes, impact) become more challenging. Therefore, the present study aims to uncover how implementation research and public policy can complement each other in evaluating governmental actions for physical activity promotion and nutrition and what this means in detail.

**Methods:** We combined insights from eight systematic reviews and two scoping reviews on physical activity promotion and healthy eating. We analysed frameworks, their use, and the concepts covered for policy implementation evaluation. Further, implementation context, actors involved, strategies used, legal quality, and jurisdiction were synthesised. Finally, we conducted impact evaluations of governmental actions in the policy fields of schools, mass media, sports participation, transport, and sustainable urban mobility plans to underpin the results. All reviews are pre-registered and published.

**Results:** The reviews identified the “Context and Implementation of Complex Interventions” (CICI) framework as the most comprehensive framework for evaluating nutrition and physical activity policies. Using the CICI framework for implementation evaluation, we propose specifications that should be considered when using the framework for governmental action implementation evaluation because the legal, political, and implementation domain is not yet specified at the level of detail required. We suggest adding details in the domain legal: level of jurisdiction, legal quality, and instruments; domain political: actor definition, power, and competencies; and domain implementation: horizontal and vertical integration to fill this gap.

**Conclusions:** Significant differences in the underlying theoretical concepts affect the understanding of outcomes and their consequences. Combining insights from both approaches is a promising and viable approach to guide the evaluation of public policies, improve the reporting and increase the understanding of results as a basis for conclusions. However, we repeat a mantra that can be found similarly in many studies analysing public policy implementation. We need more studies that fully exploit the potential of both approaches combined.

# Evaluation of a randomised trial of three weight loss intervention(s) for night shift-workers: A mixed-methods protocol

**Ms. Corinne Davis<sup>1</sup>**, Dr. Sue Kleve<sup>1</sup>, Prof. Maxine P. Bonham<sup>1</sup>, Dr. Catherine E. Huggins<sup>1,2</sup>

<sup>1</sup>Department of Nutrition, Dietetics & Food, Monash University, Notting Hill, Australia, <sup>2</sup>Institute for Health Transformation, Global Centre for Preventive Health and Nutrition, Deakin University, Burwood, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Shift workers are essential to the current 24-hour society worldwide, but are at greater risk for obesity, type 2 diabetes, and cardiovascular disease. The Shifting Weight using Intermittent Fasting in night shift workers (SWIFt) study is a randomised parallel trial (RCT) that compares three, 24-week weight-loss strategies. While the trial will evaluate weight-loss outcomes, further investigation is needed to explore mechanisms of action, or contextual factors (including individual, social, organisational, and environmental) that influence outcomes. An understanding of underlying intervention effectiveness assists in improving or developing similar interventions in different contexts. The overall aim of this mixed-methods study was to explore how the SWIFt weight-loss strategies work (or not work) for night shift workers.

**Methods:** This mixed-methods evaluation of the SWIFt study is underpinned by pragmatism as a theoretical perspective guiding research design. A convergent, mixed-methods experimental (or intervention) design was chosen where quantitative and qualitative data collection occurs concurrently, analysed separately, and converged in a final synthesis. Quantitative measures include participant engagement assessed via: dietary adherence (7-day food diaries, dietetic assessment), dietary consult attendance, self-monitoring adherence (provided food checklists), and rates for participant withdrawal/drop-out; analysed for frequency and proportions. Multivariate regression models will be built to determine associations between engagement measures, participant characteristics (gender, age, ethnicity, profession, shift type, night-shift intensity), intervention type, and weight change. Qualitative measures include semi-structured interviews at baseline and 24-weeks, and fortnightly audio diaries. Interviews/diaries will be transcribed verbatim and analysed using a five-step thematic framework analysis approach in NVivo. Results from the quantitative and qualitative data will be integrated via table and narrative form to improve validity of conclusions.

**Results:** A total of 250 participants have been recruited for the SWIFt study, with 170 having completed quantitative measures at 24-weeks, and 47 interviews and 6 hours of audio diaries complete. Data analysis is currently in progress.

**Conclusions:** This mixed-methods evaluation of the SWIFt study will provide an insight as to the mechanisms and contextual features that influence weight-loss outcomes of night shift workers and will provide essential information for the future implementation and scale-up of the SWIFt intervention(s).

# Using virtual reality to identify which street characteristics are important for promoting cycling: a qualitative think-aloud study.

**Mr. Benjamin Beirens**<sup>1</sup>, Prof. Delfien Van Dyck<sup>1</sup>, Dr. Lieze Mertens<sup>1,2</sup>

<sup>1</sup>Department of Movement and Sports Sciences, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>2</sup>Department of Public Health and Primary Care, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Despite several health benefits related to cycling for transport, the amount of people cycling for transport remains low. Studies have shown that the physical environment influences people's preferred mode of transport. Therefore it is important to create a stimulating physical environment for active transport. This study aims to use virtual reality as it is a safe and controlled way to identify which street characteristics are important for cycling for transport in three vulnerable groups who are less likely to eliminate risk factors (e.g. due to physical inability, lack of traffic education or lack of risk perception) i.e., adolescents, people with low SES and (older) adults.

**Methods:** For this qualitative study, data are gathered in adolescents aged 12-17 years, people with a low SES, and (older) adults aged 55+ years. The experimental set-up consists of a bike on rollers and a VIVE virtual reality system. By means of the think-aloud method, participants describe which street characteristics encourage / discourage cycling while cycling through a virtual street in Ghent. A qualitative content analysis (NVivo) is performed on the transcribed data.

**Results:** For this abstract, we will focus on the data collected for older adults since data collection for the other target groups is still ongoing. Complete results will be presented at the conference. In general, older adults like a calm street with green aspects, and prefer a cycling path separated from other road users, so they cannot be surprised by sudden actions such as opening car doors or crossing pedestrians. Furthermore, It is important that the road is wide, in a good condition, and that there are clear markings and traffic signs. If cars are present they should drive slowly, which could be regulated by traffic calming elements. However, this should not diminish space for cyclists.

**Conclusion:** Using virtual reality offers a safe and controlled opportunity to identify which street characteristics are important to stimulate active transport. The results can support governing bodies when improving physical environments for cycling. Furthermore, it demonstrates an efficient way of involving citizens in the decision-making process.

# Using agent-based modelling to explore commuter behaviour in the context of car and public transportation-centred policy scenarios

**Dr. Ivana Stankov**<sup>1,2</sup>, Associate Professor Jose David Meisel<sup>3</sup>, Prof. Olga Lucia Sarmiento<sup>4</sup>, Dr. Xavier Delclòs-Alió<sup>5</sup>, Prof. Ross A. Hammond<sup>6,7</sup>, Prof. Ana V. Diez Roux<sup>1</sup>

<sup>1</sup>Drexel University, Philadelphia, USA, <sup>2</sup>University of South Australia, Adelaide, Australia, <sup>3</sup>Universidad de Ibagué, Ibagué, Colombia, <sup>4</sup>Universidad de Los Andes, Bogotá, Colombia, <sup>5</sup>University of Rovira i Virgili, Tarragona, Spain, <sup>6</sup>The Brookings Institution, Washington DC, USA, <sup>7</sup>Washington University in St. Louis, St. Louis, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To: 1) model the interrelated and multi-level factors impacting commuter decision-making involving six modes of travel, including car, bus, bus rapid transit (BRT), motorbike, bicycle, and walking, and 2) simulate varying levels of fare subsidies, parking fee increases and congestion taxes and explore their separate and interacting impact on mode share, walking and total travel time, overall and by socioeconomic strata (SES).

**Methods:** We developed an agent-based model to dynamically represent the individual, social and environmental factors that influence commuting behaviour in Bogota, Colombia. The spatial characteristics, demographic and behavioural patterns observed in the in-silico city and its resident population (comprised of six SES groups) were informed by local travel surveys and empirical studies. We used data from the 2019 Bogota Household Travel Survey to calibrate and validate the model. This model was then used to simulate counterfactual policy scenarios to estimate their relative effectiveness in promoting active transportation and reductions in car use.

**Results:** Our model reproduced city-level commuting patterns observed in Bogota. The simulated fare subsidies did not impact private vehicle use. Low SES group commuters experienced the largest shifts in mode share, with substitutions from walking trips to BRT and bus use, which increased by 10% and 20%, respectively under the free fare scenario. Importantly, the median walking time decreased by 81 minutes, from 92 to 11 minutes among those in the lowest SES group, while the average total bus and BRT travel times remained unchanged (0.31min  $\pm$  1.33min). Both car parking fee increases, and congestion taxes resulted in modest shifts from car to bus and BRT use, particularly among those in the mid to high SES groups.

**Conclusions:** Car-centred policies are effective in driving shifts from car to public transportation use, and thereby increasing walking at the population level. On the other hand, fare subsidies could play an important role in promoting equitable access to transportation, particularly among low SES commuters who tend to walk long distances out of necessity rather than choice.

# Lifestyle factors and dysmenorrhea in female adolescents aged 15-16 years in Amsterdam

Dr. Tanja Vrijkotte<sup>1</sup>, Dr. Ehsan Motazed<sup>1</sup>, Dr. Emmy van den Boogaard<sup>1</sup>, Dr. Anne Timmermans<sup>1</sup>, **Prof. Mai Chin A Paw<sup>1</sup>**

<sup>1</sup>Amsterdam UMC, Amsterdam, Netherlands

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Dysmenorrhea is a prevalent menstrual disorder in adolescents, and characterized by cramping and lower abdominal pain and/or back pain. Nevertheless, research on possible related lifestyle factors is limited. This study aims to examine associations between lifestyle factors and dysmenorrhea in adolescents aged 15-16 years.

**Methods:** A cross-sectional study was conducted including 1038 females (age 15-16 years) of the Amsterdam Born Children and their Development (ABCD)-study. Lifestyle factors included were: dietary quality (based on nutritional intake), moderate-to-vigorous physical activity, screentime, sleep duration, sleep quality and perceived stress during last month, determined by self-report. Dysmenorrhea was defined as having abdominal pain and/or back pain and taking medication –pain killers and/or oral contraceptives- for menstruation-related symptoms. We used logistic regression analysis, adjusted for age, age of menarche, ethnicity and school level, to estimate adjusted odds ratios (AOR) associations between single lifestyle factors and dysmenorrhea. Additionally, we fitted a multiple lifestyle model where all lifestyle factor were included in one model.

**Results:** The prevalence of dysmenorrhea was 49.5%. In single lifestyle models, poor dietary quality (AOR:0.95;95%CI:0.90-1.00), poor sleep quality (AOR:1.07;95%CI:1.02-1.12) and perceived stress (AOR:1.05;95%CI:1.02-1.07) were significantly associated with increased odds of dysmenorrhea. The multiple lifestyle model showed perceived stress to be the only significant predictor (AOR:1.04;95CI:1.01-1.07).

**Conclusion:** Dysmenorrhea is highly prevalent among female adolescents and therefore more awareness of this public health problem is needed. Poor dietary quality, poor sleep quality and perceived stress were associated with increased odds of dysmenorrhea. These lifestyle factors could provide input for the development of effective intervention strategies to prevent dysmenorrhea.

# Peer interactions moderate the negative effect of screen time on adolescents' mental health

**Prof. Louise C. Mâsse<sup>1,2</sup>**, Dr. Olivia De-Jongh González<sup>1,2</sup>, Miss Iyoma Edache<sup>1,2</sup>

<sup>1</sup>University of British Columbia, Vancouver, Canada, <sup>2</sup>BC Children's Hospital Research Institute, Vancouver, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** The literature shows that screen time is negatively associated with adolescents' mental health. The extent to which positive peer relationships can counteract the negative effects of screen time on mental health remains unknown. Understanding the moderating role of peer relationships is particularly relevant in the pandemic context when in-person peer interactions were limited and adolescents relied more heavily on screens to connect with their peers. This study examined the association between screen time and adolescents' mental health and whether peer relationships moderate this association in the context of the COVID-19 pandemic.

**Methods:** In 2020, 402 13-year-olds (54% girls; 31% white; 27% had income less than \$70,000 CAD) in British Columbia, Canada, completed an online questionnaire which utilized validated scales/questions to assess mental health (anxiety, optimism/self-esteem, boredom), screen-time (use of screens outside of school work on weekdays, weekend days, and week), and peer relationships which included assessment of peer connectedness, belongingness and intimacy. Linear regressions, stratified by child sex, were used to examine associations between screen time and mental health. The moderating role of peer relationships was examined by introducing interaction terms with screen time.

**Results:** Compared to boys, girls reported greater levels of anxiety, lower level of optimism/self-esteem, and lower levels of peer belongingness. Screen-time (on week days, weekend days, and week) was associated with higher levels of boredom and lower levels of optimism/self-esteem among adolescents, and with greater levels of anxiety among girls. Peer connectedness and belongingness moderated the effect of screen-time on boys' levels of boredom and optimism/self-esteem, and on females' level of anxiety. Specifically, better mental health indicators were found among adolescents with higher (versus lower) levels of peer connectedness and belongingness despite their high amount of screen time.

**Conclusions:** Reducing screen time appears important to improve the mental health of adolescents. In addition, interventions that support healthy peer relationships are needed given that peer relationships seem to alleviate the detrimental effect of screen time on mental health. Developing interventions that curtail the impact of screen time on the mental health of adolescents is particularly important as screen time levels have increased with the pandemic.

# Pilot Testing of the Nourishing the Community Through Culinary Medicine program for Patients with Uncontrolled Diabetes

**Dr. Natalia Heredia<sup>1</sup>**, Ms. Lorena Macias-Navarro<sup>1</sup>, Mrs. Sarah Bentley<sup>1</sup>, Ms. Jennifer Torres<sup>1</sup>, Ms. Diana Guevara<sup>1</sup>, Mr. David Ai<sup>2</sup>, Dr. John Wesley McWhorter<sup>3</sup>

<sup>1</sup>The University of Texas Health Science Center at Houston School of Public Health, Houston, USA, <sup>2</sup>Rice University, Houston, USA, <sup>3</sup>Suvida Healthcare, Houston, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** The purpose of this study was to implement and pilot test a Virtual Culinary Medicine (VCM) program, *Nourishing the Community Through Culinary Medicine*, to promote cooking and healthy eating among U.S. adults with uncontrolled T2D.

**Methods:** Patients with uncontrolled T2D were recruited from a local primary care practice. The VCM program was delivered by a dietitian and included five 90-minute weekly bilingual (English and Spanish) sessions focused on teaching useful cooking skills and techniques, making a healthy meal following a recipe, and providing basic nutrition-related education. We conducted an explanatory sequential mixed-methods pilot study to assess improvements in nutrition knowledge, cooking attitudes, skills, and behaviors, and diet. A pre-post survey design, electronic medical record data (HbA1c, Body Mass Index, Blood Pressure, HDL, LDL and Triglycerides), and post-program interviews were used to evaluate and understand patient outcomes.

**Results:** Of the 76 patients that attended at least one session (82% completed 34 sessions) and 65 had complete pre- and post-test surveys. Preliminary findings indicate that the program reduced the perception that cooking healthy food is difficult (28% pre-test to 9% post-test) and that healthy food tastes bad or bland (33% pre-test to 19% post-test). There was an increase at post-test in the number of participants indicating they adjusted their meals to be healthier (38% pre-test to 59% post-test) and consumed at least 1 serving of vegetables per day (41% pre-test to 66% post-test). Preliminary analyses of the qualitative post-test interviews indicate that the VCM program had a positive impact on patients' dietary habits, with reports of lowered HbA1c values and weight loss. Participants expressed high satisfaction with the curriculum and reported using the associated toolkit to sustain new cooking and eating habits.

**Conclusion:** This VCM program leveraged technology to promote cooking and healthy eating among patients with uncontrolled diabetes in the U.S. Preliminary analyses indicate that the program was well-liked by participants and was successful in improving diet- and cooking-related attitudes and behaviors; finalized qualitative and quantitative analyses will be presented.

# The Association Between Food Choices, as Recommended in Canada's Food Guide 2019, and Blood Pressure Status in Canadians, Using the National Canadian Health Measures Survey

**Mr. Samer Hamamji<sup>1</sup>**, Dr. Mavra Ahmed<sup>1,2</sup>, Prof. Mary L'Abbé<sup>1</sup>

<sup>1</sup>Department of Nutritional Sciences, Temerty Faculty of Medicine, University of Toronto, Toronto, Canada,

<sup>2</sup>Joannah & Brian Lawson Centre for Child Nutrition, Temerty Faculty of Medicine, University of Toronto, Toronto, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Health Canada released the updated Canada's Food Guide (CFG) 2019 and its supportive guidelines - Canada's Dietary Guidelines (CDG) which emphasize the regular consumption of healthy food choices to improve overall health and prevent diet-related chronic disease. It is therefore crucial to investigate the quality of dietary choices of Canadians, relative to the new CFG/CDG and their link to cardiometabolic risks, such as blood pressure (BP). This study aims to: (i) develop a Food Choices Assessment Score (FCAS) according to 2019 CFG/CDG; (ii) validate the FCAS against the Dietary Approaches to Stop Hypertension (DASH) diet; and (iii) examine the association between FCAS and BP in Canadian adults.

**Methods:** A FCAS was developed relative to 2019 CFG/CDG using a semi-quantitative food frequency questionnaire from the national Canadian Health Measures Survey cycles 5 & 6 (2016 to 2019). FCAS ranged from 0 to 80, and consisted of 8 components: protein foods, whole grain, fruits, vegetables; and 4 sub-groups of highly processed foods: red processed meat, processed dairy, sugary drinks, and savory snacks. FCAS was calculated for a sample menu of the DASH diet. The association between elevated systolic ( $\geq 135$  mmHg) and diastolic ( $\geq 85$  mmHg) BP – according to Hypertension Canada - and FCAS quintiles, adjusted for age, sex, smoking, physical activity, education level, household income, self-reported hypertension, and hypertension medication, was analyzed using logistic regression.

**Results:** FCAS (mean  $\pm$  SEM) was estimated at ( $29.4 \pm 0.4$  out of 80) in Canadian adults ( $n \sim 6500$ ). FCAS for DASH menu plan was estimated at 70 out of 80, as the DASH diet menu plan includes 100% fruit juices, which are not recommended in 2019 CFG/CDG. Compared with those in the lowest quintile of the FCAS, Canadian adults in the highest quintile of the FCAS had 23% and 16% lower odds of elevated systolic and diastolic BP (OR = 0.77,  $P = 0.04$ ; OR = 0.84;  $P < 0.0001$ ), respectively.

**Conclusions:** This study indicates that the 2019 CFG/CDG FCAS is a feasible tool to assess dietary choices and showed a significant association with BP as a cardiometabolic risk factor in the Canadian population.

# The Relationship Between Active Travel and Cognitive Functioning– A Systematic Review.

**Ms. Melinda Herfet**<sup>1</sup>, Prof. Anna Timperio<sup>2</sup>, Dr. Emiliano Mazzoli<sup>2</sup>, Mr. Sebastian Kindig<sup>1</sup>, Prof. Susanne Tittlbach<sup>1</sup>

<sup>1</sup>University of Bayreuth, Bayreuth, Germany, <sup>2</sup>Deakin University, Melbourne, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** It is widely known that physical activity generally improves brain structure and functions in children, adolescents, and older adults. *Active transportation* (AT), one form of physical activity, is not only an important climate measure but is also assumed to improve neuropsychological development, benefit executive and visuospatial cognitive abilities, and prevent cognitive degeneration regardless of age. However, it is known that the cultural context plays a vital role in the relationship between active transportation and cognition. Therefore, cognitive functions related to education and language are not suitable for global comparison, so only *nonverbal intelligence* (NI) is to be considered.

**Methods:** Accordingly, this systematic review aims to summarise existing studies on the relationship between AT and NI, reveal significant research gaps, and provide avenues for further research. Five electronic databases were systematically searched for articles published within the last ten years. Out of 1333 hits, 38 articles were assessed for eligibility, and eight articles were finally included in the review. A total of 9909 healthy participants across eight countries, aged 4 to 77 years and uniformly distributed regarding gender, were analysed.

**Results:** In sum, four studies resulted in significant effects of AT on NI (visuospatial skills, reasoning ability, attention), mostly in favour of girls, whereas four studies concluded no significant associations (information-processing speed, inhibitory control, and general nonverbal intelligence).

**Conclusion:** Results demonstrate the insufficient study situation and, therefore, the need for and huge potential of exploring the relationship between AT and NI.

**Keywords:** active transportation, physical activity, nonverbal intelligence, cognition

# NEFPAT Plus: A valid and reliable tool for assessing the nutrition environment in food pantries

**Dr. Cassandra Nguyen**<sup>1</sup>, Ms. Jiayi Huang<sup>2</sup>, Mrs. Caitlin Kownacki<sup>2</sup>, Mrs. Kaitlyn Streitmatter<sup>2</sup>, Dr. Jennifer McCaffrey<sup>2</sup>

<sup>1</sup>Washington State University, Seattle, USA, <sup>2</sup>University of Illinois Extension, Urbana, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** One in six adults in the U.S. seek food from the charitable food system. Policy, systems, and environmental (PSE) initiatives are being implemented in food pantries and food banks to promote nutrition and health. However, evaluation of these efforts is hampered by the absence of validated tools which incorporate new national nutrition guidance. The objective of the current study was to develop such a tool and evaluate evidence of its validity and reliability.

**Methods:** This study was undertaken in four phases: 1) tool revision, 2) pilot testing, 3) content validity assessment, and 4) inter-rater and test-retest reliability assessment. The original Nutrition Environment Food Pantry Assessment Tool (NEFPAT) was revised to incorporate evidence from the national nutrition guidance, user feedback surveys, implementation experience, and newly published empirical evidence. The drafted NEFPAT+ was pilot tested by 9 professionals at 5 food pantries. After revisions, professionals were surveyed to rate the content validity of the NEFPAT+ on a 4-point scale. Finally, the inter-rater and test-retest reliability of the NEFPAT+ was estimated with Intra-Class Coefficients (ICCs) based on evaluations at 21 food pantries with 2-4 Extension staff and food pantry personnel completing independent ratings at two times, approximately one month apart.

**Results/findings:** The initial phase of revision resulted in a drafted tool of 105 strategies which took approximately 61 minutes to complete. After, the NEFPAT+ was rated content valid by 94% of 18 reviewers (mean=3.6, SD=0.6) and suggestions were used to finalize 86 strategies across 7 objectives of the tool. The ICC for the overall NEFPAT+ scores exceeded the threshold for excellent inter-rater reliability (ICC: 0.96; 99% CI: 0.75, 0.97) and for good test-retest reliability (ICC: 0.80; 99% CI: 0.60, 0.92). These estimates were not appreciably different when data were restricted to ratings completed by Extension staff (versus Extension and food pantry staff ratings).

**Conclusions:** Evidence supports the content validity, inter-rater reliability, and test-retest reliability of the NEFPAT+. The NEFPAT+ can be completed by Extension staff as external reviewers or by food pantry staff as a self-assessment. Future studies should assess how NEFPAT+ scores relate to interventions and client dietary behaviors.

# Deep learning of waking activity behavior profiles and their association with markers of cardiometabolic health

**Dr. Vahid Farrahi<sup>1,2</sup>**, Dr. Mourad Ouassalah<sup>1,2</sup>

<sup>1</sup>Research Unit of Health Sciences and Technology, University of Oulu, Oulu, Finland, <sup>2</sup>Center for Machine Vision and Signal Analysis, University of Oulu, Oulu, Finland

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** This study used a novel clustering technique for deep learning of device-measured sedentary and activity behavior profiles, and examined how these profiles are associated with markers of cardiometabolic health after accounting for the time composition of sedentary behaviors, light-intensity (LPA) and moderate-to-vigorous physical activity (MVPA).

**Methods:** The participants were 5,059 adults (aged 18-65) from the NHANES cycles 2003-4 and 2005-6, wearing a hip-worn accelerometer during waking hours with at least 4 days of valid data. Minute-by-minute accelerometer outputs (activity counts) over the course of valid measurement days for each participant were presented as an image, visualizing the duration, timing, intensity, and patterns of accumulated sedentary and activity behaviors. These images were then used for deep learning of sedentary and activity behavior profiles using convolutional autoencoders, a type of deep artificial neural network capable of learning image representation. The associations of these profiles with markers of cardiometabolic health were determined with compositional regression analyses simultaneously accommodating the time composition (isometric log-ratio transformation of sedentary time, LPA, and MVPA) and the identified profiles as a categorical variable.

**Results:** Five profiles with distinct patterns and varying average time in sedentary and activity behaviors were identified: “Consistently Idles”, “Somewhat Idles”, “Fragmentation of Sedentary Time”, “High Activity/High Sedentary”, and “High Activity/Low Sedentary”. “Consistently Idles”, characterized by the lowest time in MVPA and relatively more unfragmented sedentary time, was considered as the unhealthiest profile. Compared to the “Consistently Idles” profile, “Fragmentation of Sedentary Time” and “High Activity/High Sedentary” profiles were found to have fragmented patterns of accumulation of sedentary time and favorable differences in their cardiometabolic health markers (1.4-25.3% favorable percent changes in BMI, waist circumference, triglycerides, C-reactive protein, and markers of insulin sensitivity), after accounting for the time composition. Both “Somewhat Idles” and “High Activity/Low Sedentary” profiles exhibiting less fragmentation in the patterns of accumulation of their sedentary time had no apparent differences in most markers of cardiometabolic health, when compared to “Consistently Idles”.

**Conclusions:** Fragmentation of sedentary time may be more important than performing more MVPA and less sedentary time for better cardiometabolic health in adults.

# Accuracy of Parent-Measured Weight and Height in Preschool Children with Different Levels of Support

**Ms. Divya Patel**<sup>1</sup>, Dr. Susan B. Sisson<sup>1</sup>, Dr. Sara Vesely<sup>1</sup>, Dr. Dipti Dev<sup>2</sup>, Dr. Emily Guseman<sup>3</sup>, Dr. Norman Hord<sup>1</sup>, Dr. Kathrin Eliot<sup>1</sup>

<sup>1</sup>University of Oklahoma Health Sciences Center, Oklahoma City, USA, <sup>2</sup>University of Nebraska- Lincoln, Lincoln, USA, <sup>3</sup>Ohio University, Athens, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Weight and height measurements are commonly used to monitor growth in young children. Studies use parental estimates or remote measurements taken at home of their children's weight and height. The accuracy of these measurements is unknown. Examining the accuracy of parental measurements is critical for appropriate health risk classification for children. For behavioral and intervention research, it is necessary to develop remote protocols increasing access and reach to populations that are hard to recruit or those with transportation barriers. Developing innovative virtual methods of collecting weight and height is equally important as it will increase participant enrollment and reach, reduce costs, and participant and researcher burden. The purpose of this pilot study was to determine the accuracy of parental weight and height of their preschool children with varying levels of support.

**Methods:** 30 parents of preschool children participated in this study. One home visit was conducted per participant. Parents measured their child's weight and height using (i) instructional guide, (ii) guide and demonstration video, (iii) guide, video, and virtual monitoring. Paired t-tests were conducted to determine accuracy of parental measurements as compared to researcher.

**Results/findings:** Mean (SD) parental weights (kg) differed from the research weight ( $18.03 \pm 4.3$ ) by 0.82 (0.76) (using guide), 0.93 (0.73) (guide and video), and 0.75 (0.73) (guide, video, and virtual monitoring). Mean parental heights (cm) differed from researcher height ( $103.98 \pm 5.92$ ) by 0.92 (1.66) (guide), 0.41 (1.12) (guide and video), and 0.32 (1.12) (guide, video, and virtual monitoring). Using absolute differences, parental weights were the most accurate with all three levels of support, however, no significant differences found. Parental heights were significantly more accurate when using guide and video as compared to guide only ( $p=0.02$ ).

**Conclusion:** Parental weight and height was not different from researcher when they were provided with instructional guide and video. Virtual monitoring did not increase accuracy and is not needed in virtual protocols. Such remote measurement protocols could be easily replicated allowing for increased parental self-efficacy, accurate health risk classification in children, increased reach and reduced costs into behavioral nutrition and physical activity interventions, especially those with limited resources.

# Systematic literature review of instruments that measure the healthfulness of food and beverages sold in informal food outlets

**Dr. Catalina Medina<sup>1</sup>**, Dr. Maricela Piña<sup>1</sup>, Dr. Tania Aburto<sup>1</sup>, Ms. Julissa Chavira<sup>1</sup>, Ms. Uzzi López<sup>1</sup>, Dr. Mildred Moreno<sup>1</sup>, Ms. Armando G.- Olvera<sup>1</sup>, Dr. Citlali González<sup>1</sup>, Dr. Terry T-K Huang<sup>2</sup>, Dr. Simon Barquera<sup>1</sup>  
<sup>1</sup>National Institute of Public Health, Mexico, Mexico, <sup>2</sup>Center for Systems and Community Design, New York, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose.** The purpose of this study was to review available instruments that measure the quality and particularly the healthfulness of food and beverages sold within informal food outlets.

**Methods.** PubMed, LILACS, Web of Science, and Scopus databases were used. Articles were included if they reported instruments that measured the availability or type of healthy and unhealthy foods and beverages by informal food outlets, were written in English or Spanish, and published between January 1, 2010, and July 31, 2020. Two trained researchers reviewed the title, abstract and full text of selected articles; discrepancies were solved by two independent researchers. In addition, the list of references for selected articles was reviewed for any additional articles of relevance. The quality of published articles and documents was evaluated using JBI Critical appraisal checklist for analytical cross-sectional studies.

**Results.** We identified 1,078 articles of which 14 were included after applying the selection criteria. Three additional articles were considered after reviewing the references from the selected articles. From the final 17 articles, 13 measurement tools were identified. Most of the instruments were used in low- and middle-income countries (LMIC). Products were classified as healthy/unhealthy or produce/non-produce or processed/unprocessed based on availability and type. Six studies reported psychometric tests, whereas one was tested within the informal food sector.

**Conclusions.** Few instruments can measure the healthfulness of food and beverages sold in informal food outlets, of which the most valid and reliable have been used to measure formal food outlets as well. Therefore, it is necessary to develop an instrument that manages to measure, specifically, the elements available within an informal one. These actions are extremely important to better understand the food environment that is a central contributor to poor diets that are increasingly associated with the obesity and NCD pandemic.

# Switching the global salt supply: Reducing global sodium intake using potassium-enriched salt

**Dr. Katrina Kisson**<sup>1,2</sup>, Mr. James Bullen<sup>1</sup>, Prof. Bruce Neal<sup>1,2</sup>, Dr. Ellie Paige<sup>1,2,3</sup>

<sup>1</sup>The George Institute for Global Health, Newtown, Australia, <sup>2</sup>The University of New South Wales, Sydney, Australia, <sup>3</sup>The Australian National University, Canberra, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Excess sodium consumption is associated with increased blood pressure, a key risk factor for cardiovascular disease. Efforts to reduce global sodium intake through decreased salt consumption have been mostly unsuccessful as it is difficult to change dietary behaviour. Potassium-enriched salt, in which a proportion of sodium chloride is replaced with potassium chloride, has been shown to decrease blood pressure and the risk of cardiovascular disease. This research aims to examine mechanisms for switching the global salt supply to a potassium-enriched salt as a sodium-reduction strategy requiring little behaviour change.

**Methods:** We developed a comprehensive program of work, involving: (1) literature review to identify key enablers and challenges to changing the global salt supply; (2) quantitative analysis of global sodium and potassium intake from 1990 to 2018, using the Global Dietary Database, to identify countries with a high sodium to potassium ratio; (3) understanding the global salt and potassium supply chains; (4) reviewing salt reduction policies of countries around the world; and (5) bringing these data together to identify the best places to intervene and implement potassium-enriched salt.

**Results/findings:** This presentation will outline the broad program of work including data on the effectiveness of potassium-enriched salts within the context of behavioural interventions. The global salt supply has been changed before with universal salt iodisation. Findings from the literature review identified five key enablers to changing the salt supply including: (1) strong evidence of a population health problem; (2) establishment of global networks, recommendations and agreements; (3) government support through national programs, legislation, regulation, monitoring, and subsidies; (4) strong advocacy and communication; and (5) multi-sectoral efforts. Key challenges were related to small-scale salt producers; costs; trade concerns; and variation in salt consumption patterns. Findings for other areas within the program of work are not yet available.

**Conclusions:** A switch to potassium-enriched salt is likely to result in substantial improvements to population health through a reduction in cardiovascular disease burden and requires little behaviour change. Global implementation of public health measures is a challenge, but past initiatives such as salt iodisation show a pathway for how this can be achieved.

# Acute mood benefits of yoga: what role does exercise play?

**Dr. Jacinta Brinsley<sup>1</sup>**, Dr. Matthew Smout<sup>1</sup>, Dr. Danielle Girard<sup>1</sup>, Assistant Professor Kade Davison<sup>1</sup>

<sup>1</sup>University of South Australia, Adelaide, Australia

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** due to the multi-composite, mind-body features of yoga, it is of interest to determine what effect exercise plays as a component of modern yoga in providing psychological and physiological health benefits, and whether benefits are enhanced with a combination of components. While the effects of regular, long-term practice are well documented, the acute effects have received less empirical investigation. Therefore, this study aimed to identify what effect moderate-intensity exercise within yoga has on mood state and cardiovascular tone in people with depression/anxiety.

**Methods:** a within-subjects, repeated measures randomized controlled crossover trial with five conditions was conducted. Participants ( $N=41$ ) with depressive or anxiety disorders and no yoga experience completed (1) yin yoga, (2) vinyasa yoga, (3) aerobic exercise, (4) stretching control, and (5) no-intervention control. Acute changes in mood and cardiovascular tone were assessed. Linear mixed models were constructed for each outcome variable with experimental condition as a fixed effect, a random intercept and an identity covariance structure. Change within conditions were analyzed using paired sample  $t$ -tests.

**Results/findings:** A significant main effect of condition on mood was observed ( $N=38$ ;  $F_{4,127.193} = 7.507$ ,  $p = <.001$ ). Participants receiving yin, vinyasa, aerobic exercise and stretching achieved comparable improvements in mood symptoms compared to no-intervention control. Cardiovascular changes were observed for aerobic exercise and vinyasa yoga. No adverse events were reported.

**Conclusions:** The acute mood benefits of a single initial session of yoga are not significantly greater than those derived from other forms of movement. Moderate-intensity styles of yoga can provide a sufficient and equivalent acute cardiovascular exercise effect to that of traditional exercise options (i.e., cycling). This is the first study to measure the acute psycho-physiological effects of different forms of yoga and the role of exercise as a component of yoga on mood. These results progress our understanding of the mechanism and implementation of yoga as a form of exercise in the context of mood and anxiety disorders.

# Adolescents' School Travel: How Far is Too Far, How Long is Too Long, and Who Thinks What?

**Prof. Sandra Mandic**<sup>1,2</sup>, Dr. Enrique García Bengoechea<sup>3,4</sup>, Associate Professor Asaduzzaman Khan<sup>5</sup>, Prof. John Spence<sup>6</sup>

<sup>1</sup>Auckland University of Technology, Wellington, New Zealand, <sup>2</sup>AGILE Research Ltd., Wellington, New Zealand, <sup>3</sup>University of Limerick, Limerick, Ireland, <sup>4</sup>Sport Ireland, Dublin, Ireland, <sup>5</sup>University of Queensland, Brisbane, Australia, <sup>6</sup>University of Alberta, Edmonton, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Home-to-school distance is the strongest correlate of active transport to school. Threshold distances for adolescents range 1.4-3.0 km for walking and 3.0-8.0 km for cycling to school, with large variability between countries. However, perceptions of reasonable distance and duration for school travel remain largely unknown. This study examined perceptions of reasonable school travel distance and duration for different transport modes among New Zealand urban adolescents.

**Methods:** Adolescents (n=1,517; 48.3% female; 12 schools) from Dunedin, New Zealand completed an online questionnaire under supervision in 2020-2022. Participants self-reported their school travel modes and perceived reasonable time and distance for school travel using different modes. The home-to-school distance was calculated using Google Maps. Data were analysed using ANOVA and Chi-square tests.

**Results:** Overall, half of adolescents perceived reasonable distances to school to be  $\leq 2.0$  km for walking and  $\leq 3.0$  km for cycling. On average, shorter reasonable walking distances were reported by adolescents living  $\leq 2.25$  km from their school ( $2.2 \pm 1.5$  km) and walkers ( $2.3 \pm 1.6$  km; all  $p < 0.05$  compared to their peers). Furthest average reasonable cycling distance was reported by adolescents who cycled ( $5.4 \pm 3.0$  km; n=15 (1% of the total sample)). Perceived reasonable school travel duration varied by mode. Approximately half of adolescents perceived  $\leq 15$  min as reasonable school travel duration for cycling and private vehicle travel and  $\leq 20$  min for walking, busing, and the entire school journey. Average reasonable travel times reported by users of specific modes were  $20.7 \pm 12.7$  min for walking by walkers,  $19.1 \pm 9.3$  min for cycling by those who cycled,  $25.3 \pm 13.2$  min for busing by bus users and  $20.2 \pm 11.9$  min driving/being driven for private vehicle users.

**Conclusions:** Adolescents stated reasonable distances for active travel that are lower than the previously reported threshold distances reported based on rates of walking and cycling to school. Reasonable school travel duration was shorter for cycling than walking. Potential interventions could attempt to reconcile these differences. These findings have implications for urban design (10-, 15- and 20-minute city), school locations, school travel planning, public transport and adolescents' physical activity.

# Evaluating the role of amino acid in type 2 diabetes risk: a Mendelian Randomization Study

**Mr. Man Yuen Jacky Mo<sup>1</sup>**, Assistant Professor Shiu Lun Ryan Au Yeung<sup>1</sup>

<sup>1</sup>The University of Hong Kong, Hong Kong, Hong Kong

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Previous observational studies and Mendelian randomization studies suggested a potential etiologic role of different amino acids in type 2 diabetes. However, these studies may suffer from confounding or the use of potentially pleiotropic instruments respectively.

**Methods:** We extracted strong ( $p < 5 \times 10^{-8}$ ), independent ( $r^2 < 0.001$ ) genetic variants associated with nine amino acids (alanine, glutamine, glycine, histidine, phenylalanine, tyrosine, isoleucine, leucine, and valine) from summary statistics of UK Biobank ( $N \leq 115,075$ ), with exclusion of variants exhibiting pleiotropic effects. We then applied them to summary statistics of T2D from DIAMANTE Consortium ( $N_{\text{cases}} = 80,154$  and  $N_{\text{controls}} = 853,816$ ) and FinnGen study ( $N_{\text{cases}} = 37,002$  and  $N_{\text{controls}} = 215,160$ ), and glycemic traits (MAGIC consortium,  $n \leq 209,605$ ). The main analysis was inverse variance weighed (IVW) method, with sensitivity analyses including weighted median method, MR-Egger, MR-Robust Adjusted Profile Score (RAPS), and MR-Pleiotropy Residual Sum and Outlier (MR-PRESSO).

**Results:** Amongst the nine amino acids included, we found higher alanine (Odds ratio [OR] 1.51 per SD; 95% CI 1.18-1.95), isoleucine (OR 1.18 per SD; 95% CI 1.03-1.35), leucine (OR 1.16 per SD, 95% CI 1.05-1.29) and valine (OR 1.29 per SD; 95% CI 1.05-1.60) were associated with higher T2DM risk. Conversely, higher tyrosine (OR 0.90 per SD; 95% CI 0.82-0.99) was associated with lower T2DM risk. No associations were observed for the other amino acids.

**Conclusion:** This study identified several amino acids which are related to T2D risk, which helps formulation of dietary recommendations for reduction in T2D risk in the general population.

# Bidirectional day-to-day effects of movement behaviours in the population-based Study of Health in Pomerania (SHIP-TREND-1)

**Dr. Antje Ullrich**<sup>1,2</sup>, Dr. Lisa Voigt<sup>2,3</sup>, Mr. Dominic Bläsing<sup>1</sup>, Ms. Juliane Bauer<sup>4</sup>, Dr. Martin Bahls<sup>2,3</sup>, Prof. Marcus Dörr<sup>2,3</sup>, Prof. Stephan B. Felix<sup>2,3</sup>, Prof. Henry Völzke<sup>5</sup>, Prof. Carsten Oliver Schmidt<sup>6</sup>, Prof. Sabina Ulbricht<sup>1,2</sup>

<sup>1</sup>Department of Prevention Research and Social Medicine, Institute for Community Medicine, University Medicine Greifswald, Greifswald, Germany, <sup>2</sup>German Centre for Cardiovascular Research (DZHK), partner site Greifswald, Greifswald, Germany, <sup>3</sup>Department of Internal Medicine B, University Medicine Greifswald, Greifswald, Germany, <sup>4</sup>Division Work and Health, Federal Institute for Occupational Safety and Health (BAuA), Berlin, Germany, <sup>5</sup>Institute for Community Medicine, University Medicine Greifswald, Greifswald, Germany, <sup>6</sup>SHIP/Clinical Epidemiology Research, Institute for Community Medicine, University Medicine Greifswald, Greifswald, Germany

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose.** Research in physical activity (PA) and sedentary behaviour (SB) often neglects the intra-individual variability of these movement behaviours over time. This study examines the bidirectional day-to-day effects of accelerometer-based levels of SB, light physical activity (LPA), and moderate-to-vigorous physical activity (MVPA) among adults in the population-based Study of Health in Pomerania (SHIP-TREND-1).

**Methods.** The study was conducted in northeast Germany between 2016 to 2019. In total, 2177 individuals aged  $\geq 18$  years were instructed to wear an accelerometer for seven days. After application of accelerometer wear-time criteria ( $\geq 10$  h on  $\geq 4$  days, including  $\geq 1$  weekend day), the final sample comprised 1835 individuals (84.3%; 52% female;  $M=57.1$  years;  $SD=13.5$ ). We applied dynamic structural equation modelling using a multilevel bivariate autoregressive cross-lagged model to analyse day-to-day associations of movement behaviours for each individual.

**Results.** On average, individuals wore the accelerometer for 808.9 min per day (95% CI = 806.0; 811.9), among which 473.2 min were spent in SB (95% CI = 468.9; 477.6), 310.0 min were spent in LPA (95% CI = 305.9; 314.0), and 23.0 min were spent in MVPA (95% CI = 22.2; 23.8). The data revealed statistically significant autoregression for all movement behaviours. Bivariate cross-lagged values showed a significant effect of SB on next-day LPA ( $B = -0.06$ ; 95% CI =  $-0.10$ ;  $-0.03$ ) and next-day MVPA ( $B = 0.19$ ; 95% CI =  $0.02$ ;  $0.34$ ). Further, MVPA significantly predicted next-day LPA ( $B = -0.01$ ; 95% CI =  $-0.01$ ;  $-0.00$ ). The within-person variability of SB, LPA, and MVPA explained by the model was 9.6%, 13.9%, and 16.6%, respectively.

**Conclusions.** The amount of time spent in SB has an impact on next-day LPA and MVPA, but not vice versa. Our findings suggest that intra-individual day-to-day effects of SB and PA should be considered when studying movement behaviours.

# Challenges, needs and opportunities for emerging behavioural nutrition and physical activity researchers in (post-)pandemic times

**Dr. Brittany Johnson<sup>1</sup>**, Dr. Stephanie Chappel<sup>2</sup>, Dr. Brianne Bruijns<sup>5</sup>, Dr. Sarah Burkart<sup>3</sup>, Dr. Stephen Barrett<sup>13</sup>, Dr. Hilary Caldwell<sup>4</sup>, Ms. Kelly Cosgrove<sup>8</sup>, Dr. Daehyoung Lee<sup>6</sup>, Dr. Emma Lawlor<sup>14</sup>, Dr. Christine St. Laurent<sup>7</sup>, Ms. Sarah Shaw<sup>11</sup>, Dr. Inês Santos<sup>12</sup>, Dr. Taylor Willmott<sup>9</sup>, Ms. Kylie Wilson<sup>8</sup>, Dr. Simone Verswijveren<sup>10</sup>

<sup>1</sup>Caring Futures Institute, Flinders University, Bedford Park, Australia, <sup>2</sup>Appleton Institute, CQUniversity, Wayville, Australia, <sup>3</sup>University of South Carolina, Columbia, USA, <sup>4</sup>Healthy Populations Institute, Dalhousie University, Halifax, Canada, <sup>5</sup>School of Occupational Therapy, Western University, London, Canada, <sup>6</sup>University of Minnesota Duluth, Duluth, USA, <sup>7</sup>University of Massachusetts Amherst, Amherst, USA, <sup>8</sup>College of Health Solutions, Arizona State University, Phoenix, USA, <sup>9</sup>Adelaide Business School, The University of Adelaide, Adelaide, Australia, <sup>10</sup>Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Sciences, Deakin University, Burwood, Australia, <sup>11</sup>MRC Lifecourse Epidemiology Centre, University of Southampton, Southampton, United Kingdom, <sup>12</sup>Laboratório de Nutrição, Faculdade de Medicina, Universidade de Lisboa, Lisbon, Portugal, <sup>13</sup>Bendigo Health, Australia, Holsworth Research Initiative, La Trobe Bendigo, Bendigo, Australia, <sup>14</sup>School of Cardiovascular and Metabolic Health, University of Glasgow, Glasgow, United Kingdom

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Emerging researchers (i.e. students and early career researchers) constitute a substantial portion of academic institutional members worldwide. Many emerging researchers experience difficult working environments often relying on grant funding, sessional teaching, and short-term contracts. The COVID-19 pandemic may have exacerbated this stress and uncertainty, and impacted the personal and professional development of emerging researchers. We sought to understand the challenges, needs, and opportunities for behavioural nutrition and physical activity emerging researchers in (post-)pandemic times.

**Methods:** Current emerging researchers in behavioural nutrition or physical activity (including sedentary behaviour, sleep) were invited via email and social media to complete an anonymous online cross-sectional questionnaire (via Qualtrics; n=25 items). The questionnaire was developed for this study and pilot tested to refine items. Consenting participants completed socio-demographics, ratings of the impact of personal and professional challenges experienced since the start of the pandemic, and career development needs on a 10-point scale (1=no impact/need, 10=significant impact/need), with descriptive elaborations for those rated  $\geq 7$ ; and desired development opportunities. Quantitative results were analysed descriptively, and qualitative analyses are ongoing.

**Results/findings:** To date, 108 emerging researchers from over 20 countries completed the questionnaire. Preliminary findings revealed the highest-rated professional challenges as travel ( $7.7 \pm 2.7$ ), networking/collaboration ( $6.9 \pm 2.3$ ), and conducting research (e.g. recruitment;  $6.5 \pm 2.7$ ). The highest-rated personal challenges were caregiving ( $4.9 \pm 3.8$ ), mental illness ( $4.6 \pm 2.9$ ) and isolation ( $4.4 \pm 2.9$ ). The highest-rated professional development needs were grant writing ( $7.1 \pm 2.7$ ), networking/collaboration ( $6.3 \pm 2.6$ ) and analysis ( $6.3 \pm 2.5$ ). The highest-rated personal development needs were career planning ( $5.9 \pm 2.3$ ), work-life balance ( $5.7 \pm 2.6$ ) and stress/resilience ( $4.8 \pm 2.8$ ). Desired career development opportunities varied, including writing groups, mentoring, and networking.

**Conclusions:** We found the pandemic has had a broad range of professional and personal impacts on students and ECRs. Yet, career development needs and opportunities appear broadly consistent with those

pre-pandemic. Our findings can inform development and tailoring of ISBNPA initiatives and can be used to encourage other professional organizations to target support to emerging researchers post-pandemic.

# Associations between menu healthiness, proximity, and availability of neighbourhood out-of-home food outlets and eating-out frequency in Great Britain: a multiverse analysis

**Ms. Yuru Huang**<sup>1</sup>, Dr. Thomas Burgoine<sup>1</sup>, Mr. Matthew Keeble<sup>1</sup>, Mr. Thomas Bishop<sup>1</sup>, Prof. David Hammond<sup>2</sup>, Prof. Jean Adams<sup>1</sup>

<sup>1</sup>University of Cambridge, Cambridge, United Kingdom, <sup>2</sup>University of Waterloo, Waterloo, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** Many population health interventions focus on improving the healthiness of out-of-home foods, but little is known about whether healthier offerings will positively influence individual dietary behaviour. In this study, we aimed to investigate if menu healthiness, proximity, and availability of neighbourhood out-of-home food outlets are associated with eating-out frequency.

**Methods** We analysed cross-sectional online survey data in Great Britain (GB) from the International Food Policy Study in 2021 (n=3,523). We linked this with contemporaneous Ordnance Survey Points of Interest data, a comprehensive dataset containing all food outlets in GB, and defined various metrics of participants' out-of-home food outlet exposure. These included availability and proximity measures, different neighbourhood definitions (i.e., 500-1600m buffers), and incorporated healthiness scores (0-12, 0 being the unhealthiest) based on menu attributes. In multiverse analyses, where multiple reasonable analytical choices can be tested, we investigated how different exposure metrics affected the results. We used generalised linear regression models with survey weights, and the primary outcome was the number of meals purchased out-of-home in the past 7 days.

**Results** Adults in GB had access to a median of 44 (IQR 17-106) out-of-home food outlets within 1600m of their home, with a median healthiness of 6.74 (IQR 6.59, 6.91). The number of out-of-home food outlets available, regardless of their healthiness, was positively associated with the number of meals purchased out-of-home across all neighbourhood definitions (p<0.05). For example, when neighbourhoods were defined as 1600m circular buffers, there was an increase of 0.10 (95%CI 0.02, 0.17) eating-out occasions for every 100 additional food outlets in a 1600 buffer. Distance to the closest unhealthy food outlet was inversely associated with eating-out frequency (-0.04/100m, 95%CI -0.07, -0.01) irrespective of healthiness. Metrics incorporating food outlet healthiness, such as the average healthiness and proportion of healthy food outlets, were not associated with eating-out frequency, except for median healthiness of food outlets within 1000m buffers of participants' homes.

**Conclusion** Menu healthiness of out-of-home food outlets was not associated with how often people eat out. The number of food outlets available in a neighbourhood may be a more important determinant of individual eating-out frequency.

# Natural experimental evaluation of changing policies and environments: recent advances and updated guidance

**Prof. David Ogilvie**<sup>1</sup>, Prof. on behalf of the Natural Experiments Guidance Writing Group<sup>1</sup>

<sup>1</sup>University of Cambridge, Cambridge, United Kingdom

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The use of natural experimental evaluations (NEEs) has increased in the last decade, driven by advances in research methods, greater availability of data, and rising demand for evidence to support upstream approaches to improving population health. It is important that researchers, publishers, funders, and users of intervention research are aware of recent developments and of the strengths, limitations and applicability of the range of approaches and methods now available. This presentation will provide an overview of newly updated and extended guidance for using natural experiments to evaluate population health interventions, with a particular emphasis on evaluating strategies to shift population dietary and physical activity patterns by changing policies and environments.

**Methods:** The guidance has been developed by a project team comprising researchers with expertise in NEEs, drawing on four international workshops and an online consultation with researchers, journal editors and end users of NEEs, supported by a funder-assigned oversight group and an advisory group of independent experts including researchers, a journal editor and public health specialists. The project is jointly funded by the Medical Research Council and the National Institute for Health Research.

**Findings:** NEEs can provide useful information to guide decision making about interventions. However, there is a lack of consensus about the circumstances in which they should be used, key definitions and concepts remain somewhat contested, and most extant guidance focuses on the selection and use of quantitative methods for effect size estimation. The new guidance includes consideration of the range of circumstances in which an NEE may be possible, the conditions under which an NEE is most likely to be useful, the conceptualisation and theorisation of an NEE and the choice among a wide range of potential quantitative, qualitative and mixed-method approaches, the registration of study protocols, and help for journal editors, funders, peer-reviewers, and evidence users in identifying the strengths and limitations of NEE research.

**Conclusions:** This updated and extended guidance provides a single, integrated, up-to-date guide to using natural experimental approaches to evaluate population health interventions, which will be of use to researchers, funders, publishers, and users of evidence.

# Two year follow-up study of a natural experiment in an urban park in Belgium on park use and park-based physical activity

**Ms. Amber Van Puyvelde**<sup>1,2</sup>, Prof. Benedicte Deforche<sup>1,3</sup>, Dr. Lieze Mertens<sup>1,2</sup>, Ms. Emma De Keyser<sup>5</sup>, Associate Professor Jenny Veitch<sup>4</sup>, Prof. Delfien Van Dyck<sup>2</sup>, Dr. Louise Poppe<sup>1</sup>

<sup>1</sup>Department of Public Health and Primary Care, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>2</sup>Department of Movement and Sports Sciences, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>3</sup>Department of Movement and Sport Sciences, Vrije Universiteit Brussel, Brussels, Belgium, <sup>4</sup>Deakin University, Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Sciences, Geelong, Australia, <sup>5</sup>Department of Gerontology, Faculty of Medicine and Pharmacy, Vrije Universiteit Brussel, Brussels, Belgium

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Previous natural experiments have not investigated whether positive effects of park renewal on park visitation and park-based PA persist over time. Therefore, this study examined the longer-term impact of park renewal on park use and park-based PA.

**Methods:** In 2020, a public urban park in Belgium was renewed including installation of broad walking and cycling paths, benches, picnic tables, outdoor fitness equipment and playgrounds. Observational data (i.e. age group, sex, activity level) were collected using the SOPARC tool in the intervention park and in a control park with similar features and amenities at four timepoints: before, immediately after, 1 year (follow-up 1) and 2 years after park renewal (follow-up 2). Previous analyses immediately after the renewal showed an increase in the number of (active) park visitors but no change in the mean PA intensity. To examine the effects of the renewal on park use and park-based PA from pretest to each follow-up, generalized linear (mixed) models were fitted.

**Results:** At both follow-ups, the total number of park visitors and the number of visitors from each sex and in each age category (except for children at follow-up 2) was higher in the intervention park compared to the pretest and to the control park. At follow-up 1, more visitors were observed in all activity categories; however, the mean PA intensity level of the visitors decreased due to a decrease in the mean PA intensity level of older adults. At follow-up 2, only an increase in sedentary and vigorously active visitors was observed and no changes occurred in the mean PA intensity.

**Conclusion:** Extensive park renewal including the installation of park features that promote PA as well as relaxation and social interaction has longer-term positive effects on park use among all age groups. The mean PA intensity level of the park visitors (except for older adults at follow-up 1) remained the same over time and more active park visitors were observed at both follow-ups, resulting in more overall PA. Park renewal may therefore be an important way to improve physical activity and physical, mental and social health among all ages.

# Connecting physical education lessons and urban sports facilities in the urban space surrounding schools

Dr. Nicky Nibbeling<sup>1</sup>, Mr. Huib van de Kop<sup>1</sup>, Dr. Mirka Janssen<sup>1</sup>, **Mr. Niek Schaper<sup>1</sup>**

<sup>1</sup>Amsterdam University of Applied Sciences, Amsterdam, Netherlands

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Adolescents are insufficiently physically active and spent too much time sitting, which provides a health risk. In the current study the municipality of Amsterdam, secondary schools, experts in urban sports and researchers work together to stimulate healthy exercise behavior of adolescents. The urban sports facilities in the city of Amsterdam are at the center of this project. A variety of urban sports facilities have been realized over the last years. It remains however unknown which adolescents actually use these facilities. When urban space planning and physical education (PE) lessons at school are aligned and adjusted to the needs and preferences of adolescents, adolescents probably feel more competent to use the urban sport facilities surrounding their schools. The goal of this project is twofold: 1) findings working principles for designing urban sports facilities in the urban space surrounding schools 2) identifying elements in secondary school physical education lessons that motivate adolescents to use the urban sports facilities.

**Methods:** This was investigated by applying design thinking methods and co creation sessions with adolescents, PE teachers, school boards, municipality and experts in urban sports.

**Results:** First results indicate that needs, wishes and barriers of adolescents with regard to the use of urban sports facilities are currently insufficiently documented. Moreover, physical education teachers lack a feeling of competence in providing urban sports classes and there is insufficient coordination between schools, the municipality and providers of urban sports. Next steps in the design thinking cycle will be discussed as well as implications for the municipality with regard to planning of urban sports facilities around school, and how to connect physical education programming inside and outside secondary schools.

# Evaluation of Behaviour Change Support to enhance young adults' adherence to study requirements within a randomised controlled trial

**Miss Anna Worthington<sup>1</sup>**, Dr. Nicola Gillies<sup>1</sup>, Dr. Rajshri Roy<sup>1</sup>, Dr. Rina Hannaford<sup>2</sup>, Dr. Andrea Braakhuis<sup>1</sup>

<sup>1</sup>The University of Auckland, Auckland, New Zealand, <sup>2</sup>Data Science Team, AgResearch Ltd, Palmerston North, New Zealand

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical

**Purpose:** Systematic design of Behaviour Change Support (BCS) within randomised controlled trials is often overlooked when behaviour change is not the primary outcome. In the Protein Diet Satisfaction (PREDITION) trial, BCS was developed using the Nine Principles framework to enhance participant adherence to study requirements of (i) achieving a basal, healthy diet, and (ii) recording dietary intake on a smartphone application.

**Methods:** In the PREDITION trial, 80 young adults were randomised to a flexitarian or vegetarian diet for 10 weeks. All participants received BCS via private Facebook groups to change dietary behaviours, and text messages to establish dietary intake recording behaviour. The outcome measures included the pre-post change in targeted dietary behaviours using a sub score of the Healthy Diet Habits Index, adherence scores, perception of barriers to changing their diet, and an impact evaluation. Descriptive statistics were presented for all outcomes, namely mean and standard deviation. The analysis included linear imputation modelling, t-tests, and chi-square analysis.

**Results:** A total of 78 participants completed the 10-week intervention. There was a significant change in the total Healthy Diet Habits Index sub score between baseline and week 10 ( $p < 0.05$ ), primarily driven by an increase in vegetable consumption by 0.6 serves/day ( $p < 0.001$ ). Participants perceived that knowledge about healthy eating became less of a barrier over time ( $p < 0.025$ ). On average, Facebook posts were seen by 66% of participants, but overall groups had a relatively low active engagement with an average of 10 reactions and 3 comments per group over the 10 weeks. Adherence to reporting dietary intake was high; with adherence scores that could range from 0 – 100, mean reporting score of the total population was  $90.4 \pm 14.6$ . Most participants agreed the text messages and Facebook groups supported them to adhere to recording dietary intake (63%) and eating healthily (60%), respectively.

**Conclusions:** Using a behaviour change framework within the design of nutrition-related trials is a promising way to increase participant adherence to study requirements, including the burdensome behaviour of recording dietary intake. Further research is required to identify the most effective and feasible components of these frameworks for researchers to use.

# The Impact of Krajicek Playgrounds in Deprived Neighborhoods: A mixed-method study

**Ms. Gioia Muru<sup>1</sup>**, Dr. Femke van Nassau<sup>1</sup>, Dr. Joske Nauta<sup>1</sup>, Dr. Dorine Collard<sup>2</sup>, Ms. Tessa Ten Tije<sup>2</sup>

<sup>1</sup>Amsterdam UMC, location VUmc, Amsterdam, Netherlands, <sup>2</sup>Mulier instituut, Utrecht, Netherlands

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** The purpose of this study was to assess the impact of Krajicek Playgrounds (KP). The Richard Krajicek Foundation aims to provide children in deprived neighborhoods with safe public playgrounds that stimulate daily physical activity. They employ young people from the neighborhood, scholarsippers, to organize activities for the children on the KP. The research questions included: "What is the experienced value of Krajicek Playgrounds for different stakeholders compared to another regular playground?" and "What is the added value of being a Krajicek scholarshipper on the individual?"

**Methods** A mixed method design was used to collect the data. Questionnaires were distributed among policy officers, (employers of) community sport coaches and scholarsippers. Semi-structured interviews were conducted among policy offers, community sport coaches and scholarsippers. In addition, structured observations of Krajicek Playgrounds and other play areas were conducted.

**Results** For policy officers the software (i.e. activities and organized events) on the Krajicek Playground was of added value. Community sport coaches endorsed the software value, but elements of the hardware (i.e. the physical condition of the playground) were also important, such as the location of the playground and the possibility to borrow sport materials for different kinds of sports. Relative to regular playgrounds, a Krajicek Playground attracted different target groups and is easily accessible for children. Scholarsippers mentioned learning how to guide and motivate children during activities and being a Scholarshipper helped them in gaining self-confidence.

**Conclusion/disc.** According to multiple stakeholders the fact that children are able to play and exercise in their neighborhood, the activities and events and the use of scholarsippers contribute to the success of Krajicek Playgrounds. Krajicek Playgrounds also score higher on the software as well as the hardware compared to another regular playground. Being a Krajicek scholarshipper gives individuals competencies to guide a group, which leads to more self-confidence.

# A digital citizen science approach to real-time monitoring and management of climate change impacts on food and nutrition security

**Dr. Jasmin Bhawra**<sup>1</sup>, Dr. Kelly Skinner<sup>2</sup>, Mr. Duane Favel<sup>3</sup>, Ms. Brenda Green<sup>4</sup>, Dr. Tarun R Katapally<sup>5</sup>

<sup>1</sup>Toronto Metropolitan University, Toronto, Canada, <sup>2</sup>University of Waterloo, Waterloo, Canada, <sup>3</sup>Northern Village of Île-à-la-Crosse, Île-à-la-Crosse, Canada, <sup>4</sup>Île-à-la-Crosse School Division, Île-à-la-Crosse, Canada,

<sup>5</sup>Western University, London, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** To enable nutrition equity, we urgently require innovative solutions which target the adverse effects of climate change on community food security and sovereignty. Indigenous communities have a wealth of Traditional Knowledge for climate change adaptation and preparedness to strengthen food systems. Traditional Knowledge, combined with Western methods, can revolutionize ethical data collection and knowledge mobilization. This project aims to develop a sustainable digital platform that facilitates real-time decision-making in remote Indigenous jurisdictions to mitigate climate change-related impacts on health.

**Methods:** The Food Equity and Environmental Data Sovereignty (FEEDS) Project takes a participatory action, citizen science approach for early detection and warning of climate change impacts on food systems. Governed by a Citizen Scientist Advisory Council, a qualitative needs assessment was conducted with a subarctic Métis community in Saskatchewan, Canada to inform digital platform development. An environmental scan of relevant programs, key informant interviews (n=3), and two focus groups (n=8) were conducted and thematically analyzed to identify community priorities.

**Results:** Community members identified changes in wildlife patterns, land use, and early winter ice road thaw as areas of concern, particularly due to the impact on traditional food acquisition practices (i.e., hunting). While the community produces its own food through the local fishery and greenhouses, it is still dependent on a food supply from larger urban centres in southern Canada. A smartphone-based digital platform designed to geotag hazardous areas and report food insecurity in real-time, as well as the development of a backend decision-making dashboard, were identified as priorities for monitoring and mitigating negative climate change impacts on local food systems. Community conversations also highlighted the need to strengthen existing digital infrastructure necessary to support uptake and use of the FEEDS digital platform.

**Conclusions:** The FEEDS Project facilitates nutrition equity, self-determination and data sovereignty of communities through citizen-driven big data collection. The digital dashboard system provides decision makers with real-time data, thereby increasing the capacity for rapid response and self-governance. Given the urgency of climate change, digital technology provides communities with both scientific evidence and the tools to respond to emerging health crises in a timely manner.

# The association between the neighbourhood food environment and food and drink purchasing in England during lockdown: a repeated cross-sectional analysis

**Ms. Alexandra Kalbus**<sup>1</sup>, Dr. Laura Cornelsen<sup>1</sup>, Dr. Andrea Ballatore<sup>2</sup>, Prof. Steven Cummins<sup>1</sup>

<sup>1</sup>London School of Hygiene & Tropical Medicine, London, United Kingdom, <sup>2</sup>King's College London, London, United Kingdom

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** This study investigates the association between the neighbourhood food environment and food and drink purchasing during the spring 2020 lockdown in England. Under strict lockdown rules, the local food environment is hypothesised to be more relevant, potentially improving our understanding of the relationship between the food environment and behavioural outcomes.

**Methods:** Transaction-level purchasing data for food and drink items for at-home (1,221 households) and out-of-home (OOH) consumption (171 individuals) were available from the GB Kantar Fast Moving Consumer Panel for London and the North of England. The study period included 23<sup>rd</sup> March to 10<sup>th</sup> May 2020 and the same period in 2019. Outcomes included total energy purchased, energy from specific food and drink types, alcohol volume, and frequency of OOH purchasing. Exposure measures included density and proximity of supermarkets and OOH outlets within a 1 km network buffer around the home, proximity to the nearest food outlet, and composition of the food environment. Models adjusted for individual and household characteristics, population density and area deprivation were used for both years separately. Interaction terms between region and food environment exposures were explored.

**Results:** There were no consistent patterns of association between food environment exposure measures and food and drink purchasing outcomes. However, there was some evidence of associations, including a decrease of 1.4% in energy purchased from ultra-processed foods for each additional 500 m in the distance to the nearest OOH outlet (IR 0.986, 95% CI 0.977 to 0.995,  $p=0.020$ ) in 2019, and a reduction of 1.8% in total take-home energy for each additional chain supermarket per km<sup>2</sup> in the household's neighbourhood (IR 0.982, 95% CI 0.969, 0.995,  $p=0.045$ ) in 2020. Effects were similar in 2019 and 2020. Region-specific effects were observed for 2019 only.

**Conclusions:** The lack of consistent exposure-outcome relationships during lockdown, when most individuals were confined to their local food environment, indicates that the residential food environment may not be relevant for food and drink purchasing and subsequent health outcomes. The lack of region-specific effects in 2020 indicate that the pandemic acted as leveller of the relationship between the food environment and purchasing across space.

# The Evaluation of Social media to Increase Engagement Rate, Reach and health Education: The case for WoW!

**Miss Feroza Lekota**<sup>1</sup>, Prof. Victoria Estelle Lambert<sup>1</sup>, Dr. Sharief Hendricks<sup>1</sup>, Associate Professor Frederick Marais<sup>1</sup>, Mrs. Joanna Pieterse<sup>2</sup>

<sup>1</sup>Health Through Physical Activity Research Centre (HPALS), Division of Physiological Sciences, Faculty of Health Sciences, University of Cape Town, Cape Town, South Africa, <sup>2</sup>Department of Health, Service Priorities Coordination, Cape Town, South Africa

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Introduction:** In 2021, South Africans had a 51.9 percent chance of dying from an NCD. The WesternCape on Wellness program advocates for wellness, through partnership, innovation and policy in South Africa. Increasing knowledge and awareness regarding health behaviours and NCD's is an important pathway in preventing and reducing the problem at hand. Social media provides an unprecedented opportunity and innovative way to provide a solution.

**Aim & Objective:** To use a social media health campaign with expert knowledge to change healthy lifestyle actions and increase health knowledge and engagement in a para-social western cape on wellness social media group.

**Methods:** A mixed methods quantitative and qualitative analysis was undertaken. 60 lifestyle messages were posted on the WoW! Facebook group 5 times a week. Each message was disseminated by a moderator and followed a theme for the day (motivation, nutrition, transformation, fitness). Three icons were used to measure levels of participant engagement likes, shares, comments. Associated comments were extracted and coded using a codebook based on items from the supportive accountability model and peer social support analysis.

**Results:** The most common form of engagement were "likes," and engagement was higher for moderator-initiated rather than participant-initiated posts. Overall traffic to the page increased over the 3 month period from 1083 to 1300 users. Likes were the most common and easiest form of engagement ( $M=7.6$ ,  $SD\ 9.8$ ), with comments being the lowest ( $m=0.81$ ,  $SD\ 2.3$ ). The most engaged with and resonative messages were the #transformationthursday posts. Empirically physical activity behaviour increased and change in eating patterns did improve over time. The 7 main themes that were identified constituted 53.3% (112/210) of all comments in the pre and during campaign analyses. The most prevalent theme was social cohesion and connectedness at 29% (33/112). The least common theme was developing professional communication and organisational support at 4.5% (5/112).

**Conclusion:** The favourable results of the WoW! Facebook campaign shows promise for future social media-driven health campaigns to educate and prevent lifestyle related chronic conditions. Social media content for knowledge sharing should be created through a personal well-intentioned process with the support of moderators to facilitate the conversation and drive engagement.

# Feasability of a Healthy School Meals for All Policy

**Dr. Julie Metos<sup>1</sup>**, Dr. Lori Spruance<sup>2</sup>, Dr. Patricia Guenther<sup>1</sup>

<sup>1</sup>University of Utah, Salt Lake City, USA, <sup>2</sup>Brigham Young University, Provo, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The United States National School Lunch and School Breakfast programs provide an opportunity to reduce food insecurity and improve dietary intake. During the COVID-19 pandemic, school meals were provided to children at no cost regardless of income status by the Federal government, known as Healthy School Meals for All (HSMFA). Starting in school year 2022-2023, no cost meals were no longer provided. Advocates are working with state governments to assume responsibility, yet little is known about elected officials' and other stakeholder's attitudes towards HSMFA or its potential cost. The purpose of the study was to examine the feasibility of a statewide HSMFA policy in one state.

**Methods:** A mixed method approach was used to examine policymakers, school foodservice directors support and the financial implications of Healthy School Meals for All. Qualitative interviews were conducted for policymakers, surveys were conducted for school foodservice directors, and Utah State Board of Education Child Nutrition Programs data were used to determine financial costs. All (n=109) elected officials (Utah State legislatures and Utah State Board members) were contacted to participate in an interview and 25 participated. All public (n=42) and charter (n=104) foodservice directors were invited to participate in a survey and 69 completed the survey. Cost estimation models were built using participation data and reported school meals costs. A phenomenological analytic approach was used to analyze qualitative data. Survey data for foodservice directors was summarized in frequencies and percentages. Four primary cost models were calculated.

**Results/findings:** Four major themes emerged from the qualitative data; 1) awareness and experiences; 2) responsibility; 3) perspectives on school meals; 4) New opportunities. Legislators with experience volunteering with food insecurity programs or schools were supportive of HSMFA, while those without experience were not supportive. Most (81%) foodservice directors believed HSMFA should continue post-pandemic. Costs for HSMFA in Utah would cost between \$244,528,547 and \$347,354,459 per year depending on participation increases.

**Conclusions:** Discussing benefits of school meals with elected officials, involving them in school food programs, suggesting options for step-wise implementation, and providing cost estimates based on pandemic experiences may increase feasibility of a state-wide HSMFA policy.

# Acceptability of seaweed consumption among pregnant Canadian people: preliminary results

**Ms. Inès Auclair Mangliar**<sup>1,2,3,4</sup>, Ms. Marianne Rochette<sup>1,2</sup>, Mrs. Anne-Sophie Plante<sup>2,3,4</sup>, Dr. Véronique Provencher<sup>1,3,4</sup>, Mrs. Lamia L'Hocine<sup>3,4</sup>, Mrs. Lucie Beaulieu<sup>3,5</sup>, Mrs. Anne-Sophie Morisset<sup>1,2,3,4</sup>

<sup>1</sup>School of Nutrition, Laval University, Quebec, Canada, <sup>2</sup>Endocrinology and Nephrology Unit, CHU of Québec-Laval University, Quebec, Canada, <sup>3</sup>NUTRISS Research Center - Nutrition, Health and Society Center of the Institute on Nutrition and Functional Foods (INAF), Laval, Quebec City, Canada, <sup>4</sup>INAF - Institute on Nutrition and Functional Foods, Laval University, Quebec, Canada, <sup>5</sup>Department of Food Science, Laval University, Quebec, Canada, <sup>6</sup>Agriculture and Agri-Food Canada, Saint-Hyacinthe Research and Development Centre, Saint-Hyacinthe, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Seaweeds are a sustainable source of protein containing several relevant micronutrients for pregnancy, such as folic acid, calcium and iron. This study assesses the acceptability and consumption habits of seaweed during pregnancy.

**Methods:** Pregnant French Canadians were asked to complete an online survey, which included questions on their attitude toward seaweed and their consumption pattern. These include perceived health risks and benefits for themselves and their child, frequency of consumption, reasons of consumption and type of seaweed products consumed during pregnancy. At the end, participants could express personal opinion about seaweed consumption during pregnancy. Different factors influencing seaweed consumption, such as familiarity and food neophobia, were taken into account when constructing the questions to better analyze the responses. Descriptive analyses (means  $\pm$  standard deviations and percentages) are used and qualitative analyses for open-ended questions are also conducted to highlight key points. Recruitment of participants is still ongoing with the minimum target of  $n=100$ .

**Results:** Thus far, sixty-eight individuals ( $n=68$ ) completed the survey. The mean age is  $31.2 \pm 3.8$  years and the average number of weeks of pregnancy is  $22.8 \pm 9.1$ . Most of the participants are omnivores (85.3%), with 13.2 % vegetarians and 1.5% vegans. Most participants (60.3%) have a positive attitude towards algae. They believe (54.4%) that seaweed consumption has no positive or negative effect on their health and 70.6% think that it has no effect on their baby's health either. Seaweed was consumed, mainly in sushi, during pregnancy (67.7%). The main reason for consuming seaweed was for the taste (77.7%) and the reasons for not consuming seaweed were the lack of interest and/or knowledge to incorporate it into their cooking (40.9%) and the avoidance of sushi due to the presence of raw fish (31.8%). Participants expressed concern about the lack of information regarding seaweed consumption during pregnancy, particularly raw seaweed, and whether seaweed is safe for health.

**Conclusions:** Currently, in Canada, there is no specific recommendation regarding the consumption of seaweed during pregnancy. Determining acceptability and consumption habits, as well as affiliated research on the safety of consuming seaweed during pregnancy, is needed to provide reliable guidelines.

# Physical Activity Assessment and Counseling in Adults with Down Syndrome

**Dr. Nicolas Oreskovic<sup>1,2</sup>**, Ms. Ayesha Harisinghani<sup>1</sup>, Ms. Amy Torres<sup>1</sup>

<sup>1</sup>Massachusetts General Hospital, Boston, USA, <sup>2</sup>Harvard Medical School, Boston, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Background:** Individuals with Down syndrome have an increased risk for obesity compared to the general population, thought to be due to several factors including a decreased metabolism, unhealthy dietary habits, and low levels of physical activity. Numerous studies have consistently indicated that adults with Down syndrome are less physically active than the general population and do not meet physical activity recommendations. Despite the importance of counseling on physical activity, the degree to which health care providers assess and counsel adults with Down syndrome on physical activity is not known.

**Objective:** This study aims to determine whether physicians caring for individuals with Down syndrome assess and counsel on Down syndrome, and whether rates of counseling vary by medical specialty.

**Methods:** Electronic health records data were collected and reviewed on 148 adults with Down syndrome ages 18 years and older and seen at a Down syndrome clinic at Massachusetts General Hospital in Boston, USA during calendar year 2022.

**Results:** Physical activity assessment: All of the patients (148/148, 100%) followed by a Down syndrome specialist had documented physical activity assessment. Half of the patients (80/148, 54%) had physical activity assessment documented by their primary care physician. Physical activity counseling: All of the patients (148/148, 100%) subjects followed by a Down syndrome specialist had documented physical activity counseling. Less than half of the patients (64/148, 43%) had physical activity counseling documented by their primary care physician.

**Conclusion:** Wide variations in care exist in physical activity counseling by physicians treating adult patients with Down syndrome. Despite high levels of obesity and low levels of physical activity in adults with Down syndrome, primary care physicians do not routinely assess or counsel on the importance of physical activity in this high-risk population. Down syndrome specialists perform better than primary care providers in identifying and counseling on physical activity needs. Given the high prevalence of obesity in adults with Down syndrome, efforts should be made to ensure all physicians caring for adults with Down syndrome counsel on physical activity.

# Impact of Nature-Based Schoolyard Redesign on Children's Movement and Environmental Interactions During Recess

**Ms. Kylie Wilson**, Ms. Alexandra Justesen, Ms. Catherine Hudson, Dr. Jennifer Vanos, Dr. Allison Poulos  
<sup>1</sup>Arizona State University, Phoenix, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Recess is a critical opportunity for children to accrue physical activity for physical and psychosocial health. Children's movement levels are influenced by the schoolyard environment, including the presence of equipment and organized activities; however, less is known about how natural components like shade and nature (e.g., trees, boulders) influence children's movement and environmental interactions. The purposes of this study were to identify how a nature-based schoolyard redesign (>\$350,000 of landscaping improvements) impacted children's movement and interactions with shade and nature during recess, and if these changes varied by gender.

**Methods:** Observations were conducted before and after a nature-based playground redesign during recess at one urban elementary school in Phoenix, Arizona (USA) in Spring 2021 and Spring 2022 using the System for Observing Play and Leisure Activity in Youth - Shade and Nature (SOPLAY-SN). Three one-way MANOVAs with post hoc Bonferroni comparisons were conducted to determine how changes impacted children's movement, and interactions with shade and nature in the overall playground, as well as within specific playground areas, and by gender.

**Results:** No overall changes in movement levels or shade interactions were observed over time; however, overall nature interactions increased. Specific to individual playground areas, sedentary behavior levels were reduced in the basketball courts and a field where large boulders were placed; interactions with shade increased in a grassy field where trees were planted; and interactions with nature increased in areas where large boulders were placed, a grassy field where trees were planted, and a grassy field where a bioswale with a water feature was installed. When examined by gender, the increase in nature interactions persisted for boys only.

**Conclusions:** Our results suggest that nature-based schoolyard renovations can impact children's movement levels, and interactions with shade and nature during recess. While more time may be needed to see the full impact of the intervention, particularly with trees that are still immature, the addition of sustainable natural features may offer a scalable way to create schoolyard environments conducive to thermal comfort and physical activity, which is particularly relevant for schools in warm climates.

# The modifying role of environmental characteristics on the effectiveness of the SLIMMER diabetes prevention lifestyle intervention

Dr. Annemien Haveman-Nies<sup>1,2</sup>, Ms. Tess Weis<sup>3</sup>, Dr. Joreintje Mackenbach<sup>3</sup>, Prof. Edith Feskens<sup>4</sup>, Ms. Josien ter Beek<sup>2</sup>, Dr. Geerke Duijzer<sup>2</sup>, **Dr. Nicole den Braver<sup>3</sup>**

<sup>1</sup>Chair group Consumption and Healthy Lifestyles, Wageningen University and Research, Wageningen, Netherlands, <sup>2</sup>GGD Noord- en Oost-Gelderland (Community Health Service), Warnsveld, Netherlands,

<sup>3</sup>Department of Epidemiology & Data Science, Amsterdam University Medical Centres, Amsterdam,

Netherlands, <sup>4</sup>Division of Human Nutrition and Health, Wageningen University and Research Wageningen, Wageningen, Netherlands

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Effectiveness of lifestyle interventions decreases over time and when they are translated from controlled to real-life settings. A supportive environment may be key in maintaining lifestyle changes in the long-term. The aim of this study was to explore whether the effectiveness of the combined lifestyle intervention SLIMMER (SLIM iMplementation Experience Region Noord- en Oost-Gelderland) in reducing fasting insulin and body weight on the long term (18 months) was modified by neighborhood food-, physical activity- and social environmental characteristics.

**Methods:** Adults aged 40-70 years, recruited between October 2011 and September 2012, were randomly assigned to the intervention arm (10-month dietary and physical activity program) and control arm (usual healthcare) and followed up for 18 months (n=240). Outcome measures for fasting insulin (pmol/L) and weight (kilograms) were collected at baseline and 18 months. Data on the food-, physical activity- and social environment were retrieved from Geoscience and Health Cohort Consortium (GECCO) and linked to participants' residential postal codes. To investigate effect modification by environmental characteristics, linear mixed models were performed, adjusted for clustering in neighborhoods, with interaction terms ( $p_{\text{interaction}} < 0.20$ ) and stratified analyses for neighborhood characteristics.

**Results:** The overall intervention effects were a decrease in body weight of -2.5kg (-3.6; -1.4) in the intervention and a decrease of -7.7 pmol/L (-14.5; -0.15) in fasting insulin as opposed to the control group. In stratified analyses, greater intervention effects were observed in the neighborhoods with supermarkets (-3.0 kg,  $p_{\text{interaction}}=0.08$ ), local food shops (-3.3 kg,  $p_{\text{interaction}}=0.13$ ), high density of green space in the neighborhood (-13.0 pmol/L,  $p_{\text{interaction}}=0.07$ ), high distance to recreational green space (-3.7 kg,  $p_{\text{interaction}}=0.15$ ), and lower neighborhood SES (-3.2 kg,  $p_{\text{interaction}}=0.17$ ). Intervention effects did not differ by presence of fast-food outlets and neighborhood walkability.

**Conclusion:** Maintaining a healthy lifestyle may be supported in neighborhoods with healthy attributes, such as supermarkets, local food shops and green space. However, neighborhoods with a lower SES and larger distance to recreational green space also seemed to support the maintenances of a healthy lifestyle. Further exploration is needed to assess which mechanisms underlie this support in maintaining a healthy lifestyle and diabetes prevention by healthy environments.

# Walking to work: the role of neighborhood walkability around the workplace

Ms. Tea Osménaj<sup>1</sup>, Ms. Thao Lam<sup>1, 2, 3</sup>, Mr. Alfred Wagtendonk<sup>1, 2</sup>, **Dr. Nicole den Braver<sup>1, 2, 3</sup>**

<sup>1</sup>Department of Epidemiology & Data Science, Amsterdam University Medical Centres, Amsterdam, Netherlands, <sup>2</sup>Upstream Team, Amsterdam, Netherlands, <sup>3</sup>Amsterdam Public Health Institute, Health Behaviours and Chronic Diseases, Amsterdam, Netherlands

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Studies investigating walkability and transport outcomes typically focus on residential neighborhood walkability. However, walkability at destinations such as workplaces can play a key role in the decision to walk and can offer insights on worksite interventions to improve employee populations' health. Therefore, in this study we aimed to investigate the association between walkability around the workplace and commute walking of the Dutch population. Secondly, we aimed to investigate the association between combined workplace and residential neighborhood walkability and walking for commute to assess the relative importance of workplace walkability.

**Methods:** This cross-sectional study included 6,769 working-age adults that participated in the Dutch national travel survey (OVIN). Participant residential and work addresses were linked to a validated walkability index including population density, retail and service destination density, land use mix, green space, street connectivity, sidewalk density and public transport density. Commute walking was derived from the travel survey and dichotomized to any or no walking to work on the survey day (yes/no). In logistic regression models adjusted for demographic, travel and survey characteristics; we assessed the odds ratio (OR) for the association between higher workplace walkability and commute walking. Secondly, we assessed the association between combined workplace/residential walkability (high/high, high/low, low/high versus low/low) with commute walking. We tested for effect modification by age, sex, income and urbanization.

**Results:** We found significant effect modification by residential urbanization degree. For people living in rural areas, 10% increase in workplace walkability was associated with 49% higher odds of walking for commute in a fully adjusted model (OR:1.49, 95%CI:1.34-1.64,  $p_{\text{trend}} < 0.001$ ), compared to 19% in highly urban areas (OR:1.19, 95%CI:1.13-1.26,  $p_{\text{trend}} < 0.001$ ). With regard to combined workplace/residential walkability, strongest associations with commute walking were observed if both were high (OR: 3.15, 95%CI: 2.48;3.99). When either of the two was low, a high workplace walkability was slightly more strongly associated with odds of walking for commute than home walkability, though the confidence intervals overlapped (respective OR:2.81, 95%CI:2.18-3.62 and OR: 1.99, 95%CI:1.52-2.61).

**Conclusion:** Our study indicated the importance and complementary nature of walkable residence and workplace in contribution to physical activity of working individuals, through active commuting.

# Building a Methods Selector for Co-creation: A Health CASCADE study

**Mrs. Danielle Agnello<sup>1,2</sup>**, Prof. Sebastien Chastin<sup>1,2</sup>, Prof. Artur Steiner<sup>1</sup>

<sup>1</sup>Glasgow Caledonian University, Glasgow, United Kingdom, <sup>2</sup>Health CASCADE, Glasgow, United Kingdom

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Currently, tools and guidelines exist that contain some methods for co-creation. However, these sources only include a small set of methods for a specific topic or target group. There is yet to be the creation of a comprehensive and user-friendly tool for selecting methods for a co-creation project, which includes specific characterization details and instructions on applying each method. This work aims to address that gap by conducting a comprehensive inventory of all types of methods used in co-creation, and by generating a classification system for the organization and selection of co-creation methods.

**Methods:** A novel methodology for conducting an inventory of methods was created to source methods used in co-creation. This methodology, called an adapted 'recursive search' strategy, was designed to group the 13,500 articles from the Health CASCADE open-source co-creation database by the method used. The methods sourced from the inventory were subsequently categorized by method type and sub-type. Additionally, a constant comparative method was applied to the set of methods to elicit the appropriate domains for a classification structure. The resulting domains were discussed with a group of experts and tested in co-creation projects conducted in Scotland.

**Results/findings:** The inventory resulted in the identification of 430 co-creation methods, grouped by type and sub-type. The constant comparative analysis, consultation, and field testing in Scotland identified seven domains appropriate for the classification of the co-creation methods: 1) mode of delivery; 2) needed resources; 3) level of participation; 4) type of method; 5) sub-type of method; 6) method aim; and 7) target group. The methods sourced in the inventory were populated into these domains. This resulted in the generation of a prototype tool called the Methods Selector for Co-creation.

**Conclusions:** The systematic inventory and the classification domains served as an evidence-based methodology for generating an accessible tool for the selection of methods for co-creation projects. This Methods Selector for Co-creation will be an open-source tool that is accessible online and will be further tested by the co-creators who use the tool, as well as by the Health CASCADE international training network.

# Are the 2019 Canada's Food Guide recommendations on healthy food choices consistent with the EAT-Lancet sustainable diet recommendations?

**Ms. Gabrielle Rochefort**<sup>1,2</sup>, Prof. Julie Robitaille<sup>1,2</sup>, Prof. Simone Lemieux<sup>1,2</sup>, Prof. Véronique Provencher<sup>1,2</sup>, Prof. Benoît Lamarche<sup>1,2</sup>

<sup>1</sup>Centre Nutrition, Santé et Société (NUTRISS), Institut sur la nutrition et les aliments fonctionnels (INAF), Université Laval, Québec, Canada, <sup>2</sup>École de nutrition, Faculté des sciences de l'agriculture et de l'alimentation, Université Laval, Québec, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The 2019 Canada's Food Guide (2019-CFG) promotes the adoption of a healthy diet with an emphasis on plant-based foods. The aim of this study was to assess for the first time the alignment of the 2019-CFG recommendations on healthy food choices with the recommendations from the EAT-Lancet Commission for sustainable diets.

**Methods:** Analyses were conducted in a sample of 1147 French-speaking adults (50.2% female, mean age 42.8y) recruited between 2015 and 2017 in the cross-sectional PRÉDicateurs Individuels, Sociaux et Environnementaux (PRELISE) study in Canada. Dietary intakes were evaluated over a three-week period using a validated web-based 24hr dietary recall repeated on three unannounced occasions. The Healthy Eating Food Index (HEFI)-2019 was used to assess the alignment of dietary patterns to recommendations on healthy food choices in the 2019-CFG. The degree of adherence to the EAT-Lancet reference diet was assessed using the EAT-Lancet Dietary Index (EAT-I) developed by our research team. Mean HEFI-2019 and EAT-I scores in this population and among subgroups were estimated using the National Cancer Institute's population ratio method. The association between the HEFI-2019 and the EAT-I was examined using Pearson correlations.

**Results:** The estimated mean HEFI-2019 (/80) and the EAT-I (/80) scores in this population were 44.9 points (95%CI, 44.1 to 45.7) and 32.5 points (95% CI, 31.4 to 33.7), respectively. The mean EAT-I score was 6.3 points higher in women compared to men (95%CI, 4.3 to 8.4), 3.9 points higher in older (> 50 years) compared to younger (< 35 years) adults (95%CI, 1.2 to 6.6), 6.5 points higher in adults with a university degree compared to those with no degree, a high school diploma, or a trade diploma (95%CI, 3.4 to 9.6) and 7.4 points higher in non-smokers compared with smokers (95%CI, 4.6 to 10.0). The HEFI-2019 and EAT-I scores were strongly correlated ( $r = 0.57$ ,  $P < 0.001$ ).

**Conclusions:** Results suggest that the 2019-CFG recommendations on healthy food choices are fairly well aligned with the EAT-Lancet reference diet. This highlights the complementarity and compatibility of the 2019-CFG recommendations for sustainability and health promoting purposes.

# A Survey of Early Career Investigators' Experiences Applying for Funding from the National Institutes of Health in the USA

**Ms. Lauren von Klinggraeff<sup>1</sup>**, Dr. Christopher D. Pfledderer<sup>1</sup>, Dr. Alessandra Bandeira<sup>1</sup>, Dr. Sarah Burkart<sup>1</sup>, Dr. R. Glenn Weaver<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>, Dr. Michael W. Beets<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Background:** Securing competitive grant funding is critical to professional advancement for early-stage investigators (ESIs) in social and behavioral science. Collecting preliminary evidence of feasibility and/or potential for impact of behavioral interventions provides the foundation for future large-scale trials and can strengthen grant applications to successfully secure funding. This study explored the experiences of ESIs generating preliminary evidence and applying for competitive funding from the National Institutes of Health (NIH).

**Methods:** Early-stage investigators (who had completed their terminal degree in the past 10 years) involved in social/behavioral research were invited to participate in an online survey. ESIs were identified and then recruited through email using NIH award lists and professional association listservs. The survey contained questions about ESI's professional roles, the importance of funding for their careers, their ability to generate preliminary evidence for future grant proposals, and their experiences applying for funding. Data was analyzed descriptively.

**Results:** Between June and December of 2022, 383 ESIs completed the survey. Respondents were 70% female, 60% White non-Latinx, and the majority were postdoctoral researchers (45%) or Assistant Professors (33%). Across all ESIs, 81% (n=337) considered securing NIH funding important to their career goals and 89% (n=339) stated securing external funding was important for tenure and promotion in their department. Open-ended responses indicated ESIs perceive preliminary data as necessary to secure any NIH funding (e.g., K99, R21, R01) though 70% (n=272) believed it was difficult to receive funding from the NIH to conduct a preliminary study. ESIs reported being advised to gather preliminary data from mentors' projects (e.g., secondary data) or to secure internal and foundation funding to support preliminary studies. Regardless of grant type, there was broad consensus that persistence was key to securing funding.

**Conclusion:** Generating preliminary evidence to support grant applications is a key professional objective of ESIs in social/behavioral science. Though obtaining funding is thought to be necessary for career advancement, obtaining NIH funding (e.g., K99, R21, R01) seems to be dependent upon successfully securing incremental funding from other sources to generate preliminary data.

# Analyzing the structure of packaged food and non-alcoholic beverage manufacturing and grocery retailing sectors and markets in Canada: implications for food environment policy

**Ms. Alexa Gaucher-Holm<sup>1,2</sup>**, Dr. Benjamin Wood<sup>3,4</sup>, Associate Professor Gary Sacks<sup>3,4</sup>, Assistant Professor Lana Vanderlee<sup>1,2</sup>

<sup>1</sup>École de nutrition, Faculté des sciences de l'agriculture et de l'alimentation (FSAA), Université Laval, Québec, Canada, <sup>2</sup>Centre Nutrition, santé et société (NUTRISS), Institut sur la nutrition et les aliments fonctionnels (INAF), Québec, Canada, <sup>3</sup>Deakin University, Melbourne, Australia, <sup>4</sup>Global Centre for Preventive Health and Nutrition (GLOBE), Melbourne, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** National food and beverage market structure analyses can provide important insights into the power held by corporations to shape the characteristics of food environments. This study aimed to descriptively analyze the structure of Canadian packaged food and non-alcoholic beverage manufacturing and grocery retailing sectors and markets.

**Methods:** Market share data were obtained from Passport by Euromonitor International for the packaged food manufacturing sector (including 14 product markets), non-alcoholic beverage manufacturing sector (including 8 product markets), and grocery retailing sector (including 5 grocery retailing markets) as of 2020/21. Manufacturers and retailers with  $\geq 1\%$  market share in Canada were identified and characterized. Market concentration was measured for markets described above using the Herfindahl-Hirschman Index (HHI) (values  $>1800$  suggest high concentration) and the four-firm concentration ratio (CR4) (values  $>60$  suggest high concentration). Company ownership structure, including common shareholder ownership by three large global asset managers (i.e., The Vanguard Group Inc, Blackrock Institutional Trust Company, and State Street Global Advisors (US)), was assessed using data from Refinitiv Eikon.

**Results/findings:** Foreign multinational companies accounted for large components of the sampled market shares held by packaged food manufacturers (55%) and non-alcoholic beverage manufacturers (82%), compared to grocery retailers (24%). Market concentration varied across sectors and markets but was substantially greater within non-alcoholic beverage (median CR4=72; median HHI=1995) and grocery retailing (median CR4=84; median HHI=2405) sectors compared to the packaged food sector (median CR4=51; median HHI=932). Three major global asset managers owned shares in the majority of the publicly listed companies included in the analysis, many of which operate within the same sectors and markets: the Vanguard Group Inc owned at least 1% of shares in 95% of publicly listed companies, Blackrock Institutional Trust Company 71%, and State Street Global Advisors (US) 43%.

**Conclusions:** Within the Canadian food industry, substantial power is concentrated amongst relatively few large corporations. These corporations are in a position to strongly influence the characteristics of food environments and related population health and nutrition outcomes. The potential for increased government regulation of market structure (e.g., competition law) warrants further attention as part of a broad public health approach to improving population diets.

# Are students aware of their body mass and how does this affect their lifestyle behaviours?

**Miss Ellie Procter**<sup>1</sup>, Mr. Matthew Savage<sup>1</sup>, Dr. Philip Hennis<sup>1</sup>, Dr. Daniele Magistro<sup>1</sup>, Dr. Kirsty Hunter<sup>1</sup>, Dr. James Donaldson<sup>1</sup>, Dr. Ruth James<sup>1</sup>, Dr. Ryan Williams<sup>1</sup>

<sup>1</sup>SHAPE Research Group, Nottingham Trent University, Nottingham, United Kingdom

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Increased body mass is common amongst university students, with almost two thirds gaining weight during their first year (Vadeboncoeur et al., 2015). Previously, this has been associated with poor lifestyle behaviours such as reduced physical activity and diet quality (Deforche et al., 2015). Accurate perception of body mass could influence health behaviours and can impact weight loss efforts in older adolescents (Yang et al., 2014). It is currently unknown whether university students accurately perceive their body mass and whether this is associated with health-related lifestyle behaviours and weight management. Therefore, the aims of this research were to determine if students are aware of their body mass and if this is associated with lifestyle behaviours (Study A), and to examine changes in anthropometric measures over 1 year at university (Study B).

**Methods:** Study A: 171 UK students completed an online survey including questions on body mass, moderate-vigorous physical activity (MVP), time spend sedentary, diet quality and sleep quality. These students then reported for objective body mass measurement. A paired samples t-test assessed differences between perceived and objective body mass and Spearman's rank correlation analysis explored associations between the difference in perceived and actual body mass and the behavioural survey data. Study B: An opportunistic sample of 26 UK students reported for anthropometric testing in October 2021 and again in October 2022. Paired samples t-tests assessed changes in body mass, waist circumference and waist: height ratio.

**Results:** Students underestimated their body mass ( $n=171$ ;  $0.7 \pm 2.8$  kg;  $p<.001$ ), but this had no correlation with any reported lifestyle behaviours ( $p \geq .223$ ). Student body mass increased over 1 year at university ( $n=26$ ;  $2.4 \pm 4.8$  kg;  $p=0.016$ ) as did waist circumference ( $2.0 \pm 4.4$  cm;  $p=.032$ ) and waist: height ratio ( $p=.026$ ).

**Conclusion:** Students significantly underestimated body mass, but this had no associations with lifestyle behaviours. Additionally, students gained body mass and waist circumference over an academic year, in line with previous literature. Education and weight management interventions are required to raise awareness of changes in lifestyle behaviours whilst studying at university and their impact on future health outcomes.

# The co-production of research: A recreation-focused community-based participatory research project in northern Canada

**Mrs. Lauren Ray<sup>1</sup>**, Dr. Tara-Leigh McHugh<sup>1</sup>, Dr. Tristan Hopper<sup>2</sup>

<sup>1</sup>University of Alberta, Edmonton, Canada, <sup>2</sup>University of Regina, Regina, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** There is a well documented need for participatory approaches in health promotion research. Over the past decade, there has been an increase in the number of published participatory studies. However, resources “detailing the co-production of research”, particularly in the broad field of health promotion, are lacking (Smith et al., 2022). Therefore, the purpose of this presentation is to provide a detailed description of the co-production of research from a recent community-based participatory research (CBPR) project. This CBPR project was focused on understanding how leisure and recreation can support women’s mental health during the COVID-19 pandemic in northern Canada.

**Methods:** Guided by the key principles of CBPR, this research came together through a partnership with Canadian Mental Health Association-Yukon. A Community Advisory Board was developed and guided all research processes, including the development of the research question, and processes of data generation and analysis. A particularly unique aspect of this research was the use of an in-depth participatory qualitative data analysis process that was informed by Jackson’s (2008) participatory group data analysis method.

**Findings:** Lessons learned from the co-production of this research project are represented by four themes: (a) step-by-step process, (b) sustained engagement, (c) equitable engagement, and (d) relationality and researcher responsibilities.

**Conclusion:** Through practical examples, our work highlights important considerations and advances the current understanding of the co-production process in health promotion (i.e., leisure and recreation) research. This presentation contributes to the health promotion literature by providing a detailed description of the co-production of research through a CBPR project in northern Canada.

**Keywords:** participatory research, participatory data analysis, qualitative research, mental health, recreation, women’s health

# Actual not perceived movement skill competence is associated with higher levels of physical activity and aerobic fitness in children with bronchiectasis unrelated to cystic fibrosis.

**Prof. Stewart Trost**<sup>1,2</sup>, Dr. Denise Brookes<sup>1</sup>, Ms. Taryn Jones<sup>2</sup>, Dr. Emmah Baque<sup>3</sup>, Dr. Kerry-Ann O'Grady<sup>2</sup>, Prof. Anne Chang<sup>4</sup>

<sup>1</sup>The University of Queensland, Brisbane, Australia, <sup>2</sup>Queensland University of Technology, Brisbane, Australia, <sup>3</sup>Griffith University, Brisbane, Australia, <sup>4</sup>Charles Darwin University, Darwin, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Bronchiectasis (BE) unrelated to cystic fibrosis is a major contributor to respiratory morbidity and health care utilisation in children. Children with BE exhibit low levels of physical activity (PA) and developmental delays in movement skill proficiency are a major contributing factor (Joschtel et al. 2021). Perceptions of movement competence and health-related fitness are hypothesised to be important developmental mediators of the relationship between actual movement competence and habitual PA (Stodden 2008); however, this hypothesis has not been explored in children with BE. Therefore, we evaluated the inter-relationships between actual movement competence, perceived movement competence, device-measured PA, and aerobic fitness in children with BE.

**Methods:** Children with BE (N = 29, mean age =  $6.9 \pm 2.3$  y, 55% female) completed assessments of actual movement skill competence (TGMD-2), perceived movement skill competence (Pictorial Scale of Perceived Movement Skill Competence), moderate-to-vigorous PA (MVPA) (accelerometers), and aerobic fitness (modified shuttle test). Associations between variables were evaluated using Pearson correlations.

**Results:** Actual locomotor competence was positively associated with daily MVPA ( $r = 0.42$ ) and aerobic fitness ( $r = 0.77$ ), but inversely associated with perceived locomotor competence ( $r = -0.37$ ). Similarly, actual object control competence was positively associated with daily MVPA ( $r = 0.23$ ) and aerobic fitness ( $r = 0.49$ ), but inversely associated with perceived object control competence ( $r = -0.42$ ). Furthermore, perceived locomotor and object control competence were inversely associated with daily MVPA ( $r = -0.22$  to  $-0.40$ ) and aerobic fitness ( $r = -0.08$  to  $-0.29$ ). However, among older children ( $\geq 9$  y,  $n = 7$ ), perceived and actual movement skill competence were positively correlated ( $r = 0.33$  to  $0.50$ ); but only perceptions of locomotor competence were positively associated with daily MVPA ( $r = 0.40$ ) and aerobic fitness ( $r = 0.42$ ).

**Conclusions:** Actual movement skill competence rather than perceived competence is associated with higher levels of PA and fitness in children with BE. The observed inverse relationship between perceived and actual movement skill competence is consistent with the notion that young children demonstrate limited accuracy in perceiving their movement competence and report inflated levels of perceived competence relative to their actual competence.

# Physical activity and glucose intolerance in rural India- The TREND study

**Dr. Pradeepa Rajendra**<sup>1</sup>, Mrs. Lakshmi Natarajan<sup>1</sup>, Dr. Venkatesan Ulagamathesan<sup>1</sup>, Dr. Rakesh Hari<sup>1</sup>, Dr. Siddiqui Moneeza Kalhan<sup>2</sup>, Dr. Palmer Colin NA<sup>2</sup>, Dr. Mohan Viswanathan<sup>1</sup>, Dr. Anjana Ranjit Mohan<sup>1</sup>

<sup>1</sup>Madras Diabetes Research Foundation & Dr. Mohan's Diabetes Specialities Centre, Chennai, India, <sup>2</sup>School of Medicine, University of Dundee, Chennai, United Kingdom

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** N. Other

**Purpose:** Diabetes has reached epidemic proportions in India, which may be due to the adoption of unhealthy lifestyle practices by individuals at risk of developing the disorder. Physical inactivity has been identified as one of the main risk factors for diabetes. This study aimed to assess the relationship between physical inactivity and glucose intolerance in a population-based study conducted in rural India.

**Methods:** The Telemedicine Project for screening Diabetes and its complications in rural Tamil Nadu (TREND) study is a door-to-door cross-sectional survey that screened 14,117/15091 individuals aged  $\geq 18$  years for diabetes/prediabetes between 2018-2021 in 30 villages of Chengalpattu/Kancheepuram districts of Tamil Nadu. In all subjects, venous oral glucose tolerance tests were done (except in self-reported diabetes). Individuals were categorized as having normal glucose tolerance (NGT), prediabetes or diabetes using WHO criteria. Physical activity was assessed using a validated questionnaire for use in India called the Madras Diabetes Research Foundation (MDRF) Physical Activity Questionnaire. Based on physical activity level (PAL), participants were categorized into inactive (PAL:1.4–1.69), moderately (PAL:1.7–1.99) and vigorously (PAL:2.0–2.4) active.

**Results/ findings:** More than half (53.1%) of the 14,117 participants were inactive, with the prevalence of inactivity being higher in women compared to men (62% vs. 41%;  $p < 0.001$ ). Moderate and vigorous activity was 27.8% and 19.0% respectively. The prevalence of diabetes and prediabetes was 14.5% ( $n=2047$ ) and 9.0% ( $n=1270$ ) respectively. Inactivity was higher among those with diabetes (60.8%), followed by prediabetes (53.8%) and NGT (51.6%) [ $p$  for trend  $< 0.001$ ], while vigorous activity was highest among those with NGT (20.2%), followed by prediabetes (16.5%) and diabetes (10.9%) [ $p$  for trend  $< 0.001$ ]. Individuals with diabetes spent more screen time (watching television) compared to those with prediabetes and NGT ( $3.1 \pm 2.0$  vs.  $2.8 \pm 1.9$  vs.  $2.7 \pm 1.8$  hours/day respectively,  $p < 0.001$ ). Regression analysis revealed that glucose intolerance was associated with inactivity even after adjusting for age, gender, BMI, family history of diabetes and systolic blood pressure (OR: 1.12, 95% CI: 1.1–1.3,  $p < 0.001$ ).

**Conclusions:** More than half the Asian Indian rural population was inactive. Inactivity was an independent risk factor for glucose intolerance.

# Social risk screening: Added benefits of screening for nutrition security along with food security

Dr. Eric Calloway<sup>1</sup>, Ms. Leah Carpenter<sup>1</sup>, Mr. Tony Gargano<sup>1</sup>, Dr. Amy Yaroch<sup>1</sup>

<sup>1</sup>Gretchen Swanson Center for Nutrition, Omaha, USA

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Nutrition Security is "...consistent and equitable access to healthy, safe, affordable foods essential to optimal health and well-being." There's growing momentum in the United States (U.S.) to assess nutrition security alongside food security, and increasingly healthcare organizations are screening for related social determinants of health. Until recently, there was not a validated nutrition security measure in the U.S. We aimed to explore the usefulness of adding a newly published and validated one-item nutrition security screener (NSS) to the commonly used two-item food security screener (i.e., "Hunger Vital Sign" (HVS)).

**Methods:** We asked low-income racially/ethnically diverse households (n=486) across five states in the United States to complete a survey (April-June 2021) that included the NSS, HVS, health and dietary variables, and sociodemographics. We used multivariate logistic regression to assess associations between screening status and dietary (i.e., low fruits and vegetables (LFV), low scratch-cooked meals (LSCM), high fast-food meals (HFFM), high processed meals (HPM)) and health outcomes (i.e., self-reported fair or poor general health (FPGH), self-reported diet-related chronic disease (CD)) to determine if adding the NSS to the HVS increased detection of groups at health risk. We examined screeners individually and grouped respondents using both screeners. Groups: 1) food and nutrition insecure, 2) food insecure/nutrition secure, 3) food secure/nutrition insecure, 4) food and nutrition secure.

**Results:** Screening positive (food insecure or nutrition insecure, respectively) for HVS or NSS, was similarly associated with significantly increased odds (OR range: 1.74 to 2.37) for FPGH, LSCM, and LFV. HVS positive screen was associated with HPM (OR=2.14, 95%CI=1.24-3.67) and NSS with HFFM (1.71, 1.12-2.61). Other associations were not significant. Group 1, compared to groups 2 and 3 showed higher effect sizes across outcomes. In adjusted analyses, group 1 (but not groups 2 and 3) was associated with increased odds for LFV (2.56, 1.49-4.37), FPGH (2.78, 1.54-5.02), and CD (2.13, 1.14-3.97) compared to group 4.

**Conclusions:** Individually, both screeners had similar associations; however, adding the NSS to the HVS allowed identifying the highest risk group (food and nutrition insecure). This information can help healthcare and other organizations efficiently intervene to support the highest need households.

# Healthy Liver/Hígado Sano: Pilot test of a lifestyle intervention for Hispanic patients with non-alcoholic fatty liver disease

**Dr. Natalia Heredia<sup>1</sup>**, Dr. Amelia Avery<sup>2</sup>, Dr. Jessica Hwang<sup>3</sup>, Dr. Maria Fernandez<sup>1</sup>, Dr. Cici Bauer<sup>1</sup>, Dr. Lorna McNeill<sup>3</sup>

<sup>1</sup>The University of Texas Health Science Center at Houston School of Public Health, Houston, USA, <sup>2</sup>Legacy Community Health, Houston, USA, <sup>3</sup> The University of Texas MD Anderson Cancer Center, Houston, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose.** Non-alcoholic fatty liver disease (NAFLD) can lead to adverse health outcomes, including liver failure and liver cancer. Hispanic/Latinos (heretofore Hispanic) have the highest rates of NAFLD of any U.S. racial/ethnic subgroup. The most effective treatment for NAFLD is weight loss, through healthy dietary changes and increased physical activity. The purpose of this study was to pilot test a behavioral lifestyle intervention (*Healthy Liver/Hígado Sano*) for Hispanic patients with NAFLD to assess feasibility of recruitment, participant satisfaction and preliminary effectiveness on lifestyle-related variables.

**Methods.** We partnered with and received referrals of potential participants from a physician champion. Participants were contacted by study staff, assessed for eligibility, and consented. Measures included self-administered questionnaires assessing demographic, psychosocial and behavioral variables; staff-measured height and weight; 7-day use of a hip-worn accelerometer, and collection of Electronic Medical Record data at pre- and post-test. Individuals were randomized into intervention or a usual-care control group. The intervention, *Healthy Liver/Hígado Sano*, is adapted from the Diabetes Prevention Program and involves 16 weekly, group-delivered sessions.

**Results.** Of the 45 who were eligible, 33 consented and 28 individuals completed baseline and were randomized (15 to intervention and 13 to control). Among participants, 87% were female and 65% had household income <\$25,000/year. There was a 13% increase in those who said they had a good understanding of their condition (60% pre-test, 73% post-test) and a 27% increase in beliefs that healthy eating is very or extremely important for treating NAFLD (73% pre-test to 100% post-test). There was also an increase in self-efficacy; at post-test 73% indicated that were confident that they could do physical activity even if they didn't have time, compared to 53% pre-test. All intervention participants indicated that they were mostly or very satisfied with the program, and 90% indicated they would come back to the program again.

**Discussion.** We found preliminary evidence that recruitment was feasible (73% of eligible agreed to enroll) and that participants were satisfied with the intervention. We experienced difficulties with retention, mostly due to problems maintaining in contact with participants. Finalized results on the preliminary effects on lifestyle variables will be presented.

# A Systems Approach to Promote Physical activity among Youth – an introduction to the SAPPY study

**Dr. Anneke Vang Hjort<sup>1</sup>**, Ms. Sofie Rolff Carlsen<sup>1</sup>, Dr. Inger Katrine Dahl-Petersen<sup>1</sup>, Mrs. Lene Winther Ringgard<sup>1</sup>, Dr. Charlotte Demant Klinker<sup>1</sup>

<sup>1</sup>Steno Diabetes Center Copenhagen, Health Promotion Research, Herlev, Denmark

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Participatory systems approaches to address public health “wicked” problems (such as physical inactivity among vulnerable youth) is a promising innovation in (complex) intervention research. The SAPPY study will during 2023-2026 test feasibility and evaluate outcomes and change mechanisms associated with a participatory systems approach to promote physical activity among youth aged 15-25 attending the Preparatory Basic Education and Training (PBET) school program in Denmark. PBET is an education targeting youth outside the education- or labor market and the students presents as a low socio-economic status group in high risk for developing noncommunicable diseases later in life. The overall aim with the SAPPY study is to develop an evidence-based model for future large-scale implementation. This study will present the content, outline and evaluation approach of the SAPPY study.

**Methods:** In SAPPY, we combine qualitative data and quantitative methods in a systems evaluation to study (1) individual- and system level drivers for PA across all PBET schools in Denmark (n≈8.000) as well as study (2) feasibility, (3) limited effectiveness, and (4) change mechanisms associated with a participatory systems approach across three PBET schools (n≈600). Finally, we synthesize data across 1-4 to describe an implementable and scalable systems model across all PBET schools.

**Results/findings:** The participatory systems approach intervention and the corresponding actions increase capacity and builds social networks between stakeholders. The local working groups, supervised by systems-approach-educated municipal employees, develop, and implements actions with the prospect of changing the system that drives physical (in)activity among PBET students. The system change is based on commitment and ownership of local actions, which increase the prospects of achieving sustainable change.

**Conclusion:** The SAPPY study will deliver evidence on the drivers of physical activity among a vulnerable youth population group and indicate if a participatory systems approach seems promising in altering the system that drives physical activity. Implementation and sustainability are cornerstones of the proposed study and the model is expected to be integrated into routine practice during the study period, and continue to support an increase in capacity among the participating partners and physical activity at population level among PBET students.

# Measuring sleep health in primary school-aged children: A systematic review of instruments and their content validity

Ms. Maj-Britt Inhulsen<sup>1,2</sup>, **Dr. Maartje van Stralen<sup>1</sup>**, Prof. Caroline Terwee<sup>3</sup>, Dr. Joanne Ujcic-Voortman<sup>2</sup>, Prof. Jaap Seidell<sup>1,2</sup>, Dr. Vincent Busch<sup>2</sup>

<sup>1</sup>Vrije Universiteit Amsterdam, Amsterdam, Netherlands, <sup>2</sup>Sarphati Amsterdam, Public Health Service Amsterdam, Amsterdam, Netherlands, <sup>3</sup>Amsterdam UMC, Vrije Universiteit Amsterdam, Amsterdam, Netherlands

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** This review aimed to summarize instruments that measure one or more domains of sleep health (i.e. duration, quality, efficiency, timing, daytime sleepiness and sleep-related behaviors) in a general population of 4-12-year old children, and to assess these instruments' content validity. Other measurement properties were evaluated for instruments with indications of sufficient content validity.

**Methods:** A systematic literature search was performed in PubMed, PsycINFO, Web of Science, and EmBase. Methodological quality, content validity, and other measurement properties were assessed via the CONsensus-based Standards for the selection of health Measurement INstruments (COSMIN) methodology. Instruments with indications of sufficient content validity (i.e. relevance, comprehensiveness and comprehensibility) were further evaluated on other measurement properties (i.e. other aspects of validity, reliability, responsiveness). A modified GRADE approach was applied to determine the quality of evidence.

**Results:** Twenty instruments, containing 36 subscales, were included. None of the instruments measured all sleep health domains. For five (subscales of) instruments sufficient relevance and comprehensibility was found. The quality of evidence ranged from very low to moderate. For these five instruments all additional measurement properties were assessed. Sufficient results were found for structural validity (n = 1), internal consistency (n = 1), and construct validity (n = 1), with quality of evidence ranging from very low to high.

**Conclusions:** Several (subscales of) instruments measuring domains of child sleep health showed good promise, demonstrating sufficient relevance, comprehensibility, and some also sufficient results on other measurement properties. However, more high quality studies on instrument development and the evaluation of measurement properties are required. PROSPERO registration number: CRD42021224109.

# How do recently published Canadian front-of-pack labelling regulations compare with similar mandatory approaches in the Americas?

**Ms. Nadia Flexner<sup>1</sup>**, Dr. Christine Mulligan<sup>1</sup>, Ms. Jennifer Lee<sup>1</sup>, Dr. Mavra Ahmed<sup>1</sup>, Dr. Laura Vergeer<sup>1</sup>, Ms. Sarah Jeong<sup>1</sup>, Prof. Mary L'Abbe<sup>1</sup>

<sup>1</sup>University of Toronto, Toronto, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Mandatory front-of-pack (FOP) labelling, a cost-effective policy to promote healthy diets, has been implemented in several countries in the Region of the Americas. Recently, Health Canada (HC) published final regulations mandating that pre-packaged foods exceeding thresholds for sodium, sugars, and/or saturated fat display a 'high in' FOP symbol. This study aimed to compare the proportion of Canadian pre-packaged products that would display a 'high in' FOP symbol under HC's final regulations with two other nutrient profile models (NPMs) developed for FOP labelling implemented in the Region.

**Methods:** For this study, n=17,097 Canadian pre-packaged products were evaluated under three NPMs: HC NPM, the Chilean NPM, and the Pan American Health Organization (PAHO) NPM. The proportion of products meeting or exceeding each NPM's established thresholds for sodium, sugars, and/or saturated fat was calculated overall, and by nutrient. Cohen's Kappa ( $\kappa$ ) statistics was used to test the level of agreement between NPMs.

**Results:** Overall, 55.2% (n=9,442), 72.3% (n=12,361), and 78.0% (n=13,338) of products would be 'high in' at least one nutrient-of-concern under the HC, Chilean, and PAHO NPMs, respectively. Comparing by nutrient-of-concern, the HC, Chilean, and PAHO NPMs would identify, respectively, 28.9%, 39.8%, and 50% of products as 'high in' sodium; 24.4%, 29.8%, and 36.8% as 'high in' sugars; and 21.0%, 35.6%, and 33.4% as 'high in' saturated fats. Under all NPMs, most products would only be considered 'high in' one of three nutrients. The HC NPM had the highest proportion of products that would not display a 'high in' symbol (44.8% vs. 27.7% (Chile) and 22% (PAHO)). Fair agreement was found between the HC and Chilean NPMs ( $\kappa=0.30$ ) and between the HC and PAHO NPMs ( $\kappa=0.31$ ). While moderate agreement was found between PAHO and the Chilean NP model ( $\kappa=0.58$ ).

**Conclusions:** Results suggest that under all Regional NPMs, most Canadian pre-packaged products are 'high in' at least one nutrient-of-concern, with the Chilean and PAHO NPMs identifying more of such products than the HC NPM. This highlights the importance of implementing strict mandatory measures to alert consumers to the prevalence of pre-packaged products that are 'high in' nutrients-of-concern and to promote manufacture-driven reformulation.

# Eating Disorders In weight-related Therapy (EDIT)

## Collaboration: Rationale and study design

Dr. Natalie Lister<sup>1</sup>, Prof. Louise Baur<sup>1</sup>, Prof. Susan Paxton<sup>2</sup>, Associate Professor Sarah Garnett<sup>1</sup>, Prof. Amy Ahern<sup>3</sup>, Prof. Denise Wilfley<sup>4</sup>, Associate Professor Sarah Maguire<sup>1</sup>, Prof. Amanda Sainsbury<sup>5</sup>, Prof. Katharine Steinbeck<sup>1</sup>, Prof. Caroline Braet<sup>6</sup>, Prof. Andrew Hill<sup>7</sup>, Prof. Dasha Nicholls<sup>8</sup>, Dr. Rebecca Jones<sup>3</sup>, Ms. Genevieve Dammery<sup>1</sup>, Ms. Alicia Grunseit<sup>9</sup>, Ms. Kelly Cooper<sup>10</sup>, Mr. Theodore Kyle<sup>11</sup>, Ms. Faith Newsome<sup>12</sup>, Ms. Kylie Hunter<sup>1</sup>, Dr. Caitlin McMaster<sup>1</sup>, Dr. Brittany Johnson<sup>13</sup>, **Dr. Anna Lene Seidler<sup>1</sup>**, Dr. Hiba Jebeile<sup>1</sup>

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Systematic reviews demonstrate that, while for most participants medically supervised obesity treatment improves eating disorders risk scores, a subset of people who undergo obesity treatment have poor outcomes for eating disorders. The Eating Disorders In weight-related Therapy (EDIT) Collaboration aims to: (1) understand which participants are at risk of developing an eating disorder during medically supervised obesity treatment (specifically, behavioural weight management interventions); (2) understand which intervention components may contribute to eating disorder risk; (3) identify predictive pathways for increased or decreased eating disorder risk during weight management; and (4) develop resources and recommendations to reduce eating disorder development during obesity treatment.

**Methods:** The EDIT Collaboration brings together clinicians, researchers, and individuals with lived experience to improve treatment for people affected by obesity and eating disorders. Five related studies are planned. Study 1: Consultation. We will identify individual participant characteristics and intervention strategies which may contribute to an increase or decrease in eating disorder risk during weight management interventions, to be included in analysis. Studies 2 and 3: Individual participant data (IPD) meta-analyses. The gold standard for combining trial data and providing greater power for estimation of treatment effects of rarer outcomes and also enables reliable subgroup analyses. IPD will be used to identify individual predictors of eating disorder risk during weight management interventions. Study 4: Intervention deconstruction. We will code interventions into delivery features and intervention strategies using a project specific framework. Study 5: Predictive modelling. Data will be combined from Studies 2, 3 and 4 to identify any interactions between individual characteristics and intervention strategies which may increase or decrease risk of eating disorders during weight management.

**Results/ findings:** The EDIT Collaboration includes 52 studies (25 adolescent; 27 adult) as of December 2023 and will explore the complex risk factor interactions that precede changes to eating disorder risk following weight management interventions. The collaboration includes the integration of health consumers in project development and translation.

**Conclusion:** An important knowledge gain from this project is a comprehensive understanding of the impact of weight management interventions on eating disorder risk. Stakeholders interested in the collaboration should visit [www.editcollaboration.com](http://www.editcollaboration.com)

# Deconstructing complex interventions: piloting a framework of delivery features and intervention strategies for the Eating Disorders in weight-related Therapy (EDIT) Collaboration

Dr. Natalie Lister<sup>1</sup>, Dr. Hiba Jebeile<sup>1</sup>, Ms. Rabia Khalid<sup>1</sup>, Ms. Samantha Pryde<sup>2</sup>, **Dr. Brittany Johnson<sup>2</sup>**

<sup>1</sup>University of Sydney, Sydney, Australia, <sup>2</sup>Flinders University, Adelaide, Australia

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** The Eating Disorders in weight-related Therapy (EDIT) Collaboration aims to identify increases or decreases in an individual's eating disorder risk during weight management interventions among adolescent and adult populations. Weight management interventions are complex and vary in the way they are delivered and the strategies they use to change behaviours. Hence, this study aims to establish a framework and protocol to identify the delivery features and intervention strategies of weight management interventions.

**Methods:** A framework was developed through literature searches and stakeholder consultation. Six studies were independently coded by two reviewers. A detailed guidebook was developed which included a descriptor for each unique code. Consensus included recording conflict resolutions and framework changes. Eighty delivery features were developed based on the Template for Intervention Description and Replication (TIDieR) checklist. We also summarised the number and range of different outcome assessment procedures, as these may unintentionally deliver important messages about the aim and intended outcome of the intervention in addition to the planned intervention content. Categories under each delivery feature item/cluster were developed for this project drawing on relevant examples from child obesity prevention and the Human Behaviour Change Project ontologies.

Intervention strategies is the broad term used to describe the behaviour change content of interventions grouped under key categories (i.e., highest level grouping) relevant to weight management interventions. Clusters (i.e., mid-level grouping) of intervention strategies were captured under the following categories: intervention intent, framing and outcomes, dietary strategies, eating behaviours / disorder eating, movement and sleep related strategies, and psychological health related strategies. There were 86 unique intervention strategies (i.e., lowest-level grouping) across these five clusters.

**Results/ findings:** More conflicts occurred for intervention strategies compared to delivery features; both required updating definitions. Average coding times were 78 minutes (SD: 48) for delivery features and 54 minutes (SD: 29) for intervention strategies.

**Conclusion:** This project provides a detailed mapping of intervention components used in weight management trials measuring effect on eating disorder risk. This framework has the potential to be transferred or adapted to examine other safety or effectiveness outcomes in adolescent and adult weight management trials.

# Momentary experiences in neighborhood public spaces

Ms. Yuwen Zhao, **Dr. Pauline van den Berg**, Dr. Ioulia Ossokina, Prof. Theo Arentze

<sup>1</sup>TU Eindhoven, Eindhoven, Netherlands

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

A lack of physical activity is a growing challenge that impacts the health of individuals and communities. It contributes to obesity and several noncommunicable diseases, such as cardiovascular diseases, cancer, chronic respiratory diseases and diabetes. Many studies have shown that the built environment is a key factor that influences physical activity levels among local populations. Improving attractiveness of public space is often seen as a good strategy in creating healthy living environments, as attractive public space can stimulate residents to go outside and walk or cycle in the area, which contributes to their physical activity. However, knowledge about the way the built environment contributes to positive momentary experiences (emotions) of citizens is still limited, while this could give suggestions on how to implement physical environment interventions that support physical activity. Therefore, this study investigates momentary experiences in public spaces. We introduce a conceptual framework based on the Stimulus-Organism-Response (SOR) model and emotional appraisal theory. Effects of spatial and non-spatial (individual characteristics, the context of visit) variables on momentary experiences in and preferences for public spaces were investigated within this framework. A video-based stated choice experiment and an online questionnaire were used and data from 241 individuals in the Netherlands was collected. Bayesian structural equation modeling was used to analyze the data. As expected, we found that people prefer public spaces that evoke positive emotions (that make them feel relaxed, excited, safe, and comfortable). Spatial variables that positively affect momentary experiences are crowdedness (especially when it is dark), trees, grass surface, water and vertical greening. Spatial variables are found to affect individual's spatial choice both directly and indirectly through momentary experiences (emotions). Regarding non-spatial variables the results show that people who value health and pleasure more in their life experienced more positive emotions in the virtual environments. As positive emotions (momentary experiences) significantly contribute to users' public space choices, implementing these findings (e.g. adding green elements to public space) could contribute to creating attractive public space that can stimulate physical activity. Besides practical implications, this study provides a possible theoretical and methodological reference for further studies in this field.

# Description of 24-hour behavior patterns in Swedish adults: The SCAPIS study

Dr. Frida Bergman<sup>1</sup>, **Dr. Melony Fortuin-de Smidt<sup>1</sup>**, Dr. Pasan Hettiarachchi Hettiarachchi<sup>2</sup>, Dr. Daniel Arvidsson<sup>3</sup>, Prof. Mats Börjesson<sup>3,4,5</sup>, Dr. Elin Ekblom-Bak<sup>6</sup>, Prof. Örjan Ekblom<sup>6</sup>, Prof. Magnus Svartengren<sup>2</sup>, Associate Professor Patrik Wennberg<sup>1</sup>, Dr. Peter Johansson<sup>2</sup>

<sup>1</sup>Department of Public Health and Clinical Medicine, Umeå University, Umeå, Sweden, <sup>2</sup>Department of Medical Sciences, Occupational and Environmental Medicine, Uppsala University, Uppsala University Hospital, Uppsala, Sweden, <sup>3</sup>Center for Health and Performance, Department of Food and Nutrition, and Sport Science, Faculty of Education, Gothenburg University, Gothenburg, Sweden, <sup>4</sup>Center for Health and Performance, Department of Molecular and Clinical Medicine, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden, <sup>5</sup>Sahlgrenska University Hospital, Department of Medicine, Geriatrics and Acute Medicine, Gothenburg, Sweden, <sup>6</sup>Department of Physical Activity and Health, The Swedish School of Sport and Health Sciences, Stockholm, Sweden

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** To describe the 24-hour behavior patterns, including time spent in sleep, sedentary behavior (SB), and physical activity (PA) types by sex, body mass index (BMI) and educational levels among 50–64-year-old Swedish men and women.

**Methods:** The Swedish Cardio-Pulmonary bioImaging Study (SCAPIS) is an observational study that collected data at 6 centers in Sweden between 2014–2018. The participants were randomly selected from the general population using the Swedish population register. At 3 centers, Umeå (n=2500), Uppsala (n=5000) and Gothenburg (n=500), sleep, SB and PA data were measured with thigh-mounted accelerometers. Participants completed a questionnaire on age, sex, and education (basic education, high school/vocational education, university). Weight and height measurements were also done, and BMI (kg/m<sup>2</sup>) was calculated. An accelerometer was worn on the right thigh for 24 hours per day for 7 consecutive days. Sleep, SB and PA were determined from accelerometer data using ActiPASS, a custom-made software.

**Results:** The mean and median of each behavior (sleep, sitting, standing, walking, running, stair climbing, cycling and steps) will be calculated for the valid days of measurement and expressed as minutes or steps per day for the whole population. These behaviors will be compared between men and women (independent sample t-test or Mann Whitney U test for normally and non-normally distributed data, respectively) and between BMI groups (<25, 25–29, ≥30 kg/m<sup>2</sup>), and between educational groups by using a one-way ANOVA with Bonferroni *post hoc* test, for normally distributed variables or Kruskal Wallis test with Dunn *post hoc* test for non-normally distributed variables. In addition, 24-hr compositions of sleep, SB and PA will be presented visually as ternary plots.

**Conclusions:** A 24-hour perspective that includes sleep, SB and PA is a novel way to describe behavioral patterns in different groups compared to previous methods that evaluated these behaviors in isolation. Thigh-worn accelerometers also provide information on body posture e.g., sitting, standing as well as on activities such as cycling or running which may aid understanding of activity behaviors and may enhance compliance to physical activity recommendations.

# Monitoring the healthiness of food environments in supermarkets and out-of-home settings: assortment, price-promotions, in-store promotions and food marketing

Dr. Maartje Poelman<sup>1</sup>, **Mrs. Sanne Dijoosoepto**<sup>2</sup>, Assistant Professor Coosje Dijkstra<sup>3</sup>, Associate Professor Carlijn Kamphuis<sup>2</sup>, Ms. Charlotte Linnenbank<sup>4</sup>, Ms. Deborah Winkel<sup>4</sup>, Prof. Jaap Seidell<sup>3</sup>, Prof. Emely de Vet<sup>1</sup>  
<sup>1</sup>Wageningen University, Wageningen, Netherlands, <sup>2</sup>Utrecht University, Utrecht, Netherlands, <sup>3</sup>VU University Amsterdam, Amsterdam, Netherlands, <sup>4</sup>the Questionmark, Amsterdam, Netherlands

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Food environment transformations are urgently needed to improve population diets. In the Netherlands, national systems to monitor food consumption and population health are already in place, but systems to monitor the healthiness of food environments are lacking. This is important to provide insights in current performance of food outlets in supporting healthy food choices and to track performances over time. The aim of this study was to measure the healthiness of supermarket and out-of-home food environments, in particular the assortment, price promotions, in-store promotions, and food marketing (to children).

**Methods:** A quantitative design was used. Web-scraping techniques were used to collect data on food assortment (n=37,761 products) for 6 supermarket chains (total of 72% market value). All products were categorized by food group and whether they contribute to a healthy diet (yes/no). For an 8-week period, price-promotions were collected (n= 23,239 promotions) for 8 supermarket chains. To identify instore promotions (n=7,757 products) and instore food marketing to children (14 product categories, n=2,681 products) 40 supermarkets were visited (8 chains). Similar data was gathered for 21 out-of-home settings.

**Results:** Approximately 80% of food products in the assortment, as well as 80% of the products featuring in supermarkets' price- and in-store promotions were not supportive of a healthy diet. In addition, 73% of the check-outs offered snacks, but no healthy options. 97% of the food marketing to children was for products not supporting healthy diets. The top five most available food products in supermarkets were: non-alcoholic beverages, alcohol, sweets, biscuits, meat, and poultry (36% of the entire assortment). The five product groups with the highest share of products that align with the national dietary guidelines were: eggs, legumes, fish, fruit, and vegetables (13% of the entire assortment). Non-alcoholic drinks, sweets and confections, alcoholic beverages, dairy, and ready-to-eat meals were the most featured products in price-promotions. Even less supportive observations were found for out-of-home settings (these results will be presented).

**Conclusion:** Dutch food environments primarily consist of products and promotions that do not contribute to a healthy diet. Regular monitoring is needed to identify whether policies are effective to improve food environments.

# Barriers and enablers to healthier online grocery shopping by people with hypertension

**Mr. Damian Maganja (corresponding author)**<sup>1</sup>, Prof. Mark D Huffman<sup>1,2</sup>, Dr. Jason Hy Wu<sup>1</sup>, Dr. Kathy Trieu<sup>1</sup>

<sup>1</sup>The George Institute For Global Health, Sydney, Australia, <sup>2</sup>Washington University, St Louis, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Novel interventions are required to help people with hypertension meet dietary recommendations. The SaltSwitch Online Grocery Shopping trial is assessing an innovative intervention in online supermarkets that highlights sodium content of selected products and similar but lower-sodium alternatives. We investigated barriers and enablers to healthier purchasing behaviours as part of a process evaluation of the trial.

**Methods:** Participants were Australian adults with hypertension who are the primary household shoppers; those randomised to the intervention group (n=42 to date) were eligible for the process evaluation. Two experienced researchers conducted in-depth, semi-structured interviews to understand factors underpinning behaviours. We sought maximum variability sampling, stratifying by age, sex and frequency of shopping activity and use of the intervention. Interviews were audio-recorded and transcribed, with responses analysed using deductive and inductive content analysis using Nvivo. Barriers and enablers were organised using Story et al's multilevel framework of influences on dietary patterns.

**Results/findings:** This preliminary analysis is of 21 interviews conducted to date (mean duration 19.5 minutes, mean age 60.1 years, 71% female).

For some participants, health status was a pre-existing motivator to select healthier products (individual factor). Greater awareness of sodium content of groceries and health impacts of sodium (individual factor), stimulated by the intervention (physical environment), was reported to prompt healthier behaviours both within and outside the trial. Some participants noted the online setting helped minimise impulse purchases (physical environment).

Conversely, personal (individual factor) and family (social environment) taste/brand preferences were an important motivation for many, even amongst those aware of their health needs. Pricing/discounting was another key priority (macro-level environment). Incomplete product information online was mentioned as a barrier to identifying healthier options (physical environment).

**Conclusions:** Awareness of health conditions and risk factors may encourage healthier behaviours, though this may be overridden by personal/familial preferences and prices are of immediate concern to many. Multi-faceted interventions supporting healthier choices aligned with personal preferences, improving the financial accessibility of healthier options and increasing health and nutrition literacy may better help people with hypertension meet dietary guidelines. The online setting offers opportunities, including through innovative interventions such as ours, and challenges for healthy behaviours.

# Barriers and facilitators to General Practitioners' physical activity promotion behaviours when treating individuals with depression: a cross-sectional survey study

**Miss Jemima Cooper<sup>1</sup>**, Dr. Jeffrey Lambert<sup>1</sup>, Prof. Fiona Gillison<sup>1</sup>

<sup>1</sup>University of Bath, Bath, United Kingdom

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Despite the evidence-based benefits of physical activity for depression, previous studies indicate the majority (72%) of General Practitioners (GPs) do not discuss physical activity (PA) with patients during consultations. Given how integral GPs are in the management of depression, the purpose of this study is to identify the barriers and facilitators experienced by GPs to better understand why they don't engage in PA promotion for depression.

**Methods:** A cross-sectional survey was administered online to a representative sample of GPs from 1,248 GP Practices throughout England across all seven NHS Integrated Care Board regions. The sampling frame was the National GP Profiles Database held by OHID. GPs and Academics were involved in the development of the survey, which was informed by the Theoretical Domains Framework (TDF). A pilot stage was used to test recruitment methods and survey acceptability with GPs. The final survey consists of thirty-two questions from a validated questionnaire to assess respondent characteristics and GPs' barriers and facilitators to PA promotion for depression. Data will be analysed using descriptive statistics, crosstabulations to investigate relationships between demographic variables and TDF domains, and analysis of variance (ANOVAs) to investigate the relative importance of barriers and facilitators GPs experience when promoting PA for depression.

**Results:** Recruitment is ongoing with a current response rate of 5%. Initial results indicate that almost half of GPs report often discussing and recommending PA as part of their routine practice for patients who consult with them about depression. However, when treating patients with depression, over 50% of GPs report discussing and recommending other types of treatment often takes priority over discussing and recommending PA. Full results will follow the analyses detailed above. Data collection will conclude by end of December 2022.

**Conclusions:** Despite depression being the most common mental disorder, this is the first national survey to assess the barriers and facilitators to GPs' promotion of PA as a treatment for depression as a primary outcome. Increasing our knowledge and understanding of GPs PA promotion behaviours may help to inform more targeted interventions for GPs working with this sub-population of mental illness.

# Using item response theory to assess and shorten the Cooking and Food Provisioning Action Scale (CAFPAS)

Mr. Simon Karlsson<sup>1</sup>, Dr. Kathryn L. Harris<sup>1</sup>, Dr. Jeanette Melin<sup>1</sup>, Assistant Professor Jacob Lahne<sup>2</sup>, Associate Professor Julia A. Wolfson<sup>3</sup>, **Dr. Elizabeth S. Collier<sup>1,4</sup>**

<sup>1</sup>RISE Research Institutes of Sweden, Gothenburg, Sweden, <sup>2</sup>Virginia Polytechnic Institute and State University, Blacksburg, USA, <sup>3</sup>John Hopkins University, Baltimore, USA, <sup>4</sup>Linköping University, Linköping, Sweden

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** N. Other

**Background:** The Cooking and Food Provisioning Action Scale (CAFPAS) is a validated tool for measuring individuals' food agency, that is, their ability to make and meet food preparation and provisioning goals. It consists of 28 items which load on three subscales: Self-Efficacy, Attitude, and Structure. Evidence has shown that the CAFPAS is a valuable tool for assessing how food agency affects other food-related behaviors including healthy food consumption and from-scratch cooking frequency. However, this scale has not previously been assessed using item response theory (IRT), namely Rasch analysis, which can be used to identify if and which items may suffer irregularities due to misinterpretation, confusing phrasing, or do not discriminate between participants well. IRT can also be used to shorten scales, and in turn reduce cognitive load on participants in studies where several measures are employed.

**Purpose:** To assess the measurement properties of the CAFPAS using IRT and suggest a shortened version that minimizes data validity or reliability loss through a secondary analysis of data collected in two previously published studies utilizing the CAFPAS.

**Methods:** The following parameters of the three CAFPAS subscales based on a development sample (N=1853; 910 Swedish; 943 American) are evaluated: targeting, threshold ordering, item fit, unidimensionality, differential item functioning, local dependency, and person reliability. Exploratory factor analysis is also used on the Swedish data to assess the validity of the translation. Following iterative assessment of the measurement properties from different item combinations, a shortened version (11-item; CAFPAS-short) is drafted and tested using both the development sample and an additional validation sample (N=1457 Americans). Scores from the full CAFPAS and CAFPAS-short were also modelled with measures of cooking attitudes and behavior using Bayesian inference.

**Results and conclusions:** The full CAFPAS performs adequately according to Rasch analysis, although there is room for improvement. The Swedish translation of the CAFPAS has a similar underlying structure to the original English version and can be employed in studies where Swedish is the preferred language. The suggested CAFPAS-short performs similarly to the full version and may be suitable for use in studies involving several questionnaires to reduce overall survey length.

# Diabetes risk perception and metabolic profile in Asian women with a history of Gestational Diabetes Mellitus

**Dr. Seaw Jia Liew**<sup>1</sup>, Dr. Chun Siong Soon<sup>2</sup>, Mr. Yu Chung Chooi<sup>3</sup>, Dr. Mya Thway Tint<sup>1,3</sup>, Prof. Johan Gunnar Eriksson<sup>1, 3, 4, 5</sup>

<sup>1</sup>Human Potential Translational Research Program, Yong Loo Lin School of Medicine, National University of Singapore, Singapore, <sup>2</sup>Centre of Sleep and Cognition, Yong Loo Lin School of Medicine, National University of Singapore, Singapore, <sup>3</sup>Singapore Institute for Clinical Sciences, Agency for Science, Technology and Research (A\*STAR), Singapore, <sup>4</sup>Department of Obstetrics and Gynecology, Yong Loo Lin School of Medicine, National University of Singapore, Singapore, <sup>5</sup>Folkhälsan Research Center, Helsinki, Finland

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

Type 2 Diabetes (T2D) risk is high in women with prior Gestational Diabetes Mellitus (GDM). However, T2D is preventable by lifestyle changes. Previously, interventions have primarily focused on diet and physical activity (PA). Less emphasis has been given to tackle other risk factors, i.e. sleep and stress. This study aims to explore: (1) T2D risk perception of post-GDM women, and (2) feasibility of reducing T2D risk through promoting a holistic lifestyle intervention.

We intend to recruit 60 healthy non-diabetic women with prior GDM from the multi-ethnic Singaporean community. We offer everyone self-monitoring opportunity (i.e. Oura Ring and Oura mobile App) that provide daily statistics (PA, total sleep time and sleep-time heart rate). Participants are randomized to either Group 1 (self-monitoring + personalized recommendation to reinforce holistic healthy behaviors targeting diet, PA, sleep and stress) or Group 2 (self-monitoring).

Risk perception is self-reported as low, moderate, high. Glycemic status is determined by a 2-hr 75 g oral glucose tolerance test (OGTT) and HbA<sub>1c</sub>. Metabolic parameters include body mass index (BMI), lipid profile, liver and kidney function tests. Dietary intake is evaluated based on food photos shared by participants, and healthy eating is defined by 'My Healthy Plate' as recommended by the Singapore Health Promotion Board. PA is evaluated based on step counts, time spent on various PA intensity and being inactive. Total sleep duration of at least 7 hours per day is considered satisfactory. Perceived stress is self-reported. Physiological stress is derived from sleep-time heart rate variability measured by the Oura Ring.

Preliminary findings: Of 31 enrolled women, 48% perceived T2D risk as high, 32% as moderate and 20% as low. Participants were predominantly Chinese (77%). Baseline characteristics (median, 1<sup>st</sup> – 3<sup>rd</sup> quartile) were: Age: 35 (32-37) years; Time since last diagnosis of GDM: 2.4 (1.8-4.1) years; BMI: 24.2 (20.0-26.5) kgm<sup>-2</sup>; HbA<sub>1c</sub>: 5.3 (5.2-5.5)%; Fasting and 2-hour plasma glucose: 4.8 (4.6-5.1) and 7.0 (5.8-7.7) mmol/L, respectively; Systolic and diastolic blood pressures: 113 (108-117) and 71 (66-79) mmHg, respectively.

This study will be completed in April 2023. Findings on risk perception, metabolic profile and lifestyle changes will be presented at the conference.

# Economic valuation of brief advice intervention as part of routine care: How much does it cost to reduce the prevalence of physical inactivity and to avert death from NCDs?

**Mr. Danusorn Potharin<sup>1</sup>**, Dr. Bundit Sornpaisarn<sup>2</sup>, Associate Professor Piyawat Katewongsa<sup>1</sup>

<sup>1</sup>Institute for Population and Social Research, Mahidol University, Nakhon Pathom, Thailand, <sup>2</sup>Centre for Addiction and Mental Health (CAMH), Ontario, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Physical inactivity is a significant risk factor for a variety of noncommunicable diseases (NCDs) and the leading cause of premature death. The brief advice as part of routine care intervention (BA) for physical activity promotion has been implemented in Thailand to reduce physical inactivity across the country, but there is a lack of evaluation on this intervention. This study aims to evaluate BA implementation from the perspective of cost and effectiveness by health outcomes in Thailand during 2021–2030.

**Methods:** This study used the concept of health economics to analyze cost-effectiveness of BA and developed a model to increase the effectiveness of intervention. The data collection includes the costing, quantity assumption, and unit price of implementing BA on physical activity promotion on all levels of the Ministry of Public Health in Thailand. The data management includes exploration, model development, and verification. The OneHealth Tool program was used to analyze the cost of expanding the BA. The outcomes of analysis were showed in the form of cost-effectiveness ratio (CER) and the incremental cost-effectiveness ratio (ICER)

**Results:** The findings showed that physical activity promotion with BA may help to reduce the prevalence of physical inactivity among Thai population from 34.60% in 2021 to 23.44% by 2030 on the best model implementation of BA. Moreover, this intervention may help to reduce mortality of the Thai population. The intervention may prevent 1,469 (males) and 1,797 (females) deaths from cardiovascular disease; 1 death from diabetes (both sexes); 164 (males) and 231 (females) deaths from colorectal cancer; and 422 (females) deaths from breast cancer per year. The cost of implementing such measures is approximately 3,194 baht per person to meet sufficient physical activity.

**Conclusion:** The results informed that promoting physical activity through BA intervention in Thailand may contribute to reducing the prevalence of physical inactivity among Thai population and also reduce the mortality from cardiovascular disease, diabetes, colorectal and breast cancer.

# Visiting natural open spaces in urban areas during pregnancy and its association with physical activity engagement

Dr. Guillem Vich<sup>1</sup>, **Dr. Xavier Delclòs-Alió<sup>2</sup>**, Dr. Mikel Subiza-Pérez<sup>3</sup>, Dr. Asier Anabitarte<sup>3</sup>, Dr. Carolina Rueda<sup>4</sup>, Dr. Antoni Colom<sup>5</sup>, Prof. Carme Miralles-Guasch<sup>6</sup>, Dr. Aitana Lertxundi<sup>7</sup>, Dr. Jesús Ibarluzea<sup>8</sup>  
<sup>1</sup>ISGlobal, Barcelona, Spain, <sup>2</sup>Universitat Rovira i Virgili, Vila-seca, Spain, <sup>3</sup>IIS Biodonostia, San Sebastián, Spain, <sup>4</sup>Parc de Salut del Mar, Barcelona, Spain, <sup>5</sup>Fundació Institut d'Investigació Sanitària Illes Balears, Mallorca, Spain, <sup>6</sup>Universitat Autònoma de Barcelona, Cerdanyola del Vallès, Spain, <sup>7</sup>Universidad del País Vasco/Euskal Herriko Unibertsitatea, San Sebastián, Spain, <sup>8</sup>Health Department of the Basque Country, San Sebastián, Spain

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** We aim to 1) examine the relationship between visits to natural open spaces (NOS) in urban areas and physical activity (PA) engagement during pregnancy, 2) test whether this hypothesized association varies based on women's sociodemographic characteristics and residential environment, and 3) to examine if such association varies between the first and second trimesters of pregnancy.

**Methods:** A total of 731 women (416 from Donostia and 315 from Barcelona, Spain) were asked to wear an accelerometer and a GPS device for several days during the 1<sup>st</sup> trimester (T1) and the 2<sup>nd</sup> trimester (T2) of their pregnancy. The final sample for T1 consisted of 426 women who wore the devices correctly for at least one day. 131 women had valid participation days in both T1 and T2. Visits to NOS were defined as spending at least 5 consecutive minutes in NOS identified from the Urban Atlas of 2018. We first examine the association between NOS visits and daily PA in T1 accounting for sociodemographic and residential characteristics by means of multilevel modelling. Then, we focus on the subset of participants with valid data on both trimesters to explore this association longitudinally.

**Results:** Preliminary results show a mean of 0.48 and 1.75 daily visits to NOS among participants in Barcelona and Donostia in T1, respectively. We observed a significant bivariate association between visits to NOS and daily PA, especially in terms of moderate-to-vigorous PA (increasing median MVPA from 39 to 48 minutes,  $p=0.000$  from ANOVA test). We initially observed that both visits to NOS and PA levels increase in T2, strengthening the association between visits to NOS and PA.

**Conclusions:** Our preliminary results suggest that an association between visiting natural open spaces and physical activity during pregnancy exists in both the first and the second trimester. This finding highlights the need to promote access to such spaces in dense urban areas as a facilitator of healthy and active lifestyles throughout pregnancy. Further steps in this analysis will focus on the factors influencing the association between NOS visits and PA across trimesters, as well as to examine the characteristics of such visits.

# Exploring the associations of physical activity, sedentary behavior and sleep with food cravings and weight as a moderator

**Miss Flore De Vylder<sup>1</sup>**, Dr. Lieze Mertens<sup>1,2</sup>, Dr. Delfien Van Dyck<sup>1</sup>, Dr. Greet Cardon<sup>1</sup>, Dr. Lien Goossens<sup>3</sup>  
<sup>1</sup>Department of Movement and Sport Sciences, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>2</sup>Department of Public Health and Primary Care, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>3</sup>Department of Developmental, Personality and Social Psychology, Faculty of Psychology and Educational Sciences, Ghent University, Ghent, Belgium

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Food cravings are a key motive for food intake and are regularly experienced by the majority of the population, predominantly by women. They are defined as "an intense desire or urge to consume specific foods". Studies have linked food cravings with failed diet attempts, increased food intake and possible weight gain over time underlining the importance of research on the determinants of food cravings in our obesogenic society. This pilot study aims to determine if sleep, sedentary behavior and physical activity are related to food cravings, and examines weight status as a potential moderating factor.

**Methods:** For this exploratory study, data was collected in a sample of 53 healthy Belgian adults, aged 18 to 64 years. Based on BMI, participants were divided into three subgroups 'normal weight' (n=30), 'overweight' (n=12) and 'obese' (n=11). The Food Cravings Questionnaire-Trait-reduced was used to assess the frequency and intensity of food cravings. Physical activity, sedentary behavior and sleep quantity was measured for 7 days using the Axivity AX3 accelerometer. Open Movement (OM Gui) software was used for the analysis of accelerometer data. Sleep quality was measured using the Pittsburgh Sleep Quality Index (PSQI).

**Findings:** For this abstract we will focus on the descriptives only, since data analysis is still ongoing. Complete results will be presented at the conference. Of the total sample 50.9% was defined as 'high cravers'. This percentage was higher in adults with obesity (63.5%). Light physical activity was higher in the adults with overweight and obesity, although big differences were observed between participants with a range from 36-171 min/day. Very divergent results were also found for moderate to vigorous physical activity (range: 39-343 min/day), sedentary behavior (range: 451-909 min/day) and sleep quantity (range: 287-672 min/day). Participants with overweight and obesity had more severe difficulties regarding sleep quality than the adults with a normal weight.

**Conclusion:** The results of this pilot study will offer more insight into sleep, sedentary behavior and physical activity as determinants of food cravings. They can support future research aiming to develop interventions that lead to effective behavior change in high cravers in different weight categories.

# Developing a framework for engagement in NewTools, a research project with partners across the Norwegian food system

**Ms. Anne Lene Løvhaug**<sup>1</sup>, Prof. Lisa Garnweidner-Holme<sup>1</sup>, Dr. Marianne Hope Abel<sup>2</sup>, Dr. Arnfinn Helleve<sup>2</sup>, Ms. Kaja Lund-Iversen<sup>2</sup>, Dr. Helle Margrete Meltzer<sup>2</sup>, Dr. Hanne Fjerdingby-Olsen<sup>3</sup>, Dr. Helen Engelstad Kvalem<sup>4</sup>, Dr. Laura Terragni<sup>1</sup>

<sup>1</sup>OsloMet – Oslo Metropolitan University, Oslo, Norway, <sup>2</sup>Norwegian Institute of Public Health, Oslo, Norway,

<sup>3</sup>Norwegian University of Life Sciences, Ås, Norway, <sup>4</sup>Norwegian Scientific Committee for Food and Environment, Oslo, Norway

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Many cross-sectional research partnerships are currently established to address food systems challenges and promote healthier, environmentally friendly diets. These partnerships involve stakeholders having different mandates and values and conflicts of interest (COI) may impair processes and outcomes. Frameworks stating principles and rules for engagement can facilitate cooperation and prevent COI. However, very few examples exist on how research partnerships develop such frameworks and what these look like. We address this gap by describing the development and key content of a framework for engagement in NewTools, a Norwegian cross-sectional research partnership aiming at more sustainable food production and consumption through developing and testing two food profiling systems: one for nutritional quality and one for environmental and social sustainability.

**Methods:** A group of researchers and project coordinators in NewTools developed the framework using a process consisting of a purposeful selection of existing frameworks for engagement and internal project documents; discussions within the research group, and consultations within the NewTools consortium.

**Results:** *Development:* WHO's Framework for Engagement with Non-State Actors and NewTools' governing documents were selected to inform the initial stages of the process. The research group discussed e.g., engagement needs, balancing transparency towards workload, and how to identify and manage COIs. The NewTools consortium was consulted twice which led to minor adjustments.

*Framework:* The finalized framework is a practical guidance which complements the projects' legal documents, in an accessible language. Its key content is: 1) Overarching principles [e.g., transparency, regular information, adhering to defined roles and responsibilities] 2) Descriptions of roles and responsibilities [e.g., all partners have the right to being involved and heard, researchers make final decisions] 3) Procedures to ensure involvement and transparency in meetings, written input, seminars, sharing of data and other engagement forms and 4) Descriptions of conflict areas and conflict mediation. The framework may be revised during the project period.

**Conclusions:** This study provides an example on how research partnerships aiming to promote healthier and more sustainable diets can develop frameworks to facilitate engagement and help prevent COI. This may inform and support cross-sectional work contributing to meeting the Sustainable Development Goals.

# Identification of children and adolescents at high risk of obesity: Development and external validation of a prediction risk score

Dr. Christoph Buck<sup>1</sup>, Dr. Rajini Nagrani<sup>1</sup>, Dr. Tanja Vrijkotte<sup>2</sup>, Dr. Anton Schreuder<sup>2</sup>, Dr. Fabio Lauria<sup>3</sup>, Prof. Luis Moreno<sup>4,5</sup>, Prof. Stefaan De Henauw<sup>6</sup>, Prof. Lauren Lissner<sup>7</sup>, Prof. Toomas Veidebaum<sup>8</sup>, Dr. Dénes Molnár<sup>9</sup>, Dr. Charalambos Hadjigeorgiou<sup>10</sup>, Prof. Wolfgang Ahrens<sup>1,11</sup>, Dr. Claudia Böhrhorst<sup>1</sup>, Prof. Iris Pigeot<sup>1,11</sup>, Mrs. - on behalf of the GrowH! consortium

<sup>1</sup>Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, <sup>2</sup>Department of Public and Occupational Health, Amsterdam Public Health Research Institute, Amsterdam UMC, University of Amsterdam, Amsterdam, Netherlands, <sup>3</sup>Institute of Food Sciences, National Research Council, Avellino, Italy, <sup>4</sup>GENUD (Growth, Exercise, Nutrition and Development) Research Group, University of Zaragoza, Instituto Agroalimentario de Aragón (IA2), Instituto de Investigación Sanitaria de Aragón (IIS Aragón), Zaragoza, Spain, <sup>5</sup>Centro de Investigación Biomédica en Red de Fisiopatología de la Obesidad y Nutrición (CIBEROBN), Instituto de Salud Carlos III, Madrid, Spain, <sup>6</sup>Department of Public Health and Primary Care, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>7</sup>School of Public Health and Community Medicine, Institute of Medicine, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden, <sup>8</sup>Department of Chronic Diseases, National Institute for Health Development, Tallinn, Estonia, <sup>9</sup>Department of Pediatrics, Medical School, University of Pécs, Pécs, Hungary, <sup>10</sup>Research and Education Institute of Child Health, Strovolos, Cyprus, <sup>11</sup>Department of Mathematics and Computer Science, University of Bremen, Bremen, Germany

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Background:** Early life is critical in the development of obesity and a huge range of childhood risk factors has been found to affect adult obesity risk. Machine learning methods have become widely used to handle a large number of risk factors and their interrelation for future risk prediction. Within the JPI GrowH! project, we used data from the IDEFICS/I.Family cohort to identify key overweight/obesity (OW/OB) factors to develop a risk score that enables the identification of individuals early in life with high risk for future OW/OB. External validation was conducted using data of the ABCD cohort.

**Methods:** We considered data of N = 5,601 children aged 2- to <12-years without OW/OB at baseline providing information on 85 risk factors and follow-up weight status four to six years later. We used random forest regression models to select behavioural and early life factors for the development of risk score models by age strata (2- to <6-year-olds, >6- to <12-year-olds) based on variable importance. Risk score models were calculated based on the selected set of variables using logistic regression models per age stratum. Accuracy, sensitivity and specificity of predicting OW/OB four to six years later were calculated for model evaluation, internal validation using a holdout sample, and external validation.

**Results:** Besides commonly known risk factors such as parental education, baseline BMI z-score, BMI of mother and father, age, and sex, we selected 11 behavioural and early life factors in each age group for risk score development. Internal validation of risk score models to identify children who become OW/OB in four to six years showed high accuracy (>70%), good sensitivity (73% and 78%) and satisfactory specificity (74% and 73%) in both age groups. External validation showed higher sensitivity (82% to 97%), but specificity was very low (19% to 53%), particularly for predicting OW/OB in adolescence.

**Conclusion:** The developed risk scores enable the identification of children potentially developing OW/OB in future allowing targeted prevention. Predictions for older children were less accurate highlighting the focus of risk scores based on early life factors for pre-school children. External validation revealed that generalisability of risk scores is limited.

# The geographic context of physical activities – How to overcome the challenges in capturing the environmental exposure?

**Dr. Tiina Rinne<sup>1</sup>**

<sup>1</sup>Aalto University, Espoo, Finland

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

The value of multilevel research and intervention approaches in health promotion is well recognized. The social ecological approach suggests that the spatial context among other factors influence physical activity behavior. Ample research documents that physical environment factors such as mixed land use, street connectivity, accessibility, density, quality of the traffic environment, nature, and green spaces are associated with various types of physical activity behavior. Yet, to date many inconsistent associations remain, which might be explained by conceptual and methodological challenges in measuring the spatial dimensions of physical activity.

It has been suggested that research applying the principles of the social ecological models could benefit from a profound theoretical and methodological scrutiny to create more comprehensive multilevel study and intervention settings. Furthermore, research that is interested in the environmental effects on human health behavior has been urged to move beyond notions of contextual influences that rely solely to fixed locations such as residential areas, administrative boundaries or static buffered areas defined around individuals' homes.

Geospatial passive and active sensing systems enable diverse opportunities for research interested in environmental effects on physical activity. Here, passive sensing is generally associated with fast wireless communication, cyber infrastructure and the IoT and the collection of real-time geospatially referenced information without any active forms of stakeholder engagement (e.g., mobile phone data) whereas active sensing technologies draw on voluntary contributions of people to collect geospatial data (e.g., participatory mapping methods). This presentation focuses on geospatial active and passive sensing methods and their usability in capturing the environmental context of physical activities. Furthermore, this presentation explores what is known from the literature about the conceptual and methodological aspects of capturing the spatial context in physical activity research. Finally, the presentation will discuss how to close the methodological gap in capturing the geographical context that exists within the wide spectrum of health-place research.

# Physical behaviors during work and leisure time in different occupational groups - a descriptive study.

**Dr. Frida Bergman**<sup>1</sup>, Dr. Melony Fortuin-de Smidt<sup>1</sup>, Dr. Pasan Hettiarachchi<sup>2,3</sup>, Dr. Peter Johansson<sup>2,3</sup>, Dr. Viktoria Wahlström<sup>1</sup>, Dr. Andreas Hult<sup>1</sup>, Prof. Lisbeth Slunga Järvholm<sup>1</sup>, Prof. Magnus Svartengren<sup>2,3</sup>, Associate Professor Patrik Wennberg<sup>1</sup>

<sup>1</sup>Umeå University, Umeå, Sweden, <sup>2</sup>Uppsala University, Uppsala, Sweden, <sup>3</sup>Uppsala University Hospital, Uppsala, Sweden

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose** The aim of this study is to investigate the differences in device-measured physical behaviors during work and leisure time between different occupational groups.

**Methods** This study is based on data collected in the Umeå cohort (n = 2 500) of the Swedish CARDioPulmonary biolmage Study (SCAPIS). In SCAPIS, a random selection of men and women aged between 50-64 years from the general population were invited for an extensive health examination. In Umeå, measurements with thigh accelerometers were performed for 24 hours a day for 7 consecutive days to measure physical behaviors, including lying, sitting, standing, walking, running, stair walking and cycling, as well as sleep. In addition, the participants also recorded their work hours in a diary. Physical behaviors during work and leisure time will be analyzed based on the self-reported work hours. The thigh accelerometer data will be processed using the ActiPASS software. Occupational belonging, reported in the SCAPIS questionnaire, will be coded to occupational groups according to the Nordic Classification of Occupations.

**Results/findings** Mean and median values of time spent in physical behaviors will be calculated for the valid days of measurement. Differences between different occupational groups in time spent in physical behaviors during work hours and during leisure time will be presented. A one-way ANOVA with Bonferroni *post hoc* test will be used for normally distributed variables, and a Kruskal-Wallis test with Dunn *post hoc* test will be used for non-normally distributed variables.

**Conclusion** Large epidemiological studies investigating device-measured physical behaviors at work and leisure time in different occupational groups are still scarce. More knowledge about this would aid in the development of primary prevention efforts and interventions. This study will lay the groundwork for our future analyses investigating health effects of physical behaviors in the different domains of work and leisure.

# Measuring children's active travel - validity and reliability of participatory mapping method against accelerometry

**Dr. Tiina Rinne<sup>1</sup>**, Dr. Samad Esmaeilzadeh<sup>2</sup>, Dr. Päivi Berg<sup>2</sup>, Ms. Pirjo Hakala<sup>2</sup>, Dr. Arto J. Pesola<sup>2</sup>

<sup>1</sup>Aalto University, Espoo, Finland, <sup>2</sup>XAMK South-Eastern Finland University of Applied Sciences, Mikkeli, Finland

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

Active travel is a frequent, practical, and easily accessible source of physical activity for children. Studies have shown that children who walk their school trips are likely to engage in more overall physical activity and seem to meet the global physical activity guidelines compared to children who travel by motorized transportation. Examining children's active travel and related associations with health outcomes requires valid, accurate and reliable measures of their active travel habits. Accelerometry has gained ground as a present-day go-to device-based method for assessing physical activity. Besides accelerometers, self-report travel, and time use diaries and physical activity questionnaires are popular methods to estimate active travel and physical activity. These methods are generally accepted as valid, convenient, and affordable. However, the self-report retrospective physical activity questionnaires are often thought being less accurate in estimating physical activity and compared to device-based methods, they are reported being subject to recall bias and measurement errors. Despite their popularity and the multiple advantages both these methods have, there is one important element accelerometers and self-reported questionnaires lack. That is their inability to capture the environmental exposure of physical activities. Given that a vast amount of research confirms that multiple factors of the everyday environments are strongly associated with children's active travel, the questions about the environmental exposure and the spatial effect on active travel should be carefully considered. Public Participatory GIS (PPGIS) is an example of advanced spatially sensitive web-based participatory mapping method that allows for the collection of localized experiential and behavioral knowledge from large population samples that can be analyzed together with the register-based GIS data. PPGIS method enables the identification of people's space-time trajectories and the frequency and duration of exposures during active travel. However, there exists no previous research that would have analyzed the reliability and the validity of PPGIS in capturing active travel. This paper investigates the test-retest reliability and internal consistency of PPGIS-measured active travel, and validity of PPGIS measured active travel against device-measured active travel among Finnish 10 to 12 years old children and discusses the pros and cons of using PPGIS methods in capturing active travel.

# Are psychosocial factors associated with the risk of running related injuries?

**Mr. Michal Sebera<sup>1</sup>**, Prof. Steriani Elavsky<sup>1</sup>, Mr. Jiří Skýpala<sup>1</sup>

<sup>1</sup>University of Ostrava, Ostrava, Czech Republic

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Introduction and Purpose** Running is one of the most popular physical activities among people who try to engage in physical activity to keep themselves healthy. Although the health benefits of running are significant, there is also a significant risk of injury. Training and biomechanical risk factors for running related injuries are widely described in the literature, whereas there are not many studies on psychosocial factors in runners. Therefore, the aim of this study was to assess whether psychosocial factors can be linked to running-related injuries reported prospectively in recreational runners.

**Methods and analysis** The design of the study was a 1-year prospective study with 108 participants (age  $36,3 \pm 8,4$  years; height  $1,70 \pm 0,1$  m; weight  $71,5 \pm 13,2$  kg). Running behavior was measured by Polar M400 HR GPS watches across 21 days (the first of three data collection bursts throughout the year-long study). The primary outcome was running-related injuries reported in 1year follow-up. The primary exposure variables were running-related characteristics (volume, duration, speed, pace) and psychosocial factors (sleep quality, physical and mental health, self-determination, motivation, stress, depression) assessed upon entry into the study.

Linear regression models were used to assess whether psychosocial factors predicted prospectively reported injuries after accounting for effects of running-related characteristics.

**Results and Conclusion** Of the psychosocial factors examined, only sleep quality was associated with injury. However, a limitation was the low number of injured runners, so further studies with larger sample sizes are needed.

# Comparing Canada's 2018 proposed and 2022 final Front-of-Pack labelling regulations using a generic food composition database and nationally representative dietary intake survey data

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** In July 2022, Canada published its final Front-of-Pack (FOP) labelling regulations, mandating pre-packaged foods meeting and/or exceeding thresholds for nutrients-of-concern (i.e., saturated fat, sugars, sodium) display a 'high-in' FOP symbol, which differed from the proposed regulations introduced in 2018. This study compared the proposed and final FOP labelling regulations by examining the difference in the prevalence of foods requiring a FOP symbol and nutrient intakes from foods that would display a FOP symbol.

**Methods:** Using a generic food composition database (Canada Nutrient File), all foods were categorized according to proposed and final FOP labelling regulations: exempted from regulations, not display a FOP symbol as all nutrient levels are below thresholds, or would display a FOP symbol. Differences in the proportion of each category, according to the proposed and final regulations were compared. Using nationally representative dietary survey data (Canadian Community Health Survey 2015), intakes of energy and nutrients-of-concern from foods that would display a FOP symbol according to the proposed and final FOP labelling regulations were compared.

**Results/findings:** Compared to the proposed FOP labelling regulations, less foods would display a FOP symbol (49% vs. 43%) according to the final regulations, while more foods would be exempted (21% vs. 28%). Less foods would display a FOP symbol was observed for sodium (30% vs. 27%) and saturated fat (21% vs. 18%), but not sugars (14% vs. 13%). Similarly, energy intakes of Canadian adults from foods that would be exempted from final FOP labelling regulations increased (32% vs. 24%) compared to the proposed regulations, while intakes from foods that would display a FOP symbol decreased (49% vs. 43%). Intakes were lower from foods that would display FOP symbols for saturated fat (37% vs. 16%) and sodium (36% vs. 30%), but not sugars (27% vs. 25%).

**Conclusions:** Our findings show that an increase in the proportion of foods that would be exempted due to changes to the final FOP labelling regulations could negatively impact energy and/or nutrient-of-concern intakes by Canadian adults. FOP labelling regulations should be further examined, monitored, and evaluated over time to ensure policy objectives are met.

# Evaluating the maintenance of the VAMOS Program during the COVID-19 pandemic: a repeated-measure analysis of a community-based intervention in 15 cities in Brazil

**Mrs. Marina Christofolletti<sup>1</sup>**, Dr. Leandro Garcia<sup>2</sup>, Dr. Laurent Malisoux<sup>3</sup>, Dr. Tania Benedetti<sup>1</sup>

<sup>1</sup>Federal University of Santa Catarina, Florianópolis, Brazil, <sup>2</sup>Queen's University Belfast, Belfast, United Kingdom, <sup>3</sup>Luxembourg Institute of Health, Strassen, Luxembourg

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Health promotion interventions in Primary Health Care (PHC) are effective in bringing about health behavior changes. However, the COVID-19 pandemic imposed challenges to the long-term maintenance of behavioral changes achieved by PHC interventions. This study aimed to describe the maintenance in the practice of physical activity, eating habits, quality of life and body mass index (BMI) during the COVID-19 pandemic in participants of the Active Life Improving Health Behavior Change Program (VAMOS).

**Methods:** The VAMOS Program was a community-based PHC-centered intervention aiming at motivating people to adopt an active and healthy lifestyle. The program was a face-to-face intervention based on health education, with 18 sessions. PHC professionals conducted the program, which was implemented in 15 cities in the South of Brazil (16 groups). Data were collected using a validated instrument at baseline (April to August 2019, n=327), post-intervention (November to December 2019, n=191), and 16 months after (maintenance) (June to July 2021, n=118). The outcomes were leisure-time physical activity (min/week), eating habits (food consumption scale [FCS]), perceived quality of life (negative/positive) and BMI. The exposure was the data collection phase (baseline, post-intervention, and maintenance), and the covariates were age, sex, race, BMI, marital status, educational level and urban-rural classification. Multilevel mixed-effects generalized linear and logistic regression models (odds ratio [OR]) were used. The random effects were the participant and the group identification, and the fixed effect was the data collection.

**Results:** Physical activity was lower at the maintenance period compared to baseline (-44.8 min/week,  $p = 0.031$ ) and was not different compared to post-intervention. Eating habits had a continuous improvement over time (2.1 [ $p = 0.001$ ] and 1.5 [ $p = 0.024$ ] FCS-points, respectively). Perceived quality of life in maintenance had higher odds of being positive compared to the baseline (OR: 2.03,  $p = 0.031$ ) and had no difference with the post-intervention. BMI did not change over time.

**Conclusions:** Overall, participants of the VAMOS Program had no deterioration of the health behaviors during the COVID-19 pandemic, with improvements in some indicators post intervention. Physical activity decreased, but gains in eating habits and perceived quality of life since baseline were maintained.

# Trajectories of physical activity in relation to risk of neuropathy in Swedish adults with type 2 diabetes.

**Mr. Thomas Vogt<sup>1</sup>**, Dr. Emerald Heiland<sup>1</sup>, Prof. Karl Michaëlsson<sup>1</sup>, Prof. Liisa Byberg<sup>1</sup>, Dr. Beatrice Kennedy<sup>1</sup>, Associate Professor Hannah Brooke (corresponding author)<sup>1</sup>

<sup>1</sup>Uppsala University, Uppsala, Sweden

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** The relationship between longitudinal trajectories of physical activity and the risk of neuropathy in individuals with type 2 diabetes has not been elucidated. Understanding this relationship will strengthen future interventions and improve the personalisation of healthcare. We aim to describe longitudinal trajectories of physical activity, and to examine their associations with neuropathy-related outcomes.

**Methods:** We will conduct a population-based cohort study including all adults with newly diagnosed type 2 diabetes and at least one record in the Swedish National Diabetes Register in 1996-2020 (n~200,000). Physical activity is a time-updated, self-reported 5-level variable from “no” to “daily” physical activity corresponding to 30-minutes walking (or equivalent). The incidence of neuropathy will be assessed through ICD-10 code E.11.4 from nationwide hospital inpatient and outpatient registers. Directed Acyclic Graphs will be used to determine which confounders to include in the main model. We will use group-based trajectory modelling to identify individuals with similar patterns of physical activity over time. We will then use Cox Proportional Hazards models to compare the hazard rates for neuropathy-related outcomes between groups of patients belonging to different trajectories of physical activity. Individuals will be followed from diabetes diagnosis, to death, migration, or end of follow-up (December 2020), whichever comes first. We will also consider interactions by sex, and investigate the associations in men and women separately.

**Results:** Approximately 200,000 individuals, aged 18-75 years, are registered with incident type 2 diabetes from 1996 onwards. We will present descriptive summaries of this population, graphical representations of the physical activity trajectories, and hazards ratios with 95% confidence intervals for the associations between trajectories of physical activity and neuropathy.

**Conclusions:** This study will highlight how longitudinal trajectories of physical activity are associated with risk of neuropathy in individuals with type 2 diabetes. Our findings may further inform on the potential for physical activity initiation to reduce neuropathy development, which may allow clinicians to provide tailored intervention efforts to their patients.

# Evaluation of an automated dietary assessment technology for snacking behaviours

**Miss Femke de Gooijer**<sup>1,2</sup>, Mr. Alex van Kraaij<sup>2</sup>, Prof. Edith Feskens<sup>1</sup>, Assistant Professor Marlou Lasschuijt<sup>1</sup>, Dr. Guido Camps<sup>1,2</sup>

<sup>1</sup>Wageningen University and Research, Wageningen, Netherlands, <sup>2</sup>OnePlanet Research Centre, Wageningen, Netherlands

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Snacks, foods and caloric drinks consumed in between regular meals, play a significant role in the modern diet. What drives snack choice and snacking behaviour has predominantly been studied using self-reports or in controlled laboratory settings. Both methodologies lack of validity and therefore there is a need for new technologies which objectively capture snacking behaviour outside the laboratory. The aim of this study was to evaluate the *SnackBox*, a new technology for assessing snacking behaviour in real-life settings with little effort of the user and interference by the researcher.

**Methods:** The *SnackBox*, a plateau (15 x 30 cms) containing electronics with three sensing coasters on top, stores three different snacks or beverages and automatically measures how much (in grams) is consumed of each component and at what time of the day (Figure 1). To evaluate the *SnackBox*, 47 office workers (29 female, 1 unknown, mean age = 28.8, SD = 4.1) used the *SnackBox* at their workplace and in their home for five days over a two week period to record their snack consumption. On measurement days, participants completed 5-hour dietary recalls in an application on their mobile phone. Ad libitum portions of snacks and beverages were provided for the participants and after the study period, left-overs were measured to determined true consumption (in grams). Intra-correlation coefficients (ICC) of absolute agreement were used to evaluate the relationship between the true consumption and estimated weights recorded with both the *SnackBox* and the self-report. Lastly, the User Experience Questionnaire was used to assess usability of both the dietary recall application and the *SnackBox*.

**Results/findings:** The *SnackBox* showed higher reliability (ICC = 0.80, CI = 0.72, 1.85) in estimating the weight of the total amount of snacks consumed compared to the 5h dietary recall application (ICC = 0.60, CI = 0.45, 0.70). Participants scored the usability of the *SnackBox* significantly higher compared to the usability of the recall application.

**Conclusions:** This study shows that the *SnackBox* is an accurate and low-burden tool that can be used to assess snacking behaviours in real-life settings.

# Knowledge of physical activity guidelines amongst final year medical students in Scotland: Changes over a decade.

**Dr. Gemma Ryde<sup>1</sup>, Ms. Isabelle Schlegel<sup>1</sup>**

<sup>1</sup>University of Glasgow, Glasgow , United Kingdom

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** The need to increase physical activity (PA) in clinical populations is well known. However, a survey by Dunlop and Murray of final-year medical students in Scotland in 2013 found medical students' knowledge of PA guidelines and confidence in their training to deliver PA advice was low. The authors recommended improving undergraduate medical PA education in Scotland which has been implemented by some universities. This study assessed current final-year medical students in Scotland's knowledge of PA guidelines and confidence in their training to deliver PA advice 10 years after the original study.

**Methods:** An online survey was sent to final-year undergraduate medical students via email and electronic message boards across four medical schools in Scotland. This survey included ten questions about physical activity including knowledge of the PA guidelines, PA's importance compared to other morbidity risk factors and students' confidence in their medical training to deliver PA advice. This survey was a modified version from Dunlop and Murray's 2013 survey to include updated PA guidelines (now both aerobic and strength-based) and collects participant demographic information (age, gender, university and PA levels) for analytic purposes. Results will be discussed in relation to findings in 2013 to ascertain whether there has been improvement in these measures over the last ten years.

**Results/findings:** The survey was launched in November 2022 and will close February 2023. To date 101 students have completed the survey (177 students in 2013). Participants were mainly female (70%) and aged 23.5±4.1 years. Provisional analysis suggests more students in the current study were aware of the PA guidelines than in 2013 (48% v 40%), but fewer were able to correctly identify them (26% v 68%). When asked if they felt they had been adequately trained to provide PA advice to the general population, 20% in the current sample reported they were, compared to 52% from the previous study.

**Conclusions:** With the need for medical professionals to be able to prescribe physical activity, the provisional results from this study suggest they are less able to do so than 10 years ago.

# Co-creators' psychological experiences of the co-creation of a workplace health plan to reduce sedentary behaviour: A Health CASCADE study.

**Ms. Lauren McCaffrey<sup>1</sup>**, Ms. Mira Vogelsang<sup>1</sup>, Associate Professor Maria Giné-Garriga<sup>2</sup>, Dr. Bryan McCann<sup>1</sup>, Dr. Philippa Dall<sup>1</sup>

<sup>1</sup>Glasgow Caledonian University, Glasgow, United Kingdom, <sup>2</sup>Blanquerna Universitat Ramon Llull, Barcelona, Spain

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** Despite growing recognition that co-creation experience can impact engagement with the co-creation process and the success of co-created output, there is a lack of research investigating people's experience of participating in co-creation. Understanding co-creation experience could inform optimal development and use of the co-creation process. The purpose of this study was to explore the co-creators' experience of co-creating a health intervention plan to reduce sedentary behaviour.

**Methods** A case study design implementing mixed methods was adopted to gain a comprehensive understanding of the co-creation experiences of employees (n=10) from one small-to-medium enterprise in Scotland. Workshops (n=8; 90min; across 10 weeks) were video recorded. Participatory observations (during workshops) and researcher reflections (after workshops) covered pre-set topics of setting, atmosphere, behaviour of individuals and group dynamics. After the final workshop, semi-structured interviews will be conducted with the co-creators. Instances of physiological arousal/depression (measured during workshops using an Empatica E4 wristband) will be time synchronised to the video recordings and selected clips will be presented to participants during the interview. Interviews will be audio-recorded, transcribed and analysed thematically for deeper exploration of these experiences, such as range of emotions and key psychological components.

**Findings** Preliminary findings from observations reveal that the co-creators have increased their knowledge of sedentary behaviour and, importantly, their own sedentary patterns. In general, co-creators were observed to be satisfied with and to have enjoyed taking part in the workshops. Additionally, the co-creators displayed trust during the workshops by being vulnerable, speaking up, asking questions, laughing and making jokes. This contributed to fostering team cohesiveness, essential for open non-judgemental discussion. It became evident that working relationships and group dynamics are central to the success of the process. Facilitators can positively impact the co-creators' experience by acknowledging the co-creation process can be dynamic. Interviews conducted after the co-creation workshops will enrich the preliminary analysis of the observational findings.

**Conclusion** An increased understanding of the experience of participating in co-creation processes may help to inform implementation of co-creation processes, could benefit the co-creators' and improve the co-created intervention.

# Adults' perceptions of the healthiness of sugary drinks across five countries from 2018 to 2021: evidence from the International Food Policy Study

**Mrs. Virginie Drolet-labelle**<sup>1,2</sup>, Mrs. Christine M White<sup>3</sup>, Dr. Gary Sacks<sup>4</sup>, Dr. Jean Adams<sup>5</sup>, Dr. Sharon I Kirkpatrick<sup>3</sup>, Dr. Alejandra Jauregui<sup>6</sup>, Dr. James F. Thrasher<sup>7</sup>, Dr. Lilia Pedraza<sup>6</sup>, Dr. Christina Roberto<sup>8</sup>, Dr. Véronique Provencher<sup>1,2</sup>, Dr. David Hammond<sup>3</sup>, Dr. Lana Vanderlee<sup>1,2</sup>

<sup>1</sup>Centre Nutrition santé et société (NUTRISS), Institut sur la nutrition et les aliments fonctionnels (INAF), Université Laval, Québec, Canada, <sup>2</sup>École de nutrition, Faculté des sciences de l'agriculture et de l'alimentation (FSAA), Université Laval, Québec, Canada, <sup>3</sup>University of Waterloo, Waterloo, Canada, <sup>4</sup>Deakin University, Melbourne, Australia, <sup>5</sup>University of Cambridge, Cambridge, United Kingdom, <sup>6</sup>Instituto Nacional de Salud Pública, Cuernavaca, Mexico, <sup>7</sup>University of South Carolina, Columbia, USA, <sup>8</sup>University of Pennsylvania, Philadelphia, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** Sugary drink (SD) consumption is a public health concern globally. This study aimed to examine: 1) differences in SD's perceived healthiness across countries over time, and 2) relationships between perceived healthiness of SDs and SD intake.

**Methods** Adults (>18 y) from Australia, Canada, Mexico, the United Kingdom (UK), and the United States (US) completed cross-sectional online surveys conducted annually between 2018 and 2021 as part of the International Food Policy Study (n=83,048). Participants indicated perceived healthiness of a branded soft drink (cola) and another beverage type (chocolate milk, sports drinks, 100% fruit juice and others) on a scale from 1 (very unhealthy) to 7 (very healthy). Intake of 20 beverage categories in the past 7 days was also assessed (yes/no). Logistic regression models examined differences in beverage perceptions by country, and stratified models examined trends of time and associations between perceptions and intake within countries, adjusting for socio-demographics.

**Results/findings** In all countries, regular cola was perceived as unhealthy by 77.1% of the respondents, followed by sports drinks (36.2%), chocolate milk (30.7%) and 100% fruit juice (18.0%). US participants were less likely to perceive most SDs as unhealthy compared to all other countries. There was moderate evidence of decreasing likelihood of perceiving regular cola as unhealthy between 2018 and 2021 in Australia and UK. There was also moderate evidence of increasing likelihood of perceiving cola as unhealthy in US and Mexico, and strong evidence of increasing likelihood of perceiving 100% fruit juice, sports drinks and chocolate milk as unhealthy in Mexico over the same period. Participants in all countries who perceived a beverage as unhealthy were less likely to have consumed it in the past 7 days. Analyses regarding other SDs (diet soda, energy drinks, etc.) will be presented.

**Conclusion** Across countries, many adults perceived SDs as healthy despite being high in added and free sugars. The results show evidence of trends in beverage perceptions in some countries that may result in greater SD intake and encouraging trends in others. In Mexico, major shifts in beverage perceptions may suggest that environmental or policy factors are shifting cultural attitudes towards SDs.

# Adult co-creators' psychological experiences of the co-creation process: A Health CASCADE scoping review.

**Ms. Lauren McCaffrey**<sup>1</sup>, Dr. Bryan McCann<sup>1</sup>, Associate Professor Maria Giné-Garriga<sup>2</sup>, Ms. Qingfan An<sup>3</sup>, Prof. Greet Cardon<sup>4</sup>, Prof. Sebastien Chastin<sup>1</sup>, Ms. Rabab Chrifou<sup>4</sup>, Prof. Sonia Lippke<sup>5</sup>, Mr. Quentin Loisel<sup>1</sup>, Ms. Giuliana Longworth<sup>2</sup>, Ms. Katrina Messiha<sup>6</sup>, Ms. Mira Vogelsang<sup>1</sup>, Ms. Emily Whyte<sup>1</sup>, Dr. Philippa Dall<sup>1</sup>  
<sup>1</sup>Glasgow Caledonian University, Glasgow, United Kingdom, <sup>2</sup>Blanquerna Universitat Ramon Llull, Barcelona, Spain, <sup>3</sup>Umeå University, Umeå, Sweden, <sup>4</sup>Ghent University, Ghent, Belgium, <sup>5</sup>Jacobs University Bremen, Bremen, Germany, <sup>6</sup>Amsterdam UMC, Vrije Universiteit Amsterdam, Amsterdam, Netherlands

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** There is a growing investment in the use of co-creation, reflected by an increase in co-created products, services and interventions. Although there is a growing recognition of the significance of co-creators' experience to the success of the process and potential impact on the co-created output, there is a gap in the aggregation of the literature regarding their experience. The purpose of this scoping review is to uncover the breadth of existing empirical research on co-creator's experience, how it has been defined, assessed, and its key characteristics.

**Methods:** Development of the search strategy was guided by the research question, Arksey and O'Malley's scoping review methodology guidelines and through collaboration with the Health CASCADE consortium. A wide range of key words were used to capture co-creation. Key words for co-creation experience covered a range of psychological components, including emotional experience. Comprehensive searches were conducted in the Health CASCADE Co-creation Database (~13501 articles pre-screened for co-creation key words) and Scopus, with additional snowball searches of included articles. Data is being extracted on the co-creation process, how experience was assessed, and co-creators' experience during the process and psychological impact as a result of engagement in the process. The results of the review will be presented narratively in accordance with the PRISMA-ScR guidelines.

**Results:** The initial search identified 10,700 papers (after removal of duplicates), 10,066 were excluded during title and abstract screening. Full-text screening of 634 papers has been completed by least one reviewer (screening by second reviewer ongoing), indicating 150-200 articles may be included. Preliminary data extraction indicates that the process of co-creation is often poorly reported, using a wide range of terminology and frequently with key information missing. Co-creation experience is often undefined, and its method of assessment varied. We anticipate that further articles will be excluded during data extraction as our definition of co-creation is refined.

**Conclusions:** The scoping review provides an overview of the extent of literature reporting on co-creators' experience and the state of research in this area. The findings offer useful insights into co-creators' experience of participating in the co-creation process and provide guidance for future research.

# Validity of objective and subjective methods to estimate total daily energy expenditure determined by the doubly labeled water technique in a sample of adults from Rio de Janeiro, Brazil

**Prof. Luiz Anjos<sup>1</sup>**, Miss Francine Bossan<sup>2</sup>, Associate Professor Vivian Wahrlich<sup>1</sup>, Assistant Professor Karina Pfrimer<sup>3</sup>, Prof. Eduardo Ferrioli<sup>4</sup>

<sup>1</sup>Universidade Federal Fluminense, Niterói, Brazil, <sup>2</sup>Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil, <sup>3</sup>Universidade de Ribeirão Preto, Ribeirão Preto, Brazil, <sup>4</sup>Universidade de São Paulo, Ribeirão Preto, Brazil

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** The purpose of the study was to estimate the validity of objective (accelerometer - ACC) and subjective (24-hour physical activity recalls - 24hPAR) methods to determine the total daily energy expenditure (TDEE) in comparison to the doubly labeled water (DLW).

**Methods:** A convenience sample of 39 adults (21 women) living in the tropics (Rio de Janeiro, Brazil) had anthropometric (body mass and stature), basal metabolic rate (BMR) and body composition (DXA) data collected in a visit to the laboratory. Prior to receiving the DLW dose, participants were instructed to provide a baseline urine sample, were instructed to collect a urine sample daily over 14 consecutive days and to wear an ACC (Actigraph GT3X) at their waist. Four 24hPAR (2 face-to-face and 2 over the phone) were performed. The equation suggested by Sasaki et al. (2011) was used to convert the ACC data to TDEE. The MET coefficients from the Compendium of Physical Activity were used to convert the reported activities in the 24hPAR into energy expenditure which was summed to yield the TDEE24hPAR. The physical activity level (PAL) was calculated as TDEEDLW / BMR.

**Results:** Mean age and BMI (SD) were 30.6 (11.1) years and 23 (2.7), respectively. BMR was higher in men ( $1482.7 \pm 161.0$ ) than in women ( $1205.2 \pm 131.1$ ) kcal/day. TDEE was also always higher in men regardless of the method used (DLW:  $2654.5 \pm 384.4$  and  $1909.3 \pm 330.1$ ; 24hPAR:  $2831.0 \pm 309.7$  and  $2201.0 \pm 335.9$ ; and ACC:  $2220.9 \pm 297.9$  and  $1805.2 \pm 330.2$  kcal/day; in men and women, respectively). Mean PAL was 1.50 (0.17) ( $1.50 \pm 0.15$  and  $1.49 \pm 0.19$ , in men and women). TDEE estimated by ACC, in women only, and TDEE estimated by 24hPAR, in men only, were significantly different from TDEEDLW (- 4.1% and + 8.2%, respectively).

**Conclusion.** Objective and subjective methods provided inaccurate TDEE estimates depending on sex.

# Perceived Stress, Diet Quality, and Weight Satisfaction Predict Perceived Health in College Students

**Ms. Caitlyn Winn<sup>1</sup>**, Ms. Kayla Parsons<sup>1</sup>, Ms. Leigh Neptune<sup>1</sup>, Ms. Amelia Sullivan<sup>1</sup>, Ms. Emma Watras<sup>1</sup>, Dr. Jade McNamara<sup>1</sup>

<sup>1</sup>University of Maine, Orono, USA

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** J. Young Adults

**Purpose** The college environment is stressful and demanding, often leading to poor diet quality (DQ) and weight dissatisfaction in college students. This study aimed to investigate the role of perceived stress, DQ, body mass index (BMI), and weight satisfaction on perceived health in college students.

**Methods** A cross-sectional convenience sample of undergraduates completed an online health survey. DQ was measured using the Short Healthy Eating Index (sHEI), perceived stress was measured using the Perceived Stress Scale, and weight satisfaction was measured using discrepancies between reported weight and desired weight. Perceived health was measured using a single item that asked respondents to rate their health as “poor/fair” or “good/excellent.” A logistic regression assessed the effects of weight satisfaction, BMI, DQ, and stress on perceived health.

**Results** Students (N=873) were 20.9 ( $\pm 2.3$ ) years old, primarily White (87.1%), and female (70.2%). The logistic regression model was statistically significant,  $X^2 = 8.26$ ,  $p = .043$ . The overall model explained 34% variance in perceived health status and correctly classified 72% of cases. DQ was a significant positive predictor of perceived health ( $\beta = .017$ ,  $p = .043$ ), whereas weight dissatisfaction ( $\beta = -.045$ ,  $p < .001$ ) and perceived stress ( $\beta = -1.55$ ,  $p < .001$ ) were significant negative predictors. BMI was not a significant predictor of perceived healthfulness in this population.

**Discussion & Conclusion** These results indicate that students with better DQ and less perceived stress experience better perceived health than their peers. Interestingly, while weight satisfaction was a significant predictor of perceived health, BMI was not. These results emphasize the importance of a healthy diet, improved body image, and stress reduction in undergraduates' perceived health, highlighting the need for health and wellness programming that addresses these factors as a means to support the health of college students.

# Altering the food environment to promote sustainable meat consumption: promise, progress, and strategies to nudge consumers to reduce meat consumption

**Dr. Tessa Englund**<sup>1</sup>, Dr. Susan Chen<sup>2</sup>, Dr. Valisa Hedrick<sup>3</sup>, Dr. Vivica Kraak<sup>3</sup>

<sup>1</sup>University of North Carolina at Chapel Hill, Chapel Hill, USA, <sup>2</sup>San José State University, San José, USA,

<sup>3</sup>Virginia Tech, Blacksburg, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Encouraging consumers to reduce and replace meat consumption and shift toward a plant-rich, sustainable dietary pattern is needed to transition to a sustainable food system that supports human and environmental health and sustainability. This systematic review assembled and synthesized the available evidence for nudge interventions implemented in real-world food environment settings to influence consumers to reduce purchases, selection, and consumption of non-seafood meat products.

**Methods:** Five electronic databases (Business Source Complete, CINAHL, PsycINFO, PubMed, Web of Science) were searched according to PRISMA guidelines for peer-reviewed English-language studies published between 2000-2021. Articles were included if they reported objective measures of non-seafood meat purchases, selection, or intake from nudge interventions conducted in real (i.e., non-hypothetical) choice environments, and characterized according to the Typology of Interventions in Proximal Physical Micro-Environments (TIPPME) intervention framework.

**Results:** Of 2,655 unique references identified, 34 eligible intervention studies that were conducted in eight countries across Europe and North America were included. Most studies used nudge strategies to influence behavior related to general dietary patterns by reducing (e.g., calorie reduction) or encouraging consumption of specific foods (e.g., fruits and vegetables), and were not directly aimed at reducing meat consumption. More than half (19 of 34, 56%) of the identified nudge interventions resulted in statistically significant reductions in meat consumption or choice (e.g., selection or purchase) behaviors; the remainder of nudge interventions tested found no significant difference (11 of 34, 32%) or did not report significance testing for meat choice outcomes (4 of 34, 12%). Interventions that manipulated the size of products were most frequently associated with significant reductions in meat choice outcomes (7 of 9), followed by position (4 of 7) and information interventions (4 of 7).

**Conclusions:** Nudge strategies may influence behaviors and reduce meat consumption in real-world settings, especially those altering product size. Future research is needed to systematically design, evaluate, and report on the effectiveness of nudges targeted to reduce meat consumption using established frameworks, such as TIPPME. Future studies should also implement and evaluate the potential of nudge strategies across various food environments, population contexts, and outcomes (e.g., health, economic, and sustainability-related factors).

# A cross-sectional exploration of factors influencing food insecurity among adults residing in peri-urban settings in Flanders, Belgium

Ms. Yasemin Inac<sup>1,2,3,4</sup>, **Mrs. Suzannah D'hooghe**<sup>1,4,5</sup>, Dr. Stefanie Vandevijvere<sup>1</sup>, Dr. Karin De Ridder<sup>1</sup>

<sup>1</sup>Sciensano, Department of Epidemiology and Public Health, Brussels, Belgium, <sup>2</sup>Ghent University, Faculty of Sciences, Department of Geography, Ghent, Belgium, <sup>3</sup>Sciensano, Department of Chemical and Physical Health Risks, Brussels, Belgium, <sup>4</sup>Vrije Universiteit Brussel, Faculty of Psychology and Educational Sciences, Department of Educational Sciences, Brussels, Belgium, <sup>5</sup>Ghent University, Faculty of Medicine and Health Sciences, Department of Public Health and Primary Care, Ghent, Belgium

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Food insecurity and its consequences have not yet received much attention in Belgium. Even though food insecurity may result in insufficient dietary intake, overweight or obesity and the development of non-communicable diseases. The objective of this study was to report the prevalence of food insecurity and investigate associations between sociodemographic and lifestyle-related determinants and food insecurity among adults residing in peri-urban municipalities.

**Methods:** This cross-sectional was conducted among 567 participants in two peri-urban municipalities in Flanders, Belgium. Data on sociodemographic and lifestyle factors, dietary habits, and food security status were collected between May and October 2021 using a questionnaire. Diet was based on self-reported intake of fruit, vegetables, fast food, snacks and sugar-sweetened beverages. BMI was determined from self-reported height and weight. Adjusted multinomial logistic regression analyses were performed to explore the association between food insecurity, sociodemographic and lifestyle factors.

**Results/findings:** The overall prevalence of food insecurity was 17.5% (N=99). Of the food-insecure participants, 85.6% (N=83) reported that they often or sometimes feared food shortages. While 50.5% (N=49) of food insecure participants were often or sometimes short of food without money to buy more in the previous three months. Adjusted multinomial logistic regression showed that participants who received food through a food bank (OR 4.34 (95% CI 2.70 to 9.41)), reported low subjective health (OR 1.90 (95% 1.24 to 2.99)) and difficulties in their monthly financial situation (OR 5.68 (95% 3.65 to 9.38)) were more likely to experience food insecurity.

**Conclusions:** Our study shows a relatively high prevalence of food insecurity among peri-urban residents in Flanders. This adds to the literature that food insecurity is prevalent even in high-income countries with a good social welfare structure. It is important to widen food security research to include countries with good welfare structures since food insecurity is associated with many adverse health outcomes. Therefore, more research on the underlying determinants of food insecurity and which (sub)groups are most affected in Belgium is urgently needed.

# Head teachers' perceived importance of Food and Health in grade 1-4 in Norway.

**Dr. Camilla Sandvik**<sup>1</sup>, Dr. Merete Hagen Helland<sup>2</sup>, Dr. Anne Selvik Ask<sup>3</sup>, Dr. Eli Kristin Aadland<sup>4</sup>

<sup>1</sup>Nord University, Levanger, Norway, <sup>2</sup>University of Stavanger, Stavanger, Norway, <sup>3</sup>University of Agder, Kristiansand, Norway, <sup>4</sup>Western Norway University of Applied Sciences, Bergen, Norway

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose** To investigate how head teachers perceive the school subject 'Food and Health' (FH) and how they prioritise it in primary years, as high quality food education - from an early onset - is essential to teach children healthy and sustainable cooking skills and eating habits. Head teachers' attitudes and opinions can have a significant influence on the quality of teaching FH in schools, but no research has been carried out previously for grades 1-4.

**Methods** Eight semi-structured interviews were carried out with head teachers from different schools in four main regions of Norway to gain insight into how head teachers' perceived FH in grade 1-4, covering how teaching of FH was carried out, which teaching aids were used, number of lessons taught, and their knowledge of the curriculum. Data were analysed using thematic analysis.

**Results** Most head teachers saw few or little challenges related to teaching FH in the lower primary level, claiming that FH was treated equal to other subjects. When probed, we found that the subject was given low priority. The head teachers seemed to have little interest in FH, and gave class teachers much freedom in designing, planning and carrying out their teaching. Head teachers with formal training in FH and / or own teaching experience in the subject, had a higher interest in the subject, perceived it as more important and had more insight into how FH was taught at their school.

**Conclusions** The importance of FH in grade 1-4 seemed to vary at random between the schools in our study, based on head teachers' own interest, competence and values. This may lead to undesired variation in the quality of teaching, and to young students not achieving the competence aims in FH. Clearer guidelines and expectations from national education authorities, alongside with follow-up checks on the amount of lessons and quality of teaching, could be a way forward to improve teaching quality in FH for grade 1-4 in the future.

# Investigation of a 12-weeks community-based training intervention in children with obesity: Importance of intensity and exercise modality.

**Dr. Charlotte Eggertsen**<sup>1,2</sup>, Mr. Jeppe Bech Pedersen<sup>4</sup>, Prof. Søren Hagstrøm<sup>1,2</sup>, Dr. Esben Thyssen Vestergaard<sup>3</sup>, Associate Professor Ryan Godsk Larsen<sup>4</sup>, Associate Professor Morten Bilde Simonsen<sup>5</sup>

<sup>1</sup>Department of Pediatrics and Steno Diabetes Center North Denmark, Aalborg University Hospital, Aalborg, Denmark, <sup>2</sup>Department of Clinical Medicine, Aalborg University Hospital, Aalborg, Denmark, <sup>3</sup>Department of Pediatrics, Regional Hospital Randers, Randers, Denmark, <sup>4</sup>Department of Health Science and Technology, Aalborg University, Aalborg, Denmark, <sup>5</sup>Department of Materials and Production, Aalborg University, Aalborg, Denmark

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** Childhood obesity is a major public health concern. Physical activity as part of a multidisciplinary lifestyle intervention is a keystone in treating obesity. High-intensity interval-training (HIIT) has shown several physiological benefits, including weight reduction and cardiovascular health. Few studies have monitored the intensity during HIIT or compared different types of exercises. This study is part of a randomized controlled project investigating the effect of HIIT in a group of children with obesity, and focuses on the training intensity of different activities in a community-based training setting.

**Methods** Sixty-three children with obesity were enrolled in a 12-weeks training intervention, with three weekly sessions. Each session included 4x4 minutes of HIIT focusing on one of three specific exercise modalities; Ball games, CrossFit, or running. Heart rate (HR) was measured to quantify time spent in high (>85% of max HR) intensity activity. In nine of the HIIT sessions, enjoyment (Physical Activity Enjoyment Scale) and perceived exertion (Borg CR-10 scale) were recorded. A three-way (sex, modality, intensity) mixed ANOVA was used to compare the HR data. Friedman and Wilcoxon Signed-rank tests (post hoc) were used to compare enjoyment and perceived exertion between types of activity.

**Results** The participants' median age was 12.3 years, with a body-mass index of  $28.84 \pm 4.04$ . Ball games elicited less time in the high-intensity zone ( $4.96 \pm 5.75$  minutes) than CrossFit ( $7.73 \pm 7.25$  minutes,  $P = 0.010$ ) and running ( $6.36 \pm 5.80$  minutes,  $P = 0.025$ ). No gender interaction was observed ( $p=0.995$ ). The enjoyment of physical activity was rated high, on average 4.5 for all activities (scale from 1 (lowest) – 5 (highest)), but no significant difference was found. The perceived exertion was rated lower by adolescents compared to children in ball games ( $5.1 \pm 1$ ) compared to CrossFit ( $6 \pm 1$ ,  $P = 0.017$ ) and running ( $6 \pm 1$ ,  $P = 0.004$ ). Furthermore, with all participants combined, ball games were perceived as less exhausting than CrossFit ( $P = 0.002$ ) and running ( $P = 0.003$ ).

**Conclusions** The participants had high enjoyment ratings during all three modalities. CrossFit and running seem favorable to elicit more time in the high-intensity zone compared to ball games. This should be considered in future training interventions.

# Beyond eating for health: Protein foods within the Dietary Approaches to Stop Hypertension (DASH diet) are associated with lower greenhouse gases and land use

**Ms. Nicole Kling**<sup>1</sup>, Dr. Kurt Rosentrater<sup>1,2</sup>, Dr. Maren Wolff<sup>1</sup>, Dr. Lorraine Lanningham-Foster<sup>1</sup>

<sup>1</sup>Department of Food Science and Human Nutrition, Iowa State University, Ames, USA, <sup>2</sup>Department of Agricultural and Biosystems Engineering, Iowa State University, Ames, USA

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** N. Other

**Purpose:** The objective of this study was to assess the greenhouse gases (GHG), land use, and water withdrawals associated with protein foods within the Dietary Approaches to Stop Hypertension (DASH diet). Previous research has assessed the GHG associated with the DASH diet, but no studies have explored other environmental indicators, limiting our ability to understand the sustainability of this dietary pattern.

**Methods:** Over 400 Midwesterners aged 35-70 years old with hypertension were recruited in part of a yearlong exercise intervention. Participants received group and individual DASH diet counseling throughout the year. Dietary data was collected Automated Self-Administered 24-Hour (ASA-24) Recalls System. Diets were evaluated based on their adherence to the DASH diet using a nutrient-based DASH score. Using the Purchaser model (cradle-to-consumer) of the Carnegie Mellon University's Economic Input-Output Life Cycle Assessment ([www.eiolca.net](http://www.eiolca.net)), we predicted the GHG, land use, and water withdrawals associated with the protein foods within individual's diets. Multiple linear regressions were used to view associations between individual DASH nutrient scores and environmental impacts of total, animal, and plant protein foods.

**Results/findings:** More adherent DASH diets, as indicated by higher individual DASH nutrient scores, were associated with less GHG and land use from total and animal protein foods but more GHG and land use from plant-protein foods, with a few exceptions. The pattern was not clear for water withdrawals. Diets with the greatest adherence had around 25-50% lower GHG and land use from total protein foods than diets with the lowest adherence. Differences in dietary GHG and land use may be due to decreased consumption of total and animal protein foods, selection of less environmentally demanding animal protein foods, such as poultry instead of beef, and increased consumption of plant protein foods.

**Conclusions:** Based on this evaluation of protein foods, we predict that the adoption of the DASH diet may have environmental benefits, in terms of GHG and land use. As the DASH diet seems to have simultaneous health and environmental benefits, this diet could be promoted using either frame. Further research should explore the use of environmental sustainability as a motivator for adoption of the DASH diet.

# Are Danish vocational schools ready to promote students' health and wellbeing? A cross-sectional study informed by theory of organizational readiness

**Ms. Clara Heinze<sup>1,2</sup>**, Ms. Lene Winther Ringgaard<sup>1</sup>, Ms. Charlotte Klinker<sup>1</sup>

<sup>1</sup>Steno Diabetes Center Copenhagen—Copenhagen University Hospital, Herlev, Denmark, <sup>2</sup>National Institute of Public Health, University of Southern Denmark, Copenhagen, Denmark

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Background and purpose:** Vocational school students exhibit significant risk behaviours in terms of e.g. poor diet, low levels of physical activity, and poor mental health. Effective health promotion programmes targeting vocational students are needed. Higher levels of organisational readiness predict a more successful implementation of health promotion programmes, and knowledge about organisational readiness prior to implementation can help pinpoint how to optimize support to the schools. In this study, we assessed school organisational readiness prior to implementation of a participatory whole of systems programme - the 'Data-driven health promotion at vocational schools' programme - which aims to promote a health enhancing environment at vocational schools. Moreover, the study examined if school, and/or staff characteristics predict differences in organisational readiness.

**Methods:** This is a cross-sectional study, based on questionnaire data collected in January to March 2022. Questionnaires were distributed to all staff members (n=213) across eight vocational schools before the intervention. The eight schools were located in two regions and four municipalities, with two schools from each of four educational tracks (technical, business, agriculture and food service and social and health service). The questionnaire was developed based on the 'organisational readiness framework', established by Scaccia et al, and pilot tested and validated prior to data collection. This framework will also guide the analysis, which is completed in spring 2023. Organisational readiness is measured as the total sum or aggregate across three dimensions and ten sub-dimensions: Motivation (relative advantage, compatibility, complexity, and priority), General Capacity (culture, climate, and staff capacity), and Innovation-specific Capacity (knowledge, skills, and abilities).

Predictors of different levels of organisational readiness are investigated using Multiple linear regression analysis. Covariates included are staff characteristics (age, gender, education) and school characteristics (educational track, region and school size).

**Results:** In total 123 staff members answered the questionnaire (≈60%). Data on organisational readiness and related predictors will be presented.

**Conclusion:** The results of this study will be used to inform the implementation and future sustainment of programme implementation. Our conceptualization and operationalization of organisational readiness may be useful in future studies, i.e., in studies where enhancing readiness and capacity is a main objective.

# Comprehensive evaluation of a large-scale food prescription program in Houston, TX, USA.

Dr. Nalini Ranjit<sup>1</sup>, Dr. Henry Brown<sup>1</sup>, Ms. Jennifer Aiyer<sup>1</sup>, **Dr. Shreela Sharma<sup>1</sup>**

<sup>1</sup>University of Texas Health Science Center, School of Public Health, Houston, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Food prescription (FoodRx) programs are gaining interest from funders, policy makers, and healthcare payers as a value-based care strategy. A small body of research suggests that such programs effectively impact health outcomes; however, the quality of existing studies is variable, and little is known about implementation feasibility, or cost-effectiveness of such programs. This study utilized a quasi-experimental design with non-equivalent controls, to evaluate clinical impacts and cost-effectiveness of the Houston Food Bank's multi-institution FoodRx program implemented at scale. The impact analysis was supplemented with follow-up qualitative studies to evaluate implementation outcomes.

**Methods.** For the impact analysis, we completed a secondary analysis of data collected between May 2018 and March 2021. Enrollment data were obtained from 16 healthcare partners (HCPs) and prescription redemption data from across 40 food pantries in Houston, Texas. The primary outcome, 6-month change in HbA1c, was obtained from HCPs. Exposure was defined as at least one redemption from a food pantry within 6 months of enrollment. Generalized linear mixed models were used to estimate change in HbA1c by exposure status. Qualitative data were obtained from clinic staff, pantry staff, and program participants, to examine their perceptions of and experiences with the program. Simulation models were used to estimate increases in Quality Adjusted Life Years (QALYs) from participation.

**Results.** Exposed patients experienced a -0.28% ( $p=0.007$ ) greater change in HbA1c than unexposed patients, over six months. A dose-response effect of number of redemptions on A1c was evident. A key process finding was that the redemption rate was low (52%). Use of Food Rx versus control resulted in 0.07 incremental gain in QALYs, corresponding to \$288 in averted medical costs. Qualitative data revealed several addressable reasons for low redemption.

**Conclusions.** Our study of a large food prescription program involving multiple health care and food pantry sites provides robust evidence of a modest decline in HbA1c levels among participants. FoodRx programs can be cost-effective, but an important gap to address is poor redemption rates.

# Children's COOPeration Denmark (Child-COOP): Promoting physical activity in children aged 6-12 years - a 3-year controlled system dynamics trial

**Dr. Helene Kirkegaard**<sup>1</sup>, Dr. Knud Ryom<sup>2</sup>, Dr. Therese Lockenwitz Petersen<sup>3</sup>, Dr. Anneke Vang Hjort<sup>4</sup>, Dr. Eskild Klausen Fredslund<sup>1</sup>, Prof. Steven Allender<sup>5</sup>, Dr. Anne-Louise Bjerregaard<sup>3</sup>, Prof. Helle Terkildsen Maindal<sup>2</sup>, Dr. Charlotte Demant Klinker<sup>4</sup>, **Dr. Jane Nautrup Østergaard**<sup>1</sup>

<sup>1</sup>Steno Diabetes Center Aarhus, Aarhus University Hospital, Aarhus, Denmark, <sup>2</sup>Department of Public Health, University of Aarhus, Aarhus, Denmark, <sup>3</sup>Steno Diabetes Center Zealand, Holbæk, Denmark, <sup>4</sup>Steno Diabetes Center Copenhagen, Copenhagen, Denmark, <sup>5</sup>Global Centre for Preventive Health and Nutrition (GLOBE), Institute for Health Transformation, School of Health and Social Development, Deakin University, Geelong, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Background:** Lack of physical activity (PA) and sedentary behaviour in Danish children is a major challenge, and early awareness is important, as PA behaviour often tracks into adolescence and adulthood. PA behaviour is shaped by a complex interplay between a wide range of factors at individual, family, community and society levels. Interventions building on a participatory system dynamics approach has been suggested as a feasible way to address such complex problems.

**Purpose:** To present the Child-COOP trial which aims to examine if a community-based participatory system dynamics approach can promote (increase and sustain) healthy PA behaviour in children aged 6-12 years through local changes in the system that drives PA behaviour locally.

**Methods:** The three-year Child-COOP trial is designed as a controlled waiting list study with five Danish municipalities each participating with an intervention community and a control community (2023-2026). The intervention consists of an evidence based system dynamics process. First, local child health data will be collected, as both baseline data and as a way to engage key stakeholders from the communities and the municipalities. Second, the key stakeholders in each intervention community will develop a causal loop diagram of drivers of PA behaviour in children aged 6-12 years in their local community. Third, based on the causal loop diagram, stakeholders from the municipality, private sectors and the civic will be involved in developing and implementing actions to promote healthy PA behaviour through system changes. The effectiveness of trial will be evaluated through individual and systems outcomes comparing the intervention and control communities. Individual outcomes include objective measures of PA, physical literacy and anthropometrics as well as subjective health and well-being data. System outcomes include social network, community readiness and capacity. Further, a health-economic cost consequence analysis will be performed and a process evaluation will inform a final systems program theory on "what works for whom under what circumstances".

**Conclusion:** The potential of this participatory system dynamics trial includes opportunities for community engagement and local capacity building to promote healthy PA behavior in childhood. Further, Child-COOP will evaluate whether to recommend this approach for national scaling up.

# Exercise preference and motivators in young adult women who exercise regularly

**Ms. Chloe Jones**, Dr. Danielle Wadsworth

<sup>1</sup>Auburn University, Auburn, USA

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Young adult women participate in less exercise than young adult men, yet motivators and preferable modes for exercise to increase the chances of adherence in this population are understudied. Therefore, the purpose of this study is to identify preferences and motivators for exercise in young adult women who regularly participate in exercise to inform the structure and context of future physical activity and/or exercise interventions.

**Methods:** Using a survey, young women (18-34 years) who exercised regularly identified their preferred mode of exercise, exercise volume, and motivators to exercise using the Exercise Motivations Inventory-2 (EMI-2). Preferred mode of exercise and volume were examined, and MANOVA tests were conducted to explore differences in motivators amongst the group.

**Results:** Women ( $n = 269$ ;  $M = 27.04 \pm 4.70$  years) identified weightlifting as their preferred mode of exercise (32.3%). A MANOVA was used to determine if motivators for exercise differed based upon volume of muscle-strengthening (MS) training (low= 0-1 days; moderate= 2-3 days; high=  $\geq 4$  days). Significant differences were found amongst the three groups ( $\Lambda = 0.800$ ,  $F [30, 488] = 1.924$ ,  $p = 0.003$ ). Women who engaged in a high volume versus low volume of MS activities had higher levels of motivation from revitalization ( $p = 0.035$ ), enjoyment ( $p = 0.004$ ), challenge ( $p = 0.002$ ), social recognition ( $p = 0.009$ ), appearance ( $p = 0.028$ ), and strength and endurance ( $p < 0.001$ ).

**Conclusion:** Future exercise intervention studies should examine the perception of weightlifting as a primary mode of exercise amongst young, inactive women. Additionally, both intrinsic (mental) and extrinsic (physical) motivators for exercise should be conveyed to inactive women as results suggest both impact the maintenance of regular exercise amongst this sample.

# Sustainability analysis of the Mediterranean diet: results from the French NutriNet-Santé study

**Dr. Julia Baudry**<sup>1</sup>, Mrs. Floriane Neves<sup>1</sup>, Dr. Denis Lairon<sup>2</sup>, Dr. Benjamin Allès<sup>1</sup>, Dr. Brigitte Langevin<sup>3</sup>, Mrs. Joséphine Brunin<sup>1</sup>, Mrs. Florine Berthy<sup>1</sup>, Prof. Ina Danquah<sup>4</sup>, Dr. Mathilde Touvier<sup>1</sup>, Prof. Serge Hercberg<sup>1</sup>, Dr. Marie-Josèphe Amiot<sup>5</sup>, Mr. Philippe Pointereau<sup>3</sup>, Dr. Emmanuelle Kesse-Guyot<sup>1</sup>

<sup>1</sup>Sorbonne Paris Nord University, Inserm U1153, INRAE U1125, CNAM, Nutritional Epidemiology Research Team (EREN), Epidemiology and Statistics Research Center – University Paris Cité (CRESS), Bobigny, France, <sup>2</sup>Aix Marseille Université, Inserm, INRAE, C2VN, Marseille, France, <sup>3</sup>Solagro, Toulouse, France,

<sup>4</sup>Heidelberg Institute of Global Health (HIGH), Medical Faculty and University Hospital, Heidelberg University, Heidelberg, Germany, <sup>5</sup>MOISA, INRAE, CIRAD, CIHEAM, SUPAGRO, Montpellier, France

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

The Mediterranean diet is often proposed as a model of a sustainable diet. This study aimed to evaluate the associations between adherence to the Mediterranean diet and sustainability domains in a cohort of French adults, using multiple criteria including nutritional quality, environmental pressures, monetary cost, and dietary pesticide exposure. Food intakes of 29,210 NutriNet-Santé volunteers were assessed using a semi-quantitative food frequency questionnaire. Adherence to the Mediterranean diet was evaluated using the validated literature-based adherence score (MEDI-LITE). The associations between the MEDI-LITE and the various sustainability indicators were assessed using analysis of covariance models, adjusted for sex, age and energy intake. Higher adherence to the MEDI-LITE was associated with higher nutritional quality scores, better overall nutrient profile as well as reduced environmental impact (land occupation: Q5 vs. Q1: -35%, greenhouse gases emissions: -15%, and cumulative energy demand: -17%). In turn, monetary cost increased with increasing adherence to the Mediterranean diet (Q5 vs. Q1: +15%) while higher adherents to the Mediterranean diet had overall higher pesticide exposure due to their high plant-based food consumption. Higher levels of adherence to the Mediterranean diet were associated with some other Mediterranean lifestyle features: higher frequency of elevated-level of physical activity and organic food consumption, and lower consumption of ready-made products. In this large cohort of French adults, greater adherence to the Mediterranean diet was associated with nutritional and environmental benefits, but also with higher monetary cost and greater exposure to pesticides, illustrating the necessity to develop large-scale strategies for healthy, safe (pesticide- and contaminant-free), and environmentally sustainable diets for all.

# Early childhood feeding with Swedish Milk Cereal Drink, does it promote (un)healthy growth?

**Dr. Annelie Lindholm<sup>1</sup>**, Prof. Lauren Lissner<sup>2</sup>, Associate Professor Monica Hunsberger<sup>2</sup>

<sup>1</sup>School of Health and Welfare, Halmstad University, Halmstad, Sweden, <sup>2</sup>School of Public Health and Community Medicine, University of Gothenburg, Gothenburg, Sweden

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Early rapid weight gain (RWG) is associated with overweight and abdominal adiposity in children, and these factors are in turn related to adverse health consequences later in life. Early nutrition has been identified as an important risk factor. In Sweden, milk cereal drink (MCD) is recommended to be introduced at 6 months and continued during introduction of complementary foods, often longer. The aim of this study was to investigate if MCD consumption was associated with RWG in infancy and elevated waist-to-height ratio (WHtR) later in childhood.

**Methods:** This study is based on longitudinal data in the Swedish cohort of the IDEFICS study between birth and 15 years. Early growth data from archival health records and information from parents regarding MCD consumption, maternal BMI and family income was available for 1391 children. After excluding 38 children born prematurely, n=1353. RWG was defined as a change > 0.67 in weight standard deviation scores (SDS) between 6–12 months. Follow up data regarding waist circumference and height were available in around half of the children who were re-examined at ages 7–15 years. Logistic and linear regressions were used to study associations between MCD and early RWG and subsequent predictive value of RWG on WHtR later in childhood.

**Results/findings:** MCD was consumed by 59% of the children and 80% of them consumed it for more than three months. RWG, which was observed in 18% of the children between 6–12 months was associated with MCD consumption ever/never (OR: 1.47 95% CI: 1.05–2.07 p: 0.026), when corrected for maternal BMI, birth weight, sex of child and household income. When investigating WHtR in the 646 children at follow up, RWG between 6–12 months was associated with WHtR (B: 0.008 95% CI: 0.001–0.014 p: 0.025) when corrected for baseline WHtR, MCD consumption, sex and age at follow up. In the full model considering the total observation time the MCD effect was not independent of RWG.

**Conclusions:** Our results indicate that early RWG is associated with higher WHtR later in childhood. Our results also raise the possibility that MCD consumption may be involved in later development of centralized adiposity.

# Lifestyle Factors and Their Impact on Gastrointestinal Symptoms in Young Adults With and Without Irritable Bowel Syndrome

**Dr. Alexa Evenson<sup>1</sup>**, Ms. Shelby Stovern<sup>1</sup>

<sup>1</sup>College of Saint Benedict/Saint John's University, Saint Joseph, USA

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** The purpose of this research was to investigate the relationship between gastrointestinal (GI) symptoms, breath hydrogen, physical activity, stress, sleep, anxiety, and dietary intake in young adults with and without Irritable Bowel Syndrome (IBS). Studies indicate certain lifestyle variables are often more prominent in individuals with IBS including higher rates of anxiety, higher intensity physical activity, restriction of certain foods, and disrupted sleep.

**Methods:** Young adults (n=14 IBS and n=24 non-IBS; ages 18-22) participated in the study. Fasted participants consumed a low-FODMAP smoothie. Breath hydrogen and salivary cortisol were measured at Baseline, 1, 2, and 3 hours. GI symptoms were measured at baseline, .5, 1, 1.5, 2, 3, 12, and 24 hours. Questionnaires including the STICSA, IPAQ-SF, NCI Dietary Screener, PSS, and PSQI were used to measure State and Trait anxiety, physical activity, dietary intake, perceived stress, and sleep. Independent t-tests, spearman rho, and backwards stepwise regression were used to analyze variables with significance set at  $p < .05$ .

**Results/Findings:** Dietary variables, physical activity, and sleep did not correlate to breath hydrogen or GI symptoms in either Non-IBS or IBS group ( $p > .05$ ). There were no differences between non-IBS and IBS groups in any dietary variable including fruits, vegetables, fiber, dairy, added sugar, whole grains, physical activity, stress, or sleep ( $p > .05$ ). There were no differences in State or Trait anxiety between the non-IBS and IBS groups ( $p > .05$ ). The results of the regression analysis indicate that in IBS participants, Total State and Trait anxiety and cortisol levels explained 56.9% and 5.9% of the variance in GI symptoms, respectively, ( $F(3,10)=5.472$ ,  $p=.017$ ). GI symptoms were not predicted by any lifestyle variable in non-IBS participants ( $p > 0.5$ ).

**Conclusion:** In this sample of individuals with and without IBS, lifestyle factors such as dietary intake, physical activity, anxiety, and sleep did not differ significantly between groups. Anxiety and cortisol levels were large factors in predicting GI symptoms, but only in IBS participants. It may be warranted to assess anxiety and physiological stress markers in those with IBS to potentially improve GI symptoms.

# Beyond the Classroom: Nutrition Knowledge, Stress, and Dietary Intake Self Efficacy in Undergraduate Introductory Nutrition Students

**Dr. Alexa Evenson<sup>1</sup>, Dr. Emily Heying<sup>1</sup>**

<sup>1</sup>College of Saint Benedict/Saint John's University, Saint Joseph, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** The broad purpose of this research was to investigate the relationship between nutrition knowledge, perceived stress, and self-efficacy of consuming fruits and vegetables, and fiber in undergraduate students enrolled in introductory nutrition courses at a residential, liberal-arts institution. Studies indicate that self-efficacy is associated with nutrient and food group intake in college students but understanding the role of nutrition knowledge and other factors on self-efficacy is less well-known.

**Methods:** Participants (n = 336) included undergraduate students between the ages of 18-24 enrolled in introductory nutrition courses. Data was collected at the beginning (pre) and end (post) of the course via an online survey. The survey entailed a 12-item nutrition knowledge assessment, the Patient Centered Assessment and Counseling for Exercise (PACE+) dietary surveys for self-efficacy of consuming fruits and vegetables, and fiber and the perceived stress scale (PSS). Paired t-tests and backwards stepwise regression were used to analyze the data with significance set at  $p < .05$ .

**Results/Findings:** Nutrition knowledge and perceived stress increased significantly ( $p < 0.0001$ ,  $p = 0.049$ , respectively) between pre (Mean:  $6.0 \pm 1.9$ ;  $16.4 \pm 6.2$ , respectively) and post measurements (Mean:  $8.6 \pm 2.4$ ;  $17.3 \pm 6.8$ , respectively). There was no change in fruit and vegetable, or fiber intake self-efficacy scores ( $p > .05$ ). The results of the regression analysis indicated that pre-nutrition knowledge and post-self-efficacy explained 13.1% and 5.9% of the variance in post-nutrition knowledge, respectively ( $F(2, 137) = 10.67$ ,  $p < .001$ ). Pre-fruit and vegetable self-efficacy and post-nutrition knowledge explained 35.1% and 1.4% of the variance in post-fruit and vegetable self-efficacy, respectively, ( $F(2, 337) = 97.147$ ,  $p < .001$ ). Pre-fiber self-efficacy and post-nutrition knowledge explained 30.7% and 1.9% of the variance in post-fiber self-efficacy, respectively, ( $F(2, 337) = 81.575$ ,  $p < .001$ ). Ethnicity, purchasing food on or off-campus, and perceived stress were not significant predictors of post-nutrition knowledge, post-fruit and vegetable self-efficacy, or post-fiber self-efficacy.

**Conclusions:** Nutrition knowledge and perceived stress increased, which is to be expected at the end of the semester. Self-efficacy scores did not increase, which may indicate that students either already had the self-efficacy prior to enrolling in the course or the course content made them realize they had more to learn when making dietary choices.

# 24-hour time-use composition, brain volume and cognition in healthy older adults: cross-sectional findings of the ACTIVate study

**Miss Maddison Mellow**<sup>1</sup>, Dr. Dot Dumuid<sup>1</sup>, Prof. Timothy Olds<sup>1</sup>, Dr. Ty Stanford<sup>1</sup>, Dr. Jurgen Fripp<sup>2</sup>, Dr. Ying Xia<sup>2</sup>, Dr. Alexandra Wade<sup>1</sup>, Dr. Bryan Paton<sup>3</sup>, Prof. Jill Dorrian<sup>4</sup>, Prof. Michael Breakspear<sup>3</sup>, Dr. Mitchell Goldsworthy<sup>5, 6</sup>, Dr. Ashleigh Smith<sup>1</sup>

<sup>1</sup>Alliance for Research in Exercise, Nutrition and Activity (ARENA), University of South Australia, Adelaide, Australia, <sup>2</sup>Australian e-Health Research Centre, Commonwealth Scientific and Industrial Research Organisation (CSIRO), Brisbane, Australia, <sup>3</sup>The University of Newcastle, Newcastle, Australia, <sup>4</sup>Behaviour-Brain-Body Research Centre, University of South Australia, Adelaide, Australia, <sup>5</sup>Hopwood Centre for Neurobiology, South Australian Health and Medical Research Institute (SAHMRI), Adelaide, Australia, <sup>6</sup>Lifespan Human Neurophysiology Group, School of Biomedicine, University of Adelaide, Adelaide, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Physical activity (PA) in older adulthood can slow grey matter atrophy and maintain cognition, however the 24-hour day is also made up of sedentary behaviour (SB) and sleep. No studies have investigated how the balance (composition) of all activities across the 24-hour day is associated with grey matter volume in healthy older adults, or whether brain volume impacts the relationship between 24-hour time-use composition and cognition.

**Methods:** Magnetic Resonance Imaging (MRI) was undertaken in 378 healthy older adults (mean age  $65.6 \pm 3.0$ , 123 males) to measure total grey matter (GM) volume and several regions of interest (frontal lobe, temporal lobe and hippocampal volume). 24-hour time-use patterns (time spent in sleep, SB, light PA and moderate-to-vigorous PA (MVPA)) were captured using accelerometry. Three domains of cognition (memory, executive function and processing speed) were measured using a series of tests in the CANTAB test battery. Correlations between all variables were explored. Then, log-ratio multiple linear regression models were used to (1) investigate associations between 24-hour time use and brain volume outcomes, and (2) investigate interactions between 24-hour time-use composition and brain volume for cognitive outcomes.

**Results/Findings:** There were no relationships between MVPA, light PA, SB or sleep (considered independently or as a 24-h time-use composition) and brain volume outcomes. Significant time use \* total GM volume ( $p=0.04$ ) and time use \* frontal lobe volume ( $p=0.02$ ) interactions were found for memory outcomes. Predictive modelling of these relationships demonstrated that reallocating time to MVPA was associated with better memory, but only in those with smaller total GM and frontal lobe volumes (i.e., below cohort mean). There were minimal predicted associations between reallocating time to or from SB, sleep and LPA with memory outcomes, and this did not differ by volume.

**Conclusions:** This study found no associations between 24-hour time-use composition and GM volume in healthy older adults. Reallocating time towards MVPA is associated with better memory for those with lower brain volumes vs higher brain volumes. These relationships should be explored longitudinally to uncover temporal effects.

# Fit and Fabulous: Using Community-Based and Novel Methods to Assess Cardiorespiratory Fitness and Physical Activity Among American Emerging Adults who are Underrepresented in Behavioral PA Research

**Assistant Prof. Sarah Espinoza<sup>1</sup>, Dr. Eydie Kramer-Kostecka<sup>1</sup>**, Dr. Laura Hooper<sup>1</sup>, Dr. Daheia Barr-Anderson<sup>1</sup>, Dr. Dianne Neumark-Sztainer<sup>1</sup>

<sup>1</sup>University of Minnesota, Minneapolis, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Project EAT (Eating and Activity over Time) is a well-established longitudinal research program in the U.S. Using multiple methods (surveys; qualitative approaches), EAT research has informed activity, nutrition, and weight-related health interventions for decades. This poster will describe the unique community-based methods and novel assessment tools used for an EAT substudy that evaluated cardiorespiratory fitness (CRF) and physical activity (PA) among a diverse sample of emerging adults who are typically underrepresented in behavioral PA research.

**Methods:** In 2022, a subsample of EAT participants who completed surveys in 2010 and 2018 ( $N=1,568$ ; baseline  $M_{age}=14.3$  years $\pm 2.0$ ) attended in-person visits to evaluate CRF. Since U.S.-based CRF research disproportionately samples participants who are White, wealthy, and lower weight status, we oversampled participants who identified as Black, Indigenous, or Persons of Color (BIPOC) and those with BMI $>25$ . At visits, we measured anthropometrics and body composition with height boards and bioelectrical impedance analysis scales. To assess CRF, participants completed the YMCA 3-Minute Step Test, a minimally discomforting submaximal exercise test, at community gyms near their homes. We took additional measures to make CRF visits feasible and worthwhile for participants, including offering childcare, trial passes to gyms, and monetary incentives. Physical activity was assessed multiple ways: participants reported their weekly hours of PA using the modified Godin-Shephard Leisure Time Physical Activity Questionnaire (also used in EAT 2010, 2018 surveys) and completed two National Cancer Institute ACT24 (Activities Completed over Time in 24 Hours) recalls to capture their activities over separate days. This was the first time EAT participants completed the ACT24, an assessment tool that captures granular PA data, such as energy costs, associated with specific activities.

**Results:** We successfully enrolled 95 participants (64.2% female; 75% BIPOC;  $M_{age}=27.2$  years old;  $SD_{age}=1.9$ ;  $M_{BMI}=28.2$ ;  $SD_{BMI}=5.9$ ; mode $_{monthlyincome}=\$3,300-\$4,199$ ) who completed CRF, anthropometric, and PA assessments. Initial analyses show age- and sex-normed CRF ratings ranged from Excellent–Average ( $n=43$ ; 45.3%) to Below Average–Very Poor ( $n=52$ ; 54.7%).

**Conclusions:** Using community-based methods and valid assessments, we generated much-needed data on CRF and PA among diverse American adults. Scholars should consider how using accessible methods can increase representation in behavioral PA research.

# Pedestrian Safety & Walkability: Examining Relationships Across the Rural Continuum

**Dr. Marilyn E. Wende<sup>1</sup>**, Dr. Dana M. Alhasan<sup>2</sup>, Dr. Renée Umstattd Meyer<sup>1</sup>

<sup>1</sup>Baylor University, Waco, USA, <sup>2</sup>University of South Carolina, Columbia, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Rates of pedestrian injury/death are high in rural areas, showing fatality rates six times higher compared to most urban areas. However, few studies have examined the relationship between walkability and pedestrian crashes by urban-rural status to address disparities in pedestrian outcomes. This presentation examines the relationship between walkability and pedestrian crashes across Texas, overall and by urban-rural status.

**Methods:** This ecological study occurred at the block group-level in Texas, USA (N=15,811). Our continuous walkability measure (1-20), obtained from the Environmental Protection Agency's National Walkability Index (NWI;2021), includes land use mix, intersection density, and distance to transit stops. Pedestrian crash locations were ascertained from Texas Department of Transportation to create a block group-level count for 2021. Urban-rural status was determined using Rural-Urban Commuting Area codes (metropolitan, micropolitan, small rural areas, isolated rural areas), based on population density, urbanization, and commuting patterns. Choropleth maps were created to display walkability and pedestrian crashes. Negative binomial regression, with an offset for population size, was used to estimate rate ratios (RR), adjusting for population density, percentage Non-Hispanic White residents, zero-car households, and low-wage workers.

**Results:** Average annual pedestrian crash count was 0.58 (SD:1.2; range:0-35), 0.29 (SD:0.72; range:0-9), 0.17 (SD:0.47; range:0-4), and 0.18 (SD:0.54; range: 0-4) in metropolitan, micropolitan, small rural, and isolated rural areas. Overall, one-unit walkability increase was associated with 17% more pedestrian crashes (RR=1.17 [95% CI:1.16-1.18]). One-unit walkability increase was associated with 17% (RR=1.17 [95% CI:1.16-1.18]), 15% (RR=1.17 [95% CI:1.09-1.21]), and 21% (RR=1.21 [95% CI:1.11-1.32]) more pedestrian crashes in metropolitan, micropolitan, and small rural areas, respectively. In isolated rural areas, walkability was not associated with pedestrian crashes (RR= 0.99 [95% CI:0.87-1.14]).

**Conclusions:** NWI is made up of macroscale features that indicate whether active transportation to destinations is possible in any given location, regardless of safety, so findings demonstrated that increased walkability was associated with increased pedestrian crashes in non-isolated areas. Future research can incorporate *microscale* and safety-related walkability features, such as sidewalks and road buffers, to inform intervention efforts in more rural locations where active transportation is less common and spaces for leisure walking are critically needed.

# The Effect of a Home Visiting Program on Pregnant Clients' Moderate-Intensity Physical Activity: A Quasi-Experimental Design with a Propensity Score Matched Comparison Group

Dr. Angela Dyer<sup>1</sup>, Dr. Christa Lilly<sup>2</sup>, Dr. Sara Amadon<sup>3</sup>, Dr. Danielle Davidov<sup>2</sup>, **Dr. Christiaan Abildso<sup>2</sup>**

<sup>1</sup>West Virginia University Office of Health Affairs, Morgantown, USA, <sup>2</sup>West Virginia University School of Public Health, Morgantown, USA, <sup>3</sup>Child Trends, Bethesda, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** In the U.S., home visitation program workers provide evidence-based, in-home services to address health disparities experienced by disadvantaged pregnant women and/or families with young children. Low-income pregnant women are less active than wealthier ones. Thus, the purpose of this study was to evaluate the impact of the Maternal Infant Health Outreach Worker (MIHOW) peer-delivered home visitation program curriculum on pregnant clients' moderate-intensity physical activity (MPA).

**Methods:** This longitudinal study consisted of 98 intervention and 56 comparison group participants with MPA assessed at trimesters one, two and/or three using the Pregnancy, Infection, and Nutrition (PIN3) self-report instrument. A nonrandomized quasi-experimental research design was utilized to evaluate the change in metabolic equivalent of task (MET) minutes of MPA per week changed in the intervention group relative to a propensity score matched comparison group of pregnant women. Generalized linear mixed modeling with a zero inflated negative binomial distribution was used as the statistical analysis strategy.

**Results/findings:** Median MET-minutes of MPA per week for the intervention group was 1,947 (IQR 315-3,570) at trimester 1 (~10 hours of walking) and 2,238 (IQR 130.5-4,578) at trimester 2, decreasing to 792 (IQR 210-2,772) at trimester 3. Analyses showed that (1) the expected log absolute MPA MET-minutes per week decreased 1.27 less for the comparison group than for the intervention group by trimester 3 [ $\chi^2(1) = 4.77$ ,  $p = .0289$ ], (2) the expected log absolute MPA MET-minutes per week was 1.49 lower for the comparison group than for the intervention group across time [ $\chi^2(1) = 8.12$ ,  $p = .0044$ ], and (3) the log odds of not participating in any absolute MPA MET-minutes per week was 1.46 lower for the comparison group than for the intervention group [ $\chi^2(1) = 4.63$ ,  $p = .0314$ ].

**Conclusions:** The home visitation workforce includes roughly 18,500 individuals in the US - a substantial resource to help overcome the significant health disparities experienced by low-income pregnant women. The results suggest a need for more quantity or quality of MPA content in the curriculum, a greater emphasis on reducing sedentary time, and home visitor training on effective MPA curriculum delivery.

# Exploring Potential Scales to Measure the Acculturation of Hispanic Immigrants to U.S. Dietary Behaviors

**Assistant Professor Maria Romo Palafox<sup>1</sup>**, Ms. Grace K. Moore<sup>1</sup>

<sup>1</sup>Saint Louis University, St. Louis, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** U.S. Hispanic health outcomes research uses proxy measures of acculturation (i.e., the process wherein immigrants adopt the practices of a host culture), such as language or identity, to study diet-related outcomes (e.g., obesity and infant feeding styles). This methodological gap could lead to misleading conclusions about Hispanic health and perpetuate health disparities. This exploratory study tested the association between the Short Acculturation Scale for Hispanics (SASH), the Acculturation Rating Scale for Mexican Americans II (ARSMA-II), and an investigator-designed self-reported measure of dietary acculturation.

**Methods:** Preliminary, exploratory analysis of an ongoing online survey (2021-2022) with Hispanic immigrant mothers of children  $\leq 18$  years who provided demographic data, responded to the SASH, ARSMA-II, and to a Likert scale rating their diet as more similar to the U.S. diet or to the typical diet of their country of origin. SASH and ARSMA-II scores were computed per their respective methodologies; self-reported dietary acculturation is measured using the mean response to four eating scenarios (at home, with friends, at restaurants, and with family).

**Results:** Twelve Hispanic mothers of children  $< 18$  years of age immigrated from Mexico, Colombia, Honduras, Peru, and Costa Rica. Participants' age of immigration ranged from 17-46, and years lived in the U.S. ranged from  $< 1$  to 19 years. Preliminary independent t-tests suggest that there is a significant difference between self-reported dietary acculturation (mean=3.01) and SASH scores (delta=0.83, 95% CL 0.19-1.46;  $p=0.02$ ), general Hispanic Orientation (delta=1.14, 95% CL 0.45-1.78;  $p<0.01$ ), Hispanic identity (delta=1.63, 95% CL 0.65-2.61;  $p<0.01$ ) and Anglo identity (delta=-1.98, 95% CL -2.6 - -1.36;  $p<.0001$ ). Conversely, there was no significant difference between self-reported dietary acculturation and general Anglo Orientation (delta=-0.02, 95% CL -1.26 - 1.22;  $p=0.9710$ ).

**Conclusion:** Current acculturation measures fail to capture the multifaceted process of dietary acculturation, nor can they discern beneficial from harmful dietary changes and could hinder our understanding of diet-related health outcomes (e.g., obesity) of immigrant populations. Moreover, a comprehensive exploration of dietary acculturation could explain why Hispanic immigrants experience better health outcomes than white U.S. natives, yet Hispanics born to immigrants experience worse health outcomes and lead to the development of effective behavioral interventions.

# Child Report of Food Insecurity is Not Associated with Increased Consumption of Ultra Processed Foods

**Dr. Matthew Landry<sup>1</sup>**, Dr. Matthew Jeans<sup>2</sup>, Dr. Jaimie Davis<sup>2</sup>

<sup>1</sup>Stanford University, Palo Alto, CA, USA, <sup>2</sup>University of Texas at Austin, Austin, TX, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Excessive consumption of highly processed foods is a proposed mechanism to explain how children from food insecure households have lower diet quality and higher prevalence of obesity. The objective of this study was to examine dietary intake by processing category in food secure and food insecure children.

**Methods:** Cross-sectional data were used from TX Sprouts, a school-based cooking, gardening, and nutrition intervention of low-income, elementary school children (n=751). Food items from two, 24h dietary recalls were coded by extent and purpose of industrial processing (NOVA food classification system categories: ultra-processed, moderately processed, and minimally processed/unprocessed). Percentage of total energy intake by processing level were computed per day and averaged per child. Food security status was self-reported by the children via the validated 5-item Child Food Security Assessment. Mixed effect regression models were used to estimate the associations between percentage of calories consumed by processing level and food security status. Models were adjusted for child's age, sex, ethnicity, and if the child was eligible for free or reduced-price school meals.

**Results:** The sample was 47% male, mean age 9.8 years; 57% Hispanic; 63% eligible for free or reduced-price school meals. Food insecurity was not associated with a higher percentage of total energy intake of ultra-processed foods (46.4% vs. 46.0%; 95%CI: -2.6,1.5). Food insecurity was also not associated with a higher percentage of total energy intake of moderately processed or minimally processed/unprocessed foods.

**Conclusions:** Among a sample of low-income elementary aged school children, our findings do not support an association between child report of food insecurity and increased consumption of ultra-processed foods. Results do suggest an opportunity to decrease ultra-processed food consumption among low-income children in general. Further research is needed to explain the biobehavioral mechanisms behind lower diet quality and higher prevalence of obesity in food insecure children.

# Influence of body mass index z-score on social connections during a school-based obesity intervention

**Dr. Katherine Arlinghaus<sup>1</sup>**, Dr. Tyler Prochnow<sup>2</sup>

<sup>1</sup>University of Minnesota School of Public Health, Minneapolis, USA, <sup>2</sup>Texas A&M University Department of Health Behavior, College Station, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Prior research indicates weight status is related to a persons' social network and youth with a higher body mass index report more difficulties with peer relationships. The purpose of this study was to use social network analysis to examine how adolescent body mass index z-score (zBMI) relates to social connections in a school-based behavioral obesity intervention.

**Methods:** Adolescents in a public charter school in Houston, Texas were recruited to participate in a behavioral obesity intervention during their physical education (PE) class. During the first and last weeks of the semester-long intervention, adolescents (n=156) nominated up to three female and three male friends they felt closest to in PE. Height and weight were also directly measured at the beginning and end of the intervention. These measures were used to calculate zBMI. Exponential random graph modeling was used to determine if zBMI was related to social connections in PE. Separate models were conducted for each timepoint.

**Results:** Participants had a mean age of 13.51 years old (SD: 1.45) and mean zBMI of 1.09 (SD: 0.96). Most participants identified as Hispanic (85.3%) and female (52.6%). Participants with higher zBMI at baseline were significantly less likely to feel close to others in the class (PE=-0.11, p=.04); however, this effect was not significant at the end of the intervention. zBMI scores did not significantly alter the odds of students being nominated as a friend at either timepoint (PE=0.09, p=.11; PE=-0.02, p=.73).

**Conclusions:** Consistent with prior research, findings indicate zBMI to be related to social connections. However, zBMI was only related to the number of friend connections the adolescent reported, not the number of friend connections the adolescent received, which indicates that difficulties with peer relationships reported in other studies may be based on the adolescent's perception of their social connections, not their actual social connections. Further, because this association was only found at baseline, these results imply that participation in a behavioral obesity intervention as a PE class may help youth of higher zBMI feel more confident in their social connections.

# “Fitstagram”: Describing fitness-related Instagram use, information seeking, and physical activity engagement among a sample of emerging adults

**Miss Stephanie Grace**<sup>1</sup>, Marla E Eisenberg<sup>2</sup>, Maureen Weiss<sup>3</sup>, Dr. Dunja Antunovic<sup>3</sup>, Dr. Daheia Barr-Anderson<sup>3</sup>

<sup>1</sup>University of Minnesota, Twin Cities, Minneapolis, USA, <sup>2</sup>Medical School, University of Minnesota, Twin Cities, USA, <sup>3</sup>School of Kinesiology, University of Minnesota, Twin Cities,

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** J. Young Adults

**Introduction:** Emerging adults (aged 18 to 29) are using social media to learn about physical activity (PA). Instagram is a popular site among this age group, where fitness-related content is abundant. Young people may seek PA information on Instagram that could influence their PA engagement. Characterizing fitness-related Instagram use (i.e., Instagram use that involves accessing PA- or fitness-related content) with contextual factors, like PA information seeking and engagement, aids comprehension of why fitness-related social media use may be worth considering when promoting PA among emerging adults.

**Purpose:** To describe fitness-related Instagram use, PA information seeking, and PA engagement among a sample of emerging adults.

**Methods:** One hundred emerging adults in the US who used Instagram regularly ( $\geq 30$  minutes/day) answered an online survey. Participants reported daily time spent on Instagram in general and characteristics of their fitness-related Instagram use including daily viewing frequency, types of content accessed (e.g., trainers/athletes, everyday people), types of engagement with content (e.g., likes, shares, posts), and reasons for viewing (e.g., to learn about health/wellbeing, to inspire me to change my body shape). PA information seeking and engagement were also measured. Descriptive statistics and frequencies were analyzed using SAS studio.

**Results:** Participants were  $23.0 \pm 3.6$  years old. Most identified as women (74%) and white (78%). Participants spent  $1.3 \pm 1.0$  hours/day on Instagram, on average. Most reported accessing fitness-related content (94%). Of those, majority accessed it 1-5 times/day (52%) and viewed content featuring trainers/athletes (65%). Content appearing on feed (88%) and sharing content with friends (38%) were common passive observing and active contributing activities, respectively. Inspiring exercise or improving health/wellbeing was the most reported reason for accessing content. Most sought information about PA often (43%), including seeking it online, broadly (38%). Light, moderate, and vigorous PA engagement were  $8.6 \pm 9.4$ ,  $5.2 \pm 6.0$ , and  $2.9 \pm 3.4$  hours/week, respectively.

**Conclusion:** Fitness-related Instagram use seems to be common, which is important for understanding how young people use social media as a source of information and inspiration to exercise. PA promotion programs may benefit by modeling characteristics of trainers/athletes' posts while simultaneously sharing high-quality PA information to maximize young people's interest and maintain integrity of content.

# Gut microbiota modulation of lipid and immune response to fermented rye intervention

**Miss Wenyun Li**<sup>1</sup>, Associate Professor Yuwei Liu<sup>1</sup>, Prof. Rikard Landberg<sup>2</sup>, Dr. Kun Xue<sup>1</sup>, Prof. Gengsheng He<sup>1</sup>

<sup>1</sup>Fudan University, Shanghai, China, <sup>2</sup>Chalmers University of Technology, Gothenburg, Sweden

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Rye intervention has received increasing attention in treatment of cardiovascular and immune diseases. In this study, we supposed that whole grain rye intervention has beneficial effects on lipid metabolism and inflammation, and microbial metacommunity could account for the different response to high fiber intervention between subjects with obesity and normal weight.

**Methods:** A parallel dietary intervention was conducted and 182 subjects with normal weight or obesity who had a low habitual consumption of high fiber cereal foods were randomly assigned to FRB or RW group for 12 weeks. Fasting blood sample collection and gut microbiota determination were performed at week 0 and 12. Bacterial communities were measured by 16S rRNA sequencing. Taxonomic features were identified by STAMP software. KEGG pathway was analyzed by Tax4Fun2 package in R software.

**Results:** 1. Compared with RW group, the FRB group had significantly lower low-density lipoprotein cholesterol (LDL-C) (-0.30 versus -0.09 mmol/L, FRB versus RW group) and high-sensitivity C-reactive protein (hs-CRP) (-0.02 versus 0.03 mg/dL, FRB versus RW group) after 12-week intervention. No significant difference was found in total cholesterol (TC) and triglyceride (TG) levels between two groups. 2. In subjects with obesity, hs-CRP was significantly reduced in FRB group, while TC, LDL-C and TG showed no significant changes after intervention. In subjects with normal weight, TC, LDL-C and TG levels were significantly reduced in FRB group, while hs-CRP remained unchanged. 3. In subjects with obesity, the relative abundance of Lachnospiraceae was significantly increased in FRB group, and Gammaproteobacteria, Enterobacteriaceae and Enterobacterales were significantly increased in RW group at week 12. In subjects with normal weight, the relative abundance of Lachnospiraceae was significantly increased in FRB group, while no gut microbiota significantly changed after RW intervention. Moreover, the Lachnospiraceae and Lachnospiraceae abundance were negatively associated with LDL-C and hs-CRP in FRB group. 4. The predicted functions of the microbiota under FRB intervention in subjects with obesity were related to Glycerolipid metabolism.

**Conclusion:** Rye intervention had different health benefits on obesity or non-obesity, and gut microbiota could partly account for the different response to rye intervention. Personalized interventions were needed according to BMI.

# Thermal perception, physical activity, and transit use of adults in a humid subtropical climate

**Assistant Professor Kevin Lanza**<sup>1</sup>, Associate Professor Baojiang Chen<sup>1</sup>, Associate Professor Paquito Bernard<sup>2</sup>, Associate Professor Jennifer Vanos<sup>3</sup>

<sup>1</sup>The University of Texas Health Science Center at Houston, Austin, USA, <sup>2</sup>University of Quebec in Montréal, Montréal, Canada, <sup>3</sup>Arizona State University, Tempe, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** 47% of U.S. adults self-reported meeting federal guidelines for aerobic physical activity in 2020. Studies have shown high outdoor temperatures to be associated with lower physical activity levels, yet none have focused on the psychological element of thermal comfort in relation to physical activity. We determined how thermal perception of adults relates to physical activity and public transit use.

**Methods:** This cross-sectional study occurred in Austin, TX, USA where June–September is greater than 33°C (91°F) on average. Over September–November 2022, we distributed an electronic quantitative survey to a municipal database of ~9,000 Austin residents, which included the International Physical Activity Questionnaire - Short Form and items about transit use during a typical week and what temperature outside starts to feel too hot to go on a neighborhood walk. Before regression modeling to test how temperatures considered too hot were associated with weekly MVPA minutes and transit use, we utilized the pseudo-score test to assess whether piecewise linear relationships existed. Final models adjusted for survey items on age, sex, race/ethnicity, work status, income, general health, and presence of different neighborhood environment elements (e.g., sidewalks).

**Results:** The 1,087 adults (mean = 53 years, 49% female, 78% White, \$100,000–\$149,000 median household income) who completed the survey self-reported 437 (SD = 570) MVPA minutes weekly, and 13% were transit users. Average temperature considered too hot was 33°C (SD = 4°C). Temperature considered too hot did not exhibit a significant association with minutes of MVPA ( $\beta = 0.02$ ; 95% CI [-0.09, 0.13]) ( $p > 0.05$ ) up until 31°C (88°F) when the association changed to an increase ( $\beta = 0.20$ ; 95% CI [0.01, 0.38]) ( $p < 0.05$ ). Each one-unit increase in temperature considered too hot was associated with an 8% (95% CI [3, 14%]) higher likelihood of using transit ( $p < 0.01$ ).

**Conclusions:** Adults who self-report high temperature thresholds for walking outdoors may be more likely to engage in physical activity and use transit, serving as early evidence for developing psychological interventions that promote physical activity in warm climates in the face of climate change.

# Children's eating behaviours and related constructs: Conceptual and theoretical foundations and their implications for measurement and intervention

Prof. Alan Russell<sup>1</sup>, Dr. Elena Jansen<sup>2</sup>, Dr. Alissa Burnett<sup>3</sup>, Ms. Tracy Lee<sup>3, 4</sup>, **Dr. C. Georgie Russell<sup>3</sup>**

<sup>1</sup>Flinders University, College of Education, Psychology and Social Work, Bedford Park, Australia, <sup>2</sup>Johns Hopkins University School of Medicine, Division of Child & Adolescent Psychiatry, Department of Psychiatry & Behavioral Sciences, Baltimore, USA, <sup>3</sup>Deakin University, Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Science, Geelong, Australia, <sup>4</sup>Deakin University, CASS Food Research Centre, School of Exercise and Nutrition Science, Geelong, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** There is a substantial body of research on children's eating behaviours (e.g., food responsiveness and fussiness) and related constructs (e.g., eating in the absence of hunger, appetite self-regulation). This research provides a foundation for understanding children's dietary intakes and healthy eating behaviours, as well as efforts at intervention, whether in relation to food avoidance, overeating and/or trajectories to excess weight gain. The success of these efforts and their associated outcomes is dependent on the theoretical foundation and conceptual clarity of the behaviours and constructs. This, in turn contributes to the coherence and precision of the definitions and measurement of these behaviours and constructs. Limited clarity in these areas ultimately creates uncertainty around the interpretation of findings from research studies and intervention programs. At present there does not appear to be an overarching theoretical framework of children's eating behaviours and associated constructs, or for separate domains of children's eating behaviours/constructs. The main purpose of the present review was to examine the possible theoretical foundations of some of the main current questionnaire and behavioural measures of children's eating behaviours and related constructs.

**Methods:** We reviewed the literature on some of the most prominent measures of children's eating behaviours for use with children aged ~0-12 years. We focused on the explanations and justifications for the original design of the measures and whether these included theoretical perspectives, as well as current theoretical interpretations (and difficulties) of the behaviours and constructs.

**Results:** We found that the most commonly used measures had their foundations in relatively applied or practical concerns rather than theoretical perspectives.

**Conclusions:** We concluded that although existing measures have served the field well, to advance the field as a science, better contribute to knowledge development, measurement, and intervention design, increased attention should be directed to the conceptual and theoretical foundations of children's eating behaviours and related constructs. Suggestions for future directions will be outlined.

# Study design features and bursts of ecological momentary assessments: evaluating effects via randomised controlled trials embedded within a cohort study

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** To evaluate the effects of study design features on response rates to ecological momentary assessment (EMA) bursts embedded within an ongoing cohort study.

**Methods** Over a 7-month period (April to Oct 2021), three bursts of EMA were implemented within the Health@NUS cohort study. The response rate (% of completed EMA surveys) at each burst was examined. Two consecutive randomised controlled trials (RCTs) were conducted to evaluate the efficacy of (1) four different incentive structures (with fixed and bonus components) and (2) two different schedule lengths (7 or 14 days), on EMA response rate. Group differences were examined using ANOVA.

**Results** Participants (N=384) were university students (60% female, mean age 23±1.3 years). Changing the reward structure did not significantly change the response rate ( $F(3, 380) = 1.75, p = 0.157$ ). Changing the schedule length led to a significantly higher mean response rate ( $F(1, 382) = 6.23, p = 0.013$ ) for the 14-day schedule (48.34±33.17%) as compared to the 7-day schedule (38.52±33.44%).

**Conclusions** Changing the available rewards did not lead to a significant difference in the response rate, whereas schedule length did. Our study provides novel insights on how to implement EMA surveys in ongoing cohort studies. This knowledge is essential for conducting high-quality studies using EMA surveys.

# Parents' and stakeholders' views on school-delivered physical activity interventions for children and adolescents with disability: a qualitative study

Dr. Emiliano Mazzoli<sup>1,2</sup>, Ms. Alice Sims<sup>2</sup>, **Dr. Natalie Lander<sup>1,2</sup>**, Dr. Ana Maria Contardo-Ayala<sup>1,2</sup>, Prof. Anna Timperio<sup>1,2</sup>, Associate Professor Nicola D. Ridgers<sup>3</sup>, Prof. David Lubans<sup>4,5,6</sup>, Prof. John Cairney<sup>7</sup>, Dr. Harriet Koorts<sup>1,2</sup>, Prof. Lisa Barnett<sup>1,8</sup>, Dr. Kate Anderson<sup>8,9</sup>, Prof. Jo Salmon<sup>1,2</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition (IPAN), Deakin University, Burwood, Australia, <sup>2</sup>School of Exercise and Nutrition Sciences, Faculty of Health, Deakin University, Burwood, Australia, <sup>3</sup>Alliance for Research in Exercise, Nutrition and Activity, Allied Health and Human Performance, Adelaide, Australia, <sup>4</sup>Centre for Active Living and Learning, College of Human and Social Futures, University of Newcastle, Callaghan, Australia, <sup>5</sup>Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>6</sup>Faculty of Sport and Health Sciences, University of Jyväskylä, Jyväskylä, Finland, <sup>7</sup>School of Human Movement and Nutrition Sciences, Faculty of Health and Behavioural Sciences, The University of Queensland, St Lucia, Australia, <sup>8</sup>School of Health and Social Development, Faculty of Health, Deakin University, Burwood, Australia, <sup>9</sup>Institute for Health Transformation (IHT), Deakin University, Burwood, Australia

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** N. Other

**Purpose:** School-delivered physical activity interventions need to be adapted to the specific needs of children and adolescents with disability. The views of parents of children and adolescents with disability and stakeholder organisations working in disability may offer important insights on how to make current interventions more inclusive. This study aimed to explore parents' and stakeholders' perceptions on school-delivered physical activity opportunities for children and adolescents with disability, to inform the development of an inclusive whole-of-school physical activity program (i.e., TransformUs All Abilities).

**Methods:** Nine representatives from stakeholder organisations focused on disability, education, and health promotion, and 10 parents of children/adolescents with disability participated in 30-min one-on-one interviews. Stakeholder organisations were identified based on their relevance in the field and representatives were invited to participate via email. Parents were recruited via social media and snowballing. Interview questions were developed based on the framework by Proctor et al. (2011), which refers to *acceptability*, *adoption*, *appropriateness*, *feasibility*, *fidelity*, *implementation cost*, *penetration*, and *sustainability* as crucial aspects to consider for a given service/practice to be successful. Questions to parents focused on their individual-level experience, whereas questions to stakeholders were designed to capture a broader and organisational-level perspective. All interviews were audio-recorded, transcribed verbatim, and analysed using thematic analysis.

**Results:** Of the 19 interviewees, eleven identified as female. Most participants (63%) were aged between 40 and 59 years. Amongst the main factors that may contribute to the intervention success, participants identified ease of use for teacher as important in relation to *acceptability* and children related perceptions/interest in physical activity as critical to *adoption*. Tailoring the resources and equipment to cater for the specific needs of different disability types was the main theme associated with *appropriateness*. A shift in the school-culture towards favouring physical activity opportunities emerged as critical for ensuring the proposed intervention is *feasible* and *sustainable*.

**Conclusion:** Stakeholders and parents suggested that school-delivered physical activity strategies for children and adolescents with disability may be successfully implemented when they are tailored to the specific needs and interests of different students, easy for teachers to implement, and supported by the organisational culture as a whole-of-school practice.

# Detailed descriptions of physical activity patterns among individuals with prediabetes and diabetes: The Lolland-Falster Health Study

**Ms. Sofie Rath Mortensen**<sup>1,2</sup>, Prof. Søren T. Skou<sup>2,3</sup>, Associate Professor Jan Christian Brønd<sup>1</sup>, Associate Professor Mathias Ried-Larsen<sup>1,4</sup>, Dr. Randi Jepsen<sup>5</sup>, Dr. Therese Lockenwitz Petersen<sup>5,6</sup>, Associate Professor Lars Hermann Tang<sup>2,7</sup>, Mr. Lars Bo Jørgensen<sup>2,3,8</sup>, Prof. Anders Grøntved<sup>1</sup>

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose** The purpose of this study was to describe daily and weekly physical activity patterns among individuals with prediabetes and diabetes and compare these patterns with individuals with no known diabetes.

**Methods** This cross-sectional study included data from the Danish household-based prospective cohort study; The Lolland-Falster Health Study obtained in 2016-2020. Participants  $\geq 18$  years with accelerometer data and information about diabetes status were included in this study.

The primary outcome was objectively measured physical activity intensities assessed with hip-mounted AX3 accelerometry. Diabetes status was categorized into Diabetes, Prediabetes, and No diabetes by measured HbA1c and self-reported use of antidiabetic medication.

The distribution and comparison of physical activity intensities, adherence to WHO recommendations, timing of activity, and frequency of inactive days/week by diabetes status were estimated with standardization on age and sex. Multiple mixed linear, quantile and poisson regression models were used to estimate and compare physical activity patterns by diabetes status with adjustment of age and sex and subsequent for other major determinants of physical activity.

**Results/findings** Out of 3,158 participants, 181 participants had diabetes, 568 participants had prediabetes, and 2,409 participants did not have diabetes.

Participants with prediabetes and no diabetes had significantly higher daily median MVPA compared to participants with diabetes. Among participants with diabetes, 36.8 % complied with the WHO recommendations of weekly MVPA, while numbers for participants with prediabetes and no diabetes were 40.5 % and 50.4 % respectively.

The percentage of participants with diabetes having more than two consecutive days of inactivity ( $< 5$  minutes/day of MVPA) were 33.2%. Participants with diabetes were significantly less physically active in the afternoon compared to participants with no diabetes (-6.3 min, 95 % CI -10.2; -2.4). Overall, a part of but not the whole difference in physical activity patterns between participants with diabetes, prediabetes and no diabetes were explained by differences in other major determinants.

**Conclusions** This study found that a large proportion of individuals with diabetes and prediabetes were insufficiently physically active and difference in patterns of activity were observed for timing of activity, frequency of inactive days, and overall daily levels of light, moderate and vigorous activity.

# Characterising the Diet, Physical Activity and Sleep Behaviours of UK University Students

**Dr. Ruth James<sup>1</sup>**, Mr. Matthew Savage<sup>1</sup>, Dr. Daniele Magistro<sup>1</sup>, Dr. Kirsty Hunter<sup>1</sup>, Dr. Laura Healy<sup>1</sup>, Dr. James Donaldson<sup>1</sup>, Dr. Philip Hennis<sup>1</sup>

<sup>1</sup>Nottingham Trent University, Nottingham, United Kingdom

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** J. Young Adults

**Purpose:** University students represent 2.66 million individuals in the UK alone, and around 50% of school leavers now continue to higher education (Bolton, 2022). This rapidly increasing graduate population will carry the self-care habits fostered at university into their mid-life and beyond. Up to date details of the current health behaviours of UK based students are scarce, and therefore the aim of this study was to characterise the diet, physical activity and sleep behaviours of this population.

**Method:** An online self-report survey was completed by 8,296 (66.9% female; 30.7% male) students at a UK university. The questionnaire used previously validated questions to assess levels of moderate to vigorous physical activity (MVPA), sedentary behaviour (SB), diet quality (DQS), alcohol use (AUDIT) and sleep quality (SQS). Descriptive data are reported as mean  $\pm$  1 standard deviation and percentages are as a proportion of those who completed the question.

**Results:** MVPA in 6,611 students was 281 $\pm$ 481 minutes per week; 44.6% of students were not meeting the government target of 150 minutes per week. Mean sedentary behaviour time was 464 $\pm$ 254 minutes per day in 6,283 students; 68.9% of students were spending >6h per day sedentary. DQS was 10 $\pm$ 2 in 4,393 students, measured on a scale of 5 to 15. Of these, 81.9% of students had an 'unhealthy' diet (<12 out of 15). The average AUDIT score was 7 $\pm$ 4 in 6,357 students and 51.5% of students were in the 'increasing risk' or 'higher risk' groups for alcohol use. SQS in 4,397 students was 6 $\pm$ 2 on a scale of 0 to 10; 57.5% experienced terrible, poor or fair sleep quality.

**Conclusion:** A large proportion of students have health behaviours known to be linked to the development of poor long-term health and non-communicable diseases (Ronto et al., 2018; Katzmarzyk et al., 2022). Universities are uniquely positioned to positively influence the development of healthier lifestyle choices as they provide some or all of an individual's education, accommodation, recreation, diet and exercise provision. Therefore, in collaboration with key stakeholders, institutions should look to implement policies and develop initiatives aimed at improving student health behaviours.

# Knowledge, attitude and practices toward health promotion among primary school teachers in Singapore

**Associate Professor Mary F-F Chong<sup>1</sup>**, Ms. Jamie J-M Kok<sup>1,2</sup>, Mr. Julian Azfar<sup>1</sup>

<sup>1</sup>National University of Singapore, Singapore, Singapore, <sup>2</sup>National University Hospital, Singapore, Singapore

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Background** Teachers are seen to be vital stakeholders in promoting health in the school setting, yet little is known about their knowledge, attitude and practices towards health promotion. We aimed to explore these among primary school teachers in Singapore, with a focus on health eating, physical activity (PA) and screen time.

**Methods** A questionnaire was designed, based on concepts of the Social Cognitive Theory and covered demographic information, level of knowledge regarding PA, screen-time and dietary concerns, attitudinal statements, perception of practices and open-ended questions on how else teachers can promote health. This was administered via an anonymous online survey conducted over 3 months from February to April 2022. Participants were recruited through snowballing contacts and via emails found on school websites. Descriptive statistical analysis was conducted, and themes were derived from open-ended questions.

**Results** From 7980 emails sent out, a total of 126 primary school teachers responded and participated in the study (70% female). Participants generally had good knowledge regarding screen-related concerns but were less familiar with recommendations for moderate to vigorous PA for children. While most participants (83%) viewed health promotion as part of their job, about a third of felt neutral or disagreed that they have the right knowledge and skills to educate on health behaviours. Participants of older age and those with more work experience tended to have more positive attitudes and better practices ( $p < 0.05$ ). About half of the participants reported neutral or disagreed that teachers' training had taught them how to teach healthy behaviours to students, and most teachers indicate that they were willing and would benefit from further training to promote health education. However, some alluded to being overwhelmed by workload and consequently gave lower priority to health-related programs in schools, despite knowing their importance.

**Conclusion** Teachers recognised the important roles they play in promoting health among their students, but may often be limited by knowledge, skills and opportunities for training in health promotion, on top of their heavy teaching workload. There is potential for school leadership, policymakers and society to create a suitable environment to support teachers in these endeavours.

# Differences in American youth sport participation during the COVID-19 pandemic by socioeconomic status: A national survey

**Dr. Ashleigh Johnson<sup>1</sup>**, Dr. Gregory Knell<sup>2,3</sup>, Dr. Timothy Walker<sup>4</sup>

<sup>1</sup>San Diego State University, San Diego, USA, <sup>2</sup>The University of Texas Health Science Center at Houston, Dallas, USA, <sup>3</sup>Children's Health Andrews Institute for Orthopaedics and Sports Medicine, Plano, USA, <sup>4</sup>The University of Texas Health Science Center at Houston, Houston, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Opportunities for youth sports participation were notably disrupted during the COVID-19 pandemic. Although organized sports have largely resumed in the United States (US), it is unclear how the youth sports landscape shifted during COVID-19, particularly by socioeconomic status (SES). Low-SES families have fewer organized sport opportunities, due in part to cost. Given the economic impact of COVID-19, sports participation may have disproportionately affected youth from low-SES families compared to those from higher-SES families. Thus, the primary aim of this study was to compare organized sports participation during COVID-19 by SES among a national sample of US athletes ages 11-17.

**Methods:** A cross-sectional, national survey was conducted by a market research company (December 2021-January 2022) among US parents whose child had participated in sports pre-pandemic (March 2019-February 2020). Parents were asked about their child's sports participation in organized sports (yes/no) during the pandemic. Household income was categorized as low (US≤\$49,999), middle (US\$50,000-\$119,999), and high (US≥\$120,000). Weighted multivariable logistic regression was used to examine the relative odds of sports participation during COVID-19 among youth athletes from middle- and high-income households compared to those from low-income households. Covariates included age, gender, race, and number of years playing sports.

**Results:** Among youth included in the analysis (n=500; M<sub>age</sub>=14.0 years; 60.6% male), 71.0% continued playing sports during the pandemic, and 30.9% were classified as being from a low-income household. Youth athletes from a middle-income household [aOR=1.69 (95% CI=1.00-2.85)] and from a high-income household [aOR=2.20 (95% CI=1.09-4.44)] had greater odds of sports participation during the pandemic compared to youth athletes from a low-income household.

**Conclusions:** Among US youth who participated in sports pre-pandemic, athletes from middle- or high-income households (versus low-income) had greater odds of organized sports participation during the pandemic. These findings suggest that existing economic disparities in youth sports participation – and consequently physical activity – may have been exacerbated by COVID-19. As organized sports resume in the US, efforts to promote equitable participation should include low-cost opportunities and strategies that encourage resumption of sports among youth who stopped participating during COVID-19. Additional research examining participation barriers post-pandemic, particularly among low-income youth, may be needed.

# Urban–Rural Differences in Dissemination and Implementation of A Statewide Obesity Prevention Initiative before, during, and after COVID-19

Dr. Sally Davis<sup>1,2</sup>, Dr. Nan Zeng<sup>1,2</sup>, Ms. Victoria Culkin<sup>1,2</sup>, Ms. Amelia Putkaradze<sup>1,2</sup>

<sup>1</sup>University of New Mexico, Albuquerque, USA, <sup>2</sup>Prevention Research Center , Albuquerque, USA

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** The Child Health Initiative for Lifelong Eating and Exercise (CHILE) Plus is a statewide nutrition education and obesity prevention program among head start (HS) children across New Mexico. This study aimed to investigate whether the COVID-19 pandemic influenced dissemination and implementation of CHILE Plus. Specifically, the study sought to investigate how the COVID-19 pandemic affected children's eating and physical activity behaviors by community type before, during, and after the pandemic.

**Methods:** We looked at (A) "number of enrolled children/class"; (B) changes in children's health behaviors, including "proportion of kids tasting during the nutrition lesson/day" and (C) "average number of minutes of structured physical activity/day". The COVID-19 timelines were broken down into: March 27th 2019- March 27th 2020 (before outbreak), March 28th 2020 - April 5th 2021 (during: between school closing and schools given green-light to start hybrid model), and April 6th 2021 - December 1st 2022 (after: back to school full time and time of abstract drafted). HS centers were categorized by community type as urban or rural. All information was reported on the REDCap. Descriptive statistics were used and presented as mean  $\pm$  standard deviation.

**Results/findings:** A total of 60 HS centers (> 1080 children) implemented CHILE Plus between March 27th 2019 and December 1st 2022. For 39 rural centers, before COVID-19, A was  $13.39 \pm 4.32$ , B was  $0.81 \pm 0.27$ , and C was  $47.76 \pm 20.07$ . During COVID-19, A was  $6.33 \pm 2.46$ , B was  $0.71 \pm 0.33$ , and C was  $42.35 \pm 21.33$ . After COVID-19, A was  $10.67 \pm 4.19$ , B was  $0.78 \pm 0.30$ , and C was  $50.18 \pm 26.3$ . For 21 Urban centers, before COVID-19, A was  $16.67 \pm 2.42$ , B was  $0.85 \pm 0.22$ , and C was  $71.04 \pm 37.97$ . During COVID-19, A was  $9.65 \pm 2.60$ , B was  $0.84 \pm 0.25$ , and C was  $84.16 \pm 26.52$ . After COVID-19, A was  $11.7 \pm 2.75$ , B was  $0.799 \pm 0.1$ , and C was  $74.41 \pm 32.06$ .

**Conclusions:** During COVID-19, enrollment noticeably dropped in both rural and urban Head Starts, and children demonstrated decreased physical activity and eating behaviors. When schools opened post-pandemic, physical activity increased to be above pre-COVID levels. Enrollment and eating behaviors increased post-pandemic but stayed below pre-pandemic baselines. COVID-19 remarkably affects the implementation of CHILE Plus.

# Traditional nutrition education for weight management increases risk factors for disordered eating compared to intuitive eating messages: a randomized controlled trial in emerging adult women

**Dr. Carly Pacanowski<sup>1</sup>**, Ms. Julia Katcher<sup>1</sup>, Ms. Diane Vizthum<sup>1</sup>, Dr. Christine Skubisz<sup>2</sup>

<sup>1</sup>University of Delaware, Newark, USA, <sup>2</sup>Bentley University, Waltham, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** J. Young Adults

Nutrition messages should encourage health-promoting behaviors in emerging adults without increasing disordered eating risk factors like negative affect (NA). Traditional nutrition education (TNE; e.g., calories-in-calories-out, quantitative cutoffs and goals) promotes a different framework than intuitive eating (IE; e.g., hunger/fullness cues, body acceptance). Additionally, higher heart rate variability (HRV), reflects greater emotion regulation, which is inversely related to disordered eating.

**Purpose:** This randomized trial compared a TNE video to an IE video. We hypothesized that the TNE video would elicit increases in NA and worry about eating and weight and decreases in positive affect (PA) and HRV compared to the IE video.

**Methods:** Female emerging adults (ages 18-29) were randomized to one five-minute video. The TNE video was developed based on USA government guidelines, and the IE video on IE principles. Participants completed pre- and post-video measures: Positive and Negative Affect Schedule, visual analog scales for worry about eating and weight, and wore an electrocardiogram while viewing the videos. Independent samples *t*-tests with the dependent variable being change scores were run.

**Results:** The TNE group exhibited significantly greater increases in NA and worry about eating and weight compared to the IE group (NA<sub>TNE</sub>: M = 2.28, SD = 5.49; NA<sub>IE</sub>: M = -0.99, SD = 3.99;  $t(262.487) = 5.822$ ,  $p < .001$ ,  $d = .682$ ; eating<sub>TNE</sub>: M = 0.43, SD = 1.18; eating<sub>IE</sub>: M = -0.65, SD = 1.27;  $t(298) = 7.668$ ,  $p < .001$ ,  $d = .885$ ; weight<sub>TNE</sub>: M = 0.06, SD = 1.33; weight<sub>IE</sub>: M = -0.83, SD = 1.21;  $t(298) = 6.038$ ,  $p < .001$ ,  $d = .697$ ). The IE group had a significantly greater increase in PA (TNE: M = -3.80, SD = 4.86; IE: M = 0.78, SD = 4.80;  $t(293) = -8.15$ ,  $p < .001$ ,  $d = -.949$ ). Change in HRV was in the hypothesized direction.

**Conclusions.** TNE is utilized for communicating nutrition messages about weight control by government agencies; however, the present study found TNE to elicit increases in disordered eating risk factors. Delivery of nutrition messages may benefit from an IE approach so that disordered eating risk is not inadvertently increased.

# Associations between 24-hour movement behaviors and suicidal thoughts/ideation is race-dependent among Brazilian adolescents

**Dr. Diego Augusto Santos Silva<sup>1</sup>**, Dr. Markus Duncan<sup>2</sup>, Dr. Nicholas Kuzik<sup>2</sup>, Dr. Mark Tremblay<sup>2,3</sup>

<sup>1</sup>Sports Center. Federal University of Santa Catarina. , Florianópolis , Brazil, <sup>2</sup>Children's Hospital of Eastern Ontario Research Institute, Ottawa, Canada, <sup>3</sup>Department of Pediatrics, University of Ottawa, Ottawa, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** The 24-hour movement behaviors are correlates of mental health problems. However, racial disparities in these behaviors are poorly understood. We aimed to analyze the associations between 24-hour movement behaviors and suicidal thoughts among Brazilian adolescents according to race.
