**Methods:** This cross-sectional study surveyed 4,081 adolescents aged 15 to 19 years (49.9% females) across all geographic regions of Brazil. Data were collected using a self-administered questionnaire. Within the sample, 31.0% (n=1,264) self-reported as White and 69.0% (n=2,817) as Black. Adolescents who declared one or more times/week suicidal thoughts/ideation were considered as a risk group. Accruing moderate-vigorous physical activity (MVPA) during leisure time,  $\leq 2$  hours/day recreational screen time, and good sleep quality were the exposures investigated. Sociodemographic information, health behaviors and self-reported diseases were covariates in the analyses. We evaluated both additive and multiplicative interactions between race and 24-hour movement behaviors. Binary logistic regression was used to estimate the odds ratio (OR), marginal means effects (ME), and 95% confidence intervals (95%CI).

**Results/findings:** Prevalence of suicidal thoughts was 6.7% (White adolescents: 5.9%; Black adolescents: 7.1%). Black adolescents who met one (OR: 0.34; 95%CI: 0.22-0.52), two (OR: 0.17; 95%CI: 0.11-0.27) or three (OR: 0.13; 95%CI: 0.07-0.26), and White adolescents who met one (OR: 0.35; 95%CI: 0.21-0.57), two (OR: 0.14; 95%CI: 0.08-0.26), or three (OR: 0.11; 95%CI: 0.04-0.31) of the 24-hour movement behavior targets were less likely to have suicidal thoughts/ideation than Black adolescents who did not meet any of the 24-hour movement behavior targets. Black adolescents who did not meet any of the 24-hour movement behavior targets had higher suicidal thoughts/ideation likelihood (ME: 18.0%; 95%CI: 13.0%-24.0%) than White adolescents (ME: 5.0%; 95%CI: 3.9%-10.0%) who did not meet any of the 24-hour movement behavior targets and Black or White adolescents who met at least one of the 24-hour movement behavior targets.

**Conclusions:** In general, we identified an inverse association between meeting individual and combinations of 24-hour movement behavior targets with suicidal thoughts/ideation. Among adolescents who identify as Black and did not meet any targets, these associations were more evident.

# 24-hour accelerometer-measured movement behaviours in Malaysian children and adolescents: a cross-sectional study

**Dr. Sophia M. Brady**<sup>1</sup>, Dr. Ruth Salway<sup>1</sup>, Dr. Jeevitha Mariapun<sup>2</sup>, Dr. Louise Millard<sup>1</sup>, Dr. Amutha Ramadas<sup>2</sup>, Mr. Hussein Rizal<sup>2</sup>, Dr. Andy Skinner<sup>1</sup>, Mr. Chris Stone<sup>1</sup>, Dr. Laura Johnson<sup>3</sup>, Prof. Tin Tin Su<sup>2,4</sup>, Dr. Miranda E.G. Armstrong<sup>1</sup>

<sup>1</sup>University of Bristol, Bristol, United Kingdom, <sup>2</sup>Monash University Malaysia, Kuala Lumpur, Malaysia, <sup>3</sup>NatCen Social Research, London, United Kingdom, <sup>4</sup>South East Asia Community Observatory (SEACO), Kuala Lumpur, Malaysia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose** Sleep, inactive time, and physical activity (PA) are dependent interchangeable behaviours that are compositional in nature. Quantifying movement behaviours as part of a 24-hour continuum can increase understanding of how different movement behaviours interact with each other, their independent and combined effects on health, and can lead to the production of more extensive guidance and recommendations which encompass PA, sleep and inactive time behaviours. While device-based 24-hour PA movement behaviours have been explored in high-income countries, little is known about Malaysian children and adolescents. The aim of this study was to describe 24-hour accelerometer-measured sleep, inactivity and PA in a large sample of Malaysian children and adolescents; by demographic characteristics and external events (Ramadan and COVID-19 restrictions), compared to self-report PA.

**Methods** Children and adolescents (n=626) aged 7-18 recruited between November 2021-August 2022 from households in Segamat, Malaysia wore wrist-worn Axivity AX6 triaxial accelerometers for 24 hours/day over 7 days, and completed the PAQ-C physical activity questionnaire. Accelerometer data were processed using the GGIR R package, using validated cut-points to calculate daily average time and proportions of the day spent in moderate-to-vigorous intensity PA (MVPA), light-intensity PA (LPA), inactive time and sleep. Means and 95% confidence intervals (95% CI) were calculated overall and for demographic subgroups (age, gender, ethnicity, BMI categories, socioeconomic groups).

**Results** Participants spent 8.2 (95% CI= 7.9-8.4) hours/day asleep, 12.4 (95% CI= 12.2-12.7) hours/day inactive, 2.8 (95% CI= 2.7-2.9) hours/day in LPA, and 33.0 (95% CI= 31.0-35.1) minutes/day in MVPA, with only 13% meeting the World Health Organisation MVPA guidelines (average of 60 minutes/day of MVPA per week). We observed higher PA among children vs. adolescents, males vs. females, and Indian vs. Malay ethnic groups.

**Conclusions** Malaysian children and adolescents engaged in relatively low levels of MVPA and had high inactive time compared to studies using similar protocols in children from high-income countries. Further research is required to understand why PA engagement is so low in this population, particularly among girls, adolescents, and those of Malay ethnicity, in order to develop interventions, guidance, and support to increase PA and improve child health.

# Time-trends inequalities in leisure-time physical activity in a Southern Brazilian city from 2004 to 2021

**Dr. Inacio Crochemore-Silva<sup>1</sup>**, Dr. Andrea Wendt<sup>2</sup>, Dr. Alan Knuth<sup>4</sup>, Dr. Bruno Nunes<sup>1</sup>, Dr. Mario Renato Azevedo<sup>1</sup>, Dr. Helen Gonçalves<sup>1</sup>, Dr. Pedro Hallal<sup>3</sup>

<sup>1</sup>Universidade Federal de Pelotas, Pelotas, Brazil, <sup>2</sup>Pontifícia Universidade Católica do Paraná, Curitiba, Brazil,

<sup>3</sup>University of Illinois, Urbana-Champaign, USA, <sup>4</sup>Universidade Federal do Rio Grande, Rio Grande, Brazil

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** To assess time trends inequalities in leisure-time physical activity in Pelotas (Brazil) from 2004 to 2021, according to gender, socioeconomic and ethnicity.

**Methods:** Three surveys were conducted in 2004, 2010 and 2021 in Pelotas, a southern Brazilian City. All multistage sampling processes were comparable, and samples are representative from the urban population. Leisure-time physical activity was assessed using the International Physical Activity questionnaire (IPAQ). Two variables were used, including the WHO recommendations of at least 150 minutes spent in moderate-intensity or 75 minutes in vigorous-intensity activities, and the proportion of individuals reporting any minute of leisure-time physical activity. Inequalities were assessed according to gender (male/ female), ethnicity (self-report skin colour) and wealth (based on a list of household assets and divided in quintiles). Simple (difference) and complex (Slope Index of Inequality) measures of inequalities were used. In addition, intersectionality was addressed based on Jeopardy Index.

**Results:** The final sample included 3,090 adults in the 2004, 2,656 in the 2010 and 5,696 in the 2021 survey. Leisure-time physical activity in Pelotas did not change over time; around 40% of adults reported any leisure-time physical activity and around 25% reported at least 150 minutes/week. Gender inequalities persisted across the years, with women presenting a prevalence of leisure-time physical activity on average 10 percentage points (p.p.) lower than men. In 2004 the wealthiest presented a leisure-time physical activity prevalence 20p.p. higher than the poorest. Despite a reduction observed in 2010, in 2021 the wealth inequalities presented the same magnitude of the initial period assessed. Skin colour inequalities were not observed when analysed isolated, but the most marked inequality pattern was observed comparing the most privileged group represented by men, wealthiest, and white, and the most vulnerable group represented by women, poorest, and black/brown.

**Conclusions:** In addition to time trends analyses of leisure-time physical activity, monitoring inequalities and intersectionality is needed. Women, black/brown and poor are persistently presenting lower levels of leisure-time physical activity. Public policies are required and must be equity oriented.

# Facilitating co-research: lessons learned from reflection forms within three participatory action research projects

**Mrs. Ann Vandendriessche**<sup>1</sup>, Ms. Helga Emke<sup>2</sup>, Mrs. Mai Chin A Paw<sup>2</sup>, Mrs. Benedicte Deforche<sup>1,3</sup>, Mrs. Maïté Verloigne<sup>1</sup>, Mrs. Teatske Altenburg<sup>2</sup>, Mrs. Manou Anselma<sup>2</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Vrije Universiteit Amsterdam, Amsterdam, Netherlands, <sup>3</sup>Vrije Universiteit Brussel, Brussels, Belgium

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Researchers acting as facilitators of co-research within participatory action research (PAR) play an important role in establishing a mutual learning environment. Critical self-reflection on the facilitator role can improve the co-research process. However, guidelines for facilitating co-research and for structural reflection on the facilitator role are currently lacking. This study aims to extract lessons for researchers facilitating co-research based on reflection forms used in three PAR projects with children and adolescents.

**Methods:** In three health promotion projects, participatory sessions took place with children or adolescents for three to four school years. After each participatory session, facilitators filled in a reflection form assessing the group process and their role as facilitator. This resulted in 252 reflections forms of which 135 were included in the current analysis. NVivo was used for coding which was partly deductive and partly inductive.

**Results:** A successful session included active and creative participatory methods, a 'plan B' (e.g., for when a method does not really fit, timing wise) and clearly stated the goal at the beginning of the session. Making good agreements, making sure everyone is heard and taking time to have fun appeared to be important. Finally, facilitators needed to encourage co-researchers to take the lead and adapt to the present dynamics in the group.

**Conclusion:** Facilitators learned that a well-prepared session increased efficiency and allowed for more flexibility during the sessions. Furthermore, the facilitator was important in creating and maintaining a safe, functional and positive atmosphere and ensuring ownership and shared-decision making.

# Exploring the design and utility of chatbots for young adults to support healthy eating: A qualitative study.

**Dr. Lee M Ashton**<sup>1,2</sup>, Associate Professor Marc TP Adam<sup>1,2</sup>, Dr. Megan Whatnall<sup>1,2</sup>, Dr. Megan E Rollo<sup>3</sup>, Prof. Tracy L Burrows<sup>1,2</sup>, Miss Vibeke Hansen<sup>1</sup>, Prof. Clare Collins<sup>1,2</sup>

<sup>1</sup>University of Newcastle, Callaghan, Australia, <sup>2</sup>Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>3</sup>Curtin University, Perth, Australia

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** J. Young Adults

**Background:** There is limited understanding for the potential utility of a chatbot to support healthy eating among young adults. Therefore, the aim was to interview key informants regarding potential utility and design of a chatbot to: 1) increase young adults' return rates and engagement with a purpose-built healthy eating website and, 2) motivate and support young adults to improve diet quality.

**Methods:** Eighteen qualitative, semi-structured interviews were conducted with three stakeholder groups: i) experts in dietary behaviour change in young adults, ii) young adult users of a healthy eating website, and iii) experts in chatbot design. A hybrid approach using deductive and inductive reasoning was applied guided by a behaviour change theoretical framework. A template analysis was conducted using NVivo.

**Results:** Interviews identified three potential roles of a chatbot to support healthy eating in young adults (R1: improving healthy eating knowledge and facilitating discovery, R2: reducing time barriers related to healthy eating, R3: support and social engagement) and eight suggested features or content to support each role (F1: chatbot generated recommendations, F2: triage to website information or external to address current user needs, F3: nudge or behavioural prompts at critical moments, F4: assist users to navigate healthy eating websites, F5: enhance interactivity, F6: offer useful anonymous support, F7: facilitate user connection with content in meaningful ways, F8: outreach adjuncts to website (e.g., emails)). Additional 'general' chatbot features included authenticity, personalisation and effective and well-planned development, while the preferred chatbot style and language included tailoring (e.g., age and gender), with a positive and professional tone. Finally, the preferred chatbot message subjects included training (e.g., *would you like to see a video to make this recipe?*), enablement (e.g., *healthy eating doesn't need to be expensive, we've created a budget meal plan, want to see?*) and education or informative approaches (e.g., *"Did you know bananas are high in potassium which can aid in reducing blood pressure?"*).

**Conclusion:** Findings can guide chatbot designers and nutrition behaviour change researchers on potential chatbot roles, features, style and language and messaging in order to support healthy eating knowledge and behaviours in young adults.

# A comparison on perceived barriers to optimal child sleep among families with low and high income

**Dr. Elizabeth Adams<sup>1</sup>**, Mrs. Amanda Edgar<sup>1</sup>, Ms. Peyton Mosher<sup>1</sup>, Dr. Sarah Burkart<sup>1</sup>, Dr. Michael Beets<sup>1</sup>, Dr. R. Glenn Weaver<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>, Dr. Becky Siceloff<sup>1</sup>, Ms. Meghan Bastyr<sup>1</sup>, Mr. Roddrick Dugger<sup>1</sup>, Dr. Ron Prinz<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** G. Children and families

**Background:** Children in families with low-income (LI) experience more suboptimal sleep than children in higher income (HI) families. Unique drivers likely contribute to these disparities, along with factors that universally impede healthy sleep patterns, despite income level. This mixed-methods study sought to understand parents' perceptions on child sleep challenges to identify similarities/differences experienced by LI and HI families to inform the development of tailored interventions.

**Methods:** Parents were categorized as LI (n=15; \$30,000±17,845/year) or HI (n=15; \$142,400±61,373/year). All parents had to experience difficulty with their preschooler's sleep. Parents completed a survey with the Child Sleep Wake Scale (CSWS) to measure sleep quality. A semi-structured phone interview explored perceived barriers/facilitators to optimal sleep. Transcripts were coded by two researchers, for LI and HI groups separately, using inductive analyses. Constant-comparison methods generated themes and characterized similarities/differences by income group. Independent t-tests examined differences in CSWS scores.

**Results:** Groups were similar in CSWS sleep quality scores (LI: 3.4±0.7 vs. HI: 3.6±0.6; p=0.28), bedtime delays (LI: 48.7±44.3 vs. HI: 46.9±36.5 min/night; p=0.90), and time to fall asleep (LI: 62.3±52.7 vs. HI: 38±33.2 min/night; p=0.14). LI families reported more night wakings (LI: 2.0±1.1 vs. HI: 1.0±0.7 times/night; p=0.01). Groups were similar in themes related to *diverse bedtime routines* (e.g., presence of stimulating and soothing activities), *specific struggles with child sleep* (e.g., falling asleep), *strategies to reduce night wakings* (e.g., co-sleeping), *environmental contexts* (e.g., creating sleep-promoting environments), and *electronic rules* (e.g., no screens in bed). Groups differed in themes related to *motivations around setting routines* (e.g., HI: intrinsic desire for structure; LI: external sources to promote routine setting), *parent appraisal of child sleep* (e.g., HI: more mixed feelings; LI: mostly negative appraisal), *nap timing and duration*, and *resource access and strategy utilization* (e.g., HI tried more strategies and accessed more online/print resources).

**Discussion:** Parents experienced many similar barriers to child sleep, with a few distinct differences by income group. Future interventions can use these findings to inform components for all families, as well as customized components – such as fostering motivations around routine setting – to address the unique needs of families across income levels.

# mHealth use and needs of women after gestational diabetes: what do women want?

**Dr. Anna Roesler<sup>1</sup>**, Dr. Kaley Butten<sup>1</sup>, Dr. Pennie Taylor<sup>1</sup>, Dr. Elizabeth Holmes-Truscott<sup>2,3</sup>, Dr. Marlien Varnfield<sup>1</sup>

<sup>1</sup>The Australian eHealth Research Centre, The Commonwealth Scientific and Industrial Research Organisation, Brisbane, Australia, <sup>2</sup>The Australian Centre for Behavioural Research in Diabetes, Melbourne, Australia, <sup>3</sup>Deakin University, Geelong, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Gestational Diabetes Mellitus (GDM) is one of the most common medical complications of pregnancy. Women affected are at increased risk of future diabetes. Diet and lifestyle modifications remain the cornerstone of therapy to reduce future diabetes risk, and mHealth (e.g., health apps) can facilitate these modifications. However, there is limited information on health app usage and desired app features following GDM across Australia. This study aims to understand the health-aims of women after GDM, as well as drivers towards use of a health app and its functions.

**Methods:** An explorative cross-sectional survey was developed and tested with six women prior GDM. Study-specific questions measured demographic and clinical characteristics, health-aims, health-app use and motivation for an app and desired functions. The online survey was disseminated via social media (Nov 2022 – Jan 2023) to women who have experienced GDM within Australia in the last five years. Descriptive analyses were conducted.

**Findings:** Of the 1155 valid survey completers (aged 35±4.8 years), 98% reported having health aims post pregnancy (e.g. eat healthy (86%), look after mental wellbeing (80%), maintain a healthy weight (79%), exercise regularly (79%)), and 18% used a health-app to support health-aim achievement. In total, 112 health-apps were identified as used to support post pregnancy health-aim achievement (most common: MyFitnessPal, 22%). GDM specific: 1 app reported), and these apps were typically self-selected (61%). The most useful functions reported by current users included tracking capabilities for diet, exercise, glucose and weight, while non-users indicated help and information functions. Two thirds (67%) of app non-users reported motivation to use a health-app for chronic disease (e.g. diabetes) prevention if the app was recommended by their health provider, while 18% said that nothing would motivate health-app use. Overall, respondents would like more information on: future prevention of GDM (48%), weight loss plans (45%) and healthy eating plans (44%).

**Conclusions:** An app may be a well-received option to facilitate healthy behaviours after GDM. However, endorsement of mHealth by health providers is important to women. Further, there is opportunity for health-app refinement to better meet the needs and preferences of women with prior GDM.

# Adapting TransformUs – a whole-of-school physical activity program for Secondary schools: A participatory approach

**Dr. Ana Maria Contardo-Ayala<sup>1</sup>, Dr. Natalie Lander<sup>1</sup>**, Dr. Emiliano Mazzoli<sup>1</sup>, Associate Professor Nicola D. Ridgers<sup>1,2</sup>, Prof. Anna Timperio<sup>1</sup>, Ms. Nicole Biggs<sup>1</sup>, Prof. Jo Salmon<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Sciences, Deakin University, Burwood, Australia, <sup>2</sup>Alliance for Research in Exercise, Nutrition and Activity (ARENA), Allied Health and Human Performance, University of South Australia, Adelaide, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** School-based movement behaviour initiatives have been largely ineffective in increasing physical activity in secondary school students. Strategies that utilise a whole-school approach and are co-designed/adapted by teachers and students could be effective. This study aimed to inform the adaptation of TransformUs (a whole-school program originally designed for primary schools) to suit the needs and characteristics of secondary schools, using a participatory approach.

**Methods** Three Victorian secondary schools were involved in separate face-to-face participatory workshops (2.5 hours each). The workshops were informed by a systematic review, interviews with academics and stakeholders, and the Department of Education's "Active-schools framework". Students from Years 7–12, teachers representing different year levels/subjects, and school principals participated in the workshops. A design sprint process ensured collaboration during the workshops, and included: a) *understanding* TransformUs strategies and other effective strategies identified in literature; b) *defining* specific adaptation goals; c) *identifying* barriers specific to each school and developing possible solutions; d) *agreeing* on the most suitable solutions generated by the group; e) *prototyping* the identified strategies by including comprehensive details on how to deliver them; and f) *validating* strategies using teachers' feedback on their use. Each school was provided with up to AUD 40,000 to implement the strategies.

**Results** One participating school (S) was located in a regional area (S1: 10 students; 3 teachers) and one each in a high (S2: 10 students; 3 teachers; school principal) and low (S3: 9 students; 7 teachers) socioeconomic area. The following strategies were selected and adapted by each school during the workshop based on their specific needs: S1= active breaks, organised lunch-time sports and activities, height-adjustable desks and teacher professional development (TPD); S2: active breaks, active lessons, organised lunch-time sports and activities, height-adjustable desks, line markings and TDP; S3: active breaks, active lessons, teacher resource packs/whiteboards, classroom wall decals, height-adjustable desks, and TDP.

**Conclusions** There were some similarities and differences in the types of strategies each school selected/adapted to suit the context of their school community. Participatory approaches are warranted to ensure alignment with school-specific needs. Future research should determine if this participatory approach leads to change in movement behaviours.

# Are chatbots effective for improving physical activity, diet and sleep? A systematic review and meta-analysis.

**Dr. Ben Singh<sup>1</sup>**, Prof. Timothy Olds<sup>1</sup>, Dr. Jacinta Brinsley<sup>1</sup>, Dr. Dot Dumuid<sup>1</sup>, Dr. Rosa Virgara<sup>1</sup>, Dr. Lisa Matricciani<sup>1</sup>, Dr. Amanda Watson<sup>1</sup>, Ms. Kimberley Szeto<sup>1</sup>, Mrs. Emily Eglitis<sup>1</sup>, Mr. Aaron Miatke<sup>1</sup>, Mrs. Catherine Simpson<sup>1</sup>, Prof. Corneel Vandelanotte<sup>2</sup>, Prof. Carol Maher<sup>1</sup>

<sup>1</sup>University of South Australia, Adelaide, Australia, <sup>2</sup>Central Queensland University, Rockhampton, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** To: i) describe the weight management strategies used by a sample of Australian adults; ii) examine whether use of weight management strategies was associated with weight change over 12 months; and iii) examine the psycho-sociodemographic characteristics of those who used each strategy.

**Methods:** Data were from a 12-month cohort study, involving a community-based sample of Australian adults (n=368, mean age=40.1, SD=5.8). Demographic characteristics were self-reported at baseline. Participants were encouraged to weigh themselves, preferably daily but at least weekly using Fitbit Aria body weight scales (Aria 2 or Aria Air scales, Fitbit Inc., San Francisco, CA). Data were remotely gathered using custom-developed "FitnessLink" software. The use of weight management strategies were obtained using a self-report survey at eight timepoints during the 12-month period. The relationship between weight management strategies, change in weight over the 12-month period and psycho-sociodemographic characteristics was assessed using linear mixed effect models and univariate multinomial logistic regression.

**Results:** Most participants (81%) reported using as least one weight management strategy over the 12 months. The most common weight management strategies were being physically active or exercising (reported by 77%), restricting calories (63%), fasting (41%), counting calories (28%), using supplements (24%) and using diet pills (6%). Exercising or being physically active for weight control was the only strategy significantly associated with weight change (between group difference relative to those not reporting the strategy: -1.2 kg,  $p<0.01$ ). Participants who reported accepting their bodyweight were less likely to report the use of weight management strategies (OR=0.38,  $p<0.01$ ). Compared with females, males were less likely to count calories (OR=0.49,  $p<0.01$ ).

**Conclusions:** Overall, the use of weight management strategies was common in a sample of Australian adults. Public health weight management approaches should include strategies that are associated with effective weight management, and also address the perceptions that individuals have about their bodyweight.

# Effects of integrating physical literacy into active school recesses intervention on physical fitness and academic performance in Chinese School children: A Cluster Randomized Controlled Trial

**Miss Dangling Zhang**<sup>1</sup>, Ms. Lijuan Shi<sup>2</sup>, Ms. Xiaoling Zhu<sup>3</sup>, Mr. Sitong Chen<sup>4</sup>, Prof. Yang Liu<sup>1,5</sup>

<sup>1</sup>School of Physical Education, Shanghai University of Sport, Shanghai, China, <sup>2</sup>Shanghai Teacher Institute, Shanghai, China, <sup>3</sup>Education Institute of Yangpu District Shanghai, Shanghai, China, <sup>4</sup>Institute for Health and Sport, Victoria University, Melbourne, Australia, <sup>5</sup>Shanghai Research Center for Physical Fitness and Health of Children and Adolescents, Shanghai University of Sport, Shanghai, China

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** The aim of this study was to examine the effects of school-based intervention integrating physical literacy (PL) into active school recesses (ASR) on physical fitness (PF) and academic performance (AP) in Chinese children.

**Methods:** A total of 357 children (mean age:  $7.8 \pm 0.7$  years; boys: 50.4%) recruited from two schools and these two schools were randomly assigned as intervention group (IG) and control group (CG), respectively. IG consisted of 155 children (mean age:  $7.9 \pm 0.7$  years, boys: 51.0%), and 202 children (mean age:  $7.8 \pm 0.7$  years; boys: 50%) were in CG. Children in IG received a 10-week PL integrated intervention conducted during ASR. In CG, children remained engaging in regular school activity within 10 weeks. Generalized estimating equation was used to compare the effects of IG and CG on PF and AP.

**Results:** Regarding to PF, there was a significant group  $\times$  time interaction on 20-m shuttle run ( $\beta = -3.89$ , 95% CI [-5.08; -2.71],  $p < 0.001$ ) and handgrip ( $\beta = -0.70$ , 95% CI [-1.20; -0.20],  $p = 0.006$ ). Intervention group had a greater increase than the CG ( $p < 0.001$ ) with 20-m shuttle run and handgrip. In addition, the post-test performance of children in the IG was significantly greater than those in the CG (20-m shuttle run:  $p < 0.001$ , handgrip:  $p = 0.002$ ). In AP, there was a significant group-by-time interaction on Chinese level ( $\beta = -1.21$ , 95% CI [-1.91; -0.56],  $p = 0.001$ ) and math level ( $\beta = 16.71$ , 95% CI [15.14; 18.143],  $p < 0.001$ ). Significant positive difference in post-test was only observed in mathematics level between IG and CG ( $p = 0.012$ ).

**Conclusions:** This study suggests that intervention integrated PL into ASR could bring positive impacts on PF indicators and AP in Chinese children. Replicated studies with larger sample size and in different contexts are required for scale-up of the intervention.

**Keywords:** physical literacy, academic achievement, physical fitness, active break

# Associations between socioeconomic status and screen time among children and adolescents in China: a cross-sectional study

**Dr. Youzhi Ke<sup>1</sup>**, Dr. Sitong Chen<sup>2</sup>, Dr. Jintao Hong<sup>3</sup>, Dr. Yahan Liang<sup>1</sup>, Prof. Yang Liu<sup>1,4</sup>

<sup>1</sup>Shanghai University of Sport, Shanghai, China, <sup>2</sup> Victoria University, Victoria, Australia, <sup>3</sup>Shanghai Research Institute of Sports Science, Shanghai, China, <sup>4</sup>Shanghai Research Center for Physical Fitness and Health of Children and Adolescents, Shanghai, China

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Background:** Socioeconomic status (SES) is an important determinant of screen time (ST) in children and adolescents, however, the association between SES and ST is not fully understood in China. This study aimed to investigate the association between SES and ST (operationalized as meeting the ST guidelines; no more than 2 hours per day) in Chinese children and adolescents.

**Methods:** Cross-sectional data of 2,955 Chinese children and adolescents aged 8 to 17 (53.4% girls) were used. SES was measured using indicators of parental education and perceived family wealth. ST was assessed with detailed items from the Health Behaviour School-aged Children survey questionnaires. Descriptive statistics and a Chi-square test were used to report the sample characteristics and analyse ST differences across different sociodemographic groups. A binary logistic regression was then applied to analyse the association of SES indicators with ST in children and adolescents.

**Results:** Overall, 25.3% of children and adolescents met the ST guidelines. Children and adolescents with higher parental education levels were 1.84 [95% CI 1.31–2.57; father] and 1.42 [95% CI 1.02–1.98; mother] times more likely to meet the ST guidelines than those with lower parental education levels. Associations between SES and ST varied across sex and grade groups. Moreover, the associations of SES with ST on weekdays and weekends were different.

**Conclusions:** This study demonstrated the association between SES and ST in children and adolescents, highlighting the importance of targeting children and adolescents with low SES levels as an intervention priority. Based on our findings, specific interventions can be tailored to effectively reduce ST. Future studies are encouraged to use longitudinal or interventional designs to further determine the association between SES and ST.

**Keywords:** Social inequalities, health promotion, screen time, child, adolescent

# Using the Transtheoretical Domains Framework to Understand Barriers and Facilitators Influencing Physical Activity Behavior in Rural Communities

**Ms. Kirsten Ward<sup>1</sup>**, Mr. Cameron Aird<sup>1</sup>, Dr. Guy Faulkner<sup>2</sup>, Dr. Mary Jung<sup>3</sup>, Ms. Gloria Fox<sup>4</sup>, Dr. Anne Pousette<sup>5,6</sup>, Dr. Chelsea Pelletier<sup>1</sup>

<sup>1</sup>Department of Health Sciences, University of Northern British Columbia, Prince George, Canada, <sup>2</sup>School of Kinesiology, University of British Columbia, Vancouver, Canada, <sup>3</sup>School of Health and Exercise Sciences, University of British Columbia Okanagan, Kelowna, Canada, <sup>4</sup>Population and Public Health, Northern Health, Prince George, Canada, <sup>5</sup>Wellness in Northern British Columbia, Prince George, Canada, <sup>6</sup>Faculty of Medicine, University of British Columbia, Prince George, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** People living in rural communities face unique barriers and fewer opportunities for participation in physical activity than those in urban centers. The existing literature has no consensus on the definition of rural. This project aims to identify and understand the barriers and facilitators of physical activity in rural communities of British Columbia (BC), Canada and map these factors to behavior change theory to guide creation of interventions.

**Methods:** We interviewed participants from rural locations in the northern and interior regions of BC. Rural communities were defined as per the Rural Practice Subsidiary Agreement, endorsed by the provincial government and Doctors of BC, based on factors including community size and distance from major medical centers and related services. Interview questions prompted discussion about participant beliefs and lived experiences of physical activity, focusing on barriers and facilitators. Deductive analysis was used, identifying barriers and facilitators to physical activity, and mapping them to the Theoretical Domains Framework. Inductive thematic analysis was completed within domains that had more complex and nuanced coding, resulting in subthemes.

**Results:** Participants included 46 individuals from northern (n = 26) and interior (n = 20) communities, aged 22 to 77 years with 78% (n = 36) identifying as women. A total of 28 different communities were represented by participants (population size 10 - 13,400). Participants identified barriers and facilitators to physical activity most frequently associated with the domains of Social Influences (focus on interpersonal processes), Environmental Context and Resources (circumstances of the individual's environment/situation), and Beliefs About Consequences (beliefs about reality or outcomes of a behavior). Subthemes of these domains related to the availability of friends or family with whom to be physically active together; weather-related factors; infrastructure for physical activity; and beliefs about aging and fear of injuries.

**Conclusion:** To support a strengths-based approach to physical activity promotion, a focus on highlighting and supporting facilitators such as peer interaction, education, and pertinent strategies for weather conditions could be beneficial at a community level. Additionally, reviewing and updating infrastructure and improving availability of resources, such as funding, could be completed at a higher government or health promotion level.

# Is Television Viewing Related to Attitudinal Beliefs Towards Violence, Academic Performance, Agility and Movement Skill, and Health Behaviors in Adolescents?

**Dr. Alejandro Jiménez-Loaisa<sup>1</sup>**, Dr. David González-Cutre<sup>2</sup>, Dr. Eva León-Zarceño<sup>3</sup>, Dr. Javier Valenciano-Valcárcel<sup>1</sup>, Dr. Vicente J. Beltrán-carrillo<sup>2</sup>

<sup>1</sup>Department of Didactics of Physical Education, Artistic and Music. Faculty of Education. University of Castilla-La Mancha. , Toledo, Spain, <sup>2</sup>Department of Sport Sciences. Sports Research Centre. Miguel Hernández University of Elche., Elche, Spain, <sup>3</sup>Department of Behavioral Sciences and Health. Miguel Hernández University of Elche., Elche, Spain

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Prior research has found that television viewing is associated with several harmful health behaviors (e.g., physical inactivity, poor dietary intake) during adolescence, but little is known about how it is associated with other factors equally important for proper adolescent development and well-being. This correlational study examined the associations between television viewing behavior and attitudinal beliefs towards violence, academic performance, agility and movement skill, and health behaviors in adolescents.

**Methods:** A total of 307 adolescents (159 boys and 148 girls;  $M_{age} = 13.95$  years,  $SD = 1.28$ ) from a secondary Spanish school completed several measures to assess their attitudinal beliefs towards violence in educational centres (CAHV-25 questionnaire), agility and movement skill (CAMSA test), physical activity (PAQ-A questionnaire), adherence to a healthy Mediterranean diet (KIDMED questionnaire), and consumption of tobacco, alcohol, and other drugs (HBSC questionnaire). The mean of their marks in the school subjects was also used as an indicator of academic performance. Pearson's correlations and linear regression analyses were calculated to test the associations among these variables.

**Results:** Correlation analyses showed that television viewing was positively associated with attitudinal beliefs towards violence ( $r = .15$ ,  $p = .006$ ) and agility and movement skill ( $r = .14$ ,  $p = .009$ ) in adolescents. Television viewing was also negatively associated with academic performance ( $r = -.12$ ,  $p = .022$ ) and with adherence to a healthy diet ( $r = -.24$ ,  $p < .001$ ). Linear regression analyses showed that adolescents with higher agility and movement skill watched more television ( $\beta = .18$ ,  $p = .005$ ), whereas adolescents with higher academic performance ( $\beta = -.13$ ,  $p = .040$ ) and a higher adherence to a healthy diet ( $\beta = -.21$ ,  $p = .001$ ) watched less television.

**Conclusions:** Television viewing may have a considerable impact on adolescents' social behaviors, health, and education. However, more research is needed to try to clarify the mediators behind the positive association between television viewing and agility and movement skill. Future school-based interventions that try to encourage responsible TV consumption in the adolescent population are desirable.

# Inequities in diverse greenspace types by race/ethnicity and income across the United States

Dr. Ellen Stowe<sup>1</sup>, **Dr. Andrew Kaczynski<sup>1</sup>**, Dr. Morgan Hughey<sup>2</sup>, Dr. Courtney Monroe<sup>1</sup>, Dr. Dwayne Porter<sup>1</sup>  
<sup>1</sup>University of South Carolina, Columbia, USA, <sup>2</sup>College of Charleston, Charleston, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Neighborhood greenspace is tied to health and well-being but may not be equitably present in neighborhoods that vary in sociodemographic attributes, thereby contributing to environmental injustices and health disparities. The purpose of this study was to examine variations in coverage for numerous types of greenspace across the United States by race/ethnicity and income.

**Methods:** For census block groups in the contiguous United States ( $n=187,809$ ), data from the National Land Cover database and Esri USA Parks were used to calculate percent block group coverage for 11 measures of greenspace: five related to landcover (forest, shrubland, herbaceous, wetlands, total landcover greenspace), one tree canopy, and five parks (national, state, county, local, total). Data about race/ethnicity (percent non-Hispanic white) and median household income were collected from American Community Survey five-year (2012-2016) estimates for all block groups. Spatial autocorrelation tests were conducted and spatial error models using a queen spatial weights matrix were used to examine the association between race/ethnicity and income and the 11 greenspace measures (controlling for median housing age and US Census region).

**Results:** Nine of the 11 greenspace types had a significant, positive association with race/ethnicity, in that as the percentage of non-Hispanic white residents in a block group increased by 1%, so too did the proportion of greenspace: forest ( $B=0.04, SE=0.002$ ), shrubland ( $B=0.004, SE=0.001$ ), herbaceous ( $B=0.01, SE=0.001$ ), wetlands ( $B=0.01, SE=0.001$ ), total landcover ( $B=0.07, SE=0.002$ ), tree canopy ( $B=0.05, SE=0.001$ ), national parks ( $B=0.01, SE=0.001$ ), state parks ( $B=0.004, SE=0.001$ ), total parks ( $B=0.01, SE=0.001$ ). Likewise, seven of the 11 greenspace measures had a significant, positive association with median household income, in that as block group income increased by \$10,000, so too did the amount of greenspace: forest ( $B=0.29, SE=0.01$ ), shrubland ( $B=0.06, SE=0.01$ ), herbaceous ( $B=0.04, SE=0.005$ ), total landcover ( $B=0.38, SE=0.02$ ), tree canopy ( $B=0.43, SE=0.01$ ), county parks ( $B=0.01, SE=0.001$ ), local parks ( $B=0.09, SE=0.005$ ). Choropleth maps will be used to illustrate racial/ethnic and socioeconomic disparities.

**Conclusions:** Most types of greenspace were not equitably present in block groups across the United States. Government officials, city and park planners, and public health practitioners should identify local and regional disparities and develop policy and environmental solutions to ensure environmental justice and community health.

# Activity classification accuracy of the thigh-worn SENS Motion accelerometry system in laboratory and free-living conditions

**Mr. Claas Lendt<sup>1</sup>**, Ms. Angeli Gawlik<sup>1</sup>, Dr. Bianca Biallas<sup>1</sup>, Prof. Ingo Froboese<sup>1</sup>

<sup>1</sup>German Sport University Cologne, Cologne, Germany

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** Thigh-worn accelerometry may be used in various research fields to assess different dimensions of physical behavior. Accurate methods to classify physical activity types are warranted to support the emerging field of time-use epidemiology and behavior change interventions. The novel SENS Motion system combines a small-scale thigh-worn accelerometer and proprietary algorithms to classify selected physical activity types. This study aims to evaluate the accuracy of the SENS Motion system in laboratory and free-living conditions.

**Methods** 20 healthy adults (55% female; 31±9 years; 23.3±2.3 kg/m<sup>2</sup>) completed a standardized activity protocol as well as 60 minutes of unrestricted free-living activities. The SENS Motion sensor was attached to the skin of the right lateral thigh. Participants completed standardized activities with varying intensities in the laboratory. Activities included walking, running, cycling, sitting, standing and lying down. Further, participants spent free-living activities outside of the laboratory while being video-recorded with a chest-mounted camera. Videos were segmented and labeled according to the activities performed. Balanced accuracy, sensitivity, precision and specificity were calculated for each activity type in laboratory and free-living conditions.

## Results

Balanced accuracy during standardized activities in the laboratory ranged from 96.7% (cycling) to 99.9% (standing) with all additional performance metrics >94% across activities. In free-living conditions, balanced accuracy ranged from 76.4% (walking) to 95.8% (sedentary). Free-living sedentary activities (sitting, lying down) were classified with precision, sensitivity and specificity >94%. Cycling was classified with high precision and specificity (94.2% and 99.1%, respectively) while sensitivity was 57.6%.

**Conclusions** Classification accuracy varies between laboratory and free-living conditions as well as between activity types. Free-living cycling may be challenging to classify due to frequent, short periods of non-pedaling. The SENS Motion system may be used to accurately classify sedentary behavior in free-living conditions in healthy adults. Performance in classifying activities in other populations such as patient groups or children may differ and needs further investigation.

# Combining Intervention Mapping, Participatory Action Research and Systems Thinking to promote energy balance-related behaviours together with and for adolescents

**Ms Helga Emke<sup>1,2</sup>**, Dr. Teatske Altenburg<sup>2</sup>, Assistant Professor Coosje Dijkstra<sup>1</sup>, Prof. Stef Kremers<sup>3</sup>, Prof. Mai Chinapaw<sup>2</sup>

<sup>1</sup>Vrije Universiteit, Amsterdam, Netherlands, <sup>2</sup>Amsterdam UMC location Vrije Universiteit, Amsterdam, Netherlands, <sup>3</sup>Maastricht University Medical Centre, Maastricht, Netherlands

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** To improve the effectiveness of interventions tackling the complex problems of obesity in adolescents, collaboration with adolescents themselves and addressing the complex systems is promising. This paper describes how Participatory Action Research (PAR) and systems dynamics are combined to develop, implement and evaluate actions to stimulate healthy Energy Balance Related Behaviours (EBRBs) in adolescents in a disadvantaged neighbourhood in Amsterdam, the Netherlands.

**Methods** The six steps of the structured intervention (IM) protocol was used to guide the process of co-creating actions, while including the perspective of adolescents in each step with PAR. Systems dynamics was included through the creation of Causal Loop Diagrams (CLDs) to obtain insight in the broader system and the use of the Intervention Level Framework to develop systemic actions. This study is conducted with PAR groups consisting of 6-8 adolescent (10-14 years) co-researchers and a facilitator per group, meeting every week for 3 or 4 years.

**Results** Our innovative approach consisted of six steps, that were conducted by the PAR groups: 1) Build CLDs for each EBRBs through peer-research and identify overarching mechanisms, 2) Determine leverage points using the Intervention Level Framework (ILF), 3) Develop actions ideas through role-playing exercises, 4 & 5) Develop actions in detail including an implementation plan & implement the actions, 6) Evaluate the actions by the co-researchers and facilitators. PAR ensured that the actions fitted the needs of adolescents, while systems dynamics promoted a change in the system at different levels. The IM protocol ensured that the actions were theory-based. The main challenge was to integrate systems dynamics in our practice in cooperating with adolescent co-researchers.

**Conclusions** We experienced that combining IM, PAR and systems strengthened the process of action development, implementation and evaluation. The knowledge and experience with both PAR and systems dynamics of the facilitator was crucial to actively collaborate with adolescents throughout the process, specifically to integrate systems dynamics. This study can serve as an example to other studies developing actions using IM, PAR and systems dynamics.

# The development of a conceptual model for collective patterns and income inequalities of adult's leisure-time physical activity

**Miss Sophie Jones<sup>1</sup>**, Prof. Ruth Hunter<sup>1</sup>, Dr. Leandro Garcia<sup>1</sup>

<sup>1</sup>Queen's University Belfast, Belfast, United Kingdom

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Levels of physical activity are highly unequal across the population. However, despite being widely researched, there is minimal understanding of the dynamic processes involved in driving and sustaining these unequal patterns. Therefore, we sought to develop a conceptual model illustrating the dynamic interactions between an individual's personal attributes and physical and social environments, which influence their decision to practice leisure-time physical activity (LTPA). The conceptual model will consequently be used to inform the development of an agent-based model to understand how dynamic interactions between different mechanisms and conditions drive collective patterns and income inequalities in LTPA.

**Methods:** The conceptual model was developed through four main processes (1) an initial draft was developed using the knowledge of the research team, (2) an intermediary draft was developed as a result of two realist-informed reviews, (3) an expert consultation with academics in relevant areas, and (4) finalisation of the conceptual model. The consultation was conducted via an online survey to validate and verify assumptions made in the intermediary draft. Experts were asked to assess the conceptual model, including an overall agreement rate and open questions about relationships and mechanisms they would include or exclude.

**Results/findings:** The conceptual model has intention as the most proximal construct to practice LTPA, conditioned by aspects of the individual's perceived, physical, and social environment, many of which are driven by individual and/or area-level income. The conceptual model is supported by several theories, 11 reviews and 38 empirical studies. In addition, 40 experts assessed an intermediary draft of the conceptual model, with an agreement rate of 80%.

**Conclusions:** The present conceptual model adopts a dynamic perspective whereby income inequalities exist as an emergent feature of a complex system resulting from interactions within the system. The model developed is well supported by evidence and is the first to focus solely on income inequalities in adults' LTPA. Moving forward, this conceptual model will inform an agent-based model aimed at enabling a broader understanding of what shapes and sustains inequalities across different income groups, which will be of benefit from an inequality perspective and for population health.

# Developing an agent-based model for collective patterns and income inequalities of adult's leisure-time physical activity

**Miss Sophie Jones<sup>1</sup>**, Prof. Ruth Hunter<sup>1</sup>, Dr. Leandro Garcia<sup>1</sup>

<sup>1</sup>Queen's University Belfast, Belfast, United Kingdom

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Traditional linear and reductionist interventions have thus far provided minimal or no progress in reducing inequalities in physical activity levels. Furthermore, it is unclear in which contexts and conditions different types of physical activity promotion strategies may be beneficial. Approaches that adopt systems thinking, such as agent-based modelling, could help us overcome this limitation by providing a deeper understanding of the dynamic processes which occur to shape the patterns we observe. Therefore, we developed an agent-based model to understand how dynamic interactions between mechanisms and conditions drive and sustain collective patterns and income inequalities of leisure-time physical activity (LTPA) in adults.

**Methods:** The agent-based model was developed through four main stages (1) conceptual model development, (2) operationalisation of the agent-based model, (3) parameterisation and calibration and (4) consistency and sensitivity analysis. The agent-based model was designed as an abstract representation of two cities, different by income-based geographical segregation, and is governed by a conceptual model whereby individuals decide to practice LTPA each week. Within the model, there are two types of agents: people and LTPA spaces. Each week, an individual decides to practice LTPA based on their intention, conditioned to their perceived, physical, and social environment.

**Results/findings:** The analysis of the agent-based model will take place in May 2023. We plan to run a series of "what if" scenarios in the agent-based model to understand how different mechanisms and conditions may interact with individuals with varying incomes across different neighbourhoods and city types, shaping inequalities in physical activity. We will also run an uncertainty analysis to investigate what data to prioritise to inform future models.

**Conclusions:** The agent-based model designed is suitable for exploring collective patterns and income inequalities in adults' LTPA. Central to the model are the dynamic interactions between an individual, income levels, and the physical and social environments in which they live. This agent-based model will enable us to develop a different way of thinking about inequalities in LTPA, which will be beneficial for improving population levels of physical activity.

# Supporting socioeconomically vulnerable families to cook a balanced meal: Effect evaluation of the intervention “Dinner is served at 1-2-3 euros”

**Ms. Marjolijn Vos**<sup>1</sup>, Prof. Benedicte Deforche<sup>1,2</sup>, Prof. Anneleen Van Kerckhove<sup>1</sup>, Dr. Nathalie Michels<sup>1</sup>, Prof. Wendy Van Lippevelde<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Vrije Universiteit Brussel, Ixelles, Belgium

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose** There is a social health gradient, meaning that people with a lower socioeconomic status (SES) have less healthy lifestyles and more health problems than people with a higher SES. However health promoting interventions often solely rely on individual resources (e.g. psychological) whereas, to tackle social and health inequalities, it would be more effective and equitable to use more structural interventions that make changes in the environment. In Belgium, an existing intervention, called “Dinner is served at 1-2-3 euros”, seems promising in enhancing lower SES families’ meal habits and diets. The intervention is a collaboration between social organizations and a large Belgian retailer, providing subscribed families two-weekly recipe booklets with balanced meals, and offering a fixed price of one, two or three euros per person per meal. The goal of this study is to investigate the effect of this intervention on people’s food choices via purchase data retrieved from loyalty cards.

**Methods** The study has a longitudinal pre-post design, and is based on secondary purchase data from 2018 until 2022. The intervention group (i.e., participants of the intervention) will be compared to a control group (i.e., not subscribed in the intervention), by using general customer data. Consent to use the individual’s purchase data is asked. The dependent variable is food purchases, with as primary outcome measure: the products used in the recipe booklets, and as secondary outcome measures: the money spent in various food categories (e.g., vegetables and fruits, high processed foods, etc.) versus the total food shopping cart. A multilevel growth model will be used to look at each individual’s different purchase moments, with data before and during the intervention. The model represents three levels: 1) point of time/purchase, 2) customer, 3) store/location.

**Results** Data-analysis will be conducted in the following months, so that (preliminary) results will be available to present at the ISBNPA annual meeting.

**Conclusion** We expect to gain insight into the effectiveness of the intervention by looking at the bought food products from the recipes, as well as to find out if the intervention has an effect on (un)healthy food purchases.

# Supporting socioeconomically vulnerable families to cook a balanced meal: Process evaluation of the intervention “Dinner is served at 1-2-3 euros”

**Ms. Marijlijn Vos**<sup>1</sup>, Prof. Benedicte Deforche<sup>1,2</sup>, Prof. Anneleen Van Kerckhove<sup>1</sup>, Prof. Wendy Van Lippevelde<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Vrij Universiteit Brussel, Ixelles, Belgium

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose** Health inequalities between families with a different socioeconomic status (SES) have been growing. Moreover, individuals with a lower SES seem to be less likely to show health-related behaviors, like healthy food consumption. To tackle these inequalities and to reach individuals from all backgrounds, health promoting interventions should not only target individual determinants (e.g., knowledge), but be more structural (i.e., make changes in the environment). In Belgium a promising, existing intervention to enhance lower SES families' meal habits and diets, is called “Dinner is served at 1-2-3 euros”. The intervention is a collaboration between social organizations and a Belgian retailer, providing subscribed families two-weekly recipe booklets with balanced meals, and offering a fixed price of one, two or three euros per person per meal. With this qualitative study, we aim to gain insight into the experiences of participants and of social organizations (i.e., the intermediaries that lead participants to the intervention), and explore the key mechanisms of success and points of improvement.

**Methods** Participants of the program will be interviewed in one-on-one interviews and representatives of social organizations will be interviewed in focus groups, using a semi-structured interview guide. The interview guides are based on the key process-evaluation elements of Saunders and colleagues (2005), as well as on a thorough analysis of the intervention itself by means of the Intervention Mapping protocol. Interviews will be audio-recorded and transcribed verbatim. Thematic analysis will be used as qualitative analytic method. Data collection and analysis will be done by the first author as well as research assistants, hereby reaching researcher triangulation.

**Results** Data-analysis will be conducted in the following months, so that (preliminary) results will be available to present at the ISBNPA annual meeting.

**Conclusion** We expect to gain insight into the reach of the intervention, the recruitment, the context, the delivered dose and the received dose, as well as understand barriers and success factors of the intervention. With this study we hope to inform health promoters, policy makers and marketers about possible strategies to reach lower SES families.

# The Influence of Neighborhood Characteristics on Individual Weight loss in a Clinical Trial

**Dr. Nana Yaa Marfo<sup>1</sup>**, Dr. Emil Coman<sup>2</sup>, Dr. Tricia Leahey<sup>3</sup>, Dr. Kristen Cooksey Stowers<sup>3</sup>, Dr. Stephanie Milan<sup>3</sup>, Dr. Amy Gorin<sup>3</sup>

<sup>1</sup>University of Massachusetts Chan Medical School, Worcester, USA, <sup>2</sup>University of Connecticut School of Medicine, Hartford, USA, <sup>3</sup>University of Connecticut, Storrs, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Myriads of obesity-focused studies have documented the relationship between adult weight status and characteristics of the neighborhood environment (e.g., walkability and poverty rates); however, causality between these correlates has proven difficult to test or infer. Behavioral weight loss trials provide an ethical, efficient, quasi-experimental setting for the exploration of causality via the direct effects of neighborhood characteristics on individual weight loss outcomes. The purpose of this study was to assess the extent to which four characteristics of the neighborhood environment predicted participant weight loss above and beyond individual characteristics in the 16-week, weight loss-induction phase of an adult weight loss maintenance trial. We hypothesized that (1) greater neighborhood walkability and park access would predict more weight loss, while (2) lower neighborhood socioeconomic position (SEP) and less access to healthy food would predict less weight loss.

**Methods:** The study sample (n=747) consisted of predominantly White (79.57%) and female (83.06%) residents of Connecticut, USA. Average age and BMI were  $50.64 \pm 12.02$  years and  $34.70 \pm 5.62$  kg/m<sup>2</sup> respectively. Participants' addresses were anonymized, geocoded, and linked to their respective census tracts (n=265) using *PolicyMap* software. Neighborhoods were defined as census tracts for this study. Neighborhood variables (i.e., walkability, low access to supermarkets and grocery stores, and average SEP) were downloaded from *PolicyMap* at the census tract level. Park access data were downloaded from the National Neighborhood Data Archive (NaNDA): Parks by Census Tract data set. Spatial path analyses were performed to assess the extent to which each census tract-level neighborhood characteristic uniquely predicted individual level weight loss outcomes.

**Results/Findings:** On average, residents from census tracts with lower SEP and less healthy food access demonstrated less weight loss relative to their counterparts ( $B = -0.491$ ,  $SE = 0.200$ ,  $p = .014$ ;  $B = -0.666$ ,  $SE = 0.337$ ,  $p = .048$ ). Neither census tract-level walkability nor park access had additional effects on individual weight loss. These findings suggest that factors beyond the individual level impact the effectiveness of behavioral weight loss interventions, and that the complexity with which they affect health must be addressed to make these treatments more equitable.

# Urban walkability perceived by children and youth: Participatory methods and scale development in the WALKI-MUC project

**Mr. Daniel Alexander Scheller<sup>1</sup>**, Dr. Joachim Bachner<sup>1</sup>

<sup>1</sup>Associate Professorship of Didactics in Sport and Health, Department of Sport and Health Sciences, Technical University of Munich, Munich, Germany

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Youth's perceptions of a city or neighbourhood's walkability are important for determining the physical activity (PA) friendliness of their environment. Traditional objective measures of walkability fail to incorporate children and youth's subjective perceptions of places that they perceive as supportive for play and exercise. Internationally, the most promising subjective measure is the Neighborhood Environment Walkability Scale for Youth (NEWS-Y). Yet, the NEWS-Y is not available for German-speaking adolescents. In the WALKI-MUC project, a combination of participatory research methods is used to identify places that are perceived as PA-friendly by children and adolescents. Based on the findings, a German version of the NEWS-Y (NEWS-Y-G) for subjective walkability measurement is developed.

**Methods:** Ninety-three children and adolescents aged six to 17 years from six neighbourhoods of Munich, Germany, with different objectively-measured walkability took part in photovoice, walking interviews and mapping exercises to capture their perceptions on self-chosen PA-friendly places. Participants were divided into small groups within their respective neighbourhoods. One individual participated in a series of activities, including an introductory workshop with photo training, a photo mission combined with a one-on-one walking interview with the researcher, and a focus group discussion about characteristics of photographed PA-friendly places, all held on separate days. To encourage active participation, a novel approach to photovoice called "photo lottery" was utilised. Walking interviews were transcribed verbatim and coded deductively with the Tripartite Framework for Place Attachment including its dimensions Place, Person and Process.

**Results/findings:** Surrounding nature played a crucial role for visiting PA-friendly places whereas individual motives to be physically active seemed less important. Affects, emotions and memories associated with a place drove the frequency of visits differing by age and gender. Identified built and natural characteristics of PA places were used to adapt the original NEWS-Y after having translated the scale into German by using a back-translation technique.

**Conclusion:** The WALKI-MUC project combines qualitative and quantitative methods for subjective walkability measurement and scale development, providing a new participatory approach for researchers and urban planners. The NEWS-Y-G offers a German instrument for subjective walkability measurement, which will be piloted in a representative sample of adolescents in Munich.

# Accelerometer-measured physical activity and indicators of cardiometabolic risk among rural adolescents: a cross-sectional study from Bangladesh

**Mr. Mohammad Redwanul Islam**<sup>1</sup>, Associate Professor Christine Delisle Nyström<sup>2</sup>, Associate Professor Maria Kippler<sup>3</sup>, Prof. Eero Kajantie<sup>4,5</sup>, Dr. Anisur Rahman<sup>6</sup>, Associate Professor Syed Moshfiqur Rahman<sup>1,6</sup>, Prof. Marie Lof<sup>2,7</sup>, Prof. Eva-Charlotte Ekström<sup>1</sup>

<sup>1</sup>Department of Women's and Children's Health, Uppsala University, Uppsala, Sweden, <sup>2</sup>Department of Biosciences and Nutrition, Karolinska Institutet, Stockholm, Sweden, <sup>3</sup>Unit of Metals and Health, Institute of Environmental Medicine, Karolinska Institutet, Stockholm, Sweden, <sup>4</sup>Finnish Institute for Health and Welfare, Helsinki and Oulu, Finland, <sup>5</sup>PEDEGO Research Unit, MRC Oulu, Oulu University Hospital and University of Oulu, Oulu, Finland, <sup>6</sup>Maternal and Child Health Division, International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b), Dhaka, Bangladesh, <sup>7</sup>Department of Health, Medicine and Caring Sciences, Linköping University, Linköping, Sweden

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose** Physical activity (PA) behaviors and cardiometabolic risk profile tend to track from adolescence into adulthood. We sought to explore the relationship of accelerometer-assessed sedentary time (ST) and PA with conventional indicators of cardiometabolic risk at mid-adolescence in a rural birth cohort from Bangladesh.

**Methods** This cross-sectional study utilized data from the 15-year follow-up of Maternal and Infant Nutrition Interventions in Matlab (MINIMat) cohort, collected with wrist-worn (non-dominant) ActiGraph wGT3x-BT device in 5-second epochs (frequency 90 hertz). ST and time engaged in intensity-specific PA were estimated, applying Chandler cut-points. Total PA was based on daily vector magnitude counts per minute. Adolescents accumulating five days (including at least one weekend day) with  $\geq 600$  minutes/day of awake wear time were retained in the analysis ( $n = 1872$ , 52.6% girls). Waist circumference (WC), systolic blood pressure (SBP), fasting plasma triglyceride (TG), total cholesterol, low- and high-density lipoproteins (LDL and HDL), insulin and glucose levels were measured. We calculated insulin resistance using Homeostasis Model Assessment equation (HOMA-IR). Three right-skewed variables were natural log transformed: WC, TG and HOMA-IR. Overall and gender-specific linear regression and isotemporal substitution models were fitted.

**Results** The adolescents spent 64.3 minutes/day (inter-quartile range: 49.9–80.9) in moderate-to-vigorous physical activity (MVPA). ST demonstrated weak, positive associations; while total PA displayed weak, negative associations with WC and HOMA-IR after controlling for gender, household wealth, maternal education and wear time. A 10-minute-per-day higher vigorous-intensity PA (VPA) was associated with: 4.9% (95% confidence interval (CI): 2.9%–6.8%;  $P < 0.001$ ) lower WC, 3.2 mm of Hg (95% CI: 1.5–4.8;  $P < 0.001$ ) lower SBP, 10.4% (95% CI: 2.9%–17.3%;  $P = 0.008$ ) lower TG, 24.4% (95% CI: 11.3%–34.9%;  $P < 0.001$ ) lower HOMA-IR, and 0.1 mmol/L (95% CI: 0.06–0.15) higher HDL. MVPA showed similar associations of notably smaller magnitude. Except for WC, the associations were more pronounced among the boys. Substituting ST with VPA of equal duration was associated with lower WC, SBP, TG and HOMA-IR.

**Conclusion** PA – especially VPA – was associated with lower levels of cardiometabolic risk indicators. VPA represents a target for preventive strategies tailored to adolescents in a resource-limited setting.

# Gender differences in the physical activity of French adults: What links with physical activity guidelines ?

**Mr. Jérôme Bouchan**<sup>1,2</sup>, Prof. Jean-Michel Oppert<sup>2,3</sup>, Dr. Hélène Charreire<sup>4</sup>, Dr. Alice Bellicha<sup>2</sup>, Dr. Valérie Deschamps<sup>1</sup>, Dr. Benoît Salanave<sup>1</sup>, Dr. Charlotte Verdot<sup>1</sup>

<sup>1</sup>Non-Communicable Disease and Trauma Department, Santé publique France, Saint-Maurice, France,

<sup>2</sup>Nutritional Epidemiology Research Team (EREN), University of Sorbonne Paris Nord and University of Paris Cité, National Institute of Health and Medical Research (INSERM), National Research Institute for Agriculture, Food and Environment (INRAE), National Conservatory of Arts and Crafts (CNAM), Center of Research in Epidemiology and Statistics, Bobigny, France, <sup>3</sup>Nutrition Department, Pitié-Salpêtrière Hospital (AP-HP), Sorbonne University, Human Nutrition Research Center Ile-de-France (CRNH IdF), Paris, France, <sup>4</sup>Montpellier Interdisciplinary Center on Sustainable Agri-foods System (MoISA), University of Montpellier, Montpellier, France

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose** Recent physical activity (PA) survey data in France (Esteban survey, 2014-2016) have shown that 29% of adult men and up to 47% of adult women were physically inactive (ie not meeting current PA recommendations). Previous analyses only assessed total PA. With the aim to refine public health strategies, the aim of our study was to analyze PA domain and type and to assess the contribution of each PA domain to reaching PA recommendation according to gender.

**Methods** The French cross-sectional population-based survey Esteban (2014-2016) collected PA data on a representative sample of the French adult population (n=2682, age 47.0, % women 51.2) with a multi-stage sampling design. PA assessed by the Recent Physical Activity Questionnaire (RPAQ). Analyses focused on domains (leisure, work etc...) and types of PA (walking, gardening etc...) in relation to overall PA levels and several sociodemographic and health variables.

**Results** Weekly duration of moderate-to-vigorous intensity PA was significantly higher among men than women. Men compared to women engaged in more leisure-time PA (53.2% of total PA vs. 35.8%) and work PA (28.0% vs. 20.7%). While women worked more in sedentary jobs and almost a third of their PA is of low intensity (mainly due to household activities). Transport PA (active mobility) to work was extremely low (accounting for 1.2% and 0.7% of weekly PA for men and women respectively). Among leisure PA, walking ranked first and was reported by 82.6% of men and 91.6% of women. Those subjects reaching the public health PA recommendations were those who engaged in leisure-time PA more frequently and for longer periods of time, but also those who engaged in several different types of leisure PA (around 4 activities practiced by those who reached the recommendations versus 2.5 activities).

**Conclusions** Higher total PA as previously reported in French men compared to women appear related to higher leisure-time and work PA. Meeting current PA recommendation was associated with increased frequency, duration and number of PA performed during leisure-time.

# Practical learnings from applying photovoice with Aboriginal and Torres Strait Islander peoples in remote communities.

**Ms. Emma Chappell**<sup>1,2</sup>, Prof. Yvonne Cadet-James<sup>1,3</sup>, Associate Professor Julie Brimblecombe<sup>1,2,4</sup>, Associate Professor Marita Hefler<sup>1,2</sup>, Ms. Caroline Deen<sup>3</sup>, Ms. Ellie Chan<sup>5</sup>, Dr. Megan Ferguson<sup>1,2,4</sup>

<sup>1</sup>University of Queensland, Brisbane, Australia, <sup>2</sup>Menzies School of Health Research, Darwin, Australia,

<sup>3</sup>Apunipima Cape York Health Council, Cairns, Australia, <sup>4</sup>Monash University, Clayton, Australia, <sup>5</sup>Central Australian Aboriginal Congress, Alice Springs, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** To assess the application of photovoice as a participatory action research method with Australian Aboriginal and Torres Strait Islander peoples in exploring solutions to improve food security. This study explored the suitability and adaptability: i) of photovoice's goals to promote critical group dialogue on community-identified strengths, concerns and to reach policy makers, and ii) how the process applies to best practice in working with Aboriginal and Torres Strait Islander peoples.

**Methods** Aboriginal-Controlled Community Health Organisations set the priority of food security and identified the target population of pregnant women and carers of Aboriginal and/or Torres Strait Islander children aged under five. Community Advisory Groups informed photovoice recruitment and implementation. In each of four remote Aboriginal communities we aimed to recruit 4-10 participants. Three photovoice workshops (with additional time for participant support) were planned to be conducted over four weeks in each community, preceded by 1-2 weeks of recruitment. Workshops were intended to be group workshops and involve participants in theme generation. Formative evaluation in two communities sought participant preference for group versus individual workshops. The inclusion of data in further workshops with community leaders was evaluated.

**Results/findings** 25 participants participated in the first workshops, an average of six per community. In response to participant preferences, most workshops were run with individuals rather than groups. Formative evaluation suggested this related to a variety of reasons specific to this context including the sensitivity of subject matter. A new protocol for theme generation was devised, which was researcher-led and participant-checked, giving consideration to burden on participants and the fact that participants had not observed each others' stories and photos until workshop three. Post-workshop data analysis included input from two Aboriginal researchers. Overall there were community-identified strengths and concerns and some attempt at critical dialogue through viewing others' photos individually. Photovoice data did contribute to discussions by community leaders around future advocacy decisions.

**Conclusions** Photovoice is adaptable to participant needs and preferences with Aboriginal and Torres Strait Islander peoples. This study found acceptable ways to adapt the method by being informed by Aboriginal and Torres Strait Islander guidance throughout the process.

# Are digital health behavioural interventions to prevent or manage obesity in adolescents contributing to inequalities? An assessment tool for systematic appraisal of interventions

**Dr. Stephanie Partridge<sup>1</sup>**, Ms. Allyson Todd<sup>1</sup>, Ms. Sisi Jia<sup>1</sup>, Ms. Rebecca Raeside<sup>1</sup>

<sup>1</sup>Engagement and Co-design Research Hub, School of Health Sciences, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Digital health interventions have shown moderate effectiveness in helping adolescents manage their weight and adopt healthy habits. However, it is crucial to ensure that all adolescents can access and benefit from these services, regardless of their demographic backgrounds. Inequities in digital health reflect societal inequities. The populations most at risk of being excluded from digital health interventions include racial and ethnic minority groups, people with lower socioeconomic status and underserved rural communities. This review aims to assess the digital health equity of adolescent obesity interventions and identify any barriers to access and equity that may exist.

**Methods:** We will conduct a systematic review of 10 electronic databases, including cluster/randomized controlled trials (cRCT/RCT) of digital health interventions with participants aged 10-19 years without significant acute or chronic diseases. The intervention should target one or more lifestyle risk behaviours (physical activity, diet, sedentary behaviour or sleep). The study outcome will measure changes in body weight, measured by Body Mass Index (BMI) or BMI z-score. The primary outcome of this review is to assess digital health equity based on digital determinants of health across four levels of influence. This review is registered with PROSPERO (CRD42022372040) and is being conducted and reported following PRISMA statement guidelines.

**Results:** We have developed a framework guided by previous research for reviewing digital determinants of health across individual, interpersonal, community and societal levels to assess digital health equity. The included studies are evaluated for individual, interpersonal, community, and societal factors, such as access to technology, digital self-efficacy, implicit technology bias, technology norms, engagement of community partners, technology policies, accessibility, social norms, and algorithmic biases. The systematic review of digital health interventions is ongoing, and the assessment results will be presented as applied to the included studies.

**Conclusions:** Consolidating evidence across digital health intervention studies will inform decision-makers and support the development of equitable technologies/interventions to prevent and manage obesity in adolescent populations. The digital health equity framework has the potential to be applied across other areas of digital health behavioural interventions.

# Examining social disparities in youth participation on sports teams and self-reported exposure to food marketing in sports settings in two policy environments in Canada

**Ms. Elise Pauzé<sup>1</sup>**, Associate Professor Marie-Hélène Roy-Gagnon<sup>1</sup>, Associate Professor Catherine Mah<sup>2</sup>, Lana Vanderlee<sup>3</sup>, Ms. Christine White<sup>4</sup>, Dr. David Hammond<sup>4</sup>, Dr. Monique Potvin Kent<sup>1</sup>

<sup>1</sup>University of Ottawa, Ottawa, Canada, <sup>2</sup>Dalhousie University, Halifax, Canada, <sup>3</sup>University Laval, Quebec, Canada, <sup>4</sup>University of Waterloo, Waterloo, Canada

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** This study examined the socio-demographic correlates of sports participation among youth and their exposure to food marketing in sports settings in two policy environments in Canada. In the province of Quebec, sponsorship advertising related to the activities of children under 13 is permitted but must be discrete while no such restrictions exist in rest of Canada (ROC). This research sheds light on social disparities in children's health determinants and the effectiveness of Quebec's statutory advertising restrictions.

**Methods:** Data were collected by the International Food Policy Study using a cross-sectional online survey completed by 3,682 youth aged 10 to 17 years in Canada in 2019. Data were weighted by age, sex, and region. Multiple logistic regressions were performed to examine the socio-demographic correlates of children's participation on a sports team and their self-reported exposure to names or logos of food companies or restaurants on their sporting equipment or signs displayed at their sporting events.

**Results:** 31% and 40% of youth aged 10-17 reported playing on a sports team in Quebec and ROC, respectively. Among children aged 10-12 who played on a sports team, 32% in Quebec and 46% in ROC reported being exposed to food marketing while playing sports. Among those aged 13-17, 36% and 42% reported being exposed to such marketing in Quebec and ROC, respectively. The odds of playing on a sports teams were greater among children aged 10-12 compared to those aged 13-17 (AOR= 1.176; 95CI: 1.013-1.562), among children living in ROC compared to Quebec (AOR= 1.537; 95CI:1.303-1.813), among males compared to females (AOR= 1.355; 95CI:1.176-1.562), and among children who perceive their family income to be enough to meet their needs compared to barely or not enough (AOR= 1.651; 95CI:1.357-2.008). The odds of self-reporting exposure to food marketing while playing sports were greater in ROC than Quebec (AOR= 1.481; 95CI: 1.119-1.959), and among males compared to females (AOR= 1.452; 95CI: 1.154-1.827).

**Conclusion:** Social disparities in sports participation and advertising exposure may be contributing to health inequities in Canada. Quebec's statutory advertising restrictions are not sufficiently protecting children under 13 from food advertising exposure in sports settings.

# Routine dietary restraint is associated with higher body weight in Chinese adults

**Ms. Yagi Wang<sup>1</sup>**, Assistant Professor Mandy Man Ho<sup>1</sup>, Associate Professor Patsy Pui Hing Chau<sup>1</sup>, Associate Professor Susan M. Schembre<sup>2</sup>, Associate Professor Daniel Yee Tak Fong<sup>1</sup>

<sup>1</sup>School of Nursing, University of Hong Kong, Hong Kong, China, <sup>2</sup>Georgetown Lombardi Comprehensive Cancer Center, Georgetown University, Washington, DC, USA

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** Weight loss programs require participants to use dietary restraints to restrict their energy intake to promote weight loss. There are two dimensions of dietary restraint: routine and compensatory. However, the relationships between routine and compensatory restraints and body weight are unexplored. This study aimed to assess the relationship between routine and compensatory restraints and emotional and external eating and body weight in Chinese adults.

**Methods** This is a cross-sectional online survey. Routine and compensatory restraints and emotional and external eating were assessed using a validated 13-item Chinese version of the Weight-related Eating Questionnaire. The higher score indicates a higher level of eating behavior. Body mass index (BMI) was calculated using self-reported height and weight. Pearson's correlation was conducted to assess the relationship between routine and compensatory restraints, emotional and external eating, and BMI.

**Results** A total of 949 Chinese adults completed the online survey (mean age=33 years, SD=14, mean BMI=22.0 kg/m<sup>2</sup>, SD=3.8, 26.4% males). Mean routine restraint score was higher in the overweight/obese group (mean  $\pm$  SD=2.13 $\pm$ 0.76,  $p<0.001$ ) than in the normal-weight (2.08 $\pm$ 0.89) and underweight (1.72 $\pm$ 0.94) groups. However, the normal-weight group scored higher in compensatory restraint (2.88 $\pm$ 1.03,  $p=0.021$ ) than the overweight/obese (2.75 $\pm$ 0.93) and underweight (2.62 $\pm$ 1.04) groups. The routine and compensatory restraint scores did not differ between the participants aged below and above 40 years old, although young adults (<40 years old) had higher emotional and external eating scores than adults aged over 40 years old. Routine restraint ( $r=0.090$ ,  $p=0.005$ ) and emotional eating ( $r=0.131$ ,  $p<0.001$ ) were positively correlated to BMI. However, compensatory restraint ( $r=-0.10$ ,  $p=0.763$ ) and external eating were not related to BMI ( $r=0.049$ ,  $p=0.133$ ). Emotional eating was related to higher levels of external eating ( $r=0.497$ ,  $p<0.001$ ) and routine ( $r=0.251$ ,  $p<0.001$ ), and compensatory restraints ( $r=0.239$ ,  $p<0.001$ ). Similarly, external eating was related to higher levels of routine ( $r=0.151$ ,  $p=0.001$ ) and compensatory ( $r=0.190$ ,  $p<0.001$ ) restraints.

**Conclusion** Routine and compensatory restraints are related to BMI in different ways. Reducing the levels of routine restraint may be helpful for weight loss. Longitudinal studies are needed to test the causality of the relationships between routine and compensatory restraints and emotional and external eating and BMI

# The development of course content for a dietary life skills course targeting students – co-creation with future users

**Assistant Professor Ida Ulrikke Valand**<sup>1</sup>, Prof. Nina C. Øverby<sup>1</sup>, Associate Professor Charlotte Kiland<sup>2</sup>, Associate Professor Tormod Bjørkkjær<sup>1</sup>, Assistant Professor Camilla Bjørnes<sup>1</sup>, Assistant Professor Julie Nordli<sup>1</sup>, Assistant Professor Line Pettersen<sup>1,3</sup>, Prof. Frøydis N. Vik<sup>1</sup>, Prof. Elisabet R. Hillesund<sup>1</sup>

<sup>1</sup>Department of Nutrition and Public Health, Faculty of Health and Sport Sciences, University of Agder, Kristiansand, Norway, <sup>2</sup>Department of Political Science and Management, Faculty of Social Sciences, University of Agder, Kristiansand, Norway, <sup>3</sup>Department of Upbringing and Culture, Bjerkreim Municipality, Bjerkreim, Norway

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** An important role for universities is to educate and empower students in becoming healthy and literate citizens of the 21<sup>st</sup> century society. Previous studies show that students acknowledge the value of dietary knowledge and skills. The Skills for Life project aims to develop and evaluate a course targeting diet literacy in university students. This abstract describes the development and content of the theory- and evidence-based course.

**Methods:** The development of course content was originally guided by 13 focus group discussions (FGDs) with 57 university students, and literature reviews. FGDs were recorded, transcribed verbatim and thematically analysed. Preliminary course content was discussed in three new FGs involving 12 of the above students. Selected learning activities was tested and evaluated by undergraduate students in Nutrition. Preliminary course content was adapted based on feedback from the students.

**Results:** The co-created dietary life skills course comprise 10 lessons with the following topics:

- 1) Lifecourse nutrition and why diet matters
- 2) How to eat healthily
- 3) How to store food to avoid food waste
- 4) How to stock your kitchen
- 5) Preconception diet
- 6) Food labels and how to interpret them
- 7) How to make the most of the student loan
- 8) Sustainable food and “food rescuing”
- 9) What is true about food and health?
- 10) Cooking competition and mindful eating

The students will get access to a web page comprising a short video lecture and selected literature, learning activities and recipes for each lesson. They will also attend lessons at the teaching kitchen on Campus each week (120-150 minutes) for 10 weeks to engage in discussions and group work including meal planning, food preparation and cooking. The course will be piloted and evaluated among approximately 30 first-year students at the University of Agder, Norway during the autumn semester of 2023.

**Conclusion:** The Skills for Life course content was developed with extensive input from university students and includes ten lessons that will be piloted autumn 2023. We hypothesise that the course will promote health, wellbeing, social connectedness, sustainable diet, and other life skills among university students.

# Development and launch of up-to-date ergonomic recommendations for abdominopelvic surgeons to rehabilitate and prevent work-related musculoskeletal pain

**Mrs. Helle Joon Christiansen**<sup>1</sup>, Prof. Pernille Tine Jensen<sup>1</sup>, Prof. Ole Mogensen<sup>1</sup>, Associate Professor Tina Dalager<sup>1,2</sup>

<sup>1</sup>Department of Clinical Medicine, Aarhus University and Aarhus University Hospital, Aarhus N, Denmark,

<sup>2</sup>Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** Almost 9 out of 10 surgeons report musculoskeletal pain, and evidence shows that pain negatively affects their workability and leisure. Poor ergonomic practice in the operating room (OR) is a possible cause of musculoskeletal pain. However, the effects of ergonomic interventions in the OR on surgeons' musculoskeletal health are poorly elucidated as many surgeons report they are unaware of ergonomic recommendations (ER). In a systematic literature review, we narratively synthesized the evidence on the effects of OR ergonomics on musculoskeletal health among abdominopelvic surgeons, with the aim to successfully launch up-to-date ER.

**Methods** The systematic literature search inclusion criteria were: ergonomic interventions applied in the OR on abdominopelvic surgeons and a musculoskeletal health outcome. To successfully launch the evidence-based ER, we will apply a modified version of participatory ergonomics. Surgeons' and other stakeholders' (nurses, management) input will guide the development of ER in three steps: 1) discuss review findings and practical implications, 2) rank ER by appeal and feasibility, and 3) field-test the recommendations. Surgeons' awareness will be evaluated following a three-month launch period.

**Results/findings** The systematic literature search yielded 3903 records and resulted in 29 reports. The preliminary ER were developed based on study quality and effect size: 1) take short intraoperative breaks of 20-300 sec. every 20-40 min., preferably with an active component such as stretching; and 2) participate in modality-specific ergonomic training. Two to three surgeons/other stakeholders will be recruited to assist in the modified participatory ergonomics process.

**Conclusions** We expect the ER will be accessible in short videos, posters, e-mails, and presentations, and that the launch of ER will create awareness of better ergonomics within the OR. The ER will act as usual care in a randomized controlled trial investigating the effect of Individualized Physical Exercise Training (IPET) plus ER on musculoskeletal pain, compared to ER only. IPET is an app-delivered, 60 min./week training program that is tailored to work exposure, physical capacity, musculoskeletal pain and general health. Reducing surgeons' pain will secure their work longevity.

# The socioeconomic trajectories of early adulthood and associations with cardiometabolic health at age 24 years

**Dr. Eleanor Winpenny**<sup>1</sup>, Prof. Laura Howe<sup>2</sup>, Prof. Kate Tilling<sup>2</sup>

<sup>1</sup>MRC Epidemiology Unit, University of Cambridge, Cambridge, United Kingdom, <sup>2</sup>MRC Integrative Epidemiology Unit, University of Bristol, Bristol, United Kingdom

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** J. Young Adults

**Purpose** Cardiovascular health develops throughout adult life, with socioeconomic factors such as educational attainment strongly associated with cardiovascular outcomes. However, little is known about the immediate health impacts of socioeconomic exposures during early adulthood. In this study we describe the socioeconomic trajectories of early adulthood (age 16-24y) in a contemporary population, and assess associations of these trajectories with measures of cardiometabolic health at age 24y.

**Methods** ALSPAC cohort participants with data on education and employment between ages 16y to 24y (n=7,568) were included. Longitudinal latent class analysis identified classes following different socioeconomic trajectories across ages 16–24y, based on participation in education and employment, education level attained and occupational class. A metabolic health score (MetZscore) was derived based on measures of waist circumference, blood pressure, serum triglycerides, serum high-density lipoprotein cholesterol, and fasting plasma glucose at age 24y (n=3189). We modelled differences in MetZscore across the socioeconomic trajectory classes, adjusting for sex, childhood socioeconomic position, adolescent health behaviours and adolescent health.

**Results** We identified four classes of early adulthood socioeconomic trajectory: (1) Higher Education (41% of the population), (2) Continued Education (9%), (3) Part-Time Employment (21%), and (4) Early Employment (29%). The Higher Education class entered employment following completion of higher education, while the Continued Education class were still in full-time education at age 24y. The Early Employment class left education and entered employment around age 18y, while the Part-Time Employment class were distinguished by part-time employment throughout early adulthood.

The standardized MetZscore was lowest in the Continued Education class, indicating that this was the healthiest population class. No statistically significant difference was seen in MetZscore between this class and the Higher Education class. However, the Part-Time Employment class and Early Employment class showed lower metabolic health, compared to the Continued Education class (difference in intercept 0.189,  $p=0.027$  and 0.215,  $p=0.003$  respectively), after adjusting for parental and childhood covariates.

**Conclusion** Identification of socioeconomic trajectories provides a person-centred method for assessment of socioeconomic exposures across the period of early adulthood. These trajectories contribute to inequalities in cardiovascular health, which can already be identified at age 24y.

# Anything goes? Facilitators and barriers to participatory video methods: Experiences from a community-based participatory research project with women in difficult life situations

**Miss Raluca Sommer**<sup>1</sup>, Dr. Alexandra Sauter<sup>2</sup>, Miss Stephanie Linder<sup>1</sup>, Mrs. Annika Herbert-Maul<sup>1</sup>, Prof. Heiko Ziemainz<sup>1</sup>, Assistant Professor Karim Abu-Omar<sup>1</sup>

<sup>1</sup>Friedrich-Alexander-Universität, Erlangen, Germany, <sup>2</sup>University of Regensburg, Regensburg, Germany

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

## **Purpose:**

There has been an increasing interest in empowering individuals and communities to engage in research that can lead to social change (High et al., 2012). Visual research methods, such as participatory video - a “collaborative approach in which people create a video about themselves to open spaces for learning, enable change and transformation” (Milne et al., 2012, pp.36) - is the focus of this study. NU-BIG<sup>[1]</sup> involves women in difficult life situations<sup>[2]</sup> (n=6) in co-creating and co-producing a participatory video to reflect the long-term effects of a physical activity promotion program (BIG<sup>[3]</sup>) for this target group. Our research sheds light on how the group’s capacity building can be strengthened by this method.

**Methods:** We conducted a qualitative study using a semi-standardized monitoring protocol for capacity building (Sauter et al., 2020); semi-structured interviews (n=12); field notes (n=4); and a reflexive focus group interview (n=1).

**Results:** For the women, the video was a powerful means to express how BIG influenced their lives. They requested a slow and gradual process, media input, and permanent support from scientists. A workshop by a media professional developed their self-confidence, critical awareness, improved their general media literacy, even if not all capacity building dimensions could be strengthened, such as leadership. However, the process could only take place in their language and on their terms, which called for a unique role of researchers as evaluators. They underwent a continuous evolution of their identity and “positionality” in research, while the women determined their role. The process was demanding, requiring a flexible facilitation of meetings (e.g., format, seating arrangements) and a permanent ability to adapt to spontaneous situations and women’s demands.

**Conclusions:** Most women have a sense of own marginalization and the method used succeeds in creating space for an empowering process. This comes with challenges for both researchers and participating women. Conceptualizing a participatory video with this specific target group sets in motion dynamic learning and knowledge exchange, but also triggers their insecurities and inhibits active participation. Visual research methods such as participatory videos should be given more importance, particularly in community-based projects with vulnerable population groups.

# Levels in different domains of physical activity before and during the COVID-19 pandemic in the city of São Paulo, Brazil: a cohort study.

**Dr. Rildo de Souza Wanderley Júnior<sup>1</sup>**, Ms. Margarethe Thaisi Garro Knebel<sup>2</sup>, Ms. Bianca Mitie Onita<sup>2</sup>, Miss Elaynne Silva de Oliveira<sup>2</sup>, Prof. Alex Antonio Florindo<sup>1</sup>

<sup>1</sup>School of Arts, Sciences and Humanities-University of Sao Paulo, São Paulo, Brazil, <sup>2</sup>School of Public Health-University of Sao Paulo, São Paulo, Brazil

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** The aim was to analyze physical activity (PA) levels in different domains before and during the COVID-19 pandemic in citizens of the city of São Paulo-SP, Brazil.

**Methods:** It was a cohort ISA-Physical Activity and Environment conducted with a sample of 1,434 subjects interviewed in the city of São Paulo-SP in 2014-2015 (baseline: face-to-face) and 2020-2021 (2<sup>nd</sup> wave: telephone). Levels of physical activity ( $\geq 150$  minutes per week) in the domains of leisure-time, active transportation, work, and domestic were measured using the IPAQ long version before and during COVID-19 and stratified by sex; age group; race; marital status; education level; and adoption to lockdown (total isolation in the house; and leave normally or just to do obligatory services). Statistical analyzes were prevalence and 95% confidence intervals (CI), McNemar and Chi-square tests.

**Results:** PA levels had a significant increase in baseline and 2<sup>nd</sup> wave in the domain of leisure time (22.7; CI95%: 20.6-25.0 x 30.4; CI95%: 28.1-32.8;  $p=0.01$ ), work (48.2; CI95%: 44.6-51.8 x 57.5; CI95%: 53.9-61.0;  $p=0.01$ ), and domestic (52.2; CI95%: 66.2-71.0 x 68.7; CI95%: 66.2-71.0;  $p=0.01$ ), but not in active transportation (22.2; CI95%: 20.2-24.4 x 24.3; CI95%: 22.2-26.6;  $p=0.15$ ). The prevalence of leisure time PA was higher in male, <18yo at baseline, 18-39yo at second wave, single at baseline, and high education level. The prevalence in work PA was higher in male, 40-59yo at baseline, low education level, race brown at the second wave, and live with a partner at the second wave. The prevalence of domestic PA was higher in females, 40-59yo, race black at baseline, and live with a partner. The largest proportion physically active in leisure time (31.4; CI95%: 29.0-34.0;  $p<0.01$ ), work (58.0; CI95%: 54.4-61.6;  $p=0.02$ ), and domestic (69.7; CI95%: 67.1-72.1;  $p<0.01$ ) were those who didn't adopt to lockdown during the period of the COVID-19 pandemic.

**Conclusions:** There was a significant increase in PA levels in leisure time, work, and domestic domains in the two periods, however the adoption of lockdown by COVID-19 were associated inversely with leisure-time, work, and domestic PA. Active transportation should consider walking and cycling as isolated behaviors in new analyses.

**Funding:** São Paulo Research Foundation (FAPESP: 2017/17049-3; 2022/00692-9).

# Community-engaged citizen science to improve sport and physical activity participation among girls in Peru

**Dr. Maja Pedersen**<sup>1</sup>, Ms. Thalia Simich<sup>2</sup>, Ms. Macarena Scarafia<sup>2</sup>, Mr. Daniel Barrera<sup>3</sup>, Dr. Maria Pia Urgelles<sup>3</sup>, Ms. Ann Banchoff<sup>4</sup>, Ms. Isela Blanco-Velazquez<sup>4</sup>, Ms. Ines Campero<sup>4</sup>, Dr. Abby C. King<sup>1,4</sup>

<sup>1</sup>Stanford Prevention Research Center, Department of Medicine, Stanford University, Stanford, California, USA, <sup>2</sup>Fundación Deporte en Igualdad, Lima, Peru, <sup>3</sup>Universidad Peruana de Ciencias Aplicadas, Lima, Peru,

<sup>4</sup>Department of Epidemiology and Population Health, Stanford University School of Medicine, Stanford University, Stanford, California, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Increasing participation in physical activity (PA) by girls is critical to the layered goals of long-term health and social outcomes, and ultimately progress toward gender equity. One powerful, inclusive, and globally recognized approach to this end is through the field of sport. The purpose of this study was to improve understanding of social and environmental barriers to and facilitators of PA and sport participation by adolescent girls in Cusco, Peru.

**Methods:** This project was positioned within the UN framework of gender equality through sport and applied the ecological model highlighting social and environmental influences on health behavior. A partnership between Stanford University (USA), the Institute for Sports Equality (Peru) and the The Peruvian University of Applied Sciences (Peru) was developed to engage school-based sites in community participation and research-to-action science. We applied a community-engaged citizen science approach in implementing an evidence-based, participatory mobile health intervention. We asked participants to respond to a themed prompt via an iterative, smartphone-based, multimethod data collection process (the *Our Voice* method). The prompt was: “*What makes it easy or difficult for you and other girls and women to participate in sports or PA in Cusco?*”

**Results/Findings:** Fourteen girls (ages 8-17) participated; we received school site, parental, and individual approvals for all activities. There were 44 data collection timepoints, 57 photos taken with accompanying rankings (positive or negative) and narrative descriptions. High participation rates (78%) occurred across five participant interpretive meetings. Themes identified by participants included (1) discrimination; (2) inclusiveness; (3) maintenance; (4) access; (5) multi-use facilities; and (6) security. Feasibility measures indicated high levels of support and enthusiasm from participants and stakeholders including parents, school and city officials, and national representatives of Peru’s federal Institute for Sports for implementing the findings to enact change.

**Conclusions:** This study is aligned with global health initiatives for action (UN, WHO), and was conducted by an interdisciplinary partnership including two Peruvian organizations with deep-seated community and institutional ties. The long-term goals of this research are to advance knowledge and action for improving girls’ sport participation and the increased confidence, agency, and empowerment that it can engender.

# An inventory of instruments for measuring community member participation in health promotion research: Preliminary results from a scoping review

Dr. Maike Till<sup>1</sup>, Miss Raluca Sommer<sup>1</sup>, Dr. Alexandra Sauter<sup>2</sup>, **Dr. Peter Gelius<sup>1</sup>**

<sup>1</sup>Friedrich-Alexander-Universität Erlangen-Nürnberg, Erlangen, Germany, <sup>2</sup>University of Regensburg, Regensburg, Germany

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** Community participation is a key principle in health promotion, and it is essential to evaluate it to fully appreciate the benefits of participatory projects for improving community health. However, measuring the extent, type and quality of citizens' engagement in a comparable fashion is often challenging. This study aims to provide an overview of existing instruments to measure participation, to categorize and describe available instruments, and to identify research gaps and recommendations.

**Measures** Twelve scientific databases were searched from inception to June 2021 to identify English or German scientific journal articles. Search terms represented assessment, measurement, concepts of participation, engagement, involvement, and terms related to action research, community-based research, and collaboration science. Results were analyzed in line with PRISMA-ScR guidelines for scoping reviews.

**Results** Our search yielded 20,682 hits across all databases. After removing duplicates, two researchers independently screened 12,267 articles based on title/abstract, and 26 articles were selected for full-text screening. 14 were included for the qualitative synthesis, of which seven related to the development of tools, three to checking psychometric properties and four had a mixed focus of both. Regarding the concept of participation, most tools explicitly refer to participation in terms of engagement. Others focus on strength, success, and/or synergies within partnerships, and still others on group dynamics within community-based participatory research (CBPR) projects or other key dimensions of researchers-community partnerships. One study measured participation in terms of adherence of partnerships to the nine CBPR principles. In a next research step, articles focusing on development will be further assessed regarding their origin, quality and development appraisal.

**Conclusions** Preliminary results suggest there is some variety among instruments to assess participation in CBPR. Most tools are based on different principles for CBPR and aim at predicting the success of community-academic partnerships for health promotion. Our scoping review offers a resource to assist the evaluation of such partnerships and to gain a comprehensive understanding on how community members engage in health promotion research.

# Daily and Weekly Exercise Regularity May Enhance Beneficial Effects of Exercise in Active Young Adults

**Mr. Thomas Keiser<sup>1</sup>**, Dr. Elissa Hoopes<sup>1</sup>, Mr. Ben Brewer<sup>1</sup>, Dr. Susan Malone<sup>2</sup>, Dr. Melissa Witman<sup>1</sup>, Dr. Freda Patterson<sup>1</sup>

<sup>1</sup>College of Health Sciences, University of Delaware, Newark, USA, <sup>2</sup>Rory Meyers School of Nursing, New York University, New York, USA

Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM

**SIG - Primary Choice:** J. Young Adults

**Purpose:** The growing field of chronomedicine suggests that the time of day when a therapeutic is administered can enhance or diminish effects. The time-of-day effects of aerobic exercise on cardiometabolic health have yet to be elucidated. To begin to address this gap, the current study explored the extent to which different metrics of time-of-day exercise regularity moderated the association between weekly MVPA and the cardiometabolic health variables of body mass index (BMI), systolic blood pressure (SBP), and diastolic blood pressure (DBP).

**Methods:** Healthy adults completed 14-days of waist accelerometry. Exercise timing was operationalized as the start time of the longest exercise bout each day. Exercise regularity was then quantified according to two patterns: (1) 'daily' regularity (i.e., standard deviation (SD) of exercise timing across 14 days), and (2) 'weekend' regularity (i.e., engaging in >50% of exercise bouts during the same time-of-day [morning, late morning, afternoon, or evening] on Saturdays+Sundays)(binary). Clinical assessments of BMI, resting SBP, and DBP were taken following the 14-day monitoring period. Multivariable regression models that adjusted for age and sex were used to test the research questions.

**Results:** Participants (N=45) aged  $M=28.7\pm6.8y$ , were 64.4% female, with min/MVPA/week of  $M=438.0\pm231.78$ , BMI of  $M=24.4\pm3.3kg/m^2$ , and resting systolic and diastolic blood pressure of  $114.5\pm12.0mmHg$  and  $71.8\pm7.7mmHg$ , respectively. Daily exercise regularity was  $3.56h\pm1.53$ , while 66.7% exhibited weekend regularity. Multivariable models show that greater daily regularity moderated the relationship between weekly MVPA and BMI such that at the mean weekly MVPA, each 1-hour increase in SD of daily regularity increased BMI by an estimated  $0.572 kg/m^2$  ( $F_{(5,39)}=1.22$ ;  $RSE=3.21$ ;  $R^2=0.02$ ; interaction term  $p<0.05$ ). Weekend regularity was also found to moderate the associations between weekly MVPA and resting blood pressure. Specifically, among regular (versus irregular) weekend exercisers, each additional minute of MVPA decreased SBP by  $0.06mmHg$  ( $F_{(5,39)}=6.59$ ;  $RSE=9.39$ ;  $R^2=0.39$ ; interaction term  $p<0.01$ ), and DBP by  $0.03mmHg$  ( $F_{(5,39)}=5.19$ ;  $RSE=6.31$ ;  $R^2=0.32$ ; interaction term,  $p<0.05$ ).

**Conclusions:** In this highly active sample, a more regular daily and weekly exercise schedule was associated with better markers of cardiometabolic health. These data help inform hypotheses about the possible independent role of exercise timing on health.

# Factors influencing digital health intervention uptake and engagement in Singapore: findings from a Patient and Public Involvement study

**Dr. Jacqueline Louise Mair**<sup>1,2</sup>, Dr. Sarah Martine Edney<sup>2</sup>, Ms. Jumana Hashim<sup>2</sup>, Ms. Linh Thai<sup>2</sup>, Associate Professor Falk Müller-Riemenschneider<sup>1,2,6,7</sup>, Prof. E Shyong Tai<sup>1,2,6</sup>, Dr. Alicia Salamanca-Sanabria<sup>1</sup>, Dr. Jillian Ryan<sup>8</sup>, Prof. Tobias Kowatsch<sup>1,3,4,5</sup>

<sup>1</sup>Future Health Technologies, Singapore-ETH Centre, Singapore, Singapore, <sup>2</sup>Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore, <sup>3</sup>Institute for Implementation Science in Health Care, University of Zurich, Zurich, Switzerland, <sup>4</sup>School of Medicine, University of St. Gallen, St Gallen, Switzerland, <sup>5</sup>Centre for Digital Health Interventions, ETH Zurich, Zurich, Switzerland, <sup>6</sup>Yong Loo Lin School of Medicine, National University of Singapore and National University Health System, Singapore, Singapore, <sup>7</sup>Digital Health Centre, Berlin Institute of Health, Charité – Universitätsmedizin Berlin, Berlin, Germany, <sup>8</sup>The Commonwealth Scientific and Industrial Research Organisation, Adelaide, Australia

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Digital health interventions (DHIs) hold promise as scalable and cost-effective preventive healthcare solutions. However, those with the poorest health who stand to gain the most from DHIs are also among the least likely to access and engage with them. The aim of this qualitative study is to better understand factors influencing DHI uptake and engagement in the wider population, including those from underserved communities, in Singapore.

**Methods:** Adapting the Patient and Public Involvement (PPI) methodology to Singapore's context, lay facilitators approached adult patrons at seven public eateries (Hawker Centres) in residential areas for an informal discussion. The topic guide was iteratively developed based on literature and systematic debriefing after qualitative encounters, and explored the daily motivations and barriers towards DHI uptake and sustained use. An optional demographic survey was administered at the end of each encounter. Field notes were collated within four pre-defined user group categories: (1) current DHI users; (2) previous DHI users but no longer using; (3) those familiar with DHIs but never used, and (4) those who had never heard of DHIs. Data analysis is currently ongoing. We take a hybrid analysis approach whereby relevant themes are identified through inductive thematic analysis and sub-themes are then deductively mapped to behaviour change theory.

**Results/findings:** Lay facilitators interacted with 118 individuals between November 2022-February 2023. Overall, findings revealed that some people have no interest in using a DHI and will never be convinced to do so. Some could be convinced to use and continue to engage with a DHI, but several barriers need to be addressed, e.g., tedious registration processes, cost, technical instability and inaccuracy, language limitations, insufficient reward programmes, and poor digital literacy. Access to healthier food in the local environment is needed before DHIs for dietary behaviours can even be considered. Community engagement and training were suggested as methods to overcome perceived barriers towards DHI use.

**Conclusion:** Our findings will inform the design and implementation of DHIs to support healthy lifestyles and strategies to increase uptake and engagement with DHI in target populations, including those from underserved communities.

# Regional Variability in Prevalence of Food Insecurity and Diet Quality among US Children

**Dr. Jayna Dave<sup>1</sup>**, Dr. Tzuan Chen<sup>2</sup>, Ms. Alexandra Castro<sup>1</sup>, Ms. Mamie White<sup>1</sup>, Dr. Debbie Thompson<sup>1</sup>  
<sup>1</sup>USDA/ARS Children's Nutrition Research Center, Baylor College of Medicine, Houston, USA, <sup>2</sup>HEALTH Research Institute, University of Houston, Houston, USA

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** With an increase in the number of low-income individuals and families from rural areas being food insecure in the US, there is a greater need for understanding the association between food security status (FSS) and dietary intake, including differences due to living in rural vs. urban residence, among these at-risk populations. Thus, the purpose of this study was to assess the regional variability (urban vs. rural) in prevalence of food insecurity, federal nutrition assistance program (FNAP) participation, and diet quality among US children.

**Methods:** This study employed National Health and Nutrition Examination Survey (NHANES) data 2013-2016 with three age groups (2-5, 6-11, and 12-17 years old). The models were performed using SAS SURVEYREG/SURVEYFREQ procedure to account for the complex, stratified, multistage probability cluster sampling design. Multiple linear/logistic regression models were used to evaluate the association between the FSS and FNAP participation and the diet quality measures including Healthy Eating Index (HEI-2015) and its 13 subcomponents. In addition, the moderations effect of urban/rural residence were examined. Covariates included age, sex, race/ethnicity, and family monthly poverty index. Statistical significance was set at  $p < 0.05$ .

**Results/findings:** Total sample consisted of 6,403 children; mean age- 7.5 years; 51% male; 33% Hispanic, and 64% normal weight. Child and household food insecurity was reported by 13% and 30% of the sample, respectively; 90% participated in SNAP and 88% in school lunch program. Relative to 6–11-year-old children living in rural areas, children living in urban areas were significantly more likely to report household food insecurity (29.15% vs. 19.10%). Overall, HEI-2015 score was 48.2. The associations between child/household FSS and the receipt of FNAP as well as between child/household FSS and diet quality (HEI and 13 subcomponents) did not differ by urban/rural residence status regardless of children's age groups.

**Conclusions:** Diet quality of children, regardless of age or urban/rural residence, needs improvement. Children, especially those experiencing food insecurity in urban areas, are an important target group for future dietary interventions aiming to improve diet quality. Strategies for food security and diet quality improvement may include increased benefits for health food purchases within FNAP.

# Grip strength and incidence of Type 2 diabetes: A Mendelian Randomization

**Miss Zhu Liduzi Jiesisibieke**, Dr. Catherine Mary Schooling<sup>1</sup>

<sup>1</sup>1. School of Public Health, Li Ka Shing Faculty of Medicine, The University of Hong Kong, Hong Kong, China

**Poster Session #2, June 16, 2023, 10:50 AM - 12:00 PM**

**Background:** Grip strength, as an indicator of skeletal muscle strength, is easy to measure and works well as a target of intervention. However, current evidence concerning grip strength and risk of type 2 diabetes (T2D) is mostly based on observational studies, which are open to confounding and selection bias. We conducted a Mendelian randomization study, i.e., using genetic proxies of grip strength, to obtain unconfounded estimates.

**Methods:** Genome wide significant ( $p\text{-value} < 5 \times 10^{-8}$ ), independent ( $r^2 < 0.001$ ) genetic variants predicting right (N=461,089) and left (N=461,026) hand grip strength were extracted from UK Biobank. We applied these genetic predictors to the largest available genome-wide association studies of T2DM from the DIAGRAM consortium (Ncases=62,892; Ncontrols=596,424) and from FinnGen (Ncases=33,043; Ncontrols=28,4971). We used inverse variance weighting with multiplicative random-effects as the main analysis, and MR-Egger and weighted median as sensitivity analysis to test for horizontal pleiotropy. We meta-analyzed estimates from the two T2D GWAS.

**Results:** In total, 122 and 112 independent genome-wide genetic variants were obtained for right- and left-hand grip strength respectively. Right-hand grip strength (odds ratio [OR] 0.76, 95% CI 0.63 to 0.9 and left-hand grip strength (OR 0.64, 95% CI 0.53 to 0.78) were associated with lower odds of T2D. There was no evidence of horizontal pleiotropy from sensitivity analysis

**Conclusion:** Developing grip strength could be an intervention target to reduce the risk of developing T2D, ideally as marker of generally improved body composition.

# Dropouts in mHealth interventions: How to manage missing values when evaluating the effectiveness of digital health tools?

**Mr. Vinayak Anand Kumar<sup>1</sup>**, Ms. Luisa Korte<sup>2</sup>, Mr. Claas Oltmann<sup>2</sup>, Prof. Margrit Schreier<sup>1</sup>, Prof. Sonia Lippke<sup>1</sup>

<sup>1</sup>Constructor University, Bremen, Germany, <sup>2</sup>apprevent GmbH, Bremen, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** The purpose of the study was to compare approaches and provide recommendations for managing dropouts in the evaluation of mHealth interventions targeting physical activity (PA) and sedentary behaviour (SB) in patients. Participant' drop out between measurement time points is an issue that most studies face. Using work carried out to manage dropouts in a digital health tool, this study addresses the research question "what is the relative accuracy and precision of imputation strategies when evaluating effectiveness of digital health tools"?

**Methods:** A digital health tool was evaluated in a pilot study using a Randomised Controlled Trial (RCT), with 20 participants each in the intervention and control arms. The pilot study acted as a pre-cursor to a larger clinical trial, which collected outcome measures at baseline, 3-month and 6-month follow up, using validated measures of PA and SB. The evaluation used a mixed effects model to estimate the effect of the intervention and time on outcome measures. For the purposes of this presentation, synthetic data was constructed for the RCT based on observations in the pilot study, and missingness was simulated. The following approaches were evaluated, with respect to the bias and variance of model parameters:

- Listwise deletion
- Last observation carried forward (LOCF)
- Multiple imputation using Jump to Reference (MI-J2R)
- Multiple imputation using chained equations (MICE)

**Results/findings:** Preliminary results of the study indicated that listwise deletion had a positive bias; overestimating the impact of the intervention. Whilst LOCF had a negative bias and underestimated the variance of model parameters. Both MI-J2R and MICE provide relatively accurate parameter and variance estimates of the intervention effect, with the former providing more conservative estimates of the treatment effect.

**Conclusions:** MICE is a preferred method for managing missingness when accurate imputation models can be developed. However, when researchers want to take a more conservative approach for estimating the intervention effect and/ or when an accurate imputation model cannot be developed, MI-J2R is recommended. This study also provides a framework and code for developing synthetic data, carrying out simulation studies, and building reproducible statistical analysis pipelines in R.

# Are Physical Therapists Promoting Physical Activity for their Patients with Neurological Disorders?

**Dr. Winston Kennedy<sup>1</sup>**, Dr. April Bowling<sup>1</sup>

<sup>1</sup>Merrimack College, North Andover, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Physical therapists (PTs) work with people with neurological disorders (ND) to promote function, activity participation, and quality of life. PTs are also positioned to provide physical activity (PA) promotion, however, there has been little investigation into the PA promotion practices of PTs for their patients with ND. The purpose of this study is to investigate the frequency of PA promotion of PTs licensed in the United States who treat patients with ND, the factors associated with PA promotion for PTs who primarily treat patients with ND, and the types of PA promotion used.

**Methods:** This study utilized a survey which included the Determinants of Implementation Behavior Questionnaire (DIBQ) to explore which items or factors were associated with the frequency of PA promotion, and items to describe what kind of PA promotion is typically used. The survey was delivered to a geographically stratified sample recruited nationally using professional organizations and social media. Over 8 weeks 109 participants were recruited to complete the survey. Descriptive statistics were used to analyze the frequency of PA promotion and equality of proportions was used to compare PA frequency between PTs who reported a case load of over 50% and those who did not.

**Results:** Out of 76 participants who reported working with patients with ND diagnosis in any capacity, 34 (45%) reported always promoting PA. Of the 38 participants reporting a caseload of over 50% ND, 17 (45%) reported always promoting PA. There were 7 DIBQ statements representing separate behavioral domains that had a significant correlation with frequency of PA promotion. The majority of the sample reported providing education about PA with their patients (99%). Exploring perceived barriers to PA with patients was the next highest reported type of PA promotion (86%).

**Conclusion:** This study aimed to investigate the PA promotion practices of PTs licensed in the US who treat patients with ND. We found that PTs who work with patients with ND are not consistently promoting PA for their patients. Future research should investigate to how to better educate and support PTs in engaging in PA promotion, particularly for populations with ND.

# Point of sale food and beverage marketing to kids in food stores and restaurants: evidence from eleven cities in Canada.

**Dr. Leia Minaker**

<sup>1</sup>University Of Waterloo, Waterloo, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Background and objectives:** The World Health Organization called for global action to reduce the impact of marketing unhealthy foods and beverages to children over a decade ago. Several countries, such as Mexico, Ireland, and Chile, have implemented laws that restrict food and beverage broadcast marketing to children (M2K). To date, national M2K policies and monitoring predominantly focuses on broadcast media: television, radio, and social media. There are currently major gaps in policy and research on point-of-sale M2K in food retailers and restaurants. This research describes results from three separate studies (collecting data from 11 city-regions) of point-of-sale M2K in Canada.

**Methods:** The Canadian Marketing Assessment Tool for Stores (CMAT-S) assesses point-of-sale M2K in food retail establishments (e.g., supermarkets and corner stores) while the CMAT-R assesses point-of-sale M2K in restaurants. Both tools pay particular attention marketing techniques directed at children. Tools were developed based on literature syntheses and expert consultations. Inter-rater reliability was high for both tools. In 2021 and 2022, data were collected from 2,140 restaurants and 813 food stores in urban and rural regions across Canada (including in two of Canada's northern Territories). Descriptive statistics were used to describe key point-of-sale M2K indicators across cities and by area-level deprivation. Key indicators included exterior and interior marketing, as well as placement and price promotions of indicator foods. Photos of exterior and interior ads, island displays, drink and ice cream fridges, and drive-thrus were coded according to advertising strategies employed.

**Results:** Despite some regional variation, prevalence of point-of-sale M2K was very high (e.g., 65% of stores and 60% of restaurants had exterior marketing) although different types of restaurants and stores employed different M2K techniques (for example, convenience stores had more M2K than supermarkets; fast food outlets had more M2K than sit-down restaurants). There were few differences in M2K by neighbourhood income, although most indicators were slightly higher in higher-income neighbourhoods relative to lower-income neighbourhoods.

**Conclusions:** These tools can be adapted for use in other countries to demonstrate the need for M2K policies to consider and monitor point-of-sale food and beverage M2K in addition to broadcast marketing.

# One Kilometre at a time; a mixed-method evaluation of a school-based physical activity program, Kilometre Club

**Miss Teisha Schirmer**<sup>1</sup>, Dr. Andrew Bailey<sup>1</sup>, Mrs. Nicola Kerr<sup>1</sup>, Miss Alison Walton<sup>1</sup>, Dr. Linda Ferrington<sup>3</sup>, Mr. Michael Cecilio<sup>2</sup>

<sup>1</sup>Mid North Coast Local Health District, Coffs Harbour, Australia, <sup>2</sup>Northern New South Wales Local Health District, Lismore, Australia, <sup>3</sup>Rural Clinical Campus, University of New South Wales, Port Macquarie, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Background** Despite the known benefits of physical activity, there is minimal research focusing on the implementations factors of long-lasting and existing school-based physical activity programs. In 2014 one Australian school initiated a physical activity program called the Kilometre Club (KM Club). KM Club is now run by multiple schools and aims to provide children with the opportunity to run, walk or jog on an outside course. This evaluation aimed to examine families, teachers and principals' perceptions of the benefits, implementation enablers and barriers of KM Club, as well as the effects on student's physical activity levels during the school day.

**Methods** This study utilized a mixed-method design. 26 families, four teachers, and two principals from four regional New South Wales primary schools completed semi-structured interviews to understand their perceptions of KM Club. 21 students completed emotional state-scales to understand their emotions when participating in KM Club. 141 students from three schools participated in step-count measures using accelerometers. Qualitative data was analysed using an interpretive approach to thematic analysis. Linear mixed models were used to investigate the effect of KM Club on daily step counts.

**Results** Families, teachers and principals reported benefits such as improved social connectedness, wellbeing, home and classroom behaviours, participation in sport and fitness levels. Implementation enablers consisted of champion engagement, incentives, versatile facilities and integration with other school activities. Implementation barriers included the weather and environment, program timing and health issues. Most students reported that participating in KM Club made them feel proud, confident and fantastic. Students' daily steps increased significantly in the two schools that ran KM Club four or more days per week.

**Conclusion** Flexible and adaptable factors appear to be essential to the successful implementation of KM Club in primary schools. Children's health, wellbeing, and education outcomes were perceived to be positively impacted by KM Club. There was also an increase in children's physical activity levels in schools who ran the program four or more days a week. The findings from this study may help to inform future design, implementation and scale-up of school-based health promotion programs, potentially improving children's health and wellbeing outcomes.

# Perceived Neighbourhood Environment Attributes and Physical Activity in Ghana

**Ms. Vida Korleki Nyawornota<sup>1</sup>**, Dr. Fidelia Dake<sup>1</sup>, Dr. Abu Mumuni<sup>1</sup>, Prof. Stephen Owusu Kwankye<sup>1</sup>, Prof. Samuel Codjoe<sup>1</sup>, Prof. Reginald Ocansey<sup>1</sup>

<sup>1</sup>University of Ghana, Accra, Ghana

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Background:** Participation in regular and sufficient physical activity (PA) is a major approach for reducing the increasing rate of non-communicable diseases (NCDs) globally. The perceived neighbourhood environment according to empirical evidence, is a key contributor to engaging in regular physical activity. A supportive neighbourhood environment (NE) that fosters physical activity may contribute to high levels of physical activity of a population. There has been consistent evidence of a correlation between the characteristics of neighbourhood environment and physical activity, but most existing studies focuses on developed countries. Few studies have examined the association of the neighbourhood environment attributes with physical activity in low- and middle-income countries like Ghana.

**Objectives:** This study examines the association between the attributes of the perceived neighbourhood environment and physical activity in Ghana.

**Methods:** The International Physical Activity Questionnaire (IPAQ) and the Neighbourhood Environment Walkability Scale (NEWS) -Africa instrument, were used in a cross-sectional study to gather data on neighbourhood environment attributes and physical activity. Data from 1075 youth and adults aged 17 years and above, selected from diverse communities (by socioeconomic status (SES), and residential density in the Upper East, Bone and Greater Accra regions of Ghana were included in the study.

**Results:** About 53 percent of the respondents were female, while 47 percent were males. Three out of four people engaged in low PA. Residential areas with very densely packed small houses recorded high proportions of respondents with low physical activity level (81.9%). Results of multinomial regression analysis showed that five neighbourhood environment attributes: main types of housing in respondents' immediate neighbourhood (p-value < 0.001), proximity to service facilities/places (p-value < 0.001), access to service facilities/places (p-value < 0.001), road/walking path (p-value < 0.01), place for walking/cycling/playing p-value < 0.01), and crime safety (p-value < 0.01) recorded significant association with overall PA.

**Conclusion:** Neighbourhood environments that are walkability friendly and of low residential density encourage participation in high physical activity in Ghana.

# Acute effects of the physical and social environment on anxiety and perceived stress and their impact on walking levels in people with epilepsy – qualitative walk-along interviews

**Miss Julie Delobelle**<sup>1,2</sup>, Prof. Evelien Carrette<sup>1</sup>, Prof. Kristl Vonck<sup>1</sup>, Dr. Jelle Van Cauwenberg<sup>1,2</sup>, Prof. Delfien Van Dyck<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Research Foundation Flanders, Brussels, Belgium

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Background:** Many people with epilepsy (PWE) do not meet the physical activity (PA) guidelines. However, PA has antiepileptic and anxiolytic effects, which is of utmost importance for PWE, since stress and anxiety are very common triggers of seizures. Walking is an accessible and feasible way to be active. Previous studies already showed that the physical and social environment positively influences walking levels in the general population. Therefore, this study will gain in-depth qualitative information regarding which physical and social environmental characteristics influence anxiety and perceived stress and, consequently, impact PA among PWE.

**Methods:** Walk-along interviews, i.e. qualitative in-depth interviews during a walk in the participants' residential environment will be conducted, until saturation of information is reached. While walking, participants will be asked to identify and discuss physical and social attributes that (positively or negatively) affect their stress and acute anxiety levels and how this may affect their walking levels. The walk will proceed from the participant's home to a specific destination (e.g. a square or park). Participants can choose the route to walk to the destination. This route will be the participant's preferred route and this can be anticipated to be a route with a minimal presence of stimuli that can provoke anxiety and stress. The way back home will be chosen by the researcher, in order to expose the participants to potential environmental stressors and triggers of stress or anxiety that are normally avoided. Additionally, a go-pro camera will be attached to the participant's chest, to video and audio-record the interview. The audiotapes will be transcribed verbatim and processed afterwards with NVivo-12.1 software. To explore the validity and credibility of the results, member checking will be used.

**Results:** Data collection for this study will take place between March 2023 and May 2023. Qualitative analyses will be conducted and results will be presented at the conference.

**Discussion:** This study will provide in-depth information on which environmental attributes are perceived as safe or attractive and stimulate walking; and which attributes evoke feelings of acute anxiety and stress and discourage walking. These findings may contribute to interventions to promote walking in PWE.

# Disentangling the Association Between Adverse Childhood Experiences, Neighborhood Environment, and Obesity

**Dr. Krista Schroeder**<sup>1</sup>, Dr. Levent Dumenci<sup>1</sup>, Dr. David Sarwer<sup>1</sup>, Dr. Jennie Noll<sup>2</sup>, Dr. Kevin Henry<sup>1</sup>, Dr. Shakira Suglia<sup>3</sup>, Dr. Christine Forke<sup>4</sup>, Dr. David Wheeler<sup>5</sup>

<sup>1</sup>Temple University, Philadelphia, USA, <sup>2</sup>Penn State University, University Park, USA, <sup>3</sup>Emory University, Atlanta, USA, <sup>4</sup>Children's Hospital of Philadelphia, Philadelphia, USA, <sup>5</sup>Virginia Commonwealth University, Richmond, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Background:** Growing evidence documents adverse childhood experiences' (ACEs) association with adult obesity. ACEs can increase obesity risk via sequelae of chronic or severe stress or by hindering healthy behaviors. For example, ACEs have been associated with lower rates of physical activity and alterations in hunger hormones that can impact dietary intake. Multi-level research examining the influence of neighborhood environment on the ACEs-obesity association is lacking. Neighborhood factors (e.g., limited access to healthy food, limited greenspace) may contribute to both ACEs and obesity via indirect and overlapping pathways. It is difficult to disentangle neighborhood's impact on the ACEs-obesity association because many co-occur within the broader context of neighborhood poverty and racial segregation; sophisticated approaches such as geospatial analysis and novel methods for quantifying neighborhood risk are necessary.

**Purpose:** This study evaluated methods for creating a Neighborhood ACEs Index (NAI), as a first step in disentangling ACEs-obesity-neighborhood associations. A NAI is a spatial index that captures the association between neighborhood environment characteristics (e.g., healthy food access, greenspace) and individual-level ACEs exposure. A NAI can be applied in analyses to examine how neighborhood influences the ACEs-obesity association. In addition, a NAI can be used to identify neighborhood-level targets for obesity interventions and policies, because NAI creation results in weights that quantify the extent to which each neighborhood characteristic is associated with ACEs within that sample.

**Methods:** Methods entailed cross-sectional secondary analysis connecting individual-level ACEs and obesity data from the Philadelphia ACE Survey (N=1,677 Philadelphia adults) with 25 spatial datasets capturing neighborhood characteristics. Four methods were tested for index creation (three methods of principal components analysis, and a novel spatial index development approach [Bayesian index regression]). Resulting indexes were compared using Akaike Information Criteria. Linear regression analyses examined associations between ACEs, the NAI, and body mass index (BMI).

**Results:** Bayesian index regression was the best method for index creation. The NAI was associated with higher BMI, both independently and after controlling for ACEs exposure. The NAI attenuated the association between BMI and ACEs.

**Conclusions:** Future research can employ a NAI to disentangle ACEs-obesity-neighborhood associations and inform place-based approaches to interrupting ACEs-obesity associations.

# The Association Between Adverse Childhood Experiences, Neighborhood Greenspace, and Body Mass Index

**Dr. Krista Schroeder**<sup>1</sup>, Dr. Christine Forke<sup>2,3</sup>, Dr. Jennie Noll<sup>4</sup>, Dr. David Wheeler<sup>5</sup>, Dr. Kevin Henry<sup>1</sup>, Dr. David Sarwer<sup>1</sup>

<sup>1</sup>Temple University, Philadelphia, USA, <sup>2</sup>Children's Hospital of Philadelphia, Philadelphia, USA, <sup>3</sup>University of Pennsylvania, Philadelphia, USA, <sup>4</sup>Penn State University, University Park, USA, <sup>5</sup>Virginia Commonwealth University, Richmond, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** An association between adverse childhood experiences (ACEs) and elevated body mass index (BMI) has been found in previous investigations. ACEs' effects on BMI have been primarily considered via individual-level physiological and behavioral frameworks. Neighborhood factors, such as greenspace, are also associated with BMI and may merit consideration in studies examining ACEs-BMI associations. Greenspace's inverse association with BMI is hypothesized to occur through several possible pathways, including increased physical activity and improved mental well-being. Given that ACEs are associated with higher BMI and greenspace with lower BMI, it is plausible that greenspace's beneficial effects could potentially modify the negative effects of ACEs. This exploratory study examined associations of BMI with ACEs and neighborhood greenspace and tested whether greenspace moderated ACEs-BMI associations.

**Methods:** Methods entailed secondary analysis of cross-sectional data. ACEs and BMI were captured from 2012/2013 Philadelphia ACE Survey and 2012 Southeastern Household Health Survey data; greenspace percentage in participants' (n=1,679 adults) home neighborhoods was calculated using National Land Cover Database data. Multi-level, multivariable linear regression 1) examined associations between BMI, ACEs, (0 ACEs [reference], 1-3 ACEs, 4+ ACEs), and neighborhood greenspace levels (high [reference], medium, low) and 2) tested whether greenspace moderated the ACEs-BMI association (assessed via additive interaction) before and after controlling for social determinants of health-related covariates.

**Results:** Experiencing 4+ ACEs ( $\beta=1.21$ ; 95%CI: 0.26, 2.15;  $p=0.01$ ), low neighborhood greenspace ( $\beta=1.51$ ; 95%CI: 0.67, 2.35;  $p<0.01$ ), and medium neighborhood greenspace ( $\beta=1.37$ ; 95%CI: 0.52, 2.21;  $p<0.01$ ) were associated with BMI in unadjusted models. Only low neighborhood greenspace was associated with BMI ( $\beta=0.95$ ; 95%CI: 0.14, 1.75;  $p=0.02$ ) in covariate-adjusted models. The ACEs-greenspace interaction was not significant in unadjusted ( $p=0.89-0.99$ ) or covariate-adjusted ( $p=0.46-0.79$ ) models.

**Conclusions:** After accounting for key social determinants of health, low neighborhood greenspace, but not ACEs, was independently associated with BMI. Currently, most efforts to understand and address documented ACEs-obesity associations have focused at lower levels of the socio-ecological model. Future research should examine why the previously observed association between ACEs and BMI was disconfirmed in this study, after accounting for social determinants of health-related potential confounders and greenspace.

# The effectiveness of school-based physical activity interventions on girls' MVPA, sedentary behaviour and physical activity guideline adherence

**Ms. Nicole McCarthy<sup>1,2</sup>**, Dr. Alix Hall<sup>1,2</sup>, Dr. Nicole Nathan<sup>1,2</sup>, Dr. Rebecca Hodder<sup>1,2</sup>

<sup>1</sup>University of Newcastle, Newcastle, Australia, <sup>2</sup>Hunter New England Population Health, Newcastle, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Background:** Physical activity is extremely important for all children and there is emerging evidence that physical activity levels decline as children age and that physical activity levels are lower for girls than for boys. Many school-based physical activity programs have been implemented targeting children's physical activity levels with varying effects. However, there are few systematic reviews that focus on girls' physical activity. To address this evidence gap, we conducted a synthesis of studies included in the most recent comprehensive Cochrane review of school-based physical activity interventions, to determine the effect of these intervention on girls' physical activity levels.

**Methods:** Studies from the original review were considered eligible for inclusion if they: employed a randomised controlled trial design, focused on the general population of school students, and included a measure of physical activity (such as MVPA, sedentary time or the proportion of children meeting the guidelines) measured via accelerometers or pedometers across the whole day or school day. Only studies reporting the results separately for girls were eligible for inclusion in this secondary analysis. Where possible Random-effects meta-analyses were undertaken to estimate a pooled effect size for the primary outcomes.

**Results:** Twenty eligible studies were included. Meta-analysis for minutes of MVPA across the whole or school day based on 14 studies, including 11,551 participants indicated results made little to no difference to girls' MVPA [*mean difference: 0.81 minutes/day (95% CI: -0.30, 1.91, p=0.151; I<sup>2</sup>=50%; Low certainty evidence*]. Eight studies measured girls' whole-day sedentary behaviour. The meta-analysis found that school-based physical activity interventions probably decreases girls' sedentary behaviour slightly [*mean difference: -6.73 minutes/day (95% CI: -11.61, -1.85); moderate certainty evidence*] Only one study measured the proportion of students meeting guidelines resulting in little to no difference [0.65 (0.23 to 1.85) very low certainty of evidence].

**Conclusions:** School-based physical activity interventions seem to have an impact on movement but not intensity of movement. Future research should focus on increasing intensity, especially in girls.

# Relationships between body fat and objectively assessed physical activity in underweight, overweight and nonobese children: the BC–IT study

**Prof. Makama Andries Monyeki**

<sup>1</sup>Physical Activity, Sport and Recreation Research Focus Area, Faculty of Health Sciences, North-West University, Potchefstroom, South Africa

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Background:** Obesity and physical inactivity are significant health problems in developing countries. This study aimed to determine the relationships fat and objectively assessed physical activity in underweight, overweight and nonobese South African primary school children.

**Methods:** A cross-sectional study with 299 children (125 boys & 174 girls) aged 6- to 8-years who are part of a larger Body Composition using Isotope Technique Study (BC–IT study) living in the Potchefstroom areas, North West province, of South Africa. Weight and height were measured using standard procedures. The deuterium oxide (D<sub>2</sub>O) dilution determined body fatness. Fatness was classified using McCarthy centiles set at 2nd, 85th and 95th in conjunction with high fatness cut-off points (25% in boys & 30% in girls). ActiGraph accelerometer (Model GT3X-BT) was used to determine PA for a minimum of 10 hours/day for seven consecutive days. PA data was then categories into sedentary PA (<99 counts per minutes), light PA (≥ 100 counts per minutes), moderate PA (≥2296 counts per minute), vigorous PA (≥ 4012 counts per minutes) and moderate to vigorous PA (MVPA). Data were analyzed using SPSS with p-values for significant set at  $p \leq 0.05$ .

**Results:** Out of 299, 10% of the children were underweight, 63% normal weight; 15% overweight and 12% obese. Girls were more overweight and obese whilst boys were presented with high prevalence on underweight. Average daily minutes for MVPA for underweight was  $91.74 \pm 26.70$ ; normal  $77.71 \pm 22.66$ ; overweight  $72.2 \pm 24.38$ ; obese  $56.99 \pm 17.15$ . Average weekly minutes for MVPA for underweight was  $475.90 \pm 144.10$ ; normal  $433.47 \pm 16.77$ ; overweight  $410.2 \pm 145.49$ ; obese  $326.61 \pm 105.53$ . In the normal weight group, FFM was positive and significantly vigorous activity ( $r=0.28$ ,  $p=0.05$ ) and MVPA ( $r=0.31$ ,  $p=0.05$ ). Whilst in the overweight group, FFM ( $r=0.63$ ,  $p=0.05$ ), FM% ( $r=0.70$ ,  $p=0.01$ ) and FMI ( $r=0.65$ ,  $p=0.05$ ) were positive and significantly associated moderate PA. Also, MVPA was positive and significantly associated with FFM ( $r=0.58$ ,  $p=0.05$ ), FM% ( $r=0.67$ ,  $p=0.05$ ) and FMI ( $r=0.61$ ,  $p=0.05$ ).

**Conclusion:** The prevalence of underweight, overweight and obesity exists. Both overweight and obesity significantly affected participation in physical activity. Given the health implication of this results, strategic intervention is urgently recommended.

# The 2022 ParticipACTION Report Card on Physical Activity for Children and Youth: Focus on the COVID-19 pandemic impact and equity-deserving groups

**Dr. Nicholas Kuzik<sup>1</sup>**, Dr. Christine Cameron<sup>2</sup>, Dr. Valerie Carson<sup>3</sup>, Dr. Jean-Philippe Chaput<sup>1</sup>, Dr. Rachel Colley<sup>4</sup>, Dr. Joe Doiron, Dr. Guy Faulkner<sup>5</sup>, Dr. Ian Janssen<sup>6</sup>, Dr. Travis Saunders<sup>7</sup>, Dr. John C Spence<sup>3</sup>, Dr. Patricia Tucker<sup>8</sup>, Dr. Leigh M Vanderloo<sup>8,9</sup>, Dr. Mark S Tremblay<sup>1</sup>

<sup>1</sup>Healthy Active Living and Obesity Research Group, Children's Hospital of Eastern Ontario, Ottawa, Canada,

<sup>2</sup>Canadian Fitness and Lifestyle Research Institute, Ottawa, Canada, <sup>3</sup>Faculty of Kinesiology, Sport, and Recreation, University of Alberta, Edmonton, Canada, <sup>4</sup>Health Analysis Division, Statistics Canada, Ottawa, Canada, <sup>5</sup>School of Kinesiology, University of British Columbia, Vancouver, Canada, <sup>6</sup>School of Kinesiology and Health Studies, Queen's University, Kingston, Canada, <sup>7</sup>Department of Applied Human Sciences, University of Prince Edward Island, Charlottetown, Canada, <sup>8</sup>School of Occupational Therapy, University of Western Ontario, London, Canada, <sup>9</sup>ParticipACTION, Toronto, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To summarize the COVID-19-related findings from the 2022 ParticipACTION Report Card on Physical Activity for Children and Youth. Further, to highlight findings for equity-deserving groups (i.e., those identifying as: having a disability, Indigenous, 2SLGBTQ+, newcomers to Canada, racialized, or girls) and populations of interest (i.e., early years children), with results for both synthesized as equity-deserving groups.

**Methods:** The best available COVID-19-related data on physical activity and related behaviours, characteristics, and opportunities were synthesized across 14 different indicators in four categories. The 2022 Report Card Research Committee assigned letter grades (i.e., A-F) based on expert consensus of the synthesized evidence. While not graded, efforts were also made to summarize key findings for equity-deserving groups and content experts/community members were recruited to write sections of the Report Card detailing the importance of physical activity for all equity-deserving groups of children and youth.

**Results/findings:** Grades were assigned for: Daily Behaviours (Overall Physical Activity: D; Active Play: D-; Active Transportation: C-; Organized Sport: C+; Physical Education: Incomplete [INC]; Sedentary Behaviours: F; Sleep: B; 24-Hour Movement Behaviours: F), Individual Characteristics (Physical Literacy: INC; Physical Fitness: INC), Spaces & Places (Household: C, School: B-, Community & Environment: B), and Strategies & Investments (Government: B-). Compared to the 2020 Report Card, the COVID-19-specific grades increased for Active Play and Active Transportation; and decreased for Overall Physical Activity, Sedentary Behaviours, Organized Sport, and Community & Environment. Across the indicators, there was often limited data to synthesize for equity-deserving groups. Specifically, the mean percentage of indicators with no results for the equity-deserving groups was 77.6% (range: no results in 14/14 indicators [100%], no results in 5/14 indicators [35.7%]).

**Conclusions:** During the COVID-19 pandemic, the grade for Overall Physical Activity decreased from a D+ (2020) to a D, coinciding with decreases in grades reflecting fewer opportunities for sport and community/facility-based activities as well as higher levels of sedentary behaviours. Fortunately, improvements in Active Transportation and Active Play during COVID-19 prevented a worse shift in children's health behaviours. Efforts are needed to improve physical activity for children and youth during and post-pandemic, with a greater emphasis on equity-deserving groups.

# Gender and age influences on novel 24-h accelerometer-derived metrics in middle-aged Australian Adults.

**Associate Professor Joanne McVeigh**<sup>1,2</sup>, Miss Bingyan Pang<sup>1</sup>, Prof. Leon Straker<sup>1,2</sup>

<sup>1</sup>Curtin School of Allied Health, Perth, Australia, <sup>2</sup>enABLE Institute, Curtin University, Perth, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

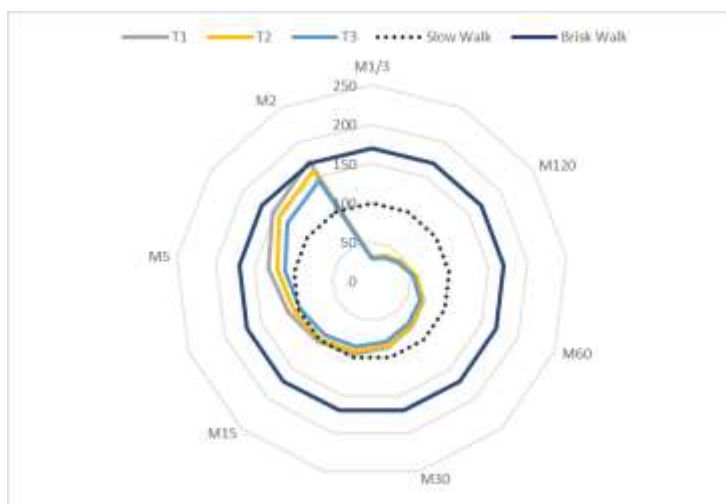

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Novel population-independent accelerometer metrics have been proposed: average acceleration (AvAcc: indicative of volume of activity); intensity gradient (IG) for the distribution of intensity across the 24-h profile and; data-driven metrics that capture the acceleration above which a person's most active minutes are accumulated, (MX variables). This study examined gender and age influences on these metrics using raw triaxial wrist-worn accelerometer data (Actigraph wGT3X-BT) from 997 middle-aged Australian adults (42.6% male) from the Raine Study in Perth, Western Australia (mean age: 56.7; SD:5.7 years).

**Methods:** Data (processed using "GGIR" package in R), expressed as acceleration in equivalent gravitational units (1 *mg* = 0.001 *g*), were used to estimate AvAcc, IG and acceleration for the most active 2 (M2), 5 (M5), 15 (M15), 30 (M30), 60 (M60), and 120 (M120) minutes of the day and M1/3 (most active 8 hours). Accelerometer metrics were also compared across tertiles of age (Tertile 1: Mean age (y) 50.7 SD: 2.9, n=339; Tertile 2: Mean age 56.7 SD: 1.3, n=317; Tertile 3: Mean age 62.8 SD:5.7, n=341).

**Results:** AvAcc was 25.6 *mg* (SD: 8.3) and varied by gender (men: 24.9 (SD: 8.7); women: 26.0 (SD: 7.9); 95%CI (-2.10 to - 0.02)). AvAcc was negatively correlated with age ( $r = -0.075$ ,  $p = 0.018$ ). The mean IG (-3.28 (SD: 0.45)) did not vary by gender or age. There were significant differences in all MX metrics for each tertile of age ( $p < 0.05$ ). Relative differences in the MX metrics between age tertiles decreased with the duration of the most active period (see Figure). The mean M2 value demonstrated that acceleration in the youngest tertile was 16% higher than the oldest tertile, while the mean M1/3 value was higher by 5%.

**Conclusion:** The influences of gender and age varied with the novel metric used. This understanding will help elucidate activity-health mechanisms when applied to subsequent studies investigating relationships with health outcomes.

Radar plot illustrating mean MX metrics for (clockwise) the most active 8 h of the day (M1/3DAY), 120 min (M120), 60 min (M60), 30 min (M30), 15 min (M15), 5 min (M5) and 2 min (M2) for three age groups.

# The association between physical activity and mothers' sleep quality on gestational weight gain and infant birth outcomes: a longitudinal cohort study

**Ms. Mugdha Deshpande<sup>1,2</sup>**, Dr. Neha Kajale<sup>1,2</sup>, Prof. Tarun Katapally<sup>3</sup>, Dr. Jasmin Bhawra<sup>4</sup>, Dr. Anuradha Khadilkar<sup>1,2</sup>

<sup>1</sup>Hirabai Cowasji Jehangir Medical Research Institute, Pune, India, <sup>2</sup>Department of Health Sciences, Savitribai Phule Pune University, Pune, India, <sup>3</sup>Western University, London, Canada, <sup>4</sup>Toronto Metropolitan University, Toronto, Canada

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** N. Other

**Purpose:** Physical activity (PA) influences maternal health during pregnancy, thereby having implications for infant health outcomes. Sleep is a bio-behavioural process crucial for overall health and well-being, especially during pregnancy. However, there is little evidence of how both PA and sleep influence maternal and infant health. This study aimed to assess the relationship between PA and sleep quality (SQ) of pregnant mothers (across 3 trimesters) in the western state of Maharashtra, India and to study their association with gestational weight gain (GWG-maternal health key indicator) and infant outcomes.

**Methods:** Using a longitudinal prospective cohort study design, data from 182 pregnant women (134 rural; 48 urban) of MAI cohort (Mother and Infant cohort) were collected between August 2020 and January 2023. PA (intensity and type) and SQ (score <5 denotes good sleep and >5 denotes worse sleep) data were collected using validated questionnaires. Data on maternal GWG and infant anthropometry such as Birth weight(BW), recumbent length, head and mid-upper arm circumference(HC and MUAC) were collected. The association between sleep and PA across trimesters were tested using an independent sample t-test, ANOVA, and Spearman's rank correlation ( $p$  value<0.05) using SPSS(V.26) software.

**Results:** Significant differences in maternal age, GWG, and infant BW for rural (23.4±3.7years; 9.9±3.7kg; 2.6±0.4kg) and urban mothers (31.0±4.7years; 12.1±4.3kg; 2.8±0.5kg) respectively were observed. Negative associations were observed between vigorous PA and GWG ( $\rho = -0.226$ ,  $p = 0.05$ ). Urban mothers who worked were more likely to deliver longer infants ( $\rho = 0.314$ ,  $p = 0.05$ ) with a greater HC ( $\rho = 0.340$ ,  $p = 0.05$ ). In contrast, rural mothers who engaged more in occupational activity delivered infants with lower BW ( $\rho = 0.175$ ,  $p = 0.05$ ). Sleep latency and poor sleep efficiency among mothers were inversely related with GWG ( $\rho = -0.185$ ,  $p = 0.05$ ;  $\rho = -0.309$ ,  $p = 0.05$ ), and infant birth length ( $\rho = -0.369$ ,  $p = 0.05$ ) and MUAC( $\rho = -0.296$ ,  $p = 0.05$ ). Poor SQ was also inversely correlated with infant length, and HC( $\rho = -0.297$ ,  $p = 0.05$ ).

**Conclusion:** Findings suggest that while PA influences maternal-infant health positively, vigorous PA was associated with lower GWG and infant BW. Inadequate sleep was also associated with inadequate GWG and poorer infant health outcomes.

# Examining factors associated with perceived barriers to physical activity between rural and urban Canadian youth

**Dr. Taru Manyanga<sup>1,2</sup>**, Ms. Nicole White<sup>1</sup>, Ms. Larine Sluggett<sup>1</sup>, Dr. David Anekwe<sup>1,2</sup>, Dr. Chelsea Pelletier<sup>1</sup>  
<sup>1</sup>University of Northern British Columbia, Prince George, Canada, <sup>2</sup>University of British Columbia, Vancouver, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** We used nationally representative data to explore associations among location of residence (rural/urban) and perceived barriers to Physical Activity (PA) among Canadian youth.

**Methods:** We analyzed the 2017 Canadian Community Health Survey, Barriers to Physical Activity Rapid Response data for 12-17-year-old-youth, with a final weighted sample of N=1,412,050 (unweighted n=1395). Nine items from the survey assessing perceived barriers to PA were combined into three barrier domains: resources, motivational, and socioenvironmental. The likelihood of reporting any barrier, or each barrier domain to PA based on rural-urban location was examined using survey-weighted binary logistic regression following a model fitting approach. Sociodemographic factors were modelled as covariates and tested in interaction with location. For each barrier domain, we derived the best-fitting model with fewest terms.

**Results:** There were no location-specific effects related to reporting any barrier or for motivation-related PA barriers. We found a sex\*location interaction predicting the likelihood of reporting resource-related barriers. Rural boys were less likely to report resource-related barriers compared to urban boys (OR=0.42 [0.20, 0.88]); this rural/urban disparity was not observed for girls (OR=1.30 [0.74, 2.27]). We found no sex difference in the odds of reporting resource-related barriers (OR=1.19 [0.73, 1.95]) among urban youth, while rural girls were more likely to report resource-related barriers compared to boys (OR=3.72 [1.66, 8.30]). Regarding socioenvironmental barriers, we observed a significant BMI\*location interaction. There were no rural/urban differences in the likelihood of reporting barriers (OR=1.04 [0.70, 1.56]) for youth with BMI in the “normal” range. However, having a BMI outside the normal range was associated with higher likelihood of reporting barriers among rural compared to urban youth (OR=2.38 [1.32, 4.30]) and to rural youth with normal BMI (OR=2.44 [1.41, 4.23]). BMI was unrelated to reporting socioenvironmental barriers for urban youth (OR=1.07 [0.67, 1.71]).

**Conclusion:** Perceived PA barriers are not universal among Canadian youth. Overall, rural youth with BMI outside the normal range were more likely to report socioenvironmental barriers compared to rural youth with normal BMI and all urban youth. Our findings demonstrate the importance of testing interactions in contextual models.

# Systematic review of 24-hour movement behaviours among children and youth living in Asian countries (2-17 years)

**Ms. Megan Clemens<sup>1</sup>**, Ms. Reyana Jayawardena<sup>2</sup>, Ms. Maia Collins<sup>1</sup>, Ms. Mariam Farooq<sup>1</sup>, Ms. Yeong-Bae Kim<sup>3</sup>, Mr. Heejun Lim<sup>1</sup>, Mr. Brendan Murphy<sup>1</sup>, Ms. An-Chi Shih<sup>1</sup>, Ms. Danica Vangsgaard<sup>1</sup>, Ms. Kathryn Wytenburg<sup>1</sup>, Dr. Mark Tremblay<sup>4</sup>, Dr. Eun-Young Lee<sup>1</sup>

<sup>1</sup>School of Kinesiology and Health Studies, Queen's University, Kingston, Canada, <sup>2</sup>Faculty of Health Sciences, Queen's University, Kingston, Canada, <sup>3</sup>Faculty of Kinesiology, Sport, and Recreation, University of Alberta, Edmonton, Canada, <sup>4</sup>Children's Hospital of Eastern Ontario Research Institute, Ottawa, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Achieving appropriate levels of 24-hour movement behaviours (MBs; i.e., physical activity [PA], sedentary behaviour [SB], and sleep) is important for healthy childhood development. However, achievement of favourable levels is low among children living in Asian countries and the relationship with social determinants of health (SDoH) is poorly understood. This systematic review examined levels and SDoH correlates of MBs among those aged 2-17 years in Asian countries.

**Methods:** Five electronic databases were searched between May and August 2021 for peer-reviewed articles in English, Japanese, and Mandarin Chinese. Covidence software was used by two independent reviewers for screening and data extraction. Retrieved evidence was synthesized using Excel, including SDoH analysis. Top-up searches will be done in February 2023.

**Results:** A total of 346 studies (1,138,233 participants from 45 countries) were included. Of these, 187 studies examined PA (n=140), SB (n=21), or sleep (n=26), exclusively, 122 studies examined two MBs, and 37 studies examined all three MBs. A preliminary analysis of 165 studies found that the mean duration for total and moderate to vigorous intensity PA (n=97) were 1.50 h/d and 1.06 h/d, respectively. The mean duration for SB (n=53) and sleep (n=49) were 6.11 h/d and 8.47 h/d, respectively. The average adherence to the 24-hour Movement Guidelines for PA and SB were 36.3% and 53.4%, respectively, among those aged 5–17 years. There was insufficient evidence on recommendation adherence in early childhood. Only three studies reported adherence to all three MBs, finding that 7.9% met all recommendations while 22.7% met none. Important SDoH were age (PA/sleep: negative; SB: mixed), gender (PA: negative for girls; SB/sleep: mixed), rurality (PA/sleep: positive; SB: negative), and household income (all three MBs: mixed).

**Conclusions:** Adherence to the 24-Hour Movement Guidelines for PA and SB were low among children in 45 Asian countries. Important SDoH correlates were identified, clarifying the relationship between some SDoH and MBs. Health promotion interventions in Asia should better support children and youth to adhere to 24-Hour Movement Guidelines.

# Objectively Measured Physical Activity and Sleep During Summer versus School Days among Children with Autism Spectrum Disorder

**Dr. Keith Brazendale<sup>1</sup>**, Dr. Jeanette Garcia<sup>1</sup>, Dr. Susan Quelly<sup>1</sup>, Dr. Shawn Lawrence<sup>1</sup>, Dr. Shilpa Gurnurkar<sup>2</sup>, Dr. Ethan Hunt<sup>3</sup>

<sup>1</sup>University of Central Florida, Orlando, USA, <sup>2</sup>Nemours Children's Hospital, Orlando, USA, <sup>3</sup>University of Texas Health Science Center, Austin, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Background:** Children with Autism Spectrum Disorder (ASD) are 42% more likely to be overweight or obese than neurotypical youth. Studies have identified summer as a 'critical window' for children, showing significant weight-gain during summer compared to school months. The 'Structured Days Hypothesis' suggests this may be due to the less-structured nature of summer, where weight-related behaviors – such as physical activity and sleep – can be negatively impacted. There is a lack of evidence exploring this hypothesis, particularly in children at greater risk of being overweight/obese, such as children with ASD. The purpose of this study is to explore differences in children with ASDs' physical activity and sleep during summer versus school months.

**Methods:** Children (N=16) with ASD were recruited to participate in this within-subjects observational study. Participants were asked to wear accelerometers on their non-dominant wrist for 24hr/d for 14 days to capture activity (sedentary, light, moderate, vigorous) and sleep (duration and timing) during a school month, and again, during a summer month. Mixed-effect models were employed considering clustering at the child level (multiple observation days) and controlling for wear-time.

**Results:** Six children (67% male, median age 6 years old, 66% Overweight/Obese, 50% Hispanic White) provided valid summer and school accelerometer data. Reasons for a lack of valid data included discomfort with wearing accelerometers (N=4), participants unavailable during summer months (N=2), and participants only providing one valid timepoint of data (school *or* summer) (N=4). Participants spent an additional +30.2 minutes per day in moderate-to-vigorous physical activity (95% CI: +19.3.1, +41.0) during school compared to summer days. Participants spent more time in light physical activity during summer compared to school days (+49.7, 95%CI: +11.0, +88.3). No statistically significant differences were observed for sedentary time or sleep duration and timing.

**Conclusions:** Preliminary evidence suggests differences in physical activity may exist during summer versus school months in children with ASD, however, the small sample size necessitates further research with larger, more diverse samples to draw meaningful conclusions. Future studies adopting objective measures of activity and sleep in children with ASD should consider additional measures (e.g., qualitative, surveys etc.) to increase study validity.

# Perspectives on yoga principles to promote holistic well-being among community health educators

**Miss Mary Frazier<sup>1</sup>**, Dr. Samantha Harden<sup>1</sup>

<sup>1</sup>Virginia Tech, Blacksburg, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose** To examine holistic well-being in community health educators (CHE) and their perspectives and current practices of yoga to inform translation of yoga principles to prevent and manage disease and burnout.

**Methods** A convenience sample of CHE in the Department of Agriculture's Virginia Cooperative Extension in the United States (n=18) filled out an electronic survey consisting of the Flourishing Index, a psychometrically validated metric for holistic well-being, as well as several questions about perceptions and current practices of yoga principles (i.e., movement, breathwork, and meditation). Data was analyzed for descriptive purposes. A 2-day virtual retreat was offered to determine reach (attendance) and satisfaction of yoga-related programming.

**Findings** Survey results demonstrated an overall level of flourishing of 7.5 (10=highest level). All CHE were interested in learning yoga principles (22% extremely [4/18], 22% very [4/18], 28% moderately [5/18], 28% slightly [5/18], 0% not at all [0/18]). The most prominent purposes reported for a personal yoga practice were relaxation (72%, 13/18), overall wellness (67%, 12/18), mental health (67%, 12/18), physical health (61%, 11/18), and self-care (61%, 11/18). CHE reported that individuals in their communities would be interested in participating in a CHE-delivered yoga program (6% extremely [1/18], 61% very [11/18], 17% moderately [3/18], 17% slightly [3/18], 0% not at all [0/18], 6% omitted [1/18]). Most CHE (67%, 12/18) did not have a personal yoga practice: 11% practice yoga postures 20-60 minutes/week (2/18), 24% practice breath exercises 20-30 minutes/week (4/18), and 33% practice meditation 10-60 minutes/week (6/18). Seventy-three CHE attended the 2-day retreat and reported satisfaction and positive perceptions of the programming (e.g., one CHE noted that it was the first time in their career that they felt like they were valued).

**Conclusions** CHE flourishing data provides a novel baseline as a target for improved well-being. In alignment with the literature on the health benefits associated with yoga, CHE perceive personal yoga practices for improved relaxation, overall wellness, mental health, physical health, and self-care. Translation of yoga principles has strong potential to prevent disease and burnout in CHE and the communities they serve.

# Family Farm to Healthy Kids: Engaging Early Learners in Fresh Food Education

**Ms. Diane Smith**

<sup>1</sup>Washington State University, Burlington, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Early learning of food groups can be foundational in increasing familiarity with different foods and acceptance of healthy food choices. This poster will present a fresh food education delivery strategy and research evaluation describing behavior change associated with an early learning food education program that included taste samplings of local produce.

**Methods:** In the 2021-2022 school year, thirteen early learning center sites participated in the Family Farm to Healthy Kids (FF2HK) project. Seasonal produce was procured from a local farm cooperative, delivered to culinary school for students to prepare tasting samples, then the prepared samples and accompanying recipe fact sheet were delivered to the early learning sites for distribution at circle time. Food education prompts were provided to the classroom teachers and a recipe fact sheet was sent home to parents. Survey tools were created to gather feedback from three target audiences served by this project: culinary students, parents, and preschool youth. Surveys were audience specific and incorporated Knowledge, Attitude and Practice (KAP) questions.

**Results/findings:** In the early learning audience, 50% of the harvest samples offered were new foods (not tried or familiar to the preschooler), with 40% of the preschoolers responded in the positive that they liked the new food, and 85% said they would try the food again. Of the culinary students, 38% reported the featured produce items were new to them (increased familiarity) and 17% purchased the harvest of the month produce item from the local store (adopt new behavior). Parents of preschoolers reported purchasing at least one of the featured produce items and 66% reported that they changed how they stored produce after reading “how to store” section of the recipe fact sheet.

**Conclusions:** Establishing food preferences early in life can influence adult eating patterns. The FF2HK project introduced fruit and vegetable through taste samples in conjunction with in-classroom food education. The program evaluation suggests that increased acceptance of new foods and behavior change in the purchase of healthy foods can be achieved through food education which includes taste samples of local produce and supplemental parent materials to extend the learning to the home environment.

# Immediate and one-year self-reported changes in food purchases after the implementation of Warning Labels in Mexico

Dr. Alejandra Contreras-Manzano<sup>1</sup>, **Dr. Alejandra Jáuregui<sup>1</sup>**, Mrs. Claudia Nieto<sup>1</sup>, Miss Katia Larissa Quevedo<sup>1</sup>, Dr. Jorge Vargas<sup>1</sup>, Dr. James F. Trasher<sup>2</sup>, Prof. Simón Barquera<sup>1</sup>, Dr. David Hammond<sup>3</sup>

<sup>1</sup>Instituto Nacional de Salud Pública, Cuernavaca, Mexico, <sup>2</sup>University of South Carolina, South Carolina, USA,

<sup>3</sup>University of Waterloo, Waterloo, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Front-of-pack warning labels were introduced in Mexico in 2020 as a public health strategy to inform consumers and promote healthier food choices. We aimed to describe the self-reported immediate (1-2 months) and one-year changes in the consumption of critical food groups after implementing warning labels. We also investigated the demographic factors associated with using warning labels.

**Methods:** We analyzed data from the 2020 and 2021 International Food Policy study among Mexican adults ( $\geq 18$  years,  $n=2,108$ ) and youth (14-17 years,  $n=1,790$ ). Participants were asked if the warning labels had changed their purchasing decisions regarding specific food groups critical for the development of nutrition-related chronic diseases and commonly labeled with warning labels (cola drinks, soda, diet soda or pop, sweetened fruit drinks, candy or chocolate bars, snacks, desserts, and sugary cereals), and beverages without warning labels (100% fruit or vegetable juice). Response options were 'buy less', 'no change', and 'buy more'. Multilevel and linear regression models were fitted to analyze differences in self-reported changes in purchasing behavior by demographic characteristics, nutrition knowledge, BMI category, and food shopping role.

**Results:** Overall, 38.7% (IC95%: 37.1, 40.3) of youth and 47.9% (IC95%: 47.1, 48.7) of adults reported buying fewer food products because of the warning labels; no differences per study year were observed. Food groups with the highest self-reported reductions in purchases among adults and youth were soda (54% and 50%), sweetened fruit drinks (52% and 41%), candy or chocolate bars (49% and 38%), and sugary cereals. The food group with the lowest self-reported reductions in purchases was 100% fruit or vegetable juice (adults: 28; youth: 20%). Higher self-reported use of warning labels was associated with being responsible for food shopping at the household, being older than 49 years, self-identifying as indigenous, and with higher self-reported nutrition knowledge.

**Conclusions:** Self-reported reductions in the purchases of key food groups for the development of nutrition-related chronic diseases were observed a few months after warning labels were implemented in Mexico and maintained after one year of implementation.

# Prevalence of the metabolic syndrome in adolescents: A comparison between the IDF and NCEP/ATP III criteria

**Prof. Makama Andries Monyeki**, Dr. Caroline M Sedumedi, Prof. Sarah J Moss

<sup>1</sup>Physical activity, Sport and Recreation Research Focus area, Faculty of Health Sciences, North-West University, Potchefstroom, 2520, Potchefstroom, South Africa

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Background:** The prevalence of metabolic syndrome (MetS) varies widely across the world in different studies. This is due to a lack of universally accepted definitions of the syndrome which makes it difficult to compare prevalence between different studies. Regardless of this, the prevalence of MetS still remains high. The current study compares the prevalence of the MetS according to the International Diabetes Federation (IDF) and the National Cholesterol Education Programme/Adult Trial Panel III (NCEP/ATP III) criteria among adolescents aged 15 years from the North West Province, South Africa.

**Methods:** This study follows a cross sectional design. Measures performed include anthropometry and markers of MetS. Prevalence of MetS in the sample population is 2.3% according to the IDF criteria and 5.6% according to the NCEP/ATP III criteria respectively. **Results:** Prevalence of MetS is twice as high when the NCEP/ATP III cut-off points were applied, compared to the IDF criteria. The difference between the two classifications is statistically significant ( $p < 0.05$ ) with a fair level of agreement ( $\kappa = 0.331$ ).

**Conclusion:** Variations in the prevalence of MetS are evident with the NCEP/ATP III criteria giving a prevalence that is twice as high compared to the IDF criteria. Standardized cut-off points for MetS in South African adolescents are needed to derive accurate identification and ensure comparable prevalence of the MetS in this population. Effective interventions strategies can only be developed and tested based on standardized cut-off points.

# The use of contracts as a form of private regulation to implement and manage healthy vending: best practice recommendations for effective and sustainable interventions

**Ms. Jane Dancey<sup>1</sup>**, Associate Professor Julie Brimblecombe<sup>1</sup>, Dr. Belinda Reeve<sup>2</sup>, Dr. Alexandra Jones<sup>3,4</sup>  
<sup>1</sup>Monash University, Melbourne, Australia, <sup>2</sup>University of Sydney, Sydney, Australia, <sup>3</sup>The George Institute, Sydney, Australia, <sup>4</sup>University of New South Wales, Sydney, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Private regulation, such as contracts, can be an effective lever to implement and sustain healthy food retail environments. However, guidance for the effective use of contracts, in food retail settings is lacking. We applied a public health regulatory framework to publicly available guidance documents for the use of contracts to implement healthy food vending to create a best-practice framework to guide practitioners.

**Methods:** Document analysis involved i) snowball sampling to identify eligible publicly available guidance documents; ii) application of a public health regulatory framework to extract data on regulatory form, substance and governance; and iii) synthesis of data to form best practice recommendations on implementation and governance. Eligible documents were those that were aimed at implementing healthier vending; published from 2000 onwards; accessible online; and included recommendations beyond nutrition standards alone, including a reference to at least one regulatory governance process (administration, implementation, monitoring, enforcement or review).

**Results:** Twelve of 92 documents identified were eligible and all were from the United States (US). Only one guidance document addressed all elements of the best-practice regulatory framework, although all noted that products need comply with nutrition standards. Other aspects of regulatory substance (i.e., pricing, promotion, placement, labelling and contract length) were less well considered as were elements of regulatory governance (regulatory rules, administration, implementation, monitoring, enforcement and review). Using the three domains and nine components and recommendations of the public health regulatory framework as a guide, we extracted information from the healthy vending guidance documents and synthesised these into a best-practice framework for application of contracts in healthy vending.

**Conclusions:** Application of an established public health regulatory framework to our data resulted in the development of a best practice framework to guide the use of contracts to create healthy food vending initiatives. Our best practice framework considers elements of regulatory form, substance and governance and may assist public health and health promotion practitioners to strengthen future initiatives using contracts to create healthy vending. We encourage further research regarding the applicability of our best practice framework to other food retail settings.

# Physical activity, residential greenness and cardiac autonomic function

**Miss Maija Korpisaari**<sup>1,2,3</sup>, Miss Soile Puhakka<sup>1,2,3</sup>, Dr. Vahid Farrahi<sup>2,5</sup>, Dr. Maisa Niemelä<sup>1,4,5</sup>, Prof. Mikko Tulppo<sup>4,6</sup>, Prof. Tiina Ikäheimo<sup>2,7</sup>, Prof. Raija Korpelainen<sup>1,2,4</sup>, Dr. Tiina Lankila<sup>1,3</sup>

Oulu, Finland, <sup>7</sup>Department of Community Medicine, University of Tromsø, the Arctic University of Norway, Tromsø, Norway

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose** Interaction with nature is positively associated with amount of physical activity (PA) and parasympathetic regulation measured with heart rate variability (HRV). Residential greenness has been associated with the amount of light PA (LPA) and a relationship between PA and cardiovascular health has been suggested. Moderate to vigorous PA (MVPA) has been reported to reduce the risk for cardiovascular diseases. The aim of this study was to evaluate the associations between PA at different intensities, residential greenness and HRV in a large population-based sample of Finnish adults.

**Methods** The study population consisted of Northern Finland Birth Cohort 1966 (originally  $n = 10,321$ ) who participated in follow-up data collection in 2012 at 46 years old with two-week PA recording with Polar Active accelerometer. The participants underwent assessments of vagally mediated HRV (root mean square of successive differences in R-R interval (rMSSD)). The final study population included those whose residential greenness was measured using Normalized Difference Vegetation Index (NDVI) based on satellite imaging ( $n=5433$ ). Independent-samples T-test was used to analyze the significance of the difference of means between grouping variables. The association between LPA, MVPA and HRV were analyzed using Generalized Additive Modeling (GAM). Multivariable GAM were adjusted with BMI, alcohol consumption, education, sleep duration, cardiorespiratory fitness, sedentary activity and NDVI.

**Results** Men had more PA in all intensity levels in green (NDVI >0.5) than non-green (NDVI <0.5) residential areas, of which LPA ( $p<0.001$ ), moderate PA ( $p<0.001$ ), total PA ( $p<0.001$ ) were statistically significant. Women in green residential areas had higher amount of LPA ( $p<0.001$ ) and total PA ( $p<0.05$ ). GAM adjusted for NDVI and other confounders showed positive linear associations between LPA, MVPA and HRV.

**Conclusions** Higher LPA and MVPA were significantly associated with higher HRV irrespective of residential greenness. Greenness was positively associated with PA in all intensity levels in men, whereas in women a positive association was found for LPA and total PA. Positive relationship of both PA with HRV, and greenness with PA was found. Residential greenness for promoting PA and heart health in adults should be considered in city planning.

# Implementation of the Promoting Activity, Independence and Stability in Early Dementia (PrAISED) intervention in clinical practice: a mixed methods study

**Dr. Emma Adams**<sup>1</sup>, Mrs. Clare Burgon<sup>1</sup>, Mrs. Juliette Lock<sup>1</sup>, Mrs. Helen Smith<sup>2</sup>, Prof. Sarah Goldberg<sup>1</sup>, Prof. John Gladman<sup>1,3</sup>, Prof. Tahir Masud<sup>3</sup>, Prof. Rowan Harwood<sup>1,3</sup>

<sup>1</sup>University of Nottingham, Nottingham, United Kingdom, <sup>2</sup>Nottinghamshire Healthcare NHS Foundation Trust, Nottingham, United Kingdom, <sup>3</sup>Nottingham University Hospitals NHS Trust, Nottingham, United Kingdom

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose** The Promoting Activity, Independence and Stability in Early Dementia (PrAISED) intervention is a 12-month, home-based, individually tailored rehabilitation programme, delivered by therapists and rehabilitation support workers, with a focus on strength, balance, physical activity and activities of daily living. We evaluated the PrAISED intervention using a multi-site randomised controlled trial. The aim of this study was to explore how the PrAISED intervention could be implemented as a clinical service.

**Methods** Patients were referred to a shortened (6 month) version of the PrAISED Intervention in one National Health Service Trust in England. Patient characteristics and the number and duration of visits were recorded by intervention delivery staff. Quantitative data were explored using descriptive statistics. Semi-structured interviews were conducted online with 7 members of staff involved in the service (2 managers, 5 delivery staff) to explore implementation. The Consolidated Framework for Implementation Research was used to inform interview guides and to conduct a codebook thematic analysis.

**Results** Between April and November 2022, 11 patients (54.5% male; mean age 78; 90.9% white British) were referred to, and participated in, the service. Patients received on average 20.9 visits (mean duration 82.1 mins). Adaptations were made to intervention processes including the eligibility criteria, referral processes, patient clinical assessments, visit schedules and visit content, whilst maintaining the principles for the delivery of PrAISED. Interviews highlighted challenges with establishing operational processes, difficulties with referrals, changes to the types of activities delivered, staff and patient enjoyment of the intervention, and perceived benefits for patients with improvements in confidence, motivation, balance and strength.

**Conclusions** It was possible to implement PrAISED as a clinical service, though adaptations were needed and referrals to the service were lower than expected. More time may be needed to establish processes and engage relevant personnel across organisations before commencing service delivery. Referral pathways need further investigation to increase the number and diversity of patients referred to the service. The PrAISED principles were used to deliver the intervention despite its shorter duration and the change in focus of some activities. PrAISED was enjoyed by staff and patients and may fill a gap in support post-dementia diagnosis.

# Sustainable development competencies among certified physical education and health teachers in Sweden

**Associate Professor Andreas Fröberg<sup>1</sup>**, Mr. Petter Wiklander<sup>1</sup>, Prof. Suzanne Lundvall<sup>1, 2</sup>

<sup>1</sup>Department of Food and Nutrition, and Sport Science, University of Gothenburg, Gothenburg, Sweden,

<sup>2</sup>Department of Sport, Food and Natural Sciences, Western Norway University of Applied Sciences, Høgskulen på Vestlandet Campus Sogndal, Bergen, Norway

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

School physical education (PE) may not only be an important cornerstone to the holistic development of students, but may also have unique characteristics that can contribute to the sustainable development (SD) agenda. However, most research to date about PE and SD has been theoretical, and we lack empirical studies with focus on PE teachers. The present study adds to the literature by exploring SD competencies among 2078 certified PE teachers in Sweden. The participants (42% males, median age: 48 years) were recruited through a digital register provided by the Swedish National Agency for Education, and data was collected using an online questionnaire. SD competencies was measured with the Physical Education Scale for Sustainable Development in Future Teachers (PESD-FT) that contained 18 items and that were answered using an eight-point Likert scale (strongly disagree to strongly agree). A SD competence index (SDC-I) was created by summarising the total score for all the 18 items (score: 18-144), and the higher the SDC-I scores, the higher the SD competence. Data was analysed with non-parametric statistics. In the total sample, the median SDC-I score for all participants was 107 (range: 18-144) out of 144. Most participants agreed with the items about making PE lessons accessible to everyone regardless of gender, race, or personal situation, and that PE can be used to improve people's physical ability. The median SDC-I score was lower among males compared to females ( $p=0.027$ ). Of the 18 items, there were sex differences for one item that concerned the economic dimension, and three items that concerned the environmental dimension (all  $p<0.05$ ). For these items, the score for males were lower compared to females. There were differences between younger ( $<40$  years) and older ( $\geq 40$  years) participants, where older participants had higher score ( $p=0.042$ ). Moreover, 31% reported having taught about SD in PE, and 67% somewhat agreed or agreed that they needed professional development education in the area of SD. Future studies are required to understand more of what types of competencies PE teacher education programmes and practicing PE teachers are lacking to fulfil the call for a contribution to the SD agenda.

# Public health nurses' wishes, needs and expectations for the development and use of a new online resource on early nutrition – a qualitative study in the Nutrition Now project

**Dr. Christine Helle<sup>1</sup>**, Prof. Elisabet Rudjord Hillesund<sup>1</sup>, Prof. Nina Cecilie Øverby<sup>1</sup>

<sup>1</sup>University of Agder, Kristiansand, Norway

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** In Norway, public health nurses (PHNs) are responsible for securing that all parents are sufficiently skilled in feeding their child. This represents a heavy responsibility, but there is an untapped potential in integrating flexible, evidence-based e-learning resources to support in-person dietary guidance. The aim of this study was to explore PHNs needs, wishes and expectations regarding development and use of an online resource on early nutrition.

**Methods:** In 2021, semi-structured interviews were taken with six PHNs working at a child health centre in a medium sized Norwegian city. The interviews were transcribed verbatim, and data were subjected to thematic analysis.

**Results:** Across all interviews, four thematic areas and 12 sub-themes were identified. The main themes were: 1) *An online resource is desirable, within some limitations;* 2) *It must be easy to use and perceived as relevant by different users;* 3) *Convey that food and meals are about more than nutrients* and 4) *Taking part in a developmental process is meaningful.*

The PHNs reported that parents frequently searched online for information on early nutrition. This information was often incorrect or misleading, and the PHNs recognized a need for a safe website to refer to. They preferred an online resource as a supplement to the ordinary consultations, fearing that watching a screen could disturb the personal contact. The resource would have to be concise and concrete. Extensive use of illustrations that facilitated understanding, was recommended. It further had to be available in at least English and Arabic in addition to Norwegian, and to work well on a smart-phone. The content should promote enjoyment of food as well as parental knowledge and skills, attempting to make nutrition less complicated by focusing on what's "good enough". Taking part in the development of the resource was viewed as meaningful and could contribute to joint knowledge and professional consensus. However, the overall workload had to be considered, and sufficient time be ensured for preparations.

**Conclusion:** PHNs recognized the need and were positive about an online resource on early nutrition as a supplement to regular consultations. Their input is included in a new online resource.

# Evidence supporting a combined movement behavior approach for children and youth's mental health – A scoping review and environmental scan

Dr. Louise de Lannoy<sup>1</sup>, Mx. Kheana Barbeau<sup>2</sup>, Dr. Leigh Vanderloo<sup>1</sup>, Dr. Gary Goldfield<sup>1</sup>, Dr. Justin Lang<sup>1</sup>, Dr. Olivia MacLeod<sup>1</sup>, **Prof. Mark Tremblay<sup>1,2</sup>**

<sup>1</sup>CHEO Research Institute, Ottawa, Canada, <sup>2</sup>University of Ottawa, Ottawa, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Introduction:** Associations between physical activity (PA), sedentary behavior (SED), and sleep – 24-hour movement behaviors (MBs) – and children/youth's mental health (MH) is well-established though often only examined separately.

**Methods:** This scoping review sought to answer the question: What evidence is there on the association between 24-hour movement behaviors and children/youth's mental health and what integrated knowledge mobilization applications/tools exist? Included articles examined all three MBs and MH among children/youth. The electronic search was conducted in June 2022 on PsycINFO, MEDLINE, CINAHL, Scopus. An environmental scan was conducted to search for MB and MH integrated knowledge mobilization applications/tools.

**Results:** A total of 55 articles were included, where 42 reported on combined MB and MH; 27/42 (64%) examined MB and mental wellness; 27/42 (64%) examined MB and indicators of mental illness; an overlap of 12/42 (29%) articles examined MB in relation to both mental wellness and illness. In total, 21/27 (78%) articles reported a positive and 6/27 (22%) reported no association between combined MB and mental wellness. Additionally, 23/27 (85%) reported a negative association between combined MB and indicators of mental illness and 4/27 (15%) reported no association. The environmental scan revealed one tool that examined how integrated MBs are associated with MH outcomes.

**Discussion:** There is a wealth of knowledge on the association between combined MB and MH though only one tool examined how combined MB and MH are associated. Efforts are warranted to better track and intervene on population and individual-level 24-hour MB for MH promotion and disease prevention.

# Immigration-related policies are associated with Supplemental Nutrition Assistance Program (SNAP) participation among Hispanic households in the U.S.

**Assistant Prof. M. Pia Chaparro**<sup>1</sup>, Dr. Amy Auchincloss<sup>2</sup>, Ms. Sofia Argibay<sup>2</sup>, Mr. Dominic Ruggiero<sup>2</sup>, Dr. Jonathan Purtle<sup>3</sup>, Dr. Brent Langelier<sup>2</sup>

<sup>1</sup>University of Washington School of Public Health, Seattle, USA, <sup>2</sup>Drexel University Dornsife School of Public Health, Philadelphia, USA, <sup>3</sup>New York University School of Global Public Health, New York, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To investigate the association between county- and state-level immigration-related policies and county-level participation in the Supplemental Nutrition Assistance Program (SNAP) among Hispanic households in the United States. SNAP is the main safety net program against food insecurity and SNAP-eligible Hispanics do not fully participate in SNAP. We hypothesized that lower SNAP participation among Hispanic households is partly due to exposure to immigrant unfriendly policies, even when unrelated to SNAP eligibility. For example, Hispanics may fear that by enrolling in SNAP, an undocumented family member could be exposed and deported.

**Methods:** Data on SNAP participation came from the American Community Survey (ACS) county-level 1-year files, 2007-2019. Data on county and state immigrant unfriendly/friendly policies for the same years came from secondary sources including the Urban Institute Immigration Policy Resource database. Our exposure was the cross-classification of county and state policies, determining whether a county had favorable (e.g., prohibiting local enforcement to share residents' migration status with federal immigration) or unfavorable policies at the county and/or state. Our outcome was county-level proportion of SNAP-participating Hispanic households. We used multivariable generalized linear models accounting for geographic and temporal autocorrelation, adjusted for the proportion of non-Hispanic White households participating in SNAP and county-level socio-demographic confounders such as poverty rate and unemployment for Hispanics and non-Hispanic Whites (n=6309 county-years).

**Results/findings:** County-level SNAP participation among Hispanic households was 2 percentage-points (B=2.02, 95%CI=0.73-3.31) higher in counties with immigrant-favorable policies at both the county and state levels, compared to counties with unfavorable policies at both levels. County-level SNAP participation among Hispanic households was 1.1 percentage point (B=1.14, 95%CI=0.23-2.06) higher in counties with discordant county-state policies (i.e., favorable at one level but not the other), when compared to counties with no unfavorable policies at both levels.

**Conclusions:** Local and state immigration policies, even when unrelated to SNAP eligibility, may influence SNAP participation among Hispanic households. Given that food insecurity prevalence is consistently higher among Hispanic households vs. non-Hispanic White households, these results are relevant for policies and programs attempting to address inequities in food insecurity and its nutritional consequences.

# Is the child's mode of commuting to school affected by parental barriers? The role of gender

**Dr. Francisco Javier Huertas-delgado<sup>1</sup>**, Dr. Carla Hermida<sup>2</sup>, Dr. Yaira Barranco-Ruiz<sup>3</sup>, Dr. Emilio Villa-González<sup>3</sup>, Dr. Adriana Quezada<sup>4</sup>, Dr. Daniel Molina-Soberanes<sup>3</sup>, Ms. Ximena Palma-Leal<sup>3</sup>, Mr. Pablo Campos-Garzón<sup>3</sup>, Dr. Daniel Orellana<sup>4</sup>, Dr. Palma Chillón<sup>3</sup>

<sup>1</sup>Teacher Training Centre La Inmaculada, Physical Activity for Health Promotion (CTS 1810) University of Granada, Granada, Spain, <sup>2</sup>Universidad del Azuay, Cuenca, Ecuador, <sup>3</sup>Department of Physical Education and Sports, Faculty of Sport Sciences, Sport and Health University Research Institute (iMUDS), University of Granada, Granada, Spain, <sup>4</sup>Universidad de Cuenca, Cuenca, Ecuador

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Active commuting to school (ACS) has been related to several health benefits, such as a higher daily amount of physical activity. Parents are the main decision-makers, and their perceptions may affect their children's ACS rates. Thus, the purposes of this study were to analyze the parental barriers by child and parent's gender and to examine the association between the parental barriers and the ACS, separately by child and parent's gender.

**Methods:** A total of 692 parents (53.9% mothers), from Spain and Ecuador, participated in this study. Parents reported their gender, educational level, and barriers to allowing their children actively commute to school, and their children's age, gender, mode, and time of commuting to school. Differences in the parental barriers by child and parent's gender were analyzed using T-student tests. Several binary logistic regression models were fitted to analyze the associations between the ACS (dependent variable) and barrier categories (independent variable, one for each model). All regressions were controlled by children's age, parental educational level, and time to school.

**Results:** The barriers to cycling to school were highly perceived by girls' parents ( $2.89 \pm 0.87$ ) than boys' parents ( $2.60 \pm 0.97$ ),  $p=0.001$ . Mothers perceived significantly higher barriers (all  $p<0.001$ ) than fathers (general:  $3.22 \pm 0.80$  vs.  $2.89 \pm 0.75$ ; walking:  $2.87 \pm 0.92$  vs.  $2.37 \pm 0.87$ ; cycling:  $2.86 \pm 0.94$  vs.  $2.58 \pm 0.91$ ; and total:  $3.05 \pm 0.79$  vs.  $2.73 \pm 0.68$ ). Lower perception of general (Odd ratio=0.430, Confidence interval; CI=0.309-0.599), walking (OR=0.544, CI=0.413-0.716), cycling (OR=0.554, CI=0.434-0.708), and total (OR=0.423, CI=0.300-0.596) barriers were associated to ACS in children for the whole sample, and for boys' parents in relation to child's gender, and for both parents' gender. Lower general barriers (OR=0.512, CI=0.309-0.847) were associated with ACS only in girls' parents.

**Conclusions:** Mothers perceived higher barriers towards ACS than fathers. A lower perception of parental barriers was associated with ACS, especially for boys' parents, for both fathers and mothers. Consequently, results suggest that it is important to educate parents, especially mothers, about the perceptions to let their children do ACS. In addition, developing improvements related to parental concerns, are needed to increase the ACS rates in modern-day youth

# Will India ever become anemia free?: A qualitative inquiry

**Dr. Neha Rathi<sup>1</sup>**, Dr. Nikitha Pedapanga<sup>1</sup>, Dr. Immanuel Joshua<sup>1</sup>, Prof. Anthony Worsley<sup>2</sup>, Prof. Sangeeta Kansal<sup>1</sup>, Mr. Aryan Raj<sup>1</sup>

<sup>1</sup>Department of Community Medicine, Institute of Medical Sciences, Banaras Hindu University, Varanasi, Uttar Pradesh, India, <sup>2</sup>School of Exercise and Nutrition Sciences, Deakin University, Geelong, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Anemia is a common micronutrient deficiency existing among adolescents in several developing countries, including India. Despite launching numerous health programs, the Indian Government has only seen a small decline in the prevalence of anemia. Therefore, it is critical to explore the reasons behind the lack of progress in anemia prevention. This study aimed to assess the views of adolescents regarding anemia and anemia prevention strategies.

**Methods:** Using convenience sampling 39 adolescents (20 males; 19 females) aged 10-19 years were recruited from Tikari village, Varanasi, India. In-depth, face-to-face interviews were conducted in Hindi to gather information on their knowledge and perceptions of anemia and its prevention. Hemoglobin concentration was also estimated using the prick method, and the interviewees were requested to share Home Science and Science textbooks. The transcribed interview data were thematically analyzed through the Template Analysis technique. Conceptual themes were identified using NVivo software. Descriptive statistics were used to examine the distributions of the hemoglobin data. Additionally, content analysis technique was implemented for analyzing textbooks to verify the coverage of anemia and anemia-related content.

**Results:** Seven themes were identified: (i) Poor understanding of the term 'anemia; (ii) Limited discussion about anemia in classroom; (iii) Awareness of few common symptoms of anemia; (iv) Awareness about prevention and cure of anemia; (v) Irregular supply of Iron Folic Acid and deworming tablets in schools; (vi) Poor engagement of health workers in the prevention of anemia; (vii) Little knowledge of health programs among adolescents. The mean hemoglobin levels in boys and girls were 12.8 g/dl and 11.1 g/dl respectively. More than half of the sample was anemic (16.7% mild, 33.3% moderate, 2.8% severe). Content analysis revealed that there was limited discussion about anemia in both Home Science and Science textbooks.

**Conclusions:** The emerging findings highlight the need for revision of Home Science and Science curricula (i.e. inclusion of both declarative and procedural nutrition knowledge) as well as the need for effective behavioral nutrition interventions to curb the escalation of anemia among adolescents. The behavioral interventions should focus on inculcating healthy culinary and dietary practices and addressing the gaps in knowledge and understanding of anemia and its prevention among adolescents.

# Longitudinal links of diet and physical activity with gestational weight gain among slum-dwelling Indian pregnant women

**Dr. Rubina Mandlik<sup>1</sup>**, Ms. Swapna Deshpande<sup>1,2</sup>, Dr. Anuradha Khadilkar<sup>1</sup>, Dr. Dipali Ladkat<sup>1</sup>, Dr. Tarun Katapally<sup>3</sup>, Dr. Jasmin Bhawra<sup>4</sup>, Dr. Sangita Kulathinal<sup>5</sup>, Dr. Tarja I Kinnunen<sup>2</sup>

<sup>1</sup>Hirabai Cowasji Jehangir Medical Research Institute, Pune, India, <sup>2</sup>Tampere University, Tampere, Finland, <sup>3</sup>Western University, Ontario, Canada, <sup>4</sup>Toronto Metropolitan University, Toronto, Canada, <sup>5</sup>University of Helsinki, Helsinki, Finland

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** N. Other

**Purpose:** A third of the population of Indian cities live in slums. Prevalence of overweight and obesity are increasing among slum-dwelling women. Information on how diet and physical activity contribute to gestational weight gain (GWG) among slum-dwelling women is scarce. This study explores the association of diet and physical activity with GWG in slum-dwelling pregnant women from Pune, India.

**Methods:** A prospective observational study was conducted of slum-dwelling pregnant women ( $\geq 18$  yrs,  $n=282$ ) enrolled during early gestation [ $<12$  weeks; T1] and followed up at mid-gestation [21 to 25 weeks; T2] and childbirth. Data on maternal sociodemographic characteristics, anthropometrics, diet (24-hour recall), and physical activity (Pregnancy Physical Activity Questionnaire) were collected. Daily energy and macronutrient intake, and physical activity scores (MET-hours/week) were calculated at T1 and T2. Total GWG was calculated as the difference between weight at the prenatal visit closest to delivery and weight at T1. Nutritional and physical activity correlates of GWG were assessed using multiple linear regression analysis.

**Results:** At T1, the cohort had the following characteristics: mean age:  $24.7 \pm 4.6$  yrs, 43% completed  $\geq 12$  yrs of schooling, 88% were homemakers, 25% were classified as overweight, and 11% as obese. Mean daily energy intake at T1 and T2 were  $1408 \pm 482$  kcal and  $1853 \pm 499$  kcal, respectively (EAR – 2010 kcal/day). Energy obtained from carbohydrates, proteins, and fats was 63%, 10%, and 26%, respectively. Nearly half of the women exceeded suggested energy intake from carbohydrates (i.e. 45-65%). Mean total energy expenditure at T1 and T2 was  $183 \pm 70$  and  $179 \pm 69$  MET-hours/week, respectively. Women reported participating mostly in light-intensity physical activity followed by moderate-intensity activities in the form of household chores and caregiving. Mean GWG was  $10.2 \pm 4.3$  kgs. Greater carbohydrate intake independent of energy intake at T2 ( $\beta = 0.02$ ;  $p=0.06$ ) and higher sedentary activity at both visits (T1:  $\beta = 0.06$ ;  $p=0.008$ ; T2:  $\beta = 0.04$ ;  $p=0.05$ ) were associated with greater GWG.

**Conclusions:** High carbohydrate intake and low physical activity among slum-dwelling pregnant women can increase GWG and should be managed in consultation with healthcare providers. More importantly, public health policies and programs should support pregnant slum-dwelling women in preventing and managing pre-, during, and post-pregnancy weight gain.

# Developing causal directed acyclic graphs to guide observational physical activity research – a scoping review

**Dr. Louise Poppe<sup>1</sup>**, Dr. Johan Steen<sup>2</sup>, Dr. Wen Wei Loh<sup>3</sup>, Prof. Geert Crombez<sup>4</sup>, Ms. Fien De Block<sup>1,5</sup>, Ms. Noortje Jacobs<sup>1</sup>, Dr. Annick De Paepe<sup>4</sup>, Dr. Jelle Van Cauwenberg<sup>1</sup>

<sup>1</sup>Department of Public Health and Primary Care, Ghent University, Ghent, Belgium, <sup>2</sup>Department of Internal Medicine and Pediatrics, Ghent University, Ghent, Belgium, <sup>3</sup>Department of Data Analysis, Ghent University, Ghent, Belgium, <sup>4</sup>Department of Experimental Clinical and Health Psychology, Ghent University, Ghent, Belgium, <sup>5</sup>Department of Movement and Sports Sciences, Ghent University, Ghent, Belgium

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose.** Observational studies tend to rely on associational rather than causal analysis. Nevertheless, causal conclusions are often made or sought by researchers. Causal Directed Acyclic Graphs (DAGs) provide the necessary tools for articulating the assumptions on which causal interpretations of statistical associations rely and provide a clear basis for constructive discussion among researchers. As yet, the use of DAGs in physical activity and, more broadly, health promotion research is limited. Our aim is to provide researchers with an overview of guidelines and recommendations for developing DAGs to answer their research questions.

**Methods.** We conducted a scoping review searching for papers and resources explicitly focusing on the development of DAGs. Three bibliographic databases (PubMed, EMBASE, and Web of Science) were searched and reference lists of selected papers were screened. Information extracted was categorized according to the following three themes: (1) the purpose of DAG development (i.e., for guiding study design and/or data analysis), (2) similarities and differences between the papers and resources regarding the proposed steps for DAG development, and (3) guidance on how to obtain domain knowledge for the development of a DAG.

**Results.** A total of 902 records were identified from the bibliographic databases and a total of eleven papers and resources providing guidelines and recommendations regarding DAG development were included. Most of the included papers focused on DAG development for data analysis. Similar steps were proposed for developing a DAG. There were some differences on how to implement common causes (i.e. sequential inclusion versus exclusion). Little to no information was available on the implementation of domain knowledge in the development of DAGs.

**Conclusions.** Causal DAGs are relevant and useful tools for guiding different phases of the research process, from study design to data analysis. Key recommendations for physical activity researchers will be discussed. We hope that our scoping review facilitates, increases and improves the practical uptake of DAGs in physical activity and, more broadly, health promotion research.

# Compositional associations of 24-hour physical activities, sedentary time, and sleep with depressive symptoms in urban and rural environments

**Ms. Marjo Seppänen**<sup>1,2,3</sup>, Dr. Maisa Niemelä<sup>5</sup>, Ms. Soile Puhakka<sup>1,2,3</sup>, Dr. Tiina Lankila<sup>1,3</sup>, Prof. Markku Timonen<sup>2,6</sup>, Prof. Raija Korpelainen<sup>2,3,4</sup>, Dr. Vahid Farrahi<sup>5</sup>

<sup>1</sup>Geography Research Unit, University of Oulu, Oulu, Finland, <sup>2</sup>Center for Life Course Health Research, University of Oulu, Oulu, Finland, <sup>3</sup>Department of Sports and Exercise Medicine, Oulu Deaconess Institute Foundation sr., Oulu, Finland, <sup>4</sup>Medical Research Center, Oulu University Hospital and University of Oulu, Oulu, Finland, <sup>5</sup>Research Unit of Health Sciences and Technology, University of Oulu, Oulu, Finland, <sup>6</sup>Unit of General Practice, Oulu University Hospital, Oulu, Finland

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** This study examined how compositions of 24-hour time-use, and time reallocations between different movement behaviors are associated with depressive symptoms in urban and rural residential environments.

**Methods:** The study population consisted of 4305 46 years old participants from the Northern Finland Birth Cohort 1966 study. Time spent in light-intensity physical activity (LPA), moderate-to-vigorous-intensity physical activity (MVPA) and sedentary time were obtained from a hip-worn accelerometer. Sleep duration was self-reported and combined with activity behaviors to obtain the 24-hour composition. Residential environment was classified as urban or rural based on participant's home address. Depressive symptoms were evaluated using Beck Depression Inventory II (BDI-II). Multivariable adjusted regression analysis, using a compositional data analysis approach based on isometric log-ratio transformation, was used to examine the associations and pairwise time reallocations of 24-hour movement behaviors with BDI-II score. The analyses were stratified by urban (N=2868) and rural (N=1172) residential environments.

**Results:** The 24-hour composition of movement behaviors was significantly associated with depressive symptoms in both environments. The pairwise time-reallocations among movement behaviors showed that more daily time in MVPA at the expense of sedentary time, LPA or sleep was associated with less depressive symptoms in both environments, but to a different extent. Replacing 30 min/day of sedentary time with MVPA was associated with -0.33 (95% CI = -0.56 – -0.10) and -0.55 (95% CI = -0.86 – -0.23) lower BDI-II scores among those living in urban and rural environments accordingly. More daily time in sleep at the expense of sedentary time or LPA was associated with lower BDI-II score in rural, but not in urban environment.

**Conclusions:** These findings suggest that more physical activity from moderate to vigorous intensity at the expense of any other movement behavior could help to prevent depressive symptoms, and the beneficial effects seem be more pronounced for rural residents.

# Pragmatic Evaluation of Systems Approaches in Public Health: The Systems Evaluation Network

**Dr. James Nobles<sup>1</sup>**, Dr. Alexandra Potts<sup>1</sup>

<sup>1</sup>Leeds Beckett University, Leeds, United Kingdom

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Calls for systems approaches to improve population health have grown rapidly in the last two decades. Systems approaches are characterised by a deep and shared understanding that many population health outcomes are the product of a complex adaptive system. To change such outcomes, we need to alter how the system functions through collective, systemic, and multi-sectoral action. This type of approach is widely advocated, and is being implemented, across the world. One challenge facing current and future systems approaches is the extent to which they can be evaluated within the traditional research paradigms. We aim to introduce the Systems Evaluation Network to help overcome this challenge.

**Methods:** The Systems Evaluation Network (SEN) was established in June 2021 to provide a mechanism for researchers, practitioners, and policy makers to share and advance methodological developments. The network meets quarterly for two hours in an online format. The focus of the SEN is member-led, meaning that the content adapts to meet the needs of its members. Here, we present a retrospective descriptive analysis of its membership and foci.

**Results:** As of March 2022, the SEN has grown to 538 members. Membership is predominantly UK-based, however there is a growing international audience, including those from the Netherlands, Finland, Sweden, the Middle East, South and Central America, the USA, Australia, Canada, and New Zealand. Over half are from academia (53.9%), with the remainder from policy, practice, and independent consultancy. The skill set and knowledge base of the current membership spans public health and health promotion, health systems and policy, behavioural science and insights, and engineering and infrastructure systems. The focus, throughout the last seven SEN meetings, has been on: designing a systems evaluation; monitoring the success of a systems approach; exploring terminology; case study examples; and, methods such as systems mapping.

**Conclusions:** The SEN was initially pitched at a UK-audience, however given the broader interest, it has now developed an international membership. The content of the SEN directly aligns to the issues covered within the ISBNPA conference, and as such, is likely to be of relevance to delegates.

# Effects of Goal-setting and Visualization on Collegiate Track & Field Athletes' Performance, Self-Confidence and Anxiety – A Pilot Study

**Dr. Jung Eun Lee<sup>1</sup>**

<sup>1</sup>University of Minnesota Duluth, Duluth, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Psychological skills training has been effective in improving overall performance, self-confidence, and reducing anxiety in athletes of various sports such as tennis, field hockey, and basketball (Mamassis & Doganis, 2004). The purpose of this study was to examine the impact of goal setting and mental imagery training on the performance, anxiety, and confidence levels of collegiate track & field athletes. It was hypothesized that mental skills training would improve participants' performance and psychological variables.

**Methods:** A total of 12 males (mean age=19.5 years, previous experience= 6.73 years) were recruited from the University's Men's Track & Field team using an email flyer. One athlete competed in sprint events (60-600m), and 10 athletes competed in distance events (800-5,000m). Participant's anxiety and self-confidence were measured using the Competitive State Anxiety Inventory-2, and their competition performances were recorded on a separate data sheet. Participants met twice per week for four weeks for instructional session of goal setting and visualization training using excerpts from the US Olympic Committee Sport Psychology Training manual, and asked to practice visualization for at least 5 min daily on their own. Data was collected prior to, and following the intervention, as well as before each competition during the four-week intervention period.

**Results:** Paired t-tests indicated that cognitive anxiety ( $t(1,11) = 2.74, p < 0.05$ ) and somatic anxiety ( $t(1,11) = 2.65, p < 0.05$ ) significantly decreased, while self-confidence ( $t(1,11) = -2.48, p < 0.05$ ) significantly increased from pre-intervention to post-intervention. Participants' performance showed an increasing trend from pre- to post-test: however, did not reach a significant level.

**Conclusions:** The findings of this study suggest that four weeks of goal setting and mental imagery training is effective in reducing pre-competition anxiety in male collegiate Track & Field athletes. These findings provide adequate evidence that regular mental skills practice should be included in any training plan. Distance running by nature is a mental game, and the practice of visualization and goal setting has the potential to give athletes an edge by reducing their pre-competition anxiety and boosting self-confidence.

# Creating content for an app that enables coach advisors to support volunteer trainers

**Dr. Janet Moeijes**<sup>1</sup>, Mr. Cor Niks<sup>1</sup>

<sup>1</sup>Windesheim University of Applied Sciences, Zwolle, Netherlands

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose** Volunteer sports trainers have difficulties in 'reading' the behavior of children with psychosocial problems. Compared to their peers, these children more often stop with sports participation after a short period, while membership of a sports club might help them to reduce their psychosocial problems. Windesheim University of Applied Sciences is developing an app which could be helpful for coach advisors such as behavioral therapists, community sports motivators, and physical education teachers, to support volunteer trainers. In order to get content for the app, rules of thumb will be formulated on how sports trainers can respond to children who show troublesome behaviour due to psychosocial problems.

**Method** Sports students will use draft versions of the observation form during the training to observe the actions of trainers and the corresponding reactions of children. Afterwards, students will interview volunteer trainers about their observations and discuss with them how similar problems could be prevented during the next training.

In focus groups, solutions provided to the trainers will be calibrated. Also possible changes in trainers' behaviour towards children with psychosocial problems will be determined.

**Results** The first experiences indicate that the observation form is easy to use. Trainers find it pleasant that their training activities are being observed. They actively implement the advices given by students in consultation with them. In the current early stage of the research project, possible effects of these advices could not yet be determined.

**Conclusion** As an initial step in developing an app that coach advisors can use to support trainers to better respond to troublesome behavior of children with psychosocial problems, an observation form is being constructed. Using draft versions of this form seems to yield sufficient input for formulating rules of thumb that have to be incorporated in the future app.

# Promotion of a healthy salt intake in Brazilian adults: a theory-based mHealth intervention

**Dr. Marilia Cornélio<sup>1</sup>**, Mrs. Milena Perin<sup>1</sup>, Dr. Maria-Cecília Gallani<sup>2</sup>, Dr. Thais São-João<sup>3</sup>, Ms. Titilayo Tatiana Agbadje<sup>2</sup>, Dr. Roberta Rodrigues<sup>1</sup>

<sup>1</sup>University of Campinas, Campinas, Brazil, <sup>2</sup>Laval University, Quebec, Canada, <sup>3</sup>University of Rhode Island, Kingston, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** To evaluate a theory-based m-Health intervention to promote healthy salt intake in Brazilian adults.

**Methods:** We conducted a two-arm randomized controlled study with adults from primary health care units of a city of São Paulo state, Brazil. Intervention development was guided by the Behavior Change Wheel framework and it was delivered by a mobile App. Participants responded questionnaires at baseline and 2 months post-intervention. The primary outcomes were Behavioral question on salt intake (using a maximum of 3g of salt/day during meal preparation) and Per capita salt consumption. Secondary outcomes were Intention and Self-efficacy of using a maximum of 3g of salt/day during meal preparation and Habit of using more than 3g of salt/day during meal preparation. The App usability was assessed by the System Usability Scale (SUS). We applied regression analysis to assess the effect of the intervention on salt intake measures and psychosocial variables, and mediation analysis to identify mediators of the intervention effect.

**Results/findings:** A total of 86 participants completed the study (Intervention group - IG n=43; Control group - CG n=43). Most participants in both groups were female (IG: 84%; CG: 86%) and with average age of IG: 34.2 and CG: 43.4 years. Participants of IG showed a significant reduction in the addition of salt/day during meal preparation (mean difference: - 1.08g; p-value: 0.0109). People of IG were 67% more likely to use, every day or most days of the week, a maximum of 3g of salt/day when preparing meals than CG. Also, participants of IG showed a significant increase of Intention and Self-efficacy and a reduction in Habit when compared to people in the CG. An average of 77.8 points was obtained on a SUS (0-100), indicating good usability. Also, Self-efficacy and Habit mediated the effect of the intervention on the Behavioral question of using, most days or every day of the week, 3g of salt/day during meal preparation.

**Conclusions:** The theory-based App intervention showed to be effective to promote healthy salt consumption and may have its impact expanded in future studies with different populations in the real context of health practice.

# Regulating the advertising of unhealthy foods and beverages on digital spaces – perspectives from stakeholders in Singapore

**Dr. Salome Rebello<sup>1</sup>**, Ms. Xin Hui Chua<sup>1</sup>, Mr. Clarence Lin Khang Chan<sup>1</sup>

<sup>1</sup>Saw Swee Hock School of Public Health, Singapore, Singapore

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Foods advertised on social media are predominantly unhealthy and there are growing calls to regulate the digital marketing of unhealthy foods and beverages. However, regulating digital spaces pose unique challenges. Understanding the perspectives of key stakeholders towards potential regulations for digital spaces can help inform policy design and implementation.

**Methods:** In this exploratory study, we interviewed nine key informants from media agencies (n=5), influencers (n=3) and regulators (n=1) to understand the (a) perceived roles of the government, the digital media industry, and social media influencers, and how these stakeholders impact and influence each other (b) operational opportunities, challenges, norms and best practices in the regulation of social media advertising and barriers to compliance.

**Results:** A preliminary regulatory landscape of the social media space with perceived roles and interactions of key actors was synthesized. Using thematic analysis, we identified two broad perceptions of the digital community in Singapore. Whilst users are law-abiding with government perceived as the legitimate source of regulation, there is a low level of regulatory presence with checks mainly driven by brands, agencies, and platforms, functioning with a self-regulatory approach. Participants narratives revealed potential barriers including perceived lack of need for regulation, presence of multiple drivers for unhealthy food choices, low barriers to entry, and business conflicts. Use of co-regulation, control points, education, equality and equity in policy design and technology for monitoring were identified as potential levers for compliance.

**Conclusion:** Leveraging on existing albeit less formal regulatory control and dissemination points, utilizing levers of compliance and explicitly addressing barriers to regulations may be of value to consider in designing and implementing digital marketing policies for unhealthy foods and beverages.

# Physical fitness tests in older adults – test reliability and exercise effects

**Mr. Manne Godhe**<sup>1,2</sup>, Prof. Johnny Nilsson<sup>1</sup>, Prof. Örjan Ekblom<sup>1</sup>, Mr. Gustaf Rönquist<sup>1</sup>, Dr. Eva Andersson<sup>1,2,3</sup>

<sup>1</sup>Department of Physical activity and Health, The Swedish School Of Sport And Health Sciences, Stockholm, Sweden, <sup>2</sup>Department of Molecular Medicine and Surgery, Karolinska institutet, Stockholm, Sweden,

<sup>3</sup>Department of Neuroscience, Karolinska Institutet, Stockholm, Sweden

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** The aim of this study was to examine test-retest reliability of easy accommodated field-based tests and to describe how exercise, twice weekly, during eight weeks influence physical fitness in older adults. Low physical fitness is a risk factor for cardiovascular-, mental-, and musculoskeletal -diseases.

**Methods** Totally 1400 community dwelling older adults (66% women), mean age 71.5±5.0 yrs (range 65-85 yrs), performed an 8-week exercise period consisting of 1h combined strength, aerobic, and balance training, performed twice weekly. A field-based physical fitness test battery (~30 different test parameters) was conducted at three separate times (pre-1, pre-2 and post-test). All tests and exercise sessions were supervised by second-year students in the health promotion program at The Swedish School of Sport and Health Sciences. Data was analyzed for men and women separately in 5-year-interval age groups

**Results** All tests showed generally good reliability (ICC >0.75) between pre-1 and pre-2 tests.

Between pre-2 and post-test:

Muscular fitness tests: No significant differences were noted in the hand grip test for any age groups. Static trunk endurance improved significantly except in the oldest age groups. In the step-height test no significant differences were seen for men in either leg, however, for all age groups in both legs in women, except 80-84yrs. All age groups in both sexes significantly improved 5-sit-to-stand-time and the 50-sit-to-stand-speed.

Cardiorespiratory fitness: In the 6-min walk test, significant improvements were seen in all age groups in women, however, only men 65-69yrs.

Significant reduced heart rates were seen in women 65-69 and 70-74yrs at the loaded cycle test, but not for men.

Motor fitness tests: The timed-up-and-go test, significant improvements were seen in both sexes for all age groups except for men 80-84yrs.

Generally, no significant differences were noted in any of the performed balance tests for any age group.

**Conclusions** There was generally good reliability between the two pre-tests in all the physical fitness tests. In some physical fitness tests, there were significant improvements after the 8-week exercise period, demonstrating which physical fitness field-tests that are suitable when examining older adults in various interventions and health contexts.

# How are physical behavior and affective well-being associated in everyday life? Findings from a systematic review

**Ms. Irina Timm<sup>1</sup>**, Dr. Marco Giurgiu<sup>1,2</sup>, Prof. Ulrich W. Ebner-Priemer<sup>1,2</sup>, Prof. Markus Reichert<sup>1,2,3</sup>

<sup>1</sup>Mental mHealth Lab, Institute of Sports and Sports Science, Karlsruhe Institute of Technology, Karlsruhe, Germany, <sup>2</sup>Department of Psychiatry and Psychotherapy, Central Institute of Mental Health, Medical Faculty Mannheim/Heidelberg University, Mannheim, Germany, <sup>3</sup>Department of eHealth and Sports Analytics, Ruhr-University Bochum, Bochum, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose** Several systematic reviews have confirmed the positive effects of physical activity (PA) on affective well-being (AWB). The PB - AWB association is highly relevant to both human physical and mental health. Unfortunately, there are barely any reviews on the dynamic momentary interplay of physical behavior (PB), including both PA and sedentary behavior (SB), and AWB in everyday life.

**Methods** We included studies using intensive longitudinal data, combined with a device-based measurement of PB (i.e., accelerometer, smartwatches) and AWB assessment via electronic diaries, as we focused on within-subject associations. Literature was searched in three databases (Web of Science, PubMed, Scopus). A data extraction was developed to categorize included studies, and a quality assessment tool was adopted to illustrate the risk of bias for the included studies.

**Results** Of the n=66 included studies, most investigated adult populations (n = 50; 76%), followed by investigations of children and adolescents, and elderly persons. The reviewed evidence on PB - AWB associations under ecological valid conditions is heterogeneous, that is, the direction and strength of relationships are ambiguous across studies. However, associations of PB with feelings of energy were homogeneous across nearly all studies, implying a dominant role of subjective energy in interaction with PB in humans' everyday life. We found a large heterogeneity of methods applied to study PB - AWB associations, which further complicates the scrutinization of real-life evidence on PB - AWB associations. While overall, the quality of studies reviewed was rated moderate to high, there is considerable room for improvements.

**Conclusions** This review summarizes the current state of research, showing that PB and AWB are bidirectionally connected in everyday life. Further experimental or intervention studies are needed to fully understand the implications of PB and its relationship with AWB. Research should adhere to consistent guidelines in utilizing and reporting ambulatory assessment methods. These insights will help to promote and develop (mobile) interventions for prevention and therapy of human physical and mental health.

# Summer Day Camp Influences Child Sleep through Parent Health-Promoting Rules/Routines: Evidence from a Randomized Controlled Trial

**Dr. Layton Reesor-Oyer<sup>1</sup>**, Dr. Sarah Burkart<sup>1</sup>, Ms. Xuanxuan Zhu<sup>1</sup>, Dr. Christopher Pfladderer<sup>1</sup>, Dr. Alessandra Bandeira<sup>1</sup>, Dr. R. Glenn Weaver<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>, Dr. Elizabeth Adams<sup>1</sup>, Dr. Michael Beets<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Elementary-age children exhibit shifted/disrupted sleep timing during the summer. It is hypothesized that this occurs because parents relax health-promoting rules/routines when children do not attend school. Attending summer day camp (SDC) may prevent degradation of rules/routines and promote more optimal sleep timing by mimicking the structure of school. In a secondary analysis of a randomized controlled trial, we evaluated the effect of SDC on child sleep timing via parent health-promoting rules/routines.

**Methods:** Children (n=374; 5-12 years, 47% female, 52% Black) recruited from Title I schools (serving majority families with low-income) were randomly assigned to receive free access to a community-based SDC for eight to ten weeks (n=205) or a control condition (n=169) during the summers of 2021 or 2022. Parents completed The Child Routines Inventory - Daily Living Routines Subscale during the school year (April/May) and summer (July/August). Potential scores 0-44; higher scores indicate greater health-promoting rules/routines. Parents reported child bed and wake times nightly for 14-days during the corresponding time frames. We used two structural equation models (one for each outcome) to evaluate the impact of access to free SDC on child 1) bedtime and 2) wake time during the summer via summer rules/routines controlling for spring measures. We used 95% bootstrap confidence intervals (5,000 resamples) to determine statistical significance. Unstandardized model results are presented.

**Results:** During the summer, parents of children who received access to free summer day camp reported an average bedtime of 9:49PM (SD=67min) and waketime of 7:50AM (SD=62min); those in the control condition reported an average bedtime of 10:02PM (SD=70min) and waketime of 8:20AM (SD=68min). Within the full models, children randomized to SDC had slightly higher health-promoting rule/routines scores (B=1.68; 95%CI=0.68,2.69), compared to those in the control condition. A one unit increase in rules/routines score was associated with a 2.8 minute earlier wake (B=-2.79; 95%CI=-3.99,-1.66) and 1.8 minute earlier bedtime (B=-1.79; 95%CI=-3.05,-0.55). SDC indirectly influenced child wake (B=-4.59; 95%CI=-8.54,-1.51) and bedtime (B=-3.01; 95%CI=-6.26,-0.65) via health-promoting rule/routines. Sensitivity analyses conducted on only weekdays produced similar results.

**Conclusions:** SDC influenced the home environment by facilitating greater health-promoting rules/routines which were associated with earlier bed and wake times.

# Estimating the effect of pre-diagnosis physical activity on survival after breast cancer: bias, bias and more bias.

Miss Frances Albers<sup>1,2</sup>, Ms. Ziyu Wang<sup>1,2</sup>, Dr. Sabrina Wang<sup>1,2</sup>, Prof. Dallas English<sup>1,2</sup>, **Associate Professor Brigid Lynch<sup>1,2</sup>**

<sup>1</sup>Cancer Council Victoria, Melbourne, Australia, <sup>2</sup>The University of Melbourne, Melbourne, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Pre-diagnostic physical activity is reported to improve survival for women with breast cancer. However, studies of pre-diagnostic exposures and cancer survival are affected by several biases, made clear when applying a target trial framework. We investigated the impact of selection bias, immortal time bias, confounding and adjustment for mediators in a systematic review and meta-analysis of the effect of pre-diagnostic physical activity on survival following breast cancer.

**Methods:** Medline, Embase and Emcare were searched for studies examining pre-diagnostic physical activity and overall or breast cancer-specific survival after breast cancer diagnosis. Random-effects meta-analysis was used to estimate pooled hazard ratios (HRs) and 95% confidence intervals (CIs) comparing highest versus lowest pre-diagnostic physical activity levels. Subgroup meta-analyses were used to compare HRs of studies with and without different biases. ROBINS-E was used to assess risk of bias.

**Results:** We included 19 studies. Women with highest versus no or low pre-diagnostic physical activity had higher breast cancer-specific survival across most analyses. However, uncertainty exists because the overall risk of bias across eligible studies was serious. When we stratified results by immortal time bias status, studies without immortal time suggested no effect HR= 0.94 (95% CI: 0.76 to 1.16), whereas the HR pooled from studies with immortal time bias was suggestive of a protective effect (HR = 0.78; 95% CI: 0.67 to 0.91). The protective effect of pre-diagnostic physical activity on breast cancer-specific survival was stronger in the subgroup that did not adjust for mediators (HR = 0.67; 95% CI: 0.54 to 0.83) compared to the subgroup that did adjust for mediators (HR = 0.95; 95% CI: 0.86 to 1.04). Insufficient studies were available to investigate impacts of selection bias and confounding.

**Conclusions:** Biases can substantially change effect estimates. Due to misalignment of start of follow-up (before or after diagnosis), specification of eligibility (at diagnosis) and treatment assignment (i.e. measurement of exposure, before diagnosis), it is not possible to correctly estimate the effects of pre-diagnostic exposures such as physical activity with current epidemiological methods. Research examining pre-diagnostic exposures needs to acknowledge these limitations carefully.

# A web-based and mobile intervention providing complementary feeding guidelines to promote responsive parental feeding practices, healthy children's eating behaviour and optimal body mass index: protocol of the NutrienT randomised controlled trial

**Ms. Camille Riera-Navarro<sup>1</sup>**, Dr. Camille Schwartz<sup>1</sup>, Dr. Pauline Ducrot<sup>2</sup>, Ms. Laurence Noiro<sup>2</sup>, Dr. Corinne Delamaire<sup>2</sup>, Prof. Edith Salès-Wuillemin<sup>3</sup>, Dr. Denis Semama<sup>4</sup>, Dr. Sandrine Lioret<sup>5</sup>, Dr. Sophie Nicklaus<sup>1</sup>

<sup>1</sup>Centre des Sciences du Goût et de l'Alimentation, CNRS, INRAE, Institut Agro, Université de Bourgogne, F-21000 Dijon, France, <sup>2</sup>Santé publique France, French national public health agency, F-94415 Saint-Maurice, France, <sup>3</sup>Psy-DREPI (Psychologie: Dynamiques Relationnelles Et Processus Identitaires), Université de Bourgogne, EA 7458, 21000 Dijon, France, <sup>4</sup>CHRU Dijon, Department of Neonatal Pediatrics, Dijon University Hospital, 21000 Dijon, France, <sup>5</sup>Université Paris Cité and Université Sorbonne Paris Nord, Inserm, INRAE, Center for Research in Epidemiology and Statistics (CRESS), F-75004 Paris, France

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** In light of the latest epidemiological and nutritional knowledge and scientific evidence supporting responsive feeding, the French feeding guidelines for 0-3 years were recently updated and nationally disseminated through a brochure and media campaign by Santé publique France. Moreover, smartphone apps become increasingly popular and are likely relevant to provide timely information across development to inform parents about child feeding practices but their effect is seldom evaluated. This randomized controlled trial (RCT) aims to investigate whether the provision of guidelines through an app and a brochure (vs. brochure alone, usual service) results in healthier parental feeding practices, infant's eating behaviours and body mass index (BMI).

**Methods:** This double-blinded monocentric 2-arm trial is conducted among first-time parents living in the area of Dijon (France) and recruited in a maternity ward. A smartphone app was developed by INRAE for the outcome evaluation and for the timely distribution of the new guidelines content: from child age 3 to 36 months, 106 age-adapted messages with dietary recommendations, educational advice, recipes and tips provided in the form of short texts and videos (intervention group only), and 36 generic messages (both groups). The primary outcome is the BMI z-score at 36 months of age. Secondary outcome measures include online parents' reports and behavioural assessments (experimental meals) of parental feeding practices and infant eating behaviours from inclusion to 36 months of age. Analyses of covariance on these outcomes will assess the effect of the intervention. Mediation and moderation analyses will explore, respectively, the mechanisms of action of the intervention and the potential moderating effect of socioeconomic, parental (attitudes and beliefs about child feeding) and infants' (general temperament) factors. Sample size was determined to be n=118 in each arm, plus 20% to compensate for potential attrition.

**Results/findings:** The first participants were enrolled in March 2022 and the recruitment is ongoing (n=110 were included on February 2023).

**Conclusions:** This is the first French RCT to assess a digital intervention targeted to first-time parents to improve feeding practices and child growth. The app may represent a potential stand-alone communication tool to complement those already disseminated to the general population.

# The feasibility of a mHealth service promoting healthy lifestyle behaviours, a mixed methods approach

**Mr. Callum Regan**<sup>1</sup>, Dr. Jenny Rossen<sup>2</sup>, Dr. Phillip Von Rosen<sup>1</sup>, Dr. Susanne Andermo<sup>1</sup>, Prof. Maria Hagströmer<sup>1,2</sup>

<sup>1</sup>Karolinska Institutet, Stockholm, Sweden, <sup>2</sup>Sophiahemmet Högskola, Stockholm, Sweden

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Mobile health (mHealth) represents a convenient and cost-effective strategy to promote health behaviours and minimise the impact of modifiable risk factors. Yet, they suffer from high attrition rates, thus there is a need to test their feasibility. This study explored the feasibility of a co-developed mHealth service, that promotes healthy lifestyle behaviours.

**Methods:** A sample of 50 adult participants (>18 years, 82% female) from the general population, signed up to use a mHealth service for 12 weeks. The service is a mobile app, functions include: goal and activity setting, knowledge library, community, coaching and feedback. A mixed method approach was applied with quantitative data from engagement and questionnaires on usability and acceptability, and qualitative data from semi-structured interviews, focus groups, self-reported feedback, and open-ended questionnaires. Quantitative data were available for 39 participants, 9 semi-structured interviews with participants and two focus groups with six coaches/product developers from the mHealth service were completed. Descriptives were used to present quantitative data, whilst an inductive content analysis approach was used to analyse qualitative data.

**Results:** The 'goal' function was used by 25 (64%) participants, 39 (100%) participants used the 'activity' function, 14 (36%) participants used the 'community' function, 20 (51%) participants used the 'individual coach' service, whilst seven (18%) participants used the 'feedback' function, under the 12 weeks. Engagement of functions reduced towards the end of the 12-week period. The mean score for usability was 50/100 and 3.3/5 for app quality (higher scores equalling higher ratings), rated by 15 participants. Participants expressed that the service helped them focus more on physical activity and diet, but voiced suggestions for optimisation, such as improving the visibility of functions. Product developers thought that the service worked well overall, however realised that the functions need to be simplified.

**Conclusion:** This study adds knowledge to how users and stakeholders experience a health promoting mHealth service. This service was found to be feasible, however functions need to be further developed to be more user-friendly and increase interaction. Results will be pivotal for its optimisation, and potentially for the design of similar services aiming to achieve long-term health behaviour change.

# Intersectionality in Eating-Related Pathology Research: A Scoping Review

**Ms. Mikyung Lee<sup>1</sup>**, Ms. Bridgett Chau<sup>1</sup>, Dr Eun-Young Lee<sup>1</sup>

<sup>1</sup>Queen's University, Kingston, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Background:** Individuals with marginalized social identities are susceptible to eating-related pathology (EP). When multiple marginalized identities are simultaneously considered, further increased risks of EP have been reported. In addition, individuals with marginalized identities experience discrimination which could contribute to greater EP risks. As such, better understanding of EP requires consideration of intersectionality which acknowledges the specificity of individuals' intersectional experiences within the systems of privilege and oppression such as discrimination, and their impact on health.

**Purpose:** To describe the application of intersectionality in the EP research and to identify the scope and gaps in EP studies that operationalized intersectionality.

**Methods:** Literature was searched on six databases between July and October 2022. All types of research were included if they addressed EP as an outcome and their investigation was guided by intersectionality.

**Results/findings:** Of 31 articles included in the review, 20, 10, and one article used quantitative, qualitative, and mixed method, respectively. Approximately, one third of the included articles (n=10) failed to define intersectionality. Half of the articles (n=15) included social identities and discrimination as exposures while 12 articles included social identities only as exposures. The most frequently observed social identity was gender (n=26), followed by race/ethnicity (n=22) and sexual orientation (n=9). The most commonly measured aspect of discrimination was racism (n=15), followed by sexism (n=10). All qualitative (100%) and three quantitative articles (15%) examined three- or four-way intersections among social identities and discrimination. Regarding EP outcomes, body image was the only outcome in qualitative articles whereas various outcomes (e.g., bingeing, purging, disordered eating) were included in quantitative articles. All included articles highlighted compounded risks of EP caused by multiple marginalized identities and discrimination.

**Conclusions:** Intersectionality-informed EP research has advanced our understanding of the influence of multiple social identities and discrimination on EP; however, major gaps are noted. The following recommendations are provided to guide future research: 1) explicitly define and apply intersectionality as a guiding framework, 2) provide theoretical conceptualization, 3) incorporate diverse social identities and discrimination, 4) examine multiple-way interactions in quantitative research, and 5) diversify EP outcomes in qualitative research.

**Key words:** Intersectionality, eating-related pathology, body image

# Realities of health consciousness and knowledge of protein and vegetable dietary intakes in college students

**Prof. Takako Tsutsui<sup>1</sup>**

<sup>1</sup>Tokyo Women's College of Physycal Education, Tokyo, Japan

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Objective:** Knowledge of food for health promotion and disease prevention should be acquired from a young age. In particular, the knowledge of food among college students is critical as they will be the caregivers of the future and will influence their family's dietary habits in subsequent years. This study investigated the current health awareness and knowledge about the intake of protein and vegetables of female college students.

**Methods:** The investigation involved 87 Tokyo Women's College of Physical Education students who belong to the Faculty of Child Education and Physical Education. The questions covered in the investigation were the levels of consciousness of health, diet, exercise, rest, and the anticipated protein and vegetable recommendations. Questionnaires on health awareness were surveyed using a Visual Analog Scale method (VAS), and knowledge of the subject's expected protein and vegetable requirements were answered numerically.

**Results:** Consciousness of total health ( $67.3 \pm 2.9$ ) was high but the behavior toward nutrition was found to be lower than that of other health-related activities such as exercise ( $p < 0.05$ ). However, the execution of nutrition and exercise in the faculty of physical education students was higher than in child education students ( $p < 0.05$ ). The students consistently overestimated the protein recommendations advised by the Ministry of Health. In addition, the students underestimated the vegetable recommendations advised by the Ministry of Health. As a result, their protein intake was  $54.4 \pm 1.7$ g, above the recommended amount, and their vegetable intake was  $335.2 \pm 15.2$ g, slightly below the recommended amount fulfilling 95% of the Ministry of Health's recommendation.

# Associations Between Device-Estimated Bedtime, Wake-Up Time, and Time in Bed Regularities and Adults' Cardiometabolic Health Markers

**Mrs. Laura Nauha**<sup>1,3,5</sup>, Dr. Vahid Farrahi<sup>1,2</sup>, Dr. Heidi Jurvelin<sup>3,4</sup>, Prof. Timo Jämsä<sup>1,5</sup>, Dr. Maisa Niemelä<sup>1,5</sup>, Dr. Maarit Kangas<sup>6</sup>, Dr. Leena Ala-Mursula<sup>3</sup>, Prof. Raija Korpelainen<sup>3,5,7</sup>

<sup>1</sup>Research Unit of Health Sciences and Technology, Oulu, Finland, <sup>2</sup>Center for Machine Vision and Signal Analysis, Oulu, Finland, <sup>3</sup>Research Unit of Population Health, Oulu, Finland, <sup>4</sup>Northern Ostrobothnia Hospital District, Oulu, Finland, <sup>5</sup>Medical Research Center, Oulu, Finland, <sup>6</sup>Infrastructure for Population Studies, Northern Finland Birth Cohorts, Faculty of Medicine, Oulu, Finland, <sup>7</sup>Oulu Deaconess Institute Foundation sr., Department of Sports and Exercise Medicine, Oulu, Finland

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Inconsistent sleep timing has been shown to be associated with accumulation of cardiometabolic risks, while physical activity (PA) is a protective factor. This study investigated the relationship between bedtime, wake-up time, and time in bed (TIB) regularities and cardiometabolic health markers including blood pressure, adiposity, blood glucose and insulin and cholesterol levels at mid age.

**Methods:** In Northern Finland Birth Cohort 1966 study all the 24-hour movement behaviors were measured for seven consecutive days among 3698 middle-aged participants. Bedtime, wake-up time and TIB were identified using our in-lab validated algorithm. We used seven-day standard deviations to reflect bedtime, wake-up time, and TIB regularities. As covariates in linear regression models, we used gender, education, marital status, work schedule, smoking status, alcohol risk use, seven-day mean TIB, chronotype, and sedentary time or total PA (B coefficients with 95% confidence intervals [CI]).

**Results:** Higher variability in bedtime, wake-up time and TIB associated with higher blood triglyceride levels (0.053, 95% CI [0.008, 0.099],  $p = 0.021$ ; 0.051, 95% CI [0.009, 0.093],  $p = 0.017$ ; 0.049, 95% CI [0.013, 0.085],  $p = 0.008$ , respectively). Similarly, higher variability in wake-up time and TIB were both associated with significantly higher 2-hour insulin levels (0.039, 95% CI [0.012, 0.066],  $p = 0.005$ ; 0.033, 95% CI [0.010, 0.056],  $p = 0.005$ , respectively). Higher variability in TIB was associated with higher diastolic blood pressure (0.175, 95% CI [0.044, 0.306],  $p = 0.009$ ). In addition, variability in bedtime was positively associated with waist circumference and fasting glucose levels (0.294, 95% CI [0.136, 0.451],  $p < 0.001$ ; 0.224, 95% CI [0.026, 0.422],  $p = 0.027$ ). Variability in bedtime remained positively associated with waist circumference after controlling for total PA (0.199, 95% CI [0.042, 0.356],  $p = 0.013$ ).

**Conclusion:** Bedtime, wake-up time and TIB irregularities were linked to unfavorable cardiometabolic health markers, even after adjusting for other risk factors. The results suggest that, in addition to bedtime and TIB regularity, wake-up time regularity can be important factor in cardiometabolic health and should be considered in studies and health behavioral counseling.

# Young people's active travel in National Urban Policy documents of 15 Asian countries: a documentary framing analysis

**Ms. Rizka Maulida<sup>1,2</sup>**, Dr. Andrea Smith<sup>1</sup>, Dr. Amy Weimann<sup>3</sup>, Dr. Tolullah Oni<sup>1</sup>, Dr. Esther van Sluijs<sup>1</sup>

<sup>1</sup>MRC Epidemiology Unit, University of Cambridge, Cambridge, United Kingdom, <sup>2</sup>Department of Epidemiology, Faculty of Public Health, University of Indonesia, Depok, Indonesia, <sup>3</sup>African Centre for Cities, University of Cape Town, Cape Town, South Africa

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Active travel to school is associated with higher levels of daily physical activity and is linked to gains in planetary health. However, young people's active travel is challenging in many parts of Asia due to urbanization and car-focused infrastructure. The UN-Habitat aids governments worldwide in creating national urban policy (NUP) to promote sustainable urban development, to achieve economic growth, equitable quality of life, and environmental protection. This study aimed to provide a comprehensive framing analysis of how young people's active travel is discussed in NUP documents from Asia.

**Methods:** We conducted a policy document framing analysis with thematic coding applied on NUP documents from Asian countries available on the UN-Habitat's Urban Policy Platform website. A theory-based coding framework with inductive and deductive approach was applied to identify discussions on key themes related to young people's active travel (active travel, transport, physical activity, young people, school). All documents were double-coded. A semi-quantitative heatmap was used to visualise patterns of coverage of identified themes (presence; level of policy-relevant detail discussed).

**Findings:** NUP documents from 15 out of 47 Asian countries were identified and analysed. Through the aid of the heatmap, it was shown that NUPs recognized the importance of promoting transport (11/15 countries featured moderate mentions), but discussions were high level and young people rarely considered (only 7/15 featured detailed discussion). The main themes active travel, physical activity, young people, and schools were treated as secondary considerations. Active travel was framed as a utilitarian solution for transportation issues, rather than a means of promoting well-being. Through inductive analysis, additional contextual considerations that linked to active travel, such as sustainability, natural disaster risk, pollution, and the need to limit urban congestion were identified.

**Conclusions:** Young people and their active travel behaviour were largely absent from NUP documents. This highlights the need for stronger policy frameworks to promote active travel among young people in urban areas. Such policies should be more integrated across different sectors (transport, health, education, and environment). By considering strategies to support active travel, NUPs could help create healthier and more sustainable urban environments for young people in Asia.

# The use of outdoor education to support physical activity during the school day in Swedish-language primary schools in Finland

**Ms. Nanna Wackström<sup>1</sup>**, Ms. Jenny Ray<sup>1</sup>, Ms. Josefine Björkqvist<sup>1,2</sup>, Dr. Nina Simonsen<sup>1,3</sup>

<sup>1</sup>Folkhälsan Research Center, Helsinki, Finland, <sup>2</sup>Institute of Applied Health Sciences, University of Aberdeen, Aberdeen, United Kingdom, <sup>3</sup>Department of Public Health, University of Helsinki, Helsinki, Finland

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose** Schools are important arenas for promoting physical activity (PA) among children. Outdoor education (OE) has in previous studies been identified as a teaching method associated with increased PA during the school day. The national curriculum for basic education in Finland emphasizes the use of various teaching methods and learning environments. Still, very little is known about the use of OE in Finland. The aim of this study was to survey the use of OE to support PA during the school day in Swedish-language primary schools in Finland and to identify possible barriers to OE.

**Methods** This study is part of the LärMiljö (Learning Environment) study. Data was collected through national web-based surveys among principals and teachers in Swedish-language primary schools in Finland. The surveys were answered by principals from 82 schools (76 principals, 42% response rate at school level) and 134 teachers from 44 schools. Descriptive statistics on OE use and perceived barriers to OE are presented.

**Results** Preliminary findings show that OE is used to some extent in 97% of the schools, but regularly in 41%, as reported by the principals. In the schools using OE regularly, OE is used by most or all of the teachers in 50% and at least weekly in 31% of the schools. A fifth of the responding teachers reported that they use OE regularly. Of teachers using OE, 24% reported using it weekly. Lack of time and teachers' motivation were the most frequently reported barriers to OE use by both principals and teachers. Only a few principals and 24% of the teachers saw the local environment as a barrier to OE. Overall, principals reported less barriers than teachers.

**Conclusions** OE is used as a teaching method in Swedish-language primary schools in Finland, though the frequency of OE use varies among schools. In this study, teachers highlighted lack of time as an important barrier to implementing OE, this being in line with other international studies. Further research into teachers' perspectives on factors that support OE is needed to broaden understanding of OE implementation and thus increasing children's PA during the school day.

# The health-related lifestyle habits of Sámi in Sweden: the SámiHET study

**Dr. Lena Maria Nilsson**<sup>1,2</sup>, Prof. Miguel San Sebastián<sup>1</sup>, Dr. Jon Petter A Stoor<sup>1,3</sup>

<sup>1</sup>Department of Epidemiology and Global Health, Umeå University, Umeå, Sweden, <sup>2</sup>Arctic Centre at Umeå University, Umeå, Sweden, <sup>3</sup>Centre for Sami Health Research, UiT - the Arctic University of Norway, Tromsø, Norway

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** N. Other

**Purpose** Little is known about the lifestyle habits of the Indigenous Sámi in Sweden. This study investigates this through examining ethnic differences among Sámi and the general Swedish population, 18-84 years.

**Methods** Data from two self-reported national population-based public health surveys conducted spring 2021 were used; the Swedish HET and the SámiHET. Lifestyle habit indicators included everyday physical activity, sedentary behaviour, intake of fruit & berries, intake of vegetables, and weekly frequency of sweetened drinks, and fish/shellfish. Some substance use indicators were also included; risky alcohol consumption, daily tobacco use (smoking and snus), and cannabis use during the last 12 months. Sex-stratified prevalence and prevalence ratios (95% CI) were calculated.

**Results** Adjusted for age and education, no ethnicity-related differences in prevalence ratios were found concerning daily physical activity. However, Sámi reported less daily intake of fruit & berries (male PR=0.85, female PR= 0.84), less daily intake of vegetables (male PR=0.84, female PR= 0.88), less weekly intake of fish/shellfish (female PR= 0.91), more weekly intake of sweetened drinks (female PR= 1.13), and more daily use of snus (male PR= 1.51, female PR 2.38). Furthermore, Sámi also reported less everyday sedentary behaviour (male PR=0.71, female PR= 0.89), less risky alcohol consumption (male PR= 0.79), less daily smoking (male PR=0.5), and less cannabis consumption (male PR= 0.63).

**Conclusion** To our knowledge, the findings in this study represent the first ever national Swedish mapping of health-related lifestyle habits among Sámi. Based on the findings, Sámi in Sweden are less likely to live a sedentary lifestyle but may need support to develop healthier food habits. Also, potential prejudices concerning Sámi men as having more problem with substance use than men in general are thoroughly disproved.

# The lifestyle habits of young adult Sámi: the SámiHET study

**Mr. Nils-Mikael Nilsson<sup>1</sup>**, Dr. Lena Maria Nilsson<sup>1,2</sup>, Prof. Miguel San Sebastián<sup>1</sup>, Dr. Jon Petter A Stoor<sup>1,3</sup>

<sup>1</sup>Department of Epidemiology and Global Health, Umeå University, Umeå, Sweden, <sup>2</sup>Arctic Centre at Umeå University, Umeå, Sweden, <sup>3</sup>Centre for Sami Health Research, UiT - the Arctic University of Norway, Tromsø, Norway

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** N. Other

**Purpose** Little is known about the lifestyle habits of the Indigenous Sámi people, and even less as regards Sámi youth. This study investigates health related lifestyle habits through examining ethnic differences among young adult Sámi, 18-29 years, and peers in the general Swedish population.

**Methods** Self-reported lifestyle indicators from a Swedish national survey, Health on Equal Terms, were compared to the same indicators from the Sámi Health on Equal Terms survey, both conducted in spring 2021. Indicators included time spent on everyday physical activity, sedentary behaviour, daily intake of vegetables, fruit and berries, and drink frequency of soda and sweetened beverages per week. Also, substance use indicators included daily smoking and snus consumption, as well as risk consumption of alcohol. Prevalence and prevalence ratios (PR) with their 95% confidence intervals were calculated.

**Results** When adjusted for sex, age, civil status, education, and income, three out of the eight health outcomes differed depending on ethnicity (Sámi vs non-Sámi). Sedentary behaviour more than 10 hours per day was less common in the Sámi population (PR=0.75; 95% CI: 0.62-0.90) compared to the non-Sámi population. The Sámi group have a 1.27 times higher prevalence of eating vegetables <1 time/day (95% CI: 1.11-1.44), and the snus consumption among Sámi was 1.63 times as high as the non-Sámi (95% CI: 1.32-2.00).

**Conclusion** The findings show that the young adult Sámi struggle with getting enough vegetables into their diet, and that they have a higher consumption of snus. However, the lower prevalence of sedentary behaviour may be indicative of a healthier lifestyle among young Sámi. To our knowledge, these results represent the first ever study on health-related lifestyle habits among the young Sámi in Sweden, with the exception of substance use. The results are valuable when prioritising the need for public health interventions in this context.

# Healthy food in out-of-school-hours care (OSHC): evaluation of a competence program among OSHC employees in Norway

**Associate Professor Cecilie Beinert<sup>1</sup>**, Associate Professor Margrethe Røed<sup>1</sup>, Prof. Frøydis Nordgård Vik<sup>1</sup>  
<sup>1</sup>University of Agder, Kristiansand, Norway

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Enhancing the diet quality of children are of great importance as their diet will have both short- and long-term health effects. Out-of-school-hours care (OSHC) are offered to all children in year 1-4 in primary school in Norway and shall facilitate daily mealtimes. However, studies show that food offered in OSHC varies. To promote healthy food practices in OSHC, a non-profit foundation, Geitmyra Culinary Centre for Children, has developed a practical course to enhance the competence of OSHC employees, aiming to improve the food and meal practice within the framework (economy, time, facilities) of the OSHC. The aim of this study is to evaluate the course developed and conducted by Geitmyra.

**Methods:** A total of 6 schools in southern Norway participated in the course in the fall of 2021 and 2022. In 2021, the first two schools served as pilot-schools. After an evaluation, four schools participated in a revised version of the same course in the fall of 2022. For all schools, the course lasted for 3 months and consisted of a practical course day at Geitmyras facilities, followed by practical guidance at each SFO. The course also included a start-up meeting, evaluation meeting halfway through, and a close-up meeting in the end. Counselling, recipes, materials, and network meetings was provided throughout the course period. Qualitative and quantitative methods will be used to evaluate the course regarding its impact on OSHC food and meal practices. Interviews with the OSHC leaders and employees will be conducted and analyzed using thematic analysis. In addition, to get an objective measure on possible changes in their food purchase before and after the course, all food receipts from January to May (2021 to 2023) will be collected and analyzed to look for potential changes in primarily fish, fruit, and vegetable purchase. Comparative analysis using IBM SPSS statistics will be used to analyze these data.

**Results:** Data collection and analysis are still ongoing and is not finalized. See method section for analysis plan.

**Conclusion:** This study will yield valuable insight into how improve the food quality in out-of-school-hours care.

# The use of mobile phone is associated with unhealthy behaviors and educational variables: a study with Spanish adolescents

**Dr. Vicente J. Beltrán-Carrillo<sup>1</sup>**, Dr. Alejandro Jiménez-Loaisa<sup>2</sup>, Dr. Eva León-Zarceño<sup>3</sup>, Dr. Palma Chillón-Garzón<sup>4</sup>, Dr. José Antonio Jiménez-Barbero<sup>5</sup>, Dr. David González-Cutre<sup>1</sup>

<sup>1</sup>Department of Sport Sciences. Sports Research Centre. Miguel Hernández University of Elche, Elche, Spain, <sup>2</sup>Department of Didactics of Physical Education, Artistic and Music. Faculty of Education. University of Castilla-La Mancha, Toledo, Spain, <sup>3</sup>Department of Behavioural Sciences and Health. Miguel Hernández University of Elche, Elche, Spain, <sup>4</sup>Department of Physical Education and Sports, Faculty of Sport Sciences, Sport and Health University Research Institute (iMUDS), University of Granada, Granada, Spain, <sup>5</sup>Department of Nursing. Faculty of Nursing. University of Murcia, Murcia, Spain

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** The new generation of mobile phones (smartphones) has become nowadays a very popular screen media among adolescents. The multiple functions offered by these devices represent fascinating opportunities, but also a matter of concern. Therefore, the aim of this study was to analyze whether the use of mobile phone is related to different health behaviors and educational variables among adolescents.

**Methods:** A correlational study was carried out with 307 adolescents (159 boys and 148 girls;  $M_{age} = 13.95$  years,  $SD = 1.28$ ) from a secondary school located in Elche (Spain). The following variables were measured: Physical activity (PAQ-A questionnaire), adherence to a healthy Mediterranean diet (KIDMED questionnaire), consumption of tobacco, alcohol, and other drugs (HBSC questionnaire), agility and movement skill (CAMSA test), attitudinal beliefs towards violence in educational centers (CAHV-25 questionnaire), and academic performance (mean of marks in the different subjects, provided by the school center). A multiple regression analysis was done, controlled by gender, with mobile phone use as dependent variable, and the rest as independent variables.

**Results:** The multiple regression analysis was significant ( $F_{(10, 280)} = 6.511$ ,  $p < 0.001$ , adjusted  $R^2 = 0.164$ ). Girls spent more minutes per day on mobile phones than boys ( $\beta = .245$ ,  $p < .001$ ). Adolescents who showed higher attitudinal beliefs towards violence ( $\beta = .174$ ,  $p < .01$ ), lower academic performance ( $\beta = -.192$ ,  $p < .01$ ) and higher alcohol consumption ( $\beta = .230$ ,  $p < .01$ ) spent more time on mobile phones. No more significant relations were found.

**Conclusions:** The use of mobile phone seems to be associated with adolescents' health and education. Future school-based interventions for the promotion of a proper use of mobile phones by adolescents are desirable.

# Young People's Participation in Organized Physical Activity and Sport and Active and Sedentary Behaviors: The Role of Gender and School Educational Level

**Dr. Alejandro Jiménez-Loaisa<sup>1</sup>**, Dr. Javier Valenciano-Valcárcel<sup>1</sup>, Dr. Alexandra Valencia-Peris<sup>2</sup>, Dr. Javier Sevil-Serrano<sup>3</sup>

<sup>1</sup>Department of Didactics of Physical Education, Artistic and Music. Faculty of Education. University of Castilla-La Mancha. , Toledo, Spain, <sup>2</sup>Department of Teaching of Physical Education, Arts and Music. Faculty of Teacher Training. University of Valencia., València, Spain, <sup>3</sup>Department of Didactics of Musical, Plastics and Corporal Expression. Faculty of Teacher Training. University of Extremadura., Cáceres, Spain

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** This work explores gender- and educational level-based differences in physical activity (PA) and leisure-time sedentary behaviors of schoolchildren according to their (non)participation in organized PA and sport (PAS).

**Methods:** A total of 1968 schoolchildren (47.8% girls, 42.6% middle school), aged 10-15 years from 34 schools, completed the PAQ and the YLSBQ questionnaires to measure their habitual PA and sedentary behaviors. Children were defined as “participants” or “non-participants” according to their engagement in organized PAS. Differences in outcome variables were assessed using Student's T tests and analyses of covariance.

**Results:** Schoolchildren who engaged in organized PAS reported significantly higher PAQ total scores (+0.2 [95%CI: 0.22, 0.34]), less recreational screen time (−29.1 min/d [95%CI: −44.30, −13.76]), less time in academic tasks (−13.3 min/d [95% CI: −24.92, −2.25]), and on total sedentary time (−56.1 min/d [95%CI: −89.82, −22.35]) than their non-participant peers. Boys and girls who participated in organized PAS had significantly higher PAQ total scores than their non-participating peers ( $p<0.01$ ). Boys who participated in organized PAS spent less screen time (−39.5 min/d [95%CI: −60.7, −18.2]) than non-participating boys while girls who took part in organized PAS spent less sedentary time socializing (−27.0 min/d [95%CI: −48.2, −5.7]), in other sedentary activities (−13.6 min/d [95%CI: −26.1, −1.1]) and on total sedentary time (−65.8 min/d [95%CI: −119.2, −12.4]) than non-participant girls. Primary and secondary students who participated in organized PAS had significantly higher PAQ total scores compared to their non-participant peers ( $p<0.01$ ). No significant differences were found between participating and non-participating primary school students in leisure-time sedentary behaviors. However, participating secondary students spent less screen time (−34.8 min/d [95% CI: −54.9, −14.8]), doing sedentary academic tasks (−19.8 min/d [95%CI: −36.8, −2.8]), socializing sedentary time (−20.2 min/d [95%CI: −40.0, −0.3]), in other sedentary activities (−14.2 min/d [95%CI: −26.4, −2.0]), and on total sedentary time (−89.0 min/d [95%CI: −133.9, −44.2]) than non-participating secondary students.

**Conclusions:** Participation in organized PAS appears not only to increase PA levels in both genders and educational stages, but also to decrease some sedentary behaviors in secondary school students.

# Cultural considerations in health messaging for physical activity interventions – A comparison of the meaning of health to Chinese and UK school-aged children

**Dr. Fiona Chun Man Ling**, Dr. Eleanor Pui Kei Cheung

<sup>1</sup>Northumbria University, Newcastle, United Kingdom, <sup>2</sup>The Education University of Hong Kong, Hong Kong, Hong Kong

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** According to the health promotion model, a vital step to effective health promotion is understanding the target population's health experiences and their value about health, i.e. what health means to them. For physical activity (PA) interventions targeting children, often the value of PA/health was 'preached' by researchers or public health practitioners, thus lacking relevance to the target population, particularly to inactive children, which might have contributed to the futility of PA interventions. Given that health behaviours are contextual, cultural differences in the meaning of health is expected. Therefore, the aim of the study is to qualitatively explore the meaning of health to Chinese and UK children.

**Methods:** Chinese children aged 6-12yrs (n=320) and UK children aged 6-11yrs (n=146) were recruited from local primary schools in Hong Kong and in the UK respectively. All participants wore a pedometer for 3 consecutive weeks for habitual PA measurement. Focus groups were formed based on participants' PA level (highest vs lowest quartile), study year group and sex. Altogether 22 focus groups were formed for the Chinese participants and 20 for the UK participants. Semi-structure focus group discussions on the meaning of health took place at respective schools. During the discussions, participants were asked to depict their answers in drawing to promote engagement.

**Findings:** Common themes from both groups are physical health and cognitive health. For physical health, lower-ordered themes include optimal body functioning, absence of illness and having 'energy' – all were valued for the purpose of developing independence. The oldest Chinese children also expressed weight status represents health. Under cognitive health, UK children considered the ability to make appropriate lifestyle decisions and creativity as being healthy, whereas for Chinese children, being alert and free from worries was considered healthy. Themes not shared are social health (i.e. being with friends, UK children) and mental health (i.e. being relaxed and in good mood, Chinese children).

**Conclusion:** This study highlighted the similarities and differences in the meaning of health to children of different cultural backgrounds. In future PA interventions, promoting PA through health messages that resonate with children's health values may enhance their effectiveness.

# The Association Between Daycare Attendance and Screen Time in Preschool-Aged Children

**Ms. Hannah Parker<sup>1</sup>**, Dr. Sarah Burkart<sup>1</sup>, Dr. Layton Reesor-Oyer<sup>1</sup>, Mrs. Michal T. Smith<sup>1</sup>, Ms. Lauren von Klinggraff<sup>1</sup>, Mr. Roddrick Dugger<sup>1</sup>, Mr. James W. White III<sup>1</sup>, Ms. Olivia Finnegan<sup>1</sup>, Ms. Meghan Bastyr<sup>1</sup>, Dr. Christopher D. Pfledderer<sup>1</sup>, Dr. Elizabeth L. Adams<sup>1</sup>, Dr. R. Glenn Weaver<sup>1</sup>, Dr. Michael W. Beets<sup>1</sup>, Dr. Bridget Armstrong<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Excessive screen time is associated with negative health outcomes (e.g. obesity, cardiometabolic health.) in childhood and across the lifespan. Health behaviors, such as screen time, are variable each day. Identifying day-level contextual factors that influence the amount of time children spend on screens may help identify potential targets for improving children's screen time. Daycare, a common form of daily structure, is a day-level contextual factor that may be related to children's screen time by reducing opportunities to engage with screens. The purpose of this study was to examine the between- and within-person effect of daycare on screen time in preschool-aged children.

**Methods:** Participants included 74 caregivers (e.g., parents) and their preschool-age children (4.7±0.9 yrs, 48.3% female, 63.2% White). Caregivers completed daily texted surveys about the number of hours their child used a screen and whether their child attended daycare that day over a 14-day period. We used linear mixed-effects models to predict screen time from daycare attendance. Daycare attendance was treated as a day-level binary variable (attended vs. did not attend). We included child age, sex, and household income as covariates. Weekends were excluded from analysis.

**Results:** Caregivers reported an average of 3.6±2.2 (range = 0.5-13.2) hours per day of child screen time and children attended daycare on 68.5% of days (range = 0-11; Mean = 6.0; Median = 7.0). Compared to children who never attended daycare, children who always attended daycare had 2.2 hours (95%CI = -3.5, -0.8) less screen time on a given day. On days when children attended daycare, they had 1.9 hours (95%CI = -2.3, -1.5) less screen time compared to days that they did not attend daycare.

**Conclusion:** Children who consistently go to daycare spend significantly less time on screens compared to children who never attend daycare. Furthermore, on days when children do attend daycare, they have significantly less screen time. Ultimately, daycare might be leveraged as an intervention to positively impact preschoolers screen time.

# Outcomes and implementation factors facilitating and hindering a community-wide campaign on the U.S./Mexico Border

**Dr. Belinda Reininger<sup>1</sup>**, Ms. Lisa Mitchell-Bennett<sup>1</sup>, Dr. Minjae Lee<sup>3</sup>, Dr. Natalia Heredia<sup>2</sup>, Ms. Soo Kyung Park<sup>2</sup>, Mr. Tianlin xu<sup>2</sup>, Ms. Rebecca Lazoya<sup>1</sup>, Dr. Paul Yeh<sup>1</sup>, Ms. Amanda Dave<sup>1</sup>, Ms. Myrrinah Martinez<sup>1</sup>, Ms. Alma Ochoa Del Toro<sup>1</sup>

<sup>1</sup>UTHealth Houston School of Public Health, Brownsville, USA, <sup>2</sup>UTHealth Houston School of Public Health, Houston, USA, <sup>3</sup>UT Southwestern, Dallas, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** This study describes the dynamic factors contributing to and hindering the scaling and sustainability of a community-wide campaign (CWC) to 11 municipalities over 8 years on the U.S./Mexico Border. The CWC is a large-scale physical activity and nutrition intervention including media, social support, education, outreach, risk factor screenings, environmental and policy changes.

**Methods:** We conducted a thematic analysis based on qualitative interviews with municipal leaders, staff implementing the program, and community leaders (average of 27 per year) between 2016 – 2022. The Consolidated Framework for Implementation (CFIR) (2009, 2022) informed the interview guide and analysis. To measure quantitative outcomes, each year, participants from every community were enrolled and followed, measuring level of engagement. We examined changes from baseline to last visit for fruit and vegetable consumption and self-reported physical (meeting guidelines) using multivariable linear and logistic regression analyses, respectively adjusting for participants' baseline data and duration of follow-up.

**Results:** Qualitative themes identified factors influencing the scaling and sustainability of the CWC. Under the Implementation Process Domain, constructs such as teaming, adapting strategies, and reflection and evaluation were facilitators. Barriers were identified under the Outer and Inner Setting Domains including critical incidents, performance-measurement pressure, and relative priority of the intervention; and from the Individual Domain changes to personnel. Each year of the CWC approximately 3000 outreach visits were conducted. Each week, approximately 200+ diverse, free exercise offerings in 24 community-based locations across the municipalities were offered.

Quantitative assessment of effectiveness compared highly engaged versus lower engaged participants. Among 6092 participants, those who were highly engaged in the program (n=1126) had 0.67 portion increase in fruit and vegetable intake compared to the low engagement group (adjusted mean change from baseline to last visit: 1.4 vs. 0.73;  $p<.0001$ ) and were more likely to meet moderate to vigorous physical activity (MVPA) guidelines (adjusted odds ratio=1.46;  $p=0.0002$ , among 3651 participants who did not meet MVPA guideline at baseline).

**Conclusions:** This study uses CFIR to provide insight into the multi-year scaling and sustainability efforts in persistent poverty municipalities where despite barriers, a sustained CWC intervention was associated with increased PA and fruit and vegetable consumption.

# Te Hau Kori: Addressing the gap between physical activity research, policy and practice through organisational co-design and genuine partnership

**Dr. Justin Richards<sup>1</sup>**, Dr. Oliver Wilson<sup>1</sup>, Dr. Lara Andrews<sup>1</sup>, Mr. Paora Te Hurihanganui<sup>1</sup>, Ms. Alana Hamill<sup>1</sup>, Associate Professor Geoff Kira<sup>1</sup>

<sup>1</sup>Te Hau Kori, Victoria University of Wellington, Wellington, New Zealand

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** Research on physical activity (PA) promotion has progressed remarkably in the past fifty years. However, much of the evidence generated has not manifested into substantive improvements in population wellbeing. This is particularly the case for groups experiencing widespread inequities, such as Māori (i.e. Indigenous people of Aotearoa New Zealand (NZ)). We posit that this stems from fractured relationships among the institutional ternion of government, academia and delivery agencies in the PA sector. Our aim was to examine these relationships and identify alternative approaches to addressing the gaps observed.

**Methods** We undertook a pragmatic partnership and co-design approach to exploring the perspectives of key stakeholders in regard to the observed discordance among PA researchers, policy-makers and practitioners in NZ. This encompassed working with representatives from the institutional ternion and key communities experiencing inequities in NZ, including Māori. Our approach was informed by an engagement framework from Te Arawhiti (Office for Māori Crown Relations) and a research framework from Te Hiringa Hauora (Health Promotion Agency).

**Results** Historical interactions among PA stakeholders were largely characterised as “consultation” (policy-makers), “collaboration” (researchers) and/or “informing” (practitioners). Although these terms are often used interchangeably, they represent distinct types of inter-institutional engagement. Importantly, none of these engagement types align with the true “partnership” approach that stakeholders believe is necessary to address the identified gaps in research translation and ongoing inequities in PA participation in NZ. Specifically, the participating stakeholders called for a genuine “co-design” approach to the development of policy- and practice-relevant research projects and PA promotion training programmes. Te Hau Kori (Centre for Physical Activity and Wellbeing) has been established as a cross-sectoral and cross-cultural partnership with this explicit purpose.

**Conclusions** Discordance among the institutional ternion underpinned the establishment of Te Hau Kori, which has three priorities: a) Improve PA promotion workforce training; b) Facilitate research translation and relevance; c) Privilege Indigenous knowledge alongside conventional science. Addressing these through genuine partnerships and co-design is intended to transcend institutional competition and enable broader cross-sectoral focus on the ultimate objective, population wellbeing through PA.

# Aotearoa New Zealand Physical Activity Recommendations: Past, present, and future

**Dr. Oliver W. A. Wilson<sup>1</sup>**, Associate Professor Geoff Kira<sup>1</sup>, Dr. Lara Andrews<sup>1</sup>, Associate Professor Justin Richards<sup>1,2</sup>

<sup>1</sup>Te Hau Kori, Faculty of Health, Te Herenga Waka Victoria University of Wellington, Wellington, New Zealand,

<sup>2</sup>Sport New Zealand Ihi Aotearoa, Wellington, New Zealand

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To examine the history of physical activity recommendations used in Aotearoa New Zealand (NZ), which stakeholders stated or implied recommendations, and how recommendations were developed.

**Methods:** Historical literature was reviewed to identify instances where government (Ministry of Health Manatū Hauora, Ministry of Education Te Tāhuhu o te Mātauranga, Waka Kotahi Transport Authority, Sport NZ Ihi Aotearoa (formerly Sport and Recreation New Zealand (SPARC), and before that Hillary Commission) and non-government (Heart Foundation, Cancer Society, and Mental Health Foundation) stakeholders stated or implied physical activity recommendations. Sources included within our review included: strategic plans, position statements, and reports. Information extracted included the: organisation; date of publication(s); the intensity, duration, and frequency of recommendations (stated or implied); and, evidence upon which recommendations were based.

**Results:** Recommendations for young people and adults have historically been, and continue to be, developed and disseminated separately. Adult recommendations can be traced back to the early 1990's based on the American College of Sports Medicine's 1978 guidelines. Though the guidelines have been based on the 1996 US Surgeon General's Report on Physical Activity and Health since the late 1990's, considerable variation within and between stakeholders is evident within sources and over time. Young people recommendations were first alluded to in 2001. In 2007 SPARC offered recommendations for young people, but in the years prior and since the Manatū Hauora have focussed on active transportation and screen time in their reporting of young people's 'physical activity' behaviours, implying screen time recommendations sporadically. Manatū Hauora published the most recent young people physical activity recommendations, which encompassed physical activity, sedentary behaviour, and sleep, in 2017 based largely on the Canadian 24-hour movement guidelines. Of the current physical activity recommendations for young people and adults, stated or implied across stakeholders, none quite align with the most recent ones communicated by the World Health Organisation.

**Conclusions:** Our findings suggest that there is a need to establish a cross-agency national plan to develop and disseminate physical activity recommendations for all ages to ensure that a cohesive message is delivered and that finite resources are not used to duplicate work.

# Feasibility and Impacts of a Childcare-Based Physical Activity Program in Children from Migrant and Seasonal Agricultural Worker Families in the Rio Grande Valley Region USA

**Dr. Zenong Yin<sup>1</sup>**, Dr. Melissa Valerio-Shewmaker<sup>2</sup>, Dr. Maria Valle<sup>3</sup>, Dr. Vanessa Errisuriz<sup>4</sup>, Mr. Jessh Mondesir Mavoungou<sup>1</sup>, Ms. Jill Johnstone<sup>1</sup>, Ms. Shiyu Li<sup>5</sup>, Mr. Christophor Huong<sup>1</sup>, Ms. Vanessa Estrada-Coats<sup>1</sup>, Dr. Alberto Cordova<sup>1</sup>, Dr. Deborah Parra-Medina<sup>4</sup>

<sup>1</sup>University of Texas San Antonio, San Antonio, USA, <sup>2</sup>UT School of Public Health, Houston, USA, <sup>3</sup>United Migrant Opportunity Services (UMOS), McAllen, USA, <sup>4</sup>University of Texas at Austin, Austin, USA, <sup>5</sup>UT Health San Antonio, San Antonio, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Background.** Children from migrant and seasonal agriculture worker (MSAW) families are at increased risk for physical inactivity. This study reports the feasibility and impacts of a pilot childcare-based program to increase physical activity (PA) and reduce sedentary behavior (SED) for children enrolled in the Migrant and Seasonal Head Start (MSHS) Program, a federal childcare program for MSAW families in the Rio Grande Valley region, Texas, USA.

**Methods.** Participants were 42 children (2-5 years old) from one MSHS center. Findings from a needs assessment of the MSHS center managers informed the 6-week pilot program (10/31/2022-12/9/2022), which included 1) the adoption of evidence-based guidelines and strategies for PA, SED, and gross motor development, 2) a 20-hour teacher training program, and 3) the provision of curricular resources, equipment for outdoor and indoor play, and instruction technologies. Teachers completed weekly evaluations and a post-study evaluation to assess the program's feasibility and acceptability. Accelerometry measured the time spent in light, moderate, and vigorous physical activity (LMVPA), SED, and step counts in randomly selected children during center hours (8:30am-2:30pm) pre-intervention and weeks 1-3 and 4-6 of the intervention. In addition, children's gross motor skills (jumping, galloping, ball kicking, and underarm ball rolling) were assessed pre-and post-intervention.

**Results.** Weekly evaluations indicated that teachers adhered to 35%-75% of the evidence-based guidelines and strategies. In the post-study evaluation, teachers' satisfaction with curricular resources, training program, and intervention strategies, and teachers' report on children's satisfaction with the pilot program activities ranged between 9.0 to 9.5 on an 11-point scale. The daily percentage of time in SED decreased from 73.5% (SD .03) to 59.5% (SD .03); the daily percentage of time in LMVPA increased from 26.4% (.03) to 40.4% (SD .03), and step counts risen from 3956 (SD 590) to 4842 (SD 484) across the three measurement time points ( $p < .001$  for all three measures). In addition, children's raw scores (range 0-12) of gross motor skill development increased from 6.04 (SD 2.69) to 9.97 (SD 2.38) from baseline to the end of the program ( $p < .001$ ).

**Conclusion.** Future studies should replicate the pilot program in an RCT to test its efficacy.

# Exploring the Relationship Between Maternal Sleepiness During and After Pregnancy with Breastfeeding Intentions and Attitudes and Infant Feeding Behaviors

**Dr. Tayla von Ash<sup>1</sup>**, Ms. Anna Alikhani<sup>1</sup>, Ms. Paola Solano<sup>1</sup>, Ms. Melanie Morales<sup>1</sup>, Ms. Selena Evora<sup>1</sup>, Dr. Katherine Sharkey<sup>1</sup>, Dr. Patricia Risica<sup>1</sup>

<sup>1</sup>Brown University, Providence, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Objective:** This exploratory secondary analysis examines the association between maternal sleepiness, both during pregnancy and after birth, with breastfeeding intentions, attitudes, and behaviors, as well as infant feeding practices at six months postpartum among a sample of low-income, tobacco smoke-exposed women in the United States.

**Methods:** We used the Epworth Sleepiness Scale (ESS) to examine maternal sleepiness at three timepoints (early pregnancy, late pregnancy, and six months postpartum), breastfeeding intentions and attitudes (the latter measured using the Mitra index) during pregnancy, and breastfeeding behavior and infant feeding practices (the latter measured using the Infant Feeding Questionnaire) postpartum. We used Pearson's correlations, t-tests, and analysis of variance (ANOVA) to assess descriptive statistics. Logistic regressions were used to examine the relationship between excessive sleepiness ( $ESS \geq 10$ ) and breastfeeding intentions and behavior. Generalized linear regressions were used to examine associations between excessive sleepiness and breastfeeding attitudes prenatally and infant feeding practices postpartum. Analyses adjusted for age, race/ethnicity, parity, marital status, and maternal education.

**Results:** Three quarters (76%) of the sample had intentions to breastfeed during both early and late pregnancy. However, 61% of the sample-initiated breastfeeding after birth, with 39% still breastfeeding at 12 weeks postpartum and only 10% still breastfeeding at 6 months postpartum. Excessive sleepiness in late pregnancy was associated with overall less favorable breastfeeding attitudes ( $B: -.19 [-.36, -.02]$ ) and embarrassment barriers, in particular ( $B: -.55 [-.87, -.24]$ ). At six months postpartum, excessive sleepiness was associated with lower likelihood of using food to calm infant fussiness ( $B: -.39 [-.77, -.02]$ ), but not after adjusting for age, race/ethnicity, parity, marital status, and maternal education. We did not find an association between excessive sleepiness with breastfeeding intentions or behavior.

**Discussion:** Our findings suggest that sleepiness during pregnancy might impact breastfeeding attitudes. More studies in diverse samples are needed to further explore relationships between not only maternal sleepiness, but also sleep quality and duration, with infant feeding attitudes and behavior.

# Validating the AX3 wearable sensor for assessing energy expenditure

**Mr. Tobias Cox**<sup>1</sup>, Dr. Tom Stewart<sup>1</sup>, Mr. Ben Smith<sup>1</sup>, Dr. Charlotte Jelleyman<sup>1</sup>, Prof. Scott Duncan<sup>1</sup>

<sup>1</sup>Auckland University of Technology, Auckland, New Zealand

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Triaxial accelerometers are commonly used to measure physical activity behaviours. However, there is uncertainty surrounding the validity of accelerometers to accurately quantify energy expenditure and physical activity intensity, particularly given the lack of standardised data processing and analysis procedures. This study aimed to determine which accelerometer-derived metric most accurately predicted energy expenditure, and whether combining thigh and back accelerometers improved predictive accuracy.

**Methods:** Twenty-one adults (11 males, aged  $26.1 \pm 5.02$  years) were equipped with a COSMED K5 indirect calorimetry unit and two Axivity AX3 accelerometers placed on their thigh and lower back. They each performed a series of seven activities ranging from lying (intensity = 1–2 Metabolic Equivalents, METs) to running (intensity = 15–20 METs). The breath-by-breath K5 data were interpolated and METs were averaged over 5-second intervals. From the raw AX3 data, the Euclidean Norm Minus One (ENMO), Mean Absolute Deviation (MAD), ActigraphCounts, and ENMO-absolute (ENMOa) accelerometer metrics were calculated for each 5-second interval. The K5 and AX3 data were then merged and labelled with the corresponding activity type based on the timestamp. A series of linear mixed models were used to determine the predictive accuracy of each metric at 5-second intervals.

**Results:** The MAD metric from the back sensor displayed the highest single-sensor accuracy (RMSE = 0.921; the average error in METs). Similarly, the ENMO (RMSE = 0.959) and ENMOa (RMSE = 0.964) metrics were more accurate when obtained from the back when compared to the thigh (RMSE = 0.979, 0.987, respectively). When thigh and back sensors were combined, energy expenditure estimates were more accurate (e.g., single back ENMO RMSE = 0.959 vs. combined ENMO RMSE = 0.852). However, there were no clear differences between ENMO, ENMOa, and MAD after sensors were combined.

**Conclusion:** Different accelerometer metrics predicted energy expenditure with varying accuracy, with the back location tending to be more accurate than the thigh. Combining both thigh and back sensors resulted in approximately 10% higher accuracy. These linear models could be used to estimate energy expenditure with approximately 0.85–0.95 METs of error depending on whether one or two accelerometers are used.

# Parental role-modelling on 24-hour movement behaviours among preschoolers during the COVID-19 pandemic

**Miss Jie Feng**<sup>1</sup>, Prof. Asaduzzaman Khan<sup>2</sup>, Prof. Patrick Wing Chung Lau<sup>1,3</sup>, Dr. Wendy Yajun Huang<sup>1,4</sup>  
<sup>1</sup>Department of Sport, Physical Education and Health, Hong Kong Baptist University, Hong Kong, China, <sup>2</sup>School of Health and Rehabilitation Sciences, The University of Queensland, Brisbane, Australia, <sup>3</sup>Laboratory of Exercise Science and Health, BNU-HKBU United International College, Zhuhai, China, <sup>4</sup>Dr Stephen Hui Research Centre for Physical Recreation and Wellness, Hong Kong Baptist University, Hong Kong, China

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The coronavirus (COVID-19) pandemic has resulted in children having a more sedentary lifestyle and increased family time. However, little is known about the relationships between parents' and children's 24-hour movement behaviours during the pandemic. Such knowledge may aid the development of strategies to promote healthy lifestyles for preschoolers. This study examined the association between the 24-hour movement behaviours of parents and their preschool children and investigated sex differences in this association.

**Methods:** A total of 1,740 preschoolers (4.5 ± 0.8 years old, 50.3% boys) and their parents (35.4 ± 4.9 years old, 24.3% males) in China participated in this study and provided valid and complete data. Parents completed an online survey or a written questionnaire in the period between October and December 2020. Preschoolers' and parents' movement behaviours (physical activity [PA], sedentary behaviour [SB], screen time, and sleep) and demographic information were reported by the parents. Generalised linear models and logistic regression models were used to examine the associations between the parents' and preschoolers' movement behaviours.

**Results:** Positive associations were found between parents' and preschoolers' moderate-to-vigorous intensity PA ( $\beta = 0.28$ ; 95% confidence interval [CI]: 0.20, 0.36), total PA ( $\beta = 0.21$ ; 95% CI: 0.17, 0.24), and sleep ( $\beta = 0.05$ ; 95% CI: 0.03, 0.06) with no apparent sex difference. No significant relationships were found between parents' and preschoolers' SB or screen time. Girls were more likely to meet all three 24-hour movement guidelines when their parents met them (odds ratio = 2.38; 95% CI: 1.42, 4.01), but the relationship was not significant for boys.

**Conclusions:** Parental role-modelling was positively associated with children's PA and sleep. This finding suggests that supporting parents' movement behaviours has the potential to promote a healthy lifestyle among preschoolers.

# Does the association between home food availability and accessibility and food consumption differ by a child's temperament?

**Mrs. Riikka Pajulahti**<sup>1,2</sup>, Prof. Katariina Salmela-Aro<sup>1</sup>, Dr. Reetta Lehto<sup>2</sup>, Dr. Henna Vepsäläinen<sup>1</sup>, Dr. Elviira Lehto<sup>1</sup>, Mrs. Kaija Nissinen<sup>3</sup>, Ms. Essi Skaffari<sup>1</sup>, Dr. Katri Sääksjärvi<sup>1</sup>, Prof. Eva Roos<sup>1,2</sup>, Prof. Nina Sajaniemi<sup>4</sup>, Prof. Maijaliisa Erkkola<sup>1</sup>, Associate Professor Carola Ray<sup>2</sup>

<sup>1</sup>University of Helsinki, Helsinki, Finland, <sup>2</sup>Folkhälsan research center, Helsinki, Finland, <sup>3</sup>Seinäjoki University of Applied Sciences, Seinäjoki, Finland, <sup>4</sup>University of Eastern Finland, Joensuu, Finland

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The physical features of the home food environment, namely food availability, and accessibility, are well-established determinants for children's food consumption. Understudied are, however, whether the role of the physical home food environment is uniform for all children independent of their individual characteristics, such as temperament. This study examined whether a child's temperament modifies the association between home food availability and accessibility and the consumption of fruits and vegetables and sugar-rich foods and drinks.

**Methods:** Altogether, 1216 Finnish children aged 3–6 years provided data for the analyses. The study is part of the DAGIS (Increased Health and Wellbeing in Preschools) project and utilized data from a cross-sectional survey conducted in 2015–2016 and intervention baseline data collected in 2017. Parents reported home food availability and accessibility with a questionnaire, their child's food consumption frequency with a food frequency questionnaire, and the child's temperament with the very short form of the Children's Behavior Questionnaire. Concurrent associations between home availability and accessibility and the consumption of fruits and vegetables and sugar-rich foods and drinks were examined with linear regression models. The modifying role of temperament was examined by adding temperament as a moderator to the model. Analyses were adjusted for the child's age, gender, and mother's highest education.

**Results:** None of the examined temperament dimensions modified the association between availability and the consumption frequency of fruits and vegetables or sugar-rich foods and drinks. A child's negative affectivity modified the association between home food accessibility of sugar-rich foods and drinks and the consumption frequency of those foods. The association was stronger for children with higher scores on negative affectivity.

**Conclusions:** The findings imply that children with higher negative affectivity are more susceptible to the home accessibility of sugar-rich foods and drinks. Considering a child's individual temperamental dispositions when counseling families on eating issues could be beneficial.

# The Australian Park Life Project – a national survey of park use and the contribution of park-based physical activity to total physical activity

Dr. Paula Hooper<sup>1</sup>, Dr. Nicole Edwards<sup>1</sup>, Dr. Perri Edwards<sup>1</sup>

<sup>1</sup>The University of Western Australia, Perth, Australia

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Within the physical activity and parks literature, few studies measure the exact parks people use. Additionally, studies have not typically measured where physical activity occurs, nor have they quantified the proportion of park-based physical activity to overall physical activity levels and intensity. In direct response to these gaps the Australian Park Life project aimed to:

- (1) Undertake a national survey of park use in Australian capital cities using a public participatory GIS survey.
- (2) Measure physical activity undertaken within and outside of parks to determine the contribution that park-based physical activity makes to overall physical activity levels.

**Methods:** Adults were surveyed from 8 Australian cities (Adelaide, Brisbane, Canberra, Darwin, Hobart, Melbourne, Perth, Sydney). Using a map-based survey, participants identified the park they typically use 'most often' and any other parks they visit. For each park mapped, participants identified the activities undertaken in the park, the frequency and duration of the visit, the mode of transport to the park and the usual origin of the trip to the park.

Using the Park Physical Activity Questionnaire participants self-reported their frequency and duration of walking for recreation, walking for transport and moderate and vigorous physical activity in the past week and that undertaken in parks.

Recruitment was via a snowball method with assistance from local governments, community groups, and sporting and industry associations.

**Results:** Analyses of the data from the participatory GIS survey will identify the parks used, the characteristics and features of the most popular reported spaces, and the demographic characteristics of park users and non-users. Regression models will estimate associations between park visits and physical activity time in parks and the contribution of park-based physical activity to total physical activity levels, adjusting for potential confounders.

**Conclusions:** Knowledge of how parks contribute to the physical activity patterns and health outcomes of communities is imperative to inform interventions and public health programs to increase park-based physical activity to help meet physical activity guidelines and provide health benefits. Additionally, to advocate effectively for improved park infrastructure, public health advocates must understand and demonstrate the benefits of parks to health behaviours and outcomes.

# The overflow effects of movement behavior change interventions in children and adolescents: A systematic review and meta-analysis of randomized controlled trials

**Dr. Wendy Yajun Huang**<sup>1,2</sup>, Ms. Jie Feng<sup>1</sup>, Dr. Chen Zheng<sup>3</sup>, Dr. Jiao Jiao<sup>1,2</sup>, Dr. Asaduzzaman Khan<sup>4</sup>, Ms. Mehwish Nisar<sup>4</sup>, Prof. Stephen Heung Sang Wong<sup>3</sup>

<sup>1</sup>Department of Sport, Physical Education and Health, Hong Kong Baptist University, Hong Kong, China, <sup>2</sup>Dr. Stephen Hui Research Centre for Physical Recreation and Wellness, Hong Kong Baptist University, Hong Kong, China, <sup>3</sup>Department of Sports Science and Physical Education, The Chinese University of Hong Kong, Hong Kong, China, <sup>4</sup>School of Health and Rehabilitation Sciences, The University of Queensland, Brisbane, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Physical activity (PA), sedentary behavior (SB), and sleep are co-dependent movement behaviors in a 24-hour day. Interventions to change movement behaviors have been widely reported for children and adolescents. The purpose of this systematic review and meta-analysis was to examine the overflow effects of interventions targeting a single movement behavior on other non-targeted movement behaviors in children and adolescents.

**Methods:** A systematic search of six databases (MEDLINE, PsycINFO, EMBASE, PubMed, Web of Science, and SPORTDiscus) was performed on 7 March 2022. Randomized controlled trials (RCTs) that examined the effect of single behavior (targeted) interventions on non-targeted behaviors in healthy children and adolescents under 18 years of age were included. Meta-analyses were conducted by using Review Manager 5.4. The revised Cochrane risk-of-bias tool for randomized trials (RoB 2) was employed to assess the risk of bias. Percentage of wear time spent in each movement behavior were computed whenever appropriate to facilitate comparison across studies.

**Results:** Of 8,135 publications considered, 87 RCTs comprising 39,566 participants from 21 countries met the inclusion criteria, and 54 of them were included in meta-analysis. Pooled analysis of PA (targeted) interventions ( $n = 34$ ) showed an overall significant mean difference in SB ( $-0.86\%$  of wear time;  $95\% \text{ CI} = -1.37, -0.35$ ). Subgroup analyses further indicated that these effects were stronger among school-aged children and adolescents (6 – 17 years), with intervention duration of at least 12 weeks, and in a school setting. For interventions targeting SB ( $n = 3$ ), meta-analyses yielded an increase in standing ( $3.87\%$  of wear time;  $95\% \text{ CI} = 1.99, 5.75$ ), but no significant effect on stepping time ( $Z = 0.95, p = 0.34$ ). Based on narrative synthesis, sleep interventions showed no effects on PA or SB ( $n = 2$ ), and vice versa ( $n = 6$ ).

**Conclusions:** Interventions targeting PA resulted in a small reduction in SB, while interventions aimed at reducing SB led to a small increase in standing time. The findings suggest that PA and SB should be considered as interrelated behaviors in future behavioral interventions. Co-dependence between sleep timing and daytime movement behaviors warrants further investigation.

# A Comprehensive Assessment of Chinese Physical Activity and Sedentary Behavior Policies

**Mr. Sitong Chen**<sup>1</sup>, Ms. Jintao Hong<sup>2</sup>, Associate Professor Karen Milton<sup>3</sup>, Dr. Bojana Klepac<sup>1</sup>, Dr. Jiani Ma<sup>4</sup>, Prof. Zeljko Pedisic<sup>1</sup>

<sup>1</sup>Victoria University, Melbourne, Australia, <sup>2</sup>Shanghai Research Institute of Sports Science (Shanghai Anti-Doping Agency), Shanghai, China, <sup>3</sup>University of East Anglia, Norwich, United Kingdom, <sup>4</sup>Deakin University, Melbourne, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** Physical activity (PA) and sedentary behaviour (SB) policies play a key role in promoting PA and reducing SB at the population level. Research on PA and SB policies is developing, but, from a research perspective, little is known about the policy landscape in China. Therefore, the aims of this study were to: advance knowledge on PA and SB policies in China; highlight related gaps; and make recommendations for future policy development.

**Methods** Literature and web-based searches were performed to identify national PA and SB policies in China. The policies were assessed against 17 key elements for a successful national policy approach to PA promotion listed in the Health-Enhancing Physical Activity Policy Audit Tool (HEPA PAT, version 2). In addition, four 'cornerstones' of PA and SB policy (i.e., guidelines, targets, surveillance and monitoring, and public education) were examined based on the content of the policy documents.

**Results** Sixty national PA and SB policies were identified, of which 54 focused on PA only and 6 focused on both PA and SB. There were no standalone SB policies. There has been a rapid increase in the number of PA and SB policies issued over the past two decades. In totality, the policies include all 17 key elements for a successful national policy approach to PA promotion according to HEPA PAT. The policies reflect multisectoral efforts around PA targets, recommendations for PA and SB, strategies for public education on PA, and surveillance and monitoring of PA and SB.

**Conclusion** There has been an increasing focus on developing PA and SB policies in China, reflected in multisectoral policy efforts. SB policies may require more emphasis, as they seem to be less developed than PA policies. Collaboration and involvement of different sectors in the development and implementation of Chinese PA and SB policies should continue to be facilitated as part of a whole-of-system approach to health promotion.

# Interventions to Change School Recess Activity Levels in Elementary School Students from Space Utilization Perspective: A Systematic Review

**Dr. Yiping Yan<sup>1</sup>**, Dr. Youzhi Ke<sup>1</sup>, Prof. Yang Llu<sup>1</sup>

<sup>1</sup>Shanghai University of Sport, Shanghai, China

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Recess offers a key setting for elementary school students to promote physical activity (PA). In urban elementary schools with limited space, the choice of feasible recess interventions is an issue that needs to be addressed immediately. This review summarizes the results of PA interventions for elementary school students during recess based on space utilization perspective, to provide practical references for promoting PA levels during recess between classes of under global urbanization.

**Method:** Peer-reviewed literature was searched until 31st January 2023 in PubMed, Web of Sciences, ERIC, SPORTDiscus and Academic Search Premier databases. Inclusion criteria were used to screen out English articles that focused on elementary school students, employed controlled experiments or quasi-experiment, measured PA levels during school recess and chose the intervention of utilizing existing school spaces. Study quality was assessed using an adapted eight-item assessment scale described by Van Sluijs and colleagues.

**Result:** 27 studies were included in the review, of which 18 were identified as high-quality studies. In these studies, the frequencies of the selected space utilization strategies in descending order are: modification of physical environment (MPE) totaled 26, allocation of time and space for the use of sports venues (ATS) totaled 6, and development of unused space functions (DSF) totaled 3. A total of 11 studies used a single intervention protocol, of which 7 confirmed the effectiveness of the MPE, and 1 confirmed the uncertainty of the effectiveness of DSF. A total of 16 studies used the combination of interventions, of which 4 combined interventions of space utilization strategies were proven to be effective, and 9 combined interventions of space and non-space utilization strategies were confirmed to be effective.

**Conclusion:** To prompt the PA of students during recess, the intervention program of using single MPE, the combination of space utilization strategies and the combination of space and non-space utilization strategies can be used in urban elementary schools as a reference program, when the elementary school space is insufficient. Future studies should analyze the extent to which each intervention strategy in the combined intervention affects physical activity, so as to customize the elementary school recess intervention plan.

# Promoting Active Living Policies and Financing Environmental Change Strategies through School-Led Population Health Surveillance

**Dr. Elizabeth Ackley**<sup>1,2</sup>

<sup>1</sup>Center for Community Health Innovation, Salem, USA, <sup>2</sup>Roanoke College, Salem, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

While recognizing the need to invest in active environments and normalize a culture of health, municipal governments have struggled to identify effective approaches to actualize these goals due to inadequate citizen representation in available datasets. Innovative health surveillance strategies which leverage school systems in the data collection process may be effective in catalyzing policies, systems, and environmental change strategies to enhance active living at scale.

**Purpose:** To describe how a mid-sized urban community leveraged a school-led health surveillance system to (1) develop comprehensive active living policies and (2) finance environmental change strategies to promote active living.

**Methods:** From 2017 to 2019, mixed-methods data collection strategies were employed to gather youth health outcomes and barriers to active living from families with children enrolled in the city's public-school system. Data was analyzed geospatially to demonstrate associations between health outcomes and environmental barriers and resources impacting active living behaviors. Thirty-nine focus groups and six citizen working groups converged to examine surveillance findings, categorizing themes across active living barriers. Themes were used to develop community priorities, policies, and action items representing the needs of diverse residents. Geographical inequities in health outcomes and barriers to active living were used to identify the city's next target investment area.

**Results:** "Interwoven Equity" and "Healthy Community" were infused as novel themes in the city's 2040 Comprehensive Plan. Across the Plan, 10 priorities, 25 policies, and 75 action items were included to promote active living in the context of land use, transportation, urban design, and economic development. Residents allocated \$5 million in Housing and Urban Development funds to facilitate environmental change strategies in response to community needs.

**Conclusion:** School-led health surveillance serves as a promising strategy for enhancing community representation in policy and government finance decision-making efforts aimed at promoting active living.

# The selection and operationalization of implementation strategies in the Nutrition Now project

**Miss Natalie Garzon Osorio<sup>1</sup>**, Prof. Frøydis Nordgård Vik<sup>1</sup>, Associate Professor Anine Christine Medin<sup>1</sup>, Prof. Nina Cecilie Øverby<sup>1</sup>

<sup>1</sup>Department of Nutrition and Public Health, Faculty of Health and Sport Sciences, University of Agder, Kristiansand, Norway

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Implementation strategies are crucial for bridging the evidence-to-practice gap in public health nutrition, but there is a lack of guidance regarding which to use and how to select them. The current paper aims to describe a practical approach using implementation mapping aspects for the selection and operationalization of implementation strategies in the Nutrition Now project, an eHealth intervention aiming to improve nutrition in the first 1000 days of life.

**Method:** A 3-step approach was used: **(1) Identify facilitators and barriers** for the implementation effort by conducting in-depth interviews, one concept mapping session, and several meetings with key stakeholders, **(2) Select strategies** from the ERIC (Expert Recommendations for Implementing Change) taxonomy based on the determinants identified in step 1, and **(3) Operationalize selected strategies** according to Proctor and colleagues' guidelines in terms of the seven dimensions: the actor, the action, the action target, temporality, dose, and justification, and addressing potential overlap between strategies guided by Waltz and colleagues' cluster map of ERIC strategies. The research group iteratively reviewed and refined the strategies until reaching agreement on a set perceived to be highly important and highly feasible for the Nutrition Now project.

**Results:** In total, 21 of the 73 ERIC strategies were selected across 8 out of 9 clusters: six strategies (#4, #14, #18, #27, #46, #56) under the 'Use evaluative and iterative strategies' cluster, one strategy (#33) under the 'Provide interactive assistance' cluster, two strategies (#51, #63) under the 'Adapt and tailor to context' cluster, five strategies (#6, #17, #35, #38, #47) under the 'Develop stakeholder interrelationships' cluster, three strategies (#15, #28, #31) under the 'Train and educate stakeholders' cluster, one strategy (#58) under the 'Support clinicians' cluster, two strategies (#41, #69) under the 'Engage consumers' cluster, one strategy (#44) under the 'Change infrastructure' cluster, and zero strategies from the 'Utilize financial strategies' cluster.

**Conclusion:** This study provides a practical example on how to use implementation mapping aspects to select and operationalize implementation strategies for complex multi-setting interventions in real-world conditions.

# Joint Associations of Device-based Physical Activity and Diet with Mortality and Incident CVD and Cancer: a prospective analysis of the UK Biobank Study

**Dr. Elif Inan-Eroglu<sup>1,2</sup>**, Dr. Matthew Ahmadi<sup>2</sup>, Dr. Raaj Biswas<sup>2</sup>, Associate Professor Ding Ding<sup>3</sup>, Prof. Emmanuel Stamatakis<sup>2</sup>

<sup>1</sup>Department of Molecular Epidemiology, German Institute of Human Nutrition, Potsdam-Rehbruecke, Germany, <sup>2</sup>Charles Perkins Centre, School of Health Sciences, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia, <sup>3</sup>Sydney School of Public Health, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Current evidence on the joint association of physical activity (PA) and diet relies exclusively on self-reported PA assessments, which can only capture partial PA accounts and are subject to several biases. We examined the joint associations of device-measured intensity-specific PA and diet with all-cause mortality, and cardiovascular disease (CVD) and cancer incidence.

**Methods:** We conducted our study using the UK Biobank population-based prospective cohort (n=79,988). Light PA (LPA), moderate to vigorous PA (MVPA), vigorous PA (VPA) and total PA (TPA) were measured using a wrist accelerometer. We categorised PA and diet quality score (DQS) based on tertiles and derived joint PA and diet variables. Outcomes were all-cause mortality, cardiovascular disease, and cancer incidence (total; PA, diet and adiposity-related (PDAR)).

**Results/Findings:** During a median follow-up of 6.9 years, 2,234 participants died from all causes, 9,412 participants developed CVD, 8,103 total cancer and 2,956 PDAR cancer. Compared with the least favourable referent group (PA tertile / low DQS), participants with middle and high (total and intensity specific) PA had lower all-cause mortality risk and incident CVD risk, regardless of DQS. For example, among middle and high MVPA and high DQS groups, CVD HR were 0.80 (95%CI 0.74, 0.87) and 0.77 (95%CI 0.70, 0.85), respectively. The pattern of cancer results was less pronounced but in broad agreement with the ACM and CVD incidence findings (e.g. HR 0.90, 95%CI 0.81-0.99, HR 0.89, 95%CI 0.81-0.98 and HR 0.85, 95%CI 0.77-0.93 among high VPA for low, moderate and high DQS group, respectively). PDAR cancer risk was lowered with higher VPA irrespective of DQS group, although the MVPA and DQS joint exposure showed less clear associations. LPA was not associated with any outcomes.

**Conclusion:** Regardless of diet quality, middle and high levels of device-measured PA of any intensity were favourably associated with mortality and CVD incidence risk. Compared to previous literature, device-based PA reveals novel joint associations with other health behaviours. Our results highlight the relative importance of sufficient PA for reducing risk of chronic disease and premature mortality.

# A longitudinal time-series analysis of celebrity chef popularity and its relation to household purchases: a potential game changer for health promotion campaigns?

**Mr. Viktor Proesmans<sup>1</sup>**, Prof. Dirk Van den Poel<sup>1</sup>, Prof. Iris Vermeir<sup>1</sup>, Prof. Maggie Geuens<sup>1</sup>

<sup>1</sup>Ghent University, Gent, Belgium

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Over the past two decades, celebrity chefs have gained widespread popularity in most Western countries. A trend that seems to be here to stay. While studies have been conducted on how celebrity chef popularity affects our dietary behavior, the available research is limited to focus groups and survey data. This provides only a partial understanding of the short-term and long-term effects of this phenomenon. This study aims to investigate the relationship between celebrity chef popularity, online and on television, and households' purchases of meat and vegetables across different age groups in the period 2009-2018. A significant relationship would signal celebrity chefs can play a role in health promotion campaigns.

**Methods:** This study took a time-series approach using impulse response functions to examine how changes in celebrity chef popularity affect purchase behavior among Flemish households in the same and subsequent months. Online celebrity chef popularity was estimated using Google Trends data on how often the most popular celebrity chefs and their cooking shows were looked up in Flanders (Belgium). Television celebrity chef popularity was estimated using data on the television-ratings of the most popular celebrity chef television - shows in Flanders. Finally, meat and vegetables purchases were estimated using data from the professional marketing agency GfK, which tracked all food purchases of 4300-6200 Flemish households over the period 2009-2018.

**Results/findings:** A standard deviation increase in online celebrity chef popularity resulted in an increase in vegetable and meat purchases in the following month in the age group <30 and 50-64years. This impact was higher among the age group <30 as they saw an 1.79% and 1.85% increase in meat and vegetable purchases in the following month compared to 0.82% and 1.09% increase in the age group 50-64. In contrast, television celebrity chef popularity showed no impact on purchase behavior in any age group, which is in line with previous survey studies.

**Conclusions:** This study showed how online celebrity chef popularity relates to dietary purchases, especially among younger generations. These findings are in line with previous studies that advocate for using online interventions and celebrity chefs for health promotion campaigns among younger generations.

# Examining the Referral of Patients with Elevated Blood Pressure to Health Resources in an Under-Resourced Community in South Africa

**Associate Professor Mark Stoutenberg<sup>1</sup>**, Ms. Lia K. McNulty<sup>1</sup>, Ms. Stephanie Evans<sup>1</sup>, Mr. Daniel Katiyo<sup>2</sup>, Ms. Delisile Kubheka<sup>2</sup>, Ms. Mimi Mhlaba<sup>2</sup>, Ms. Amy Harrison<sup>3</sup>, Associate Professor Lisa J. Ware<sup>2</sup>

<sup>1</sup>Temple University, Philadelphia, USA, <sup>2</sup>University of Witwatersrand, Johannesburg, South Africa, <sup>3</sup>Philasonke, Johannesburg, South Africa

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Introduction:** Under-resourced communities in low-and-middle income countries face disparities affecting access to healthcare services and necessary treatment. Community health workers (CHWs) can connect patients to health resources in these communities; however, little has been done to examine how referrals to these resources would be acted upon by community members.

**Purpose:** To investigate factors influencing patient engagement with referrals connecting them to appropriate resources for elevated blood pressure.

**Methods:** CHWs conducted home visits, including blood pressure (BP) screening and counseling, with community members in Soweto, South Africa. Based on their BP level, moderate (BP=120-139/80-89 mmHg) and high (BP≥140/90 mmHg) risk patients were referred to a local gym or health clinics, respectively. Interviews were conducted with individuals given a referral who: 1) went to the gym, 2) did not go to the gym, 3) went to the clinic, and 4) did not go to the clinic. The interviews were transcribed and analyzed to identify common themes and differences between groups regarding their decisions to act on the referrals.

**Results:** CHWs visited 1056 homes, with 1009 community members consenting to the screening; 27.9% of patients were classified as healthy, 38.7% as moderate risk, and 33.4% as high risk. Only 25.7% of community members accepted a referral from the CHW. Five themes emerged from the interviews: 1) prior knowledge and thoughts on BP, 2) psychosocial factors associated with BP control, 3) factors influencing acting on the referral, 4) perception about receiving the referral, and 5) perceived benefits of acting on the referral.

**Discussion:** CHWs can connect community members to health resources to which they may not have regular access. However, further examination is needed to explore community members hesitancy to receive and/or acting upon the referrals.

# Implementing and Evaluating the Integration of Physical Activity into a Major Health System and Connecting Patients to Community-Based Physical Activity Programs

**Associate Professor Mark Stoutenberg<sup>1</sup>**, Prof. Jennifer Trilk<sup>2</sup>, Prof. John Brooks<sup>3</sup>, Ms. Stephanie Eskuri<sup>4</sup>, Dr. Meenu Jindal<sup>4</sup>, Assistant Professor Leah Schumacher<sup>1</sup>, Assistant Professor Chris Wichman<sup>6</sup>, Mr. Alex Ewing<sup>4</sup>, Prof. Paul Estabrooks<sup>5</sup>

<sup>1</sup>Temple University, Philadelphia, USA, <sup>2</sup>University of South Carolina School of Medicine Greenville, Greenville, USA, <sup>3</sup>University of South Carolina, Columbia, USA, <sup>4</sup>Prisma Health, Greenville, USA, <sup>5</sup>University of Utah, Salt Lake City, USA, <sup>6</sup>University of Nebraska Medical Center, Omaha, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To examine strategies for optimally implementing a clinic-to-community model (Exercise is Medicine Greenville; EIMG®) that identifies physically inactive patients in primary care settings and connects them to a community-based physical activity (PA) program.

**Methods:** This study will utilize a pragmatic, stepped wedge cluster randomized design to examine EIMG® implementation across primary care clinics in a large U.S. health system. After a run-in period and onboard training, six primary care clinics will enter the study every six months. Our specific aims are to: 1) determine differences and factors associated with provider-level adoption, implementation, and reach of EIMG® at newly onboarded primary care clinics; 2) assess the effectiveness of patient engagement in a 12-week PA program offered at local community PA centers on self-reported PA levels and health outcomes captured via electronic health records, and 3) evaluate the cost of implementing EIMG® and the cost-effectiveness of patients participating in EIMG® vs. standard of care. As an exploratory aim, we will evaluate long-term adaptations and sustainability of EIMG® implementation in the primary care clinics.

**Results/Findings:** We will use a mixed methodological approach to explore factors related to achieving optimal implementation and reach of EIMG® (primary outcome = provider referrals) and patient engagement in the community-based PA program. The RE-AIM framework will inform the assessment of our primary implementation outcomes, while the i-PARIHS framework will explore contextual factors impacting clinic- and patient-level outcomes. To estimate the cost-effectiveness of EIMG®, we will compare extracted patient data from clinics with and without EIMG® to estimate healthcare costs. These estimates will be used in a short-term cost-effectiveness analysis and long-term modeling examining changes in secondary health outcomes on healthcare costs. Throughout the study, we will pay special attention to issues of health equity across all RE-AIM dimensions.

**Conclusions:** This study has the potential to significantly improve clinical practice by informing future strategies for optimizing and scaling up comprehensive PA models into health systems. This study also will provide information on potential savings to health systems looking to implement PA as a population health management tool through clinic-community linkages.

# Finding Food Security without Federal Food Assistance: A Look at US Households above Poverty Thresholds for SNAP

**Ms. Ana Altares<sup>1</sup>**, Dr. Megan Mueller<sup>1</sup>

<sup>1</sup>Colorado State University, Fort Collins, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** Federal programs in the United States such as the Supplemental Nutrition Assistance Program (SNAP) address food insecurity by providing financial assistance to households with income at or below 130% of the federal poverty level (FPL). These income requirements are the same across the US, despite regional variations in cost-of-living. While food insecurity often tracks with poverty, households in high cost-of-living regions may report income above 130% FPL, making them ineligible for SNAP; yet they may still experience food insecurity. One particular mountain resort-rural region in the US experiences food insecurity challenges including high cost-of-living due, in part, to ski tourism, long travel distances to food sources, and limited transportation routes.

This project will explore how households above and at/below 130% FPL in this region cope with food insecurity. Specifically, we aim to evaluate how they utilize community food assistance resources (i.e., food pantries) and whether they make different economic tradeoffs (i.e., forgoing medical expenses for food). We hope to understand how households navigate food access in this region and their lived experience of food insecurity.

**Methods** First, we will survey 1080 food insecure residents above and below 130% FPL within this region. We will assess food insecurity, use of community food assistance resources, and economic tradeoffs. We will analyze these findings using ordinal logistic regression to determine differences in food resources use and economic coping strategies by income group. We will then use a participatory action research method, photovoice, to encourage residents (n=30) to photograph and share their lived experience with food insecurity, and create action steps to improve regional food security.

**Results** These findings will add to our understanding of food insecurity coping strategies and experiences, particularly among households that cannot access federal food assistance due to income. This research also hopes to encourage and empower residents to take part in community change and knowledge production.

**Conclusions** The findings from this study will inform 5-year strategic plan to end food insecurity within this region. This research may also serve as a model to other high cost-of-living regions impacted by food insecurity across the United States and other countries.

# A systematic review and meta-analysis of interventions designed to increase moderate-to-vigorous physical activity among families

**Dr. Justin Guagliano**<sup>1,2</sup>, Miss Holly Hliounakis<sup>1</sup>, Associate Professor Emma George<sup>1,2</sup>, Dr. Cristy Brooks<sup>1</sup>, Dr. Sarah Kennedy<sup>1,2</sup>

<sup>1</sup>Western Sydney University, Sydney, Australia, <sup>2</sup>Translational Health Research Institute, Sydney, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Most young people and adults do not accumulate the recommended amount of moderate-to-vigorous physical activity (MVPA). Targeting whole families may be an important strategy for sustained behaviour change. However, many studies do not consider the family as a unit that may work together to change behaviour. The purpose of this study was to determine the effectiveness of interventions designed to increase MVPA among families.

**Methods:** A systematic review and meta-analysis were conducted. Four electronic databases were searched: MEDLINE, Scopus, SPORTDiscus, and PsycINFO, with forward searching in Google Scholar. Included studies sampled generally healthy school-aged children (i.e.,  $\geq 5$  to  $< 18$  years old) and at least one adult primarily responsible for their care. Studies must have tested an intervention aiming to increase family MVPA, using any experimental (e.g., randomised controlled trials, cross-over designs) or quasi-experimental design. Included studies also must have measured physical activity on at least one child and at least one adult primarily responsible for their care. Random-effects meta-analyses were conducted to determine the intervention effect on family MVPA. Analyses were conducted using Stata Version 17.

**Results/Findings:** From an initial pool of 24,913 nonduplicate records, 11 studies were included. Most studies were conducted in Europe ( $n=5$ ), followed by North America ( $n=3$ ), Asia ( $n=2$ ), and Oceania ( $n=1$ ). All studies used accelerometry as the primary physical activity measure. Nine studies provided sufficient data for inclusion in the meta-analyses at the time of abstract submission. Meta-analyses demonstrated a small nonsignificant effect for MVPA post-intervention for children (Hedge's  $g = .261$ , 95% CI  $-.148-.670$ ,  $p = .212$ ) and parents (Hedge's  $g = .156$ , 95% CI  $-.055-.367$ ,  $p = .149$ ). There was no effect for MVPA for children or parents at longer-term follow-up. Only 3 studies reported family co-participation in physical activity.

**Conclusions:** This study demonstrated that family-based physical activity interventions were not effective at increasing childrens' or parents' accelerometer-measured daily MVPA at post-intervention or at longer-term follow-up. Null findings may be due to well-designed interventions not reaching the target populations as intended (e.g., inactive/low-active families) or effects not maintained across the day. Family co-participation in physical activity was also rarely measured.

# Feasibility of Reducing and Breaking Up University Students' Sedentary Behaviour: Pilot Trial and Process Evaluation

**Dr. Oscar Castro**<sup>1,2</sup>, Dr. Ineke Vergeer<sup>1</sup>, Dr. Jason Bennie<sup>1</sup>, Prof. Stuart Biddle<sup>1,3</sup>

<sup>1</sup>Physically Active Lifestyles Research Group (USQ-PALs), Centre for Health Research, University of Southern Queensland, Springfield Central, QLD, Australia, <sup>2</sup>Future Health Technologies, Singapore-ETH Centre, Campus for Research Excellence And Technological Enterprise (CREATE), Singapore, Singapore, <sup>3</sup>Faculty of Sport & Health Sciences, University of Jyväskylä, Jyväskylä, Finland

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Accumulating high levels of sedentary behaviour has been linked to poor health outcomes. This quasi-experimental (pre-post) pilot study examined the feasibility and preliminary, short-term effects of a theory-based intervention aimed at reducing total and prolonged sedentary behaviour in university students.

**Methods:** Nine ambulatory undergraduate students (Mean age =  $22 \pm 2.32$ ) participated in a one-on-one session, including an educational component around the health effects of sedentary behaviour and three distinct activities (feedback, “pros and cons” exercise, and suggested behaviour change strategies). In addition, automated daily text messages targeting sedentary behaviour were sent for 6 days (four messages per day at fixed intervals). The Behaviour Change Wheel framework guided the intervention design process. Outcomes were assessed over 6 days in pre- and post-intervention periods and included accelerometer-based (activPAL) and self-reported (Nightly-Week-U) total sedentary time, as well as accelerometer-based number of steps and prolonged sedentary time. Students completed a process evaluation interview upon completing the trial.

**Results:** From pre- to post-intervention, there was a significant reduction in accelerometer-based total and prolonged sedentary time during weekend days. In addition, there was a significant increase in accelerometer-based standing time and stepping during weekend days. There were no statistically significant changes in accelerometer-based sedentary time, standing time or number of steps during weekdays. Process evaluation results indicated that the intervention and its assessment is feasible. Reductions in sedentary time were likely to be mediated by positive changes in the student’s reflective and automatic motivation.

**Conclusions:** Findings from this small, short-term intervention suggest that a single one-on-one session, together with automated text messages, may help university students reduce sedentary behaviour and enhance movement during weekend days. Additional strategies to maximise the intervention effects are discussed (e.g., establishing a collaboration with university staff, introducing sit-to-stand desks, and/or facilitating social support). A randomised control trial assessing sedentary behaviour over a longer period is needed to adequately study the intervention’s effectiveness.

# Development of a measurement tool to quantify park-based, and total, physical activity levels: Park-PAQ

**Dr. Nicole Edwards<sup>1</sup>**, Dr. Paula Hooper<sup>1</sup>

<sup>1</sup>University of Western Australia, Perth, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** Few studies have explicitly quantified the proportion of park-based physical activity to park users' overall physical activity levels. Population studies need new context-specific physical activity measurement tools to achieve this. The objective of this study was to develop a reliable measure of self-reported park use and physical activity undertaken within and outside of parks to determine the contribution that park-based physical activity makes to overall physical activity levels.

**Methods** A test-retest reliability study ( $n=104$ ) was conducted using the Park Physical Activity Questionnaire (Park-PAQ), an instrument based on the Active Australia Survey. Park-PAQ items captured the frequency and duration of walking for recreation or exercise, walking for transport, moderate and vigorous physical activity and strength, conditioning and balance activities done in parks and elsewhere.

**Results** Recall of doing any walking for recreation ( $\kappa = 0.649$ ,  $p < 0.001$ ) and any vigorous physical activity ( $\kappa = 0.772$ ,  $p < 0.001$ ) was 'substantial', recall of doing any moderate physical activity ( $\kappa = 0.553$ ,  $p < 0.05$ ) was 'moderate/acceptable', and recall of any walking for transport ( $\kappa = 0.840$ ,  $p < 0.001$ ) 'near perfect'. Recall of the time spent walking for recreation in parks ( $ICC = 0.652$ ,  $p < 0.001$ ) was 'substantial', whilst recall of time spent doing moderate activity in parks ( $ICC = 0.925$ ,  $p < 0.001$ ) and vigorous activity in parks ( $ICC = 0.962$ ,  $p < 0.001$ ) was 'near perfect'. Time spent walking for transport in a park ( $ICC = 0.350$ ,  $p = 0.056$ ) showed 'fair' agreement. Repeatability of the usual level of park use ( $\kappa = 0.957$ ) was 'near perfect'.

**Conclusions** The Park-PAQ reliably measures four domains of physical activity and quantifies the proportion of physical activity done in parks as a proportion of total physical activity. The Park-PAQ, used alone or embedded into park or physical activity surveys, will reliably capture context-specific activities that will optimise population level physical activity interventions, park programming and park management and design.

# A Machine Learning Study on Risk Factors of Sleep Insufficiency in 3-month-old Infants

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Introduction:** Sleep is pivotal during infancy for optimal development including executive function, memory consolidation, language learning and physical growth, however many infants do not attain adequate sleep. Sleep is multi-factorial, yet most studies only investigate one or few factors at a time, hence we aim to apply machine learning on a multimodal dataset to identify potential risk factors underlying insufficient sleep among 3-month old infants from a Singaporean birth cohort.

**Materials and Methods:** We applied machine learning on perinatal data from 605 healthy mother-child dyads from the Growing Up in Singapore Towards healthy Outcomes (GUSTO) birth cohort study to model associations between different features in our dataset and sleep insufficiency in 3 months old infants (caregiver reported total sleep duration <14 hours using the Brief Infant Sleep Questionnaire). We considered all combinations of the 9 risk factor categories including demographics, parental and child health, polygenic score and lifestyle factors like sleep, physical activity and nutrition and developed feedforward neural networks (FFN) models for each combination. Salient features were identified using three salience detection methods (DeepLIFT, Integrated gradients and GradientSHAP).

**Results:** The key risk factor categories in the top performing models are maternal antenatal nutrition, demographics, infant sleep arrangement, maternal health and antenatal physical activity. After recursive model reduction, we identified the salient features to be maternal antenatal plasma fatty acid, betaine, calcium and tryptophan concentrations, co-sleeping and room sharing, feeding the infant to sleep, infant snoring, maternal physical activity before pregnancy, extent that stress impacted health, maternal education and having other children at home. Specifically, we found that higher maternal education, having other children at home, greater physical activity before conception, greater extent where stress affected their health in the past, lower oleic acid percentage and higher n-3:n-6 fatty acid ratio in the maternal antenatal plasma were associated with lower risk of sleep insufficiency in 3 months old infants.

**Conclusions:** Many of the risk factors associated with sleep insufficiency in 3 months old infants are antenatal and potentially modifiable. Our findings provide future opportunities for interventions that can target these risk factors to address infant sleep insufficiency.

# Development of “LvL UP”: A smartphone-based, conversational agent-delivered holistic lifestyle intervention for the prevention of non-communicable diseases and common mental disorders

**Dr. Oscar Castro**<sup>1</sup>, Dr Jacqueline Mair<sup>1,2</sup>, Dr. Alicia Salamanca-Sanabria<sup>1</sup>, Ms. Aishah Alattas<sup>1</sup>, Mr. Roman Keller<sup>1,2</sup>, Ms. Shenglin Zheng<sup>2</sup>, Mr. Ahmad Jabir<sup>7</sup>, Ms. Xiaowen Lin<sup>7</sup>, Ms. Bea Frese<sup>1,3</sup>, Mr. Chang Siang Lim<sup>1</sup>, Mr. Prabhakaran Santhanam<sup>5</sup>, Prof. Rob Van Dam<sup>2</sup>, Prof. Josip Car<sup>8,9</sup>, Prof. Jimmy Lee<sup>7,10,11</sup>, Prof. E Shyong Tai<sup>1,2,4</sup>, Prof. Elgar Fleisch<sup>1,3</sup>, Prof. Florian von Wangenheim<sup>1,5</sup>, Associate Professor Lorainne Tudor Car<sup>7,9</sup>, Dr. Falk Müller-Riemenschneider<sup>1,2,6</sup>, Associate Professor Tobias Kowatsch<sup>12,13,5,1</sup>

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Non-communicable diseases (NCDs) and common mental disorders (CMDs) are the leading causes of death and disability worldwide. Lifestyle interventions via mobile apps and conversational agents present themselves as low-cost, scalable solutions to prevent these conditions. This work describes the rationale for, and development of, “LvL UP”, a digital lifestyle intervention aimed at preventing NCDs and CMDs.

**Methods:** A multidisciplinary team led the intervention design process of LvL UP, involving four phases: (i) preliminary research (stakeholder consultations, systematic market reviews), (ii) selecting intervention components and developing the conceptual model, (iii) whiteboarding (prototype development), and (iv) testing and refinement. The Multiphase Optimization Strategy and the UK Medical Research Council framework for developing and evaluating complex interventions were used to guide the intervention development.

**Results:** Preliminary research highlighted the importance of targeting holistic wellbeing (i.e., both physical and mental health). Accordingly, the first version of LvL UP features a smartphone-based, conversational agent-delivered holistic lifestyle intervention built around three pillars: Move More (physical activity), Eat Well (nutrition and healthy eating), and Stress Less (emotional regulation and wellbeing). Intervention components include health literacy and psychoeducational coaching sessions, daily “Life Hacks” (healthy activity suggestions), breathing exercises, and journaling. In addition to the intervention components, formative research also stressed the need to introduce engagement-specific components to maximise uptake and long-term use. LvL UP includes a motivational interviewing and storytelling approach to deliver the coaching sessions, as well as progress feedback and gamification. Offline materials are also offered to allow users access to essential intervention content without needing a digital device.

**Conclusions:** The development process of LvL UP led to an evidence-based and user-informed digital health intervention that aims to help adults prevent NCDs and CMDs. LvL UP is designed to be a scalable, engaging, prevention-oriented intervention focused on healthy nutrition, physical activity, and psychological wellbeing. A feasibility study and subsequent optimisation and randomised-controlled trials are planned to further refine the

intervention and establish effectiveness. The development process described here may prove helpful to other intervention developers.

# Effects of Virtual Reality-Based Exercise Intervention on Promoting College Students' Physical Activity Levels

**Dr. Wenxi Liu<sup>1</sup>**, Dr. Kun Wang<sup>1</sup>, Dr. Tao Huang<sup>1</sup>, Dr. Zan Gao<sup>2</sup>

<sup>1</sup>Shanghai Jiao Tong University, Shanghai, China, <sup>2</sup>University of Minnesota Twin Cities, Minneapolis, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** The present study examined the effects of an immersive virtual reality (VR) biking exercise intervention on promoting college students' physical activity (PA) levels.

**Methods:** 36 college students ( $M_{age} = 23.89$ ,  $SD = 3.57$ ;  $M_{BMI} = 25.29$ ,  $SD = 3.96$ ) participated in a 4-week intervention. Participants were randomly assigned to the intervention (participants exercised on an immersive VR-based exercise bike for one hour per session, two times per week, for 4 weeks) and control group (participants maintained their usual activities for 4 weeks). Participants' PA levels were assessed by the International Physical Activity Questionnaire (IPAQ) at baseline and post-intervention. Two-way repeated measures ANOVAs examined between-group differences on the preceding physiological and psychological outcomes over time.

**Results:** The two-way repeated measures ANOVA indicated a significant main effect of time on PA ( $F(1,34) = 15.84$ ,  $p < 0.001$ ,  $h_p^2 = 0.34$ ). Further, the significant "time \* group" interaction was observed ( $F(1,34) = 17.35$ ,  $p < 0.001$ ,  $h_p^2 = 0.36$ ). The tests of between-subjects effects indicated a significant group difference on PA after 4 weeks intervention ( $F(1,34) = 5.91$ ,  $p = 0.02$ ,  $h_p^2 = 0.16$ ), indicating that intervention participants reported significant higher level of PA as compared to control group after 4 weeks. In detail, Intervention group's PA has increased 1075.12 MET-minutes/week after 4 weeks, whereas control group's PA has decreased 24.44 MET-minutes/week after 4 weeks.

**Conclusion:** The findings suggested that the immersive VR-based exercise can be an enjoyable and effective tool for motivating college students participating in greater PA. The longitudinal study is warranted to further conclude the long-term effects of VR-based exercise on promoting PA and health.

# Screen time and cardiometabolic health risk: Are all screens the same?

**Ms. Haley Dennis<sup>1</sup>**, Dr. Jennifer Copeland<sup>1</sup>

<sup>1</sup>University of Lethbridge, Lethbridge, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Engaging in high amounts of sedentary behaviour has been linked to poor health, and sedentary screen time may be especially detrimental. While TV viewing time has been associated with cardiometabolic health risk, contemporary screen time behaviours have changed to be ubiquitous and include many different types of “screens”. The purpose of this study was to explore the relationship between cardiometabolic health risk and self-reported leisure time spent using five common types of screens.

**Methods:** Healthy adult volunteers ( $n = 80$ , 61% women,  $40.7 \pm 16.1$  years of age) completed a screen time questionnaire regarding typical weekly sedentary screen use including TVs, TV-connected devices, laptops/computers, smartphones, and tablets. Clustered cardiometabolic risk scores (CMRS) were calculated based on eleven health biomarkers. To measure physical activity, ActivPAL4™ inclinometers were worn by participants continuously for one week. Cross-sectional associations between CMRS and time viewing each screen type were examined using Spearman's bivariate correlations and multiple linear regressions adjusted for age, sex, and physical activity.

**Results:** Participants reported total screen time of  $5.99 \pm 3.66$  hours per day with  $1.43 \pm 1.63$  hours per day of TV-viewing time and  $2.39 \pm 1.92$  hours per day of smartphone use. TV-viewing time was significantly associated with CMRS ( $\rho = 0.33$ ,  $p = 0.003$ ), whereas total sedentary time and the other screen types were not. Total screen time was significantly associated with CMRS in the fully adjusted model ( $B = 0.04$ , 95% CI 0.01–0.07,  $p = 0.013$ ). CMRS was associated with TV time ( $B = 0.09$ , 95% CI 0.02–0.16,  $p = 0.017$ ) and smartphone time ( $B = 0.07$ , 95% CI = 0.00–0.14,  $p = 0.048$ ) in unadjusted models, but after controlling for covariates these associations were no longer significant.

**Conclusions:** Greater self-reported screen time was associated with greater cardiometabolic health risk among healthy adults across a wide age range. These results suggest that the total screen time an individual accumulates might be more important than the type of screen they are viewing. However, we did not examine the types of activities completed by participants while using screens, which could have implications for cardiometabolic health.

# How can we make healthy young people increase physical activity?

**Associate Professor Harunobu Usui<sup>1</sup>**

<sup>1</sup>Aichi Medical College, Aichi pref., Japan

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Regular physical activity can help prevent cardiovascular disease. Low physical activity is an issue faced by for generations. Therefore, determining an effective way to increase physical activity is crucial. Previous studies have employed accelerometers to measure physical activities, and encouragement from others is shown to be effective in increasing physical activity. Online meeting systems were widely used during the coronavirus disease 2019 pandemic. Can online feedback be used to increase physical activity awareness? The purpose of this study is to investigate the impact of online feedback on physical activity among healthy young people.

**Methods:** The 20 young and healthy individuals participated in the study. All participants separated a control group or feedback group. They participated for 4 weeks study, and their physical activity was measured using an accelerometer (HJA-750C/OMRON). The feedback group participants were provided online feedback every week by the other volunteers. They showed the participants their one-week physical activity information and advised them to increase their physical activity using google meet online system. No feedback was provided the control group. Total active time (min) per week and physical activity [(METs\*hour) more than 3 METs (metabolic equivalents)] per week were calculated.

**Results:** The median total active time in the control group was 4344 min at the initial stage, 4496 min at two weeks after, and 4285 min at four weeks after. The median total active time in the feedback group was 4385 min at the initial stage, 4799 min at two weeks after, and 5071 min at four weeks after. The medians of physical activity more than 3 METs in the control group were 16.3 METs\*h at the initial stage, 16.9 METs\*h at two weeks after, and 18.4 METs\*h at four weeks after. The medians of physical activity more than 3 METs during the feedback group were 17.6 METs\*h, 22.4 METs\*h, and 25.3 METs\*h at the initial stage, two weeks after, and four weeks after, respectively.

**Conclusions:** Online feedback may influence and increase physical activity. Future study would allow for more participations and follow ups.

# Adherence and predictors of physical activity and screen viewing time guidelines among Singaporean toddlers

**Ms. Shuen Lin Tan<sup>1</sup>**, Ms. Natarajan Padmapriya<sup>2,3</sup>, Dr. Narasimhan Kothandaraman<sup>1</sup>, Dr. Anne HY Chu<sup>1,2</sup>, Ms. Claire Marie Jie Lin Goh<sup>2</sup>, Prof. Yap-Seng Chong<sup>1,3</sup>, Prof. Lynette P Shek<sup>1,4</sup>, Prof. Kok Hian Tan<sup>5</sup>, Prof. Peter D Gluckman<sup>1,6</sup>, Prof. Fabian KP Yap<sup>7,8,9</sup>, Prof. Yung Seng Lee<sup>1,4</sup>, Assistant Professor See Ling Loy<sup>7,10</sup>, Prof. Jerry KY Chan<sup>7,10</sup>, Prof. Keith M Godfrey<sup>11</sup>, Prof. Johan G Eriksson<sup>1,3,12,13</sup>, Associate Professor Shiao-Yng Chan<sup>1,3</sup>, Dr. Jonathan Y Bernard<sup>14</sup>, Prof. Falk Müller-Riemenschneider<sup>2,15</sup>

<sup>1</sup>Singapore Institute for Clinical Sciences (SICS), Agency for Science, Technology and Research (A\*STAR), Singapore, Singapore,

<sup>2</sup>Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore, <sup>3</sup>Department of Obstetrics & Gynaecology, Yong Loo Lin School of Medicine, National University of Singapore, Singapore, Singapore, <sup>4</sup>Department of Paediatrics, Yong Loo Lin School of Medicine, National University of Singapore, Singapore, Singapore, <sup>5</sup>Department of Maternal Fetal Medicine, KK Women's and Children's Hospital, Singapore, Singapore, <sup>6</sup>Liggins Institute, University of Auckland, Auckland, New Zealand, <sup>7</sup>Duke-NUS Medical School, Singapore, Singapore, <sup>8</sup>Department of Pediatrics, KK Women's and Children's Hospital, Singapore, Singapore, <sup>9</sup>Lee Kong Chian School of Medicine, Nanyang Technological University, Singapore, Singapore, <sup>10</sup>Department of Reproductive Medicine, KK Women's and Children's Hospital, Singapore, Singapore, <sup>11</sup>MRC Lifecourse Epidemiology Centre and NIHR Southampton Biomedical Research Centre, University of Southampton and University Hospital Southampton NHS Foundation Trust, Southampton, United Kingdom, <sup>12</sup>Department of General Practice and Primary Health Care, University of Helsinki, Helsinki, Finland, <sup>13</sup>Folkhälsan Research Center, Helsinki, Finland, <sup>14</sup>Université Paris Cité, Inserm, INRAE, Centre for Research in Epidemiology and Statistics (CRESS), Paris, France, <sup>15</sup>Center for Digital Health, Berlin Institute of Health, Charité University Medical Centre, Berlin, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** International guidelines recommend  $\geq 180$  minutes of physical activity (PA) and  $\leq 1$  hour per day of sedentary screen viewing time (SVT) for toddlers. There is limited research on whether these guidelines are being met in young children, particularly in Asia. We aimed to investigate the proportion of children meeting the recommendation among Singaporean toddlers.

**Methods:** In the longitudinal Singapore Pre-Conception Study of Long-Term Maternal and Child Outcomes (S-PRESTO), parents/caregivers reported information on light-intensity PA (LPA), moderate-to-vigorous PA (MVPA) and SVT of 2- and 3-year-old children. PA time and SVT were calculated and categorized based on Singapore PA guidelines ( $\geq 60$ -minutes of MVPA/day above 3-years,  $\geq 180$ -minutes of total PA/day,  $\leq 1$ -hour of SVT/day). Maternal age, education, and ethnicity were collected during pre-conception using an interviewer-administered questionnaire, and child sex ascertained at delivery. We used McNemar's chi-square test to compare the proportions of children meeting guidelines at ages 2- and 3-years, and multivariable logistic regression at both timepoints to investigate the associations of socio-demographic factors and adherence to the guidelines.

**Results/findings:** 239 children had PA and SVT data at both timepoints. Compared to age 2 years, at age 3 years, a higher proportion of children met total PA (2-years: 50% vs 3-years: 92%,  $p < 0.001$ ) and MVPA (2-years: 59% vs 3-years: 84%,  $p < 0.001$ ) guidelines. However, compared to age 2 years, at age 3 years a lower proportion of children met SVT guidelines (2-years: 52% vs 3-years: 37%,  $p < 0.001$ ). At both age 2- and 3-years, children of mothers with at least a university degree are more likely to meet SVT guidelines [Odds ratio (95% confidence interval): 2-years: 2.49 (1.33, 4.73), 3-years: 3.53 (1.76, 7.51)]. No other sociodemographic factors investigated had a significant association with SVT. Regression with PA did not yield significant predictors.

**Conclusions:** Our study shows that the proportion of children meeting SVT guidelines decreases as children grow older, and that maternal educational attainment is a significant predictor of children's SVT. We need to further explore the favorable changes in adherence to PA guidelines at age 3 years to see if they could possibly be attributed to motor skills development or school attendance.

# Facilitating Ambulatory Heart Rate Variability Analysis by using Accelerometer-based Classifications of Physical Behaviour

**Ms. Marlene Rietz<sup>1,2</sup>**, Dr. Jesper Schmidt-Persson<sup>1</sup>, Prof. Anders Grøntved<sup>1</sup>, Associate Professor Jan C. Brønd<sup>1</sup>

<sup>1</sup>Center for Research in Childhood Health, Research Unit for Exercise Epidemiology, Department of Sports Science and Clinical Biomechanics, Odense, Denmark, <sup>2</sup>Karolinska Institutet, Stockholm, Sweden

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** This study compared ambulatory heart rate variability (HRV) across behaviours during wake and sleep in free-living settings to facilitate standardised analysis of HRV.

**Methods** Beat-to-beat heart rate (HR) and accelerometry were collected using single-lead ECG (Firstbeat Bodyguard 2) and trunk- and thigh-worn Axivity AX3 among 161 adults participating in the SCREENS trial (Region of Southern Denmark) for six days. HR files were loaded and processed in HRVdata structures employing the RHRV R-package. Using a validated algorithm, start time and duration spent in the behaviours sitting, standing, and lying were extracted, and information on self-reported sleep was added. Time and frequency analysis for each episode was executed in an automated fashion. Differences in root mean square of successive RR interval differences (RMSSD) and normalised unit (nu) low and high frequency (LFnu, HFnu) across activities were compared using linear mixed regression adjusted for age and sex with subject ID as random effect. Moreover, a nested repeated-measures Bland-Altman analysis was used to compare gold-standard 24 h summary RMSSD estimates with RMSSD during self-reported or normalised sleep (0:00 - 5:00), and limits of agreement (LoA) and concordance correlation coefficients (CCC) were computed.

**Results** HRV was estimated for 31,289 episodes in 161 individuals (52.8% female) at a mean age of 41.44 years. Compared to seated position, mean differences (95% confidence interval [CI]) in RMSSD while standing and lying (wake) were -2.63 ms (-3.24, -2.01) and 4.53 ms (4.15, 4.91), respectively. There were significant differences in lying HRV across sleep status including increased RMSSD and HFnu and decreased LFnu in asleep state. Bland-Altman analyses showed a bias (95% LoA) of 4.49 ms (-25.05, 16.07) and 4.42 ms (-26.88, 18.04) at a CCC (95% CI) of 0.78 (0.76, 0.80) and 0.72 (0.68, 0.75) for total and normalised sleep compared to 24 h RMSSD, respectively.

**Conclusions** This analysis characterised differences in HRV across activities during wake and sleep in a large, ambulatory sample. Findings highlight significant differences in HRV across physical behaviours and poor agreement between long-term HRV assessments (24h, sleep). Methodologies to address these differences are required to reduce measurement bias with ambulatory HRV analysis.

# Development of a Water Orientation measurement Tool for children with Autism Spectrum Disorders

**Mrs. Patty van t Hooft<sup>1</sup>**, Dr. Janet Moeijes<sup>1</sup>, Dr. Jooske van Busschbach<sup>1,2</sup>, Dr. Esther Hartman<sup>2</sup>

<sup>1</sup>Windesheim University of Applied Science, Zwolle, Netherlands, <sup>2</sup>University of Groningen, University Medical Center Groningen, Center for Human Movement Sciences, Groningen, Netherlands

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** This study aims to develop and validate an observation instrument of water-related motor skills in Children with Autism Spectrum Disorders. Apart from disorders in social communication, interaction, and repetitive behaviors, 80% of children with Autism Spectrum Disorders (ASD) are at risk for motor impairments. Aquatic interventions offer opportunities to practice, experience, discover, and develop motor skills. However, to tailor training and therapy to the needs of these children, insight into their movement behavior is essential; therefore, an observation tool for these children is needed.

It is necessary that the observation tool aligns with the motor problems and the symptoms associated with ASD. A swimming method that meets these requirements, is the Halliwick method (Lambeck, 2015). Therefore, this method was taken as a starting point in developing the observation tool.

**Methods** The five-stage model for developing and validating a systematic observation tool was used (Brewer & Jones, 2002; Roberts & Fairclough, 2012). After a literature search, observation training followed to identify specific motor behavior (stage 1); in stage 2, the instrument was developed, and stage 3 contained the determination of the instrument's face and construct validity by experts. In stage 4, the phase we are currently in, inter-rater reliability will be established via the intraclass correlation coefficient (ICC); and in stage 5, internal consistency via Cronbach's alpha will be measured.

**Results** Stages 1 to 3 have resulted in a validated observation tool with 24 items. Existing observation tools based on the Halliwick method and experts with a solid knowledge of the Halliwick-swimming method and/or experts in the field of ASD were consulted. The results of stages 4 and 5 are expected in May 2023 and will be presented at the symposium.

**Conclusion** To evaluate the water-based motor skills of children with ASD and to measure improvement after training/therapy, this new observation tool based on the Halliwick method is developed. The observation instrument is valuable to help children with ASD gain water-based motor skills by offering child-centred programs.

# Food policy and facilitators and barriers to adoption and implementation of nutrition interventions in higher education settings in Flanders: findings from a qualitative study

**Ms. Evelyn Fonderie**<sup>1,2</sup>, Prof. Wendy Van Lippevelde<sup>1</sup>, Prof. Benedicte Deforche<sup>1,2</sup>, Prof. Maïté Verloigne<sup>1</sup>, Prof. Tom Deliëns<sup>2</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Vrije Universiteit Brussel, Brussels, Belgium

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** As unhealthy dietary behavior and obesity are two main risk factors of cancer, it is of utmost importance to create a shift in younger individuals towards lifelong healthy dietary patterns and the prevention of weight gain. The transition from high school to college or university is a well-known and well-studied risk period for weight and/or fat gain and not meeting the recommended dietary guidelines. Unfortunately, students are an often neglected target group in health promotion efforts and, to date, there is only little understanding of the influencing factors of adoption and implementation of nutrition interventions in higher education settings. Therefore, the aim of this project is to provide insight into the organization of the food policies in higher education settings and stakeholders' perspectives on facilitators and barriers to adoption and implementation of nutrition interventions which aim at promoting healthy and sustainable eating behaviors among higher education students in Flanders.

**Methods:** Focus groups will be conducted with stakeholders (e.g., director/staff of student services or student restaurants, dieticians, responsible person for food policy on campus) from several Flemish higher education institutions with a semi-structured interview guide based on the Consolidated Framework for Implementation Research. Data collection will be continued until data saturation is reached. This goal is envisioned with an estimate of 5 to 10 focus groups with 6 to 10 participants. We aim to conduct 4 focus groups at colleges and 4 at universities with mixed food policy quality scores based on the regularly conducted Prevention Survey by the Flemish Institute of Healthy Living. Afterwards, the audio-recorded focus groups will be transcribed verbatim and analyzed using thematic analysis.

**Results:** The results are not yet available as the study is ongoing. Preliminary results will be presented at the congress. An overview of the organization of the food policies and facilitating and hindering factors will be reported.

**Conclusion:** The findings of this research will add to the literature on implementation science and will aim at informing future development and implementation of nutrition interventions promoting healthy and sustainable diets in higher education students in Flanders.

# “Including us, talking to us and creating a safe environment”- Youth Public and Patient Involvement (PPI) in the Walking In Schools (WISH) Study

**Prof. Marie Murphy**<sup>1,2</sup>, Dr. Maria O’Kane<sup>1</sup>, Dr. Angela Carlin<sup>1</sup>, Dr. Leanne Doherty<sup>1</sup>, Prof. Russell Jago<sup>3</sup>, Dr. Ian Lahart<sup>4</sup>, Dr. Maria Faulkner<sup>5</sup>, Mr. Gary McDermott<sup>1</sup>, Prof. Alison Gallagher<sup>6</sup>

<sup>1</sup>Centre for Exercise Medicine, Physical Activity and Health, Sports and Exercise Sciences Research Institute, Ulster University, Belfast, United Kingdom, <sup>2</sup>Physical Activity for Health Research Centre (PHARC), Institute for Sport, Physical Education and Health Sciences, University of Edinburgh, Edinburgh, United Kingdom, <sup>3</sup>Centre for Exercise, Nutrition & Health Sciences, School for Policy Studies, University of Bristol, Bristol, United Kingdom, <sup>4</sup>Faculty of Education, Health and Wellbeing, University of Wolverhampton, Walsall Campus, Walsall, United Kingdom, <sup>5</sup>Department of Law and Humanities, Atlantic Technological University, Letterkenny Campus, Letterkenny, Ireland, <sup>6</sup>Nutrition Innovation Centre for Food and Health (NICHE), Biomedical Sciences Research Institute, Ulster University, Coleraine Campus, Coleraine, United Kingdom

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Young people have the right to be informed, involved, and consulted about decisions affecting their lives. Patient and Public Involvement (PPI) ensures that research is carried out ‘with’ or ‘by’ young people rather than ‘to’, ‘about’ or ‘for’ them. To date, young people have had limited involvement in the design, implementation, and dissemination of public health research and in particular, physical activity (PA) research. We aimed to involve young people in the design, implementation, and dissemination of a PA intervention for adolescent girls.

**Methods:** Following the Walking In Schools (WISH) feasibility study that consulted young people pre- and post-intervention, a Youth Advisory Group (YAG) was set up within the main intervention trial. YAG meetings took place on three occasions and schools were asked to invite pupils aged 12-14 years and 15-18 years (walk leaders). Participative methods were used to answer researcher questions, develop study plans and review study documentation. The impact of these PPI activities was evaluated.

**Results/Findings:** The YAG meetings informed recruitment strategies for pupils and walk leaders. We aimed to recruit n384 pupils (average n24 pupils per school), this target was exceeded with n589 pupils recruited (average n32.7 pupils per school), and n51 (8.7%) of pupils subsequently withdrawing from the study. The YAG advised on the acceptability of data collection methods, accelerometry and incentives for returning accelerometers. At four timepoints, pupils were asked to wear the accelerometer for seven days (n2213 devices issued over 12 months). Only n3 (0.14%) devices were unreturned. Pupils were engaged with data collection and at all timepoints >84% of pupils met wear-time criteria. PPI shaped the development and refinement of the WISH Walk Leader Award and the number of walk leaders recruited (n149; n16.6 per school), exceeded the initial target of n135 or n15 per school. Over the intervention period, only n4 (2.7%) of walk leaders withdrew from the study.

**Conclusions** The views of young people were central to the development of the WISH Study and although difficult to evaluate the impact of PPI, in this instance, there is strong evidence of a positive impact on study recruitment, attrition, and data collection.

# Levels and barriers to physical activity and sport participation among equity-deserving groups in Canada with an intersectionality lens: A systematic review

**Ms. Mikyung Lee<sup>1</sup>**, Ms. Yas Alamshahi<sup>1</sup>, Ms. Bridgett Chau<sup>1</sup>, Ms. Joy Cheng<sup>1</sup>, Dr. Eun-Young Lee<sup>1</sup>

<sup>1</sup>Queen's University, Kingston, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Background:** Regular participation in physical activity has numerous benefits on health and well-being. Although it is important to ensure that all individuals have access to quality physical activity and sport experiences, most individuals living in Canada do not meet national physical activity guidelines, and members of equity-deserving groups generally report even lower rates of physical activity and sport participation, placing these populations at even greater risk for poor health outcomes and premature death. Equity-deserving groups also have been disproportionately impacted by COVID-19 with regards to access and opportunities to physical activity and sport participation. However, information about barriers to these opportunities among equity-deserving individuals is largely lacking.

**Purpose:** This systematic review was to summarize results from peer-reviewed, original research articles describing the levels of and barriers to physical activity and sport participation among the members of the equity-deserving groups, with an intersectionality lens.

**Methods:** Articles published in 2000 and up are identified and summarized, using Preferred Reporting Items for Systematic Reviews and Meta-Analyses. Searches were performed on five electronic databases using the following keywords: “physical activity”, “sport”, “exercise”, “equit\*”, “underserve\*”, “disadvantage\*”, “deprive\*”, and their variations and synonyms. Research articles were deemed eligible for inclusion if the following criteria were met: 1) peer-reviewed, published research articles; 2) described barriers to physical activity and sport participation; 3) written in English; 4) published between 2000 and present; 5) included the members of the equity-deserving groups; and 6) involved individuals living in Canada. Included articles will be synthesized both quantitatively and qualitatively.

**Results/findings:** After removing duplicates (n = 1,338), a total of 2,904 articles were available for the Level 1 screening. The review team is currently conducting the Level 2 screening and the results will be available by April 2023 and the full findings will be presented at the conference.

**Conclusions:** Multi-level barriers to physical activity and sport participation among the members of the equity-deserving groups will be identified. The outcome of this review will inform the development of inclusive strategies to promote physical activity and sport participation among people with diverse marginalized identities living in Canada.

# The acceptability and experiences of entomophagy in a UK adult population: an online survey.

**Dr. Lauren McGale**<sup>1</sup>, Dr. Maxine Sharps<sup>3</sup>, Dr. Jay Duckworth<sup>2</sup>

<sup>1</sup>Edge Hill University, Ormskirk, United Kingdom, <sup>2</sup>De Montfort University, Leicester, United Kingdom,

<sup>3</sup>University of Liverpool, Liverpool, United Kingdom

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Food choice has been identified as an important consumer impact area in sustainability efforts (Nash, 2009). Entomophagy (consuming insects) is gaining attention, due to potential nutritional and environmental advantages over other protein sources, being both high in protein and micro-nutrients (Dobermann, 2017) and having less environmental impact than larger livestock (Food and Agriculture Organization of the United Nations, 2020). However, in Western countries, where consuming insects is not common practice, it is generally considered to be disgusting and reserved as a novelty food (Deroy et al., 2015). The purpose of this study is to identify factors which may affect willingness to consume insects and to establish existing experience with entomophagy in the UK.

**Methods:** UK adults ( $M=34.03$  yrs,  $SD=10.74$  yrs;  $n=603$ ) were recruited to complete an online, cross-sectional survey, using the Prolific recruitment platform. Participants were 76% female. The survey consisted of demographic measures (age, gender, ethnicity, and education level), as well as measures of socioeconomic status (measured using the NS-SEC), environmental concern (via the ISSP-R), attitudes towards commodities (in this case insects, using the AtIT), Food Disgust (via the Food Disgust Scale), in addition to measures of anticipated taste/sensory perceptions and willingness to consume insects. Quantitative data analysis will be carried out using SPSS and will include multivariate analysis of variance (MANOVA) and multinomial logistic regression analyses, as appropriate. This study protocol has been preregistered ([osf.io/p3z62](https://osf.io/p3z62)).

**Results/findings:** Results are to be determined.

**Conclusions:** This study provides a well-timed opportunity to understand willingness to consume insects in a novel, Western population. It could potentially inform strategies which may improve acceptability of entomophagy, which could contribute to a reduction of the double burden of malnutrition and obesity, in addition to providing a potential agricultural solution to global food security and sustainability. Understanding consumer attitudes towards, and perceptions of, insects as a novel food source is key, if we wish to avail of this opportunity.

# Does context matter? The association between affective states and physical behavior and its moderation by weather factors measured with ambulatory assessment

**Ms. Irina Timm<sup>1</sup>**, Prof. Markus Reichert<sup>1,2,3</sup>, Prof. Ulrich W. Ebner-Priemer<sup>1,2</sup>, Dr. Marco Giurgiu<sup>1,2</sup>

<sup>1</sup>Mental mHealth Lab, Institute of Sports and Sports Science, Karlsruhe Institute of Technology, Karlsruhe, Germany, <sup>2</sup>Department of Psychiatry and Psychotherapy, Central Institute of Mental Health, Medical Faculty Mannheim/Heidelberg University, Mannheim, Germany, <sup>3</sup>Department of eHealth and Sports Analytics, Ruhr University Bochum, Bochum, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Physical behavior (PB) is a key lifestyle factor in regulating and preventing diseases across the lifespan. Researchers identified affective, cognitive, and contextual factors like weather conditions, as significant contributors in determining if individuals are physically active. However, there is scarce empirical evidence about potential associations between PB (i.e., physical activity and sedentariness) and affective states influenced by weather conditions in daily life. This study examined the within-subject association between affective states and subsequent PB. Additionally, the effects of contextual weather factors on PB were analyzed and interactions were exploratively considered.

**Methods:** Utilizing ambulatory assessment, 79 participants completed electronic diaries about their affective states (i.e., valence, energetic arousal, and calmness) up to six times a day over five days, and their PB was simultaneously recorded via accelerometers. Weather conditions (i.e., temperature and precipitation) recorded near participants' locations served as moderators in the multilevel analyses.

**Results:** Exploratory analyses showed that temperature significantly moderated the relationship between calmness, valence, and PB. Higher temperatures enhanced the positive effects of valence on physical activity ( $\beta = .001$ ,  $p = .023$ ) and attenuated the negative effects of calmness on physical activity ( $\beta = .001$ ,  $p = .021$ ). Moreover, higher temperatures enhanced the positive effects of valence on reduced sedentary behavior ( $\beta = -0.011$ ,  $p = .043$ ). In addition, we revealed a significant positive association between temperature, and physical activity ( $\beta = 0.025$ ;  $p = .015$ ). Furthermore, we confirmed earlier findings associating affective states with PB. Increased valence and energetic arousal were positively associated with physical activity ( $\beta = 0.007$ ;  $p < .001$ ), whereas calmness predicted lower levels of physical activity ( $\beta = -0.006$ ;  $p < .001$ ). Higher levels of calmness showed a positive association with sedentary behavior ( $\beta = 0.054$ ;  $p = .003$ ).

**Conclusions:** Moderating effects, such as higher temperatures enhancing the positive effects of valence on physical activity, provide mechanistic real-life insights as a basis for future health technologies. Just-in-time adaptive interventions offer the possibility to incorporate weather conditions and allow triggering individuals within their preferred weather conditions to promote physical activity. Such personalized real-time systems have recently been promoted by the WHO as most promising.

# Maternal smoking, breastfeeding, birth outcomes and overweight/obesity at ages of 3 and 10 years

**Ms. Mian Bao**<sup>1</sup>, Prof. Torsten Plösch<sup>1</sup>, Prof. Torsten Plösch<sup>2</sup>, Dr. Eva Corpeleijn<sup>3</sup>

<sup>1</sup>Department of Obstetrics and Gynecology, University Medical Center Groningen, University of Groningen, Groningen, Netherlands, <sup>2</sup>Perinatal Neurobiology, School of Medicine and Health Sciences Carl von Ossietzky University Oldenburg, Oldenburg, Germany, <sup>3</sup>Department of Epidemiology, University Medical Center Groningen, University of Groningen, Groningen, Netherlands

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Objective:** Great emphasis has been placed on the negative impact of maternal smoking during pregnancy on the offspring, while breastfeeding is beneficial for both mothers and children. The purpose of this study is to investigate the short-term and long-term effects of maternal smoking, breastfeeding, and especially to investigate if breastfeeding can reduce the negative effect of maternal smoking during pregnancy, on children's risk of overweight/obesity.

**Method:** 2142 mother-child pairs from the Dutch GECKO Drenthe cohort were included. Maternal smoking and breastfeeding data were based on multiple questionnaires for mothers and midwives. Birth outcomes were derived from clinical records. Weight and height were measured by Well Baby Clinic nurses. Overweight and obesity of children were classified by International Obesity Task Force (IOTF) criteria. Linear and logistic regression analyses, adjusted for relevant confounders, were used for continuous and dichotomous outcomes, respectively. Two-way ANOVA was used to detect the interaction effect.

**Results:** Of the 2142 pregnant women, 20.7% (443) mothers smoked during pregnancy. Maternal smoking during pregnancy was found to be associated with a lower birth weight ( $\beta$ : -0.15, 95%CI: -0.30-(-0.17),  $p<0.001$ ), lower birth length ( $\beta$ : -0.11, 95%CI: -1.13-(-0.39),  $p<0.001$ ) and lower head circumference at birth ( $\beta$ : -0.17, 95%CI: -1.20-(-0.35),  $p<0.001$ ), but not with placenta weight ( $\beta$ : -0.01, 95%CI: -23.44-16.50,  $p=0.733$ ). Maternal smoking during pregnancy was also found to be associated with overweight/obesity in children at ages 3 and 10 (aOR: 2.24, 95%CI: 1.28-3.94,  $p<0.01$ ; aOR: 2.29, 95%CI: 1.55-3.38,  $p<0.001$ ). 74.6% (1598/2142) of the mothers gave breastfeeding ever. Ever breastfeeding was not found to be associated with overweight/obesity at ages 3 and 10 (aOR: 1.58, 95%CI: 0.93-2.65,  $p=0.093$ ; aOR: 1.15, 95%CI: 0.81-1.63,  $p=0.437$ ). There was no interaction effect between maternal smoking during pregnancy and breastfeeding on children's BMI at ages of 3 and 10 years ( $p=0.737$ ;  $p=0.636$ ).

**Conclusion:** Maternal smoking during pregnancy may have short-term and long-term effects on children's growth, while breastfeeding may not counteract the negative impact of maternal smoking during pregnancy on children's overweight/obesity.

**Keywords:** Maternal smoking; breastfeeding; growth parameters; overweight/obesity

# Are the university campuses built environment associated with the active commuting of Chilean and Spanish students?

Ms. Ximena Palma-Leal<sup>1,2</sup>, Dr. Francisco Sergio Campos-Sánchez<sup>3</sup>, Prof. Greet Cardon<sup>4</sup>, Dr. Delfien Van Dyck<sup>4</sup>, Dr. Maria Paula Santos<sup>5,6</sup>, Dr. Fernando Rodríguez-Rodríguez<sup>2</sup>, Dr. Daniel Camiletti-Moirón<sup>7,8</sup>, **Dr. Palma Chillón<sup>1</sup>**

<sup>1</sup>Department of Physical Education and Sports, Faculty of Sport Sciences, Sport and Health University Research Institute (iMUDS), University of Granada, Granada, Spain, <sup>2</sup>IRyS Group, School of Physical Education, Pontificia Universidad Católica de Valparaíso, Viña del Mar, Chile, <sup>3</sup>Department of Urban and Spatial Planning, University of Granada, Granada, Spain, <sup>4</sup>Department of Movement and Sports Sciences – Research Unit Physical Activity and Health, Ghent University, Ghent, Belgium, <sup>5</sup>Research Center on Physical Activity, Health and Leisure (CIAFEL), Faculty of Sport, University of Porto, Porto, Portugal, <sup>6</sup>Laboratory for Integrative and Translational Research in Population Health (ITR), Porto, Portugal, <sup>7</sup>GALENO Research Group, Department of Physical Education, Faculty of Education Sciences, University of Cádiz, Puerto Real, Spain, <sup>8</sup>Instituto de Investigación e Innovación Biomédica de Cádiz (INiBICA), Cádiz, Spain

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Background:** Considering the daily interaction between university students and their campuses, specific characteristics of the built environment of campuses could be important to increase physical activity while actively commuting to the university.

**Purpose:** firstly, to describe the mode of commuting of university students and the built environment of six university campuses in Chile and Spain; and secondly, to explore the associations between the built environment of their university campuses and active commuting of university students.

**Methods:** A total of 1419 university students (47.3% women; 25.6 ± 4.7 years old) self-reported their mode of commuting to the university. The built environment of six university campuses (3 in each country) was evaluated by the QGIS 3.22.14. software obtaining nine built environment characteristics. Associations were studied using multinomial logistic regression analysis.

**Results/findings:** The main mode of commuting in Chile was public transport (59.5%) followed by active commuting (38.2%), while in Spain the main mode was private transport (56.9%) followed by public transport (22.7%) ( $p < 0.001$ ). The built environment of campuses in Chile showed high scores in land-use mix, bicycle racks, public space ratio, and air pollution, while campuses in Spain showed high scores in residential density, connectivity, cycle lanes, service density, and green space density (all,  $p < 0.001$ ). In Chile, higher connectivity (Campus 1: Odds Ratio (OR): 81.58,  $p < 0.001$ ; Campus 2: OR: 4.75,  $p = 0.024$ ), higher land-use mix (Campus 1: OR: 17.17,  $p = 0.001$ ), more cycle lanes (Campus 1: OR: 62.12,  $p < 0.001$ ), and more green space density (Campus 1: OR: 72.77; Campus 2: OR: 3.97; Campus 3: OR: 7.74; all,  $p < 0.001$ ) were associated with higher odds of active commuting compared to private transport commuting. In Spain, higher green space density (Campus 4: OR: 3.97; Campus 5: OR: 4.39; both,  $p < 0.001$ ) was associated with higher odds of active commuting compared to private transport.

**Conclusions:** To increase the active commuting in university populations, it may be important to keep changing the built environment of university campuses, with a specific focus on connectivity and land-use mix in Chile, and green space density in both countries.

# Adaptation of the BIA-Obesity framework for countries facing a double burden of malnutrition based on a scoping review and a Delphi survey

**Ms. Carmen Klinger**<sup>1,2</sup>, Dr. Olufunke Alaba<sup>3,4</sup>, Associate Professor Peter Delobelle<sup>5,6</sup>, Ms. Nicole Holliday<sup>1,2</sup>, Prof. Estelle Vicki Lambert<sup>4</sup>, Ms. Anna Leibinger<sup>1,2</sup>, Mr. Elochukwu Christopher Okanmelu<sup>1,2</sup>, Prof. Eva Annette Rehfuess<sup>1,2</sup>, Dr. Peter von Philipsborn<sup>1,2</sup>

<sup>1</sup>Chair of Public Health and Health Services Research; Institute for Medical Information Processing, Biometry and Epidemiology; Ludwig-Maximilians-Universität (LMU Munich), Munich, Germany, <sup>2</sup>Pettenkofer School of Public Health, Munich, Germany, <sup>3</sup>Health Economics Unit; School of Public Health; University of Cape Town, Cape Town, South Africa, <sup>4</sup>Health through Physical Activity, Lifestyle and Sport Research Centre (HPALS); Department of Human Biology; University of Cape Town, Cape Town, South Africa, <sup>5</sup>Chronic Disease Initiative for Africa; University of Cape Town, Cape Town, South Africa, <sup>6</sup>Department of Public Health; Vrije Universiteit Brussels, Brussels, Belgium

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** The aim of the Business Impact Assessment on Obesity and population-level nutrition (BIA-Obesity) framework, as developed by the International Network for Food and Obesity/Non-communicable Diseases Research, Monitoring and Action Support (INFORMAS), is to systematically assess and benchmark food industry policy and action and develop evidence-informed recommendations for food industry actors. The term 'double burden of malnutrition' (DBM) describes the co-existence of various forms of malnutrition (including undernutrition, micronutrient deficiencies, unhealthy diets, overnutrition and obesity) within an individual over the life course, at the household level or in communities or entire populations. As BIA-Obesity focuses on obesity and unhealthy diets, it is the objective of this research to adapt this framework for countries facing a DBM.

**Methods** Using scoping review methodology as recommended by the Joanna Briggs Institute, we will identify and map recommendations for and best practices by the formal food industry to address undernutrition and food insecurity, considered in isolation or as part of broader strategies to address the DBM. For the scoping review, we will include academic and grey literature that i) focus on individuals of any age with undernutrition, with or without other co-existing forms of malnutrition, ii) discuss recommendations and/or best practices and/or lived experiences of the formal food industry, iii) in any context. We will use the results of the scoping review to adapt the existing framework to the DBM, by adding, revising, and potentially removing existing indicators based on a Delphi survey with relevant experts.

**Results/Findings** Compared to similar frameworks, the adapted BIA-Obesity framework will be less resource-intensive and more easily implementable in countries affected by a DBM. Due to its staged approach, the first phase will only assess the commitments and level of disclosure of food industry actors, whereas the actual implementation will be assessed in a subsequent phase. Another advantage is the assessment of the entire range of the formal food industry, producing a comprehensive picture of its role in addressing the DBM.

**Conclusions** The formal food industry (food and beverage manufacturers, food retailers, food wholesalers, caterers, and quick-service-restaurants) represents an important lever to address the various components of the DBM.

# A hybrid 3 study evaluating the scale up of evidence-based early-life nutrition interventions in a community setting - the Nutrition Now project protocol for phase 2

**Associate Professor Anine Christine Medin**<sup>1</sup>, Prof. Frøydís Nordgård Vik<sup>1</sup>, Prof. Elisabet Rudjord Hillesund<sup>1</sup>, Prof. Nina Cecilie Øverby<sup>1</sup>

<sup>1</sup>Department of Nutrition and Public Health, Faculty of Health and Sport Sciences, University of Agder, Kristiansand, Norway

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Very few efficacious dietary interventions are scaled up and implemented in real-life settings. The Nutrition Now project set out to improve dietary behaviours in pregnant women, 0–2-year-olds and their parents, both directly and through early childhood education and care (ECEC), and maternal and child health care. This is done by implementing and scaling up four interventions targeting early-life nutrition, which are combined in a digital resource (the Nutrition Now resource). The interventions in the Nutrition Now resource have previously been found to be efficacious in smaller trials and are currently being tested out in a Hybrid 1 study in one municipality, to gather information on implementation strategies and assess effectiveness. Building on this, the main aim of this study is to test the impact of different implementation strategy packages when scaling up. Evaluation of intervention effectiveness will also be assessed as a secondary outcome.

**Methods:** This is a hybrid 3 study in which 25 municipalities in the county of Agder, South Norway, will be given access to the Nutrition Now resource at the start of the study without being accompanied by specific implementation strategies. A non-randomized stepped wedge design will be used, in which different clusters (municipalities) will be exposed to implementation strategy packages at different time points. We will expose the different municipalities to either a low-, or medium-resource-demanding implementation strategy package and continuously monitor implementation outcomes in all municipalities throughout the study. Established implementation outcomes from the RE-AIM framework and others will be assessed, through user data and short popup questions embedded in the Nutrition Now resource, in addition to qualitative interviews. Effectiveness will be assessed using food purchase data from ECECs and municipal spending on nutrition-related activities documented in the municipalities' budget.

**Results/findings:** As of March 2023, we plan to start collecting data in autumn 2023.

**Conclusions:** Scaling up effective interventions is important. This work will advance the understanding of what it takes to implement and scale up early-life interventions, in a real-life community setting. This study may also inform future national implementation and scale-up of the Nutrition Now resource.

**Trial registration:** ISRCTN10694967

# Evaluation of the impact of the community-based complex intervention "10,000 Steps Duesseldorf" in two cities in North Rhine-Westphalia: replication study.

**Ms. Elena Schmitz<sup>1</sup>**, Dr. Paula M Matos Fialho<sup>1</sup>, Ms. Sorina Willemsen<sup>1</sup>, Dr. Markus Vomhof<sup>2,3,4</sup>, Prof. Andrea Icks<sup>2,3,4</sup>, Mr. Alexander Lang<sup>5</sup>, Prof. Oliver Kuss<sup>5,6</sup>, Dr. Simone Weyers<sup>1</sup>, Prof. Claudia Pischke<sup>1</sup>

<sup>1</sup>Institute of Medical Sociology, Centre for Health and Society, Medical Faculty, Heinrich Heine University Duesseldorf, Duesseldorf, Germany, <sup>2</sup>Institute for Health Services Research and Health Economics, Centre for Health and Society, Medical Faculty, Heinrich Heine University Duesseldorf, Duesseldorf, Germany, <sup>3</sup>Institute for Health Services Research and Health Economics, German Diabetes Center, Leibniz Center for Diabetes Research, Heinrich Heine University Duesseldorf, Duesseldorf, Germany, <sup>4</sup>German Center for Diabetes Research, Partner Duesseldorf, Muenchen-Neuherberg, Germany, <sup>5</sup>Institute for Biometrics and Epidemiology, German Diabetes Center, Leibniz Institute for Diabetes Research, Heinrich Heine University Duesseldorf, Duesseldorf, Germany, <sup>6</sup>Centre for Health and Society, Medical Faculty, Heinrich Heine University Duesseldorf, Duesseldorf, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The World Health Organization (WHO) recommends that adults engage in 150-300 minutes of moderate physical activity (PA) per week. This corresponds to approximately 7,000-10,000 steps per day. In Germany, fewer than half of all adults achieve this goal. This highlights the need for population-based intervention approaches to promote regular daily PA. The aims of this replication study are to adapt, implement and evaluate a community-based complex PA intervention originally developed and successfully implemented in Belgium.

**Methods:** The intervention includes components at different levels (e.g. individual level: website; organizational level: promotion of PA e.g. in companies, senior citizens' associations; community level: media campaign, environmental changes, e.g. signage in parks). The intervention "10,000 Steps Ghent" was adapted in a participatory development phase with relevant stakeholders of the city of Duesseldorf and two health insurance companies, including a joint implementation strategy.

To investigate the effects of the intervention, PA and other secondary endpoints will be assessed in representative samples of adults aged 25-75 years (n=399) in the cities of Duesseldorf and Wuppertal (control city) at baseline and the follow-up. In spring 2021, participants took part in a one-hour telephone interview and wore a pedometer (30% of the sample wore an additional accelerometer) for one week. The follow-up assessment will take place starting May 2023 until September 2023 after the one year of intervention is completed.

In addition, a process evaluation will be conducted. To identify processes of implementation and maintenance of the program, as well as facilitating and hindering factors, organizations in the intervention city areas will be surveyed using an online questionnaire. To analyse the cost-effectiveness of the intervention, a health economic evaluation will be conducted.

**Results/findings:** The baseline survey for the study was conducted from April 2021 until the end of March 2022. The intervention began in April 2022 and will end in April 2023. Preliminary results on intervention development and baseline survey implementation will be presented at the ISBNPA.

**Conclusions:** To our knowledge, this study is the first research project aiming to replicate the effects of a complex PA intervention successfully implemented in another European country.

# Association between Chronotype, Social Jetlag and Body Mass Index in Adolescents

**Dr. Paula Jakszyn**<sup>1,2</sup>, Dr. Marta Crous-Bou<sup>1,3</sup>, Miss Nuria Nadal<sup>1</sup>, Dr. Nithya Shankar Krishnan<sup>1</sup>

<sup>1</sup>Catalan institute of Oncology, Barcelona, Spain, <sup>2</sup>Blanquerna School of Health Sciences, Ramon Llull University, , Barcelona, Spain, <sup>3</sup> Department of Epidemiology, Harvard TH Chan School of Public Health, Boston, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Background:** Recent research has indicated that along with unhealthy dietary patterns, irregular sleeping habits too play an important role in adolescent health and wellbeing. Adolescents' circadian preference and sleeping patterns are predictive factors of health. The main aim of this review was to determine whether there is an association between chronotype and social jetlag with Body Mass Index in adolescents.

**Methods:** Electronic databases such as PubMed, Google Scholar and Scientific Electronic Library Online were screened to identify studies published in the last ten years (2012 to 2022) in the adolescent population (10-19 years). The final articles were selected based on the following criteria: target population; adolescent definition as per the WHO criteria ; study design (cross sectional, cohort); assessment methods for chronotype/social jetlag (Morningness Eveningness Questionnaire MEQ; Munich Chronotype Questionnaire MCQ; Morningness Eveningness Scale for Children MESQ; actigraphy; Reduaed Morningness Eveningness Questionnaire rMEQ; Morningness Eveningness Self Assessment MEQ SA and adapted versions) evaluation of the association between BMI and chronotype, and BMI and Social jet lag.

**Results:** Twenty-one studies were included in the final review. More than 60% of studies found a positive association between chronotype and Body Mass Index . Over 60% of studies also found a positive association between social jetlag and Body Mass Index. However, only few have found a statistically significant association.

**Conclusion:** However, despite not conclusive results, shorter sleep duration and social jetlag seem to prevail quite commonly among adolescents, thus it is imperative to promote healthy sleeping habits in this population. Future research specifically longitudinal studies could be beneficial in order to confirm these associations.

# The influence of dwelling type on food expenditure: a cross-sectional analysis of the 2020 Belgian Household Budget Survey

**Mr. Allan Estandarte**, Prof. Lukar Thornton

<sup>1</sup>Department of Marketing, Faculty of Business and Economics, University of Antwerp, Antwerp, Belgium

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** In Belgian cities, the persistent inaccessibility of housing compels individuals to reside in poor-quality dwellings often designed with small and non-functional kitchens. Dwelling conditions may therefore influence the types of foods individuals purchase, store, prepare, and consume in the household setting, yet this remains understudied. To address this knowledge gap, this study aims to explore differences in food expenditure by dwelling type among Belgian households.

**Methods:** Using nationally-representative data from the Belgian Statistics Office (Statbel) 2020 Household Budget Survey, this study examined food expenditure within 6,104 households. Preliminary analysis was performed to examine differences in median bi-monthly fruit and vegetable expenditure by dwelling types (categorised as detached house, semi-detached house, adjoining single-family house, and small (building with 1-2 dwellings), medium (building with 3-9 dwellings), and large (building 10 or more dwellings) apartment blocks. Further analysis will utilise two-part regression models controlling for confounding factors to help identify the independent influence of housing type on food expenditure using a broader range of food items.

**Results:** Households residing in detached houses reported the highest median expenditure (reported in EUR) on fruits (median=17.03; IQR=8.11, 30.12) and vegetables (median=23.82; IQR=12.93, 40.34), compared to other dwelling types. Households residing in small apartment blocks reported the lowest expenditure on fruits (median=10.08; IQR=4.75, 20.24) and vegetables (median=16.64; IQR=8.06, 30.81).

**Conclusions:** Belgian households residing in small apartment blocks tend to spend less on fruits and vegetables than those living in other dwelling types. These preliminary results suggest that dwelling type may influence food purchasing behaviours. With the adoption of compact living policies in Belgium, these findings require further investigation into how dwelling type and conditions may influence food purchasing behaviours.

# The impact of tiered soft drink taxes in Europe on sugar content of soft drinks: a controlled interrupted time series and synthetic control study

**Ms. Anna Leibinger**<sup>1,2</sup>, Mr. Oliver Huizinga<sup>3</sup>, Prof. Diana Rubin<sup>4</sup>, Mr. Karl Emmert-Fees<sup>5,6</sup>, Dr. Sara Pedron<sup>5</sup>, Prof. Michael Laxy<sup>5</sup>, Prof. Eva Rehfues<sup>1,2</sup>, Dr. Jacob Burns<sup>1,2,5</sup>, Dr. Peter von Philipsborn<sup>1,2</sup>

<sup>1</sup>Chair of Public Health and Health Services Research, Ludwig-Maximilians-Universität München (LMU Munich), Munich, Germany, <sup>2</sup>Pettenkofer School of Public Health, Munich, Germany, <sup>3</sup>German Non-Communicable Disease Alliance (DANK), Berlin, Germany, <sup>4</sup>Centre for Nutritional Medicine, Vivantes Humboldt-Klinikum, Berlin, Germany, <sup>5</sup>Professorship of Public Health and Prevention, Technical University of Munich, Munich, Germany, <sup>6</sup>Institute of Epidemiology, Helmholtz Zentrum München, Neuherberg, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** A high intake of sugar from beverages is associated with an increased risk for obesity and other non-communicable diseases, such as diabetes and cardiovascular disease. The WHO recommends tiered soft drink taxes, with a higher tax rate on beverages with a higher sugar content, to incentivise reformulation and thus decrease sugar consumption. While most previous studies have explored the effect of soft drink taxes on soft drinks sales and consumption, the purpose of this study is to evaluate the impact of tiered soft drink taxes on the sugar content of soft drinks in four European countries that implemented such taxes: France, Ireland, Portugal, and the United Kingdom.

**Methods** We use aggregated annual sales data from Euromonitor International to calculate the mean sales-weighted sugar content of soft drinks in the intervention and control countries from 2009 to 2022. We employ two quasi-experimental approaches to assess the effects of tiered soft drink taxes on sugar content: a controlled interrupted time series study and a synthetic control study. These two analyses differ in their creation of a counterfactual post-intervention – whereas the former uses all control countries equally, the latter employs a data-driven approach to construct a “best-fitting” control.

**Results/Findings** The study's findings will provide insights into the effectiveness of tiered soft drink taxes in reducing sugar content in soft drinks in four European countries. The synthesis of findings from two quasi-experimental approaches will provide a more comprehensive evaluation, and hence increase the robustness of the study.

**Conclusions** The findings will shed light on the effectiveness of tiered soft drink taxes as a public health policy tool to decrease sugar content of beverages, and may inform policy development in other regions and thus contribute to the global effort to promote healthy diets and reduce the burden of diet-related diseases.

# Associations between waist circumference, device-measured physical activity, and incident cardiovascular disease in men and women: UK Biobank study

Dr. Miguel Adriano Sanchez-lastra<sup>1,2,3</sup>, Associate Prof. Melody Ding<sup>4</sup>, Señor. Borja Del Pozo Cruz<sup>5,6</sup>, Dr. Knut Eirik Dalene<sup>7</sup>, Dr. Jakob Tarp<sup>8</sup>, **Prof. Ulf Ekelund<sup>1,7</sup>**

<sup>1</sup>Norwegian School of Sport Sciences, Oslo, Norway, <sup>2</sup>University of Vigo, Vigo, Spain, <sup>3</sup>Galicia-Sur Health Research Institute, Vigo, Spain, <sup>4</sup>The University of Sydney, Sydney, Australia, <sup>5</sup>University of Southern Denmark, Odense, Denmark, <sup>6</sup>University of Cádiz, Cádiz, Spain, <sup>7</sup>Norwegian Institute of Public Health, Oslo, Norway, <sup>8</sup>Aarhus University & University Hospital, Aarhus, Denmark

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Previous studies suggest that physical activity (PA) may mitigate the risk of cardiovascular diseases (CVD) associated with high waist circumference (WC). However, it remains unclear whether different intensities of PA may modify these associations and if the shape of the association is different between men and women. We aimed to examine the joint associations between WC and device-measured PA with incident fatal and non-fatal CVD in men and women.

**Methods:** Participants from the UK Biobank were classified according to WC as low (<88cm in women, <102cm in men) or high (equal-to or above the cut-offs) abdominal adiposity. PA data was obtained from accelerometer measurements and categorized as tertiles of light-intensity, moderate-to-vigorous-intensity, vigorous-intensity, and total weekly PA. CVD diagnoses and deaths were obtained from registries. Participants who had events in the first two years of follow-up, those with prevalent diseases and/or physical limitations were excluded to reduce reverse causality bias. We used hazard ratios from proportional sub-hazards models with multivariable adjustment, including the body mass index, to examine the associations between combined categories of WC with PA with CVD, accounting for non-CVD deaths as competing events.

**Results:** A total of 30,869 men and 39,967 women were included (mean age  $\pm$  SD = 61.6  $\pm$  7.9 years), and followed for a median of 6.9 years, during which 2,799 incident CVD events were recorded. High WC was associated with higher risk of CVD in both men and women, especially in those with low levels of moderate-to-vigorous intensity PA (hazard ratios [95 % confidence interval] = 1.33 [1.10, 1.61] for men and 1.49 [1.16, 1.91] for women). High volumes of PA across the entire intensity spectrum of PA attenuated and even eliminated the risk, particularly in those with a median of 510 minutes of moderate-to-vigorous intensity or 32 minutes of vigorous-intensity per week.

**Conclusion:** High levels of PA attenuate the risk of CVD associated with high WC in both men and women. Promoting small amounts of vigorous intensity physical activity may have similar beneficial effects compared to much larger volumes of moderate intensity to offset the risk of CVD.

# Mechanisms Underlying Acute Effects of Physical Activity on Cognitive Function in Healthy Young Individuals: A Systematic Review of Randomized Controlled Trials

**Miss Renyan Ma**<sup>1</sup>, Associate Professor Peter J. Joris<sup>1</sup>, Assistant Professor Brenda A.J. Berendsen<sup>1</sup>, Prof. Hans H.C.M. Savelberg<sup>2</sup>

<sup>1</sup>Department of Nutrition and Movement Sciences, NUTRIM, School of Nutrition and Translational Research in Metabolism, Maastricht University, Maastricht, Netherlands, <sup>2</sup>Department of Nutrition and Movement Sciences, NUTRIM, School of Nutrition and Translational Research in Metabolism and SHE, Maastricht School for Health Professions Education, Maastricht University, Maastricht, Netherlands

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose** Physical activity (PA) is well-known to beneficially affect mental health and cognitive function. Evidence has also already indicated that PA maintains normal brain vascular function (cerebral blood flow, CBF), increases neurogenesis, and further exerts neuroprotective effects on the brain. Nowadays, young individuals have unhealthy lifestyles with prolonged sedentary behavior and low PA levels, resulting in the development of cardiometabolic diseases, reduced mental health and cognitive function, and even premature death. Randomized controlled trials (RCTs) have already elucidated acute effects of PA on cognitive function, CBF, or other parameters in these young adults. Notably, PA was associated with an improved glucose metabolism, which may underlie the beneficial effects observed on cognitive function and problem-solving. However, the specific acute effects of PA on these outcomes and the involved mechanisms have not yet been fully elucidated. The aim of this systematic review is therefore to summarize these effects on cognitive function in healthy young individuals and to further address possible underlying mechanisms.

**Methods** A systematic literature search was performed until February 2023 involving three databases (PubMed, Web of Science and Medline). This search was performed independently by two reviewers using Rayyan software. Inclusion criteria were: RCTs; healthy (young) individuals, aged 18-35 years old; focusing on acute effects of PA; and involving the primary outcome with at least one of the secondary outcomes. The primary outcome was cognitive function, and the secondary outcomes included CBF, circulating (i.e., BDNF, IGF-1, VEGF, glucose, insulin) and salivary parameters (i.e., cortisol and testosterone concentrations).

**Results** The search resulted in a total of 6146 articles, of which 1810 articles were retrieved from PubMed, 3425 from Embase, and 911 from the Web of Science. After removing duplicates, 4471 articles were screened by title and abstract, and 241 articles were selected for retrieval and their full-texts will be screened.

**Discussion** This systematic review will discuss possible mechanisms underlying the beneficial acute effects of PA on cognitive function. These mechanisms include neurotrophic factors, neurotransmitters, glucose metabolism, hormones, and CBF. Lastly, we will also identify possible limitations and reveal interesting future study topics to explore that are related to the described outcomes/conclusions.

# Interim Evaluation of Germany's Sugar Reduction Strategy for Soft Drinks: Commitments versus Actual Trends in Sugar Content and Sugar Sales from Soft Drinks

**Dr. Peter von Philipsborn**<sup>1</sup>, Mr. Oliver Huizinga<sup>2</sup>, Mrs. Anna Leibinger<sup>1</sup>, Prof. Diana Rubin<sup>3</sup>, Dr. Jake Burns<sup>1, 4</sup>, Mr. Karl Emmert-Fees<sup>4, 5</sup>, Dr. Sara Pedron<sup>4</sup>, Prof. Michael Laxy<sup>4</sup>, Prof. Eva Rehfuess<sup>1</sup>

<sup>1</sup>Ludwig-Maximilians-Universität München (LMU Munich), Munich, Germany, <sup>2</sup>German Non-Communicable Disease Alliance (DANK), Berlin, Germany, <sup>3</sup>Centre for Nutritional Medicine, Vivantes Humboldt-Klinikum, Berlin, Germany, <sup>4</sup>Professorship of Public Health and Prevention, Technical University of Munich, Munich, Germany, <sup>5</sup>Institute of Epidemiology, Helmholtz Zentrum München, Neuherberg, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** A high intake of sugar from sugar-sweetened soft drinks increases the risk for obesity, type 2 diabetes mellitus and dental caries. The German government has pursued a national strategy for sugar reduction in soft drinks based on voluntary commitments by industry since 2015, but its effects are unclear.

**Methods** We use aggregated annual sales data from Euromonitor International to assess trends in mean sales-weighted sugar content of soft drinks and per capita sugar sales from soft drinks in Germany from 2015-2021. We compare these trends to the reduction path set by Germany's national sugar reduction strategy, and to data for the United Kingdom, which adopted a soft drinks tax in 2017 and which we selected as best practice comparison country based on pre-defined criteria. Moreover, we compare the trend in the years before the policy was announced (2011-2015) to the trend after the policy was announced (2015-2021) by calculating the compound annual reduction rate.

**Results/Findings** Between 2015-2021, the mean sales-weighted sugar content of soft drinks sold in Germany decreased by 2% from 5.3 to 5.2 g/100ml, falling short of an interim 9% reduction target and a 29% reduction observed in the United Kingdom over the same period. Sugar sales from soft drinks in Germany decreased from 22.4 to 21.6 g/capita/day (-4%) between 2015-2021. After the sugar reduction strategy was announced in 2015, the compound annual reduction rate of the mean sales-weighted sugar content of soft drinks sold in Germany increased slightly from 0.2% to 0.4%.

**Conclusions** Reductions in the sugar content of soft drinks observed under Germany's voluntary sugar reduction strategy fall short of stated targets and trends observed internationally under best practice conditions. Additional policy measures may be needed to support sugar reduction in soft drinks in Germany, and should be considered as part of Germany's new national nutrition strategy announced for 2023.

**Note:** A shorter version of this abstract and the full paper on which it is based have been published in *Annals of Nutrition and Metabolism* (<https://doi.org/10.1159/000529592>).

# Impact on mental health of a three-armed randomized controlled trial using self-monitoring of daily steps with and without counseling in prediabetes and type 2 diabetes: the Sophia Step Study

**Mr. Yohannes Woldamanuel<sup>1</sup>**, Dr. Jenny Rossen<sup>1</sup>, Associate Professor Patrick Bergman<sup>4</sup>, Associate Professor Therese Anderbro<sup>3</sup>, Associate Professor Philip von Rosen<sup>2</sup>, Prof. Maria Hagströmer<sup>1,2,5</sup>, Prof. Unn-Britt Johansson<sup>1,6</sup>

<sup>1</sup>Department of Health Promoting Science, Sophiahemmet University, Stockholm, Sweden, <sup>2</sup>Department of Neurobiology, Care Sciences and Society, Karolinska Institutet, Sweden, Stockholm,, Sweden, <sup>3</sup>Department of Psychology, Stockholm University, Stockholm, Sweden, <sup>4</sup>Department of Medicine and Optometry, eHealth Institute, Linnaeus University, Kalmar, Sweden, <sup>5</sup>Academic Primary Care Center, Region Stockholm, Stockholm, Sweden, <sup>6</sup>Department of Clinical Science and Education, Södersjukhuset, Karolinska Institutet, Stockholm, Sweden

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Aim** This study aimed to evaluate the effect of a two-year self-monitoring daily steps intervention with or without counseling on a secondary outcome on mental health in people with prediabetes and type 2 diabetes.

**Method** Sophia Step Study was a three-armed parallel randomized controlled trial. Participants with prediabetes or type 2 diabetes were recruited in the primary care setting. Allocation 1:1:1 was made to a multi-component intervention (self-monitoring of steps with counseling support), a single-component intervention (self-monitoring of steps without counseling support) or standard care. Mental health was assessed using questionnaires about diabetes distress, depression, anxiety, and health-related quality of life at baseline and months 3, 6, 12, and 24. The intervention effects were evaluated by linear mixed model.

**Result** In total 188 participants were allocated, 64 to the multiple-component group, 59 to the single-component group, and 64 to the standard care group. Mean age was 64.1 (SD, 7.7) years, 40% were women, 20 % had prediabetes, 46.3% had high level of education, 66% lived with a partner, mean BMI was 30.0 (SD, 4.4) kg/m<sup>2</sup>, and mean HbA1c level was 49.9 (SD, 11.4) mmol/mol. The retention rate was 91% in the first year and 81% at two years. At baseline, the levels of mental health measures were within the normal range for all groups. The magnitude of reduction in all mental health outcomes showed no significant difference within each group at any measurement from baseline up to 24 months. The mental health symptoms showed no significant differences between the interventions (multi- or single-component intervention) and the control group in any assessed outcome or time point.

**Conclusion** The two-year self-monitoring of steps intervention with or without counseling in people with prediabetes and type 2 diabetes showed no effect on the mental health outcomes throughout the intervention. However, this sample showed a good mental wellbeing at baseline.

**Trial registration:** *ClinicalTrials.gov*, [NCT02374788](https://clinicaltrials.gov/ct2/show/NCT02374788), <https://clinicaltrials.gov/ct2/show/NCT02374788>

**Key words:** Activity tracker; Anxiety; Behavior; Depression; Diabetes distress; Mental health; Pedometer; Physical activity; Quality of life, Steps.

# Intervention adherence and Physical Activity Outcomes of a Behavioural Change Intervention: Findings from the Physical Activity at Work study in Thai Office Workers

**Dr. Katika Akksilp**<sup>1,2</sup>, Associate Professor Falk Mueller-Riemenschneider<sup>1,3</sup>, Dr. Yot Teerawattanannon<sup>1,2</sup>, Associate Professor Cynthia Chen<sup>1,3</sup>

<sup>1</sup>SAW SWEE HOCK School of Public Health, National University of Singapore, Singapore, Singapore, <sup>2</sup>Health Intervention and Technology Assessment Program, Bangkok, Thailand, <sup>3</sup>Yong Loo Lin School of Medicine, National University of Singapore, Singapore, Singapore

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

Sedentary reduction and physical activity promotion programmes require comprehensive multi-component intervention development and evaluation. Intervention adherence is important as it affects the outcomes of the programme. The Physical Activity at Work programme was developed to reduce sedentary time and increase physical activity in Thai office workers. Socio-ecological model was used to create multi-component interventions, including individual (pedometer and individual-level incentives), social (movement breaks and team-level incentives), organisational (leaders involvement), and environmental (posters) levels. A full-scale cluster-randomised trial with a 6-month intervention period was implemented. The ActiGraph<sup>TM</sup> accelerometer was used to measure objective physical activity data at baseline and 6-month follow-up. We conducted a process evaluation to identify the effects of adherence to the core intervention component; the four-times daily movement breaks, on between-group differences in sedentary time and physical activity at 6-month follow-up. Adherence was defined by the percent participation in movement breaks, calculated as the percentage of individual attendances out of the maximum of 480 movement-break sessions. Multivariable linear mixed-effect models adjusted for wear-time, office size, baseline data, and adherence were used to analyse between-group differences in sedentary time, time spent in moderate-to-vigorous physical activity, and steps, with intervention group as the fixed effect and offices as the random effect. 245 participants with valid ActiGraph<sup>TM</sup> data from 18 offices (124 control and 121 intervention participants, nine offices each) were included in the analyses. By increasing 10% adherence, the analyses showed a sedentary time reduction of -8.51 min (95%CI: -16.4 to -0.590 min), increased time spent in moderate-to-vigorous physical activity by 3.06 min (95%CI: 1.16 to 4.96 min), and increased step count of 313 (95%CI: 91 – 534 steps) during waking hours. Similar results were found during working hours, with increased time spent in moderate-to-vigorous physical activity of 3.00 min (1.81 – 4.20 min) and step count of 216 (88 – 344). The results emphasise the importance of intervention adherence on sedentary time reduction and physical activity promotion in office workers and the need to refine the multi-component intervention to increase adherence and maximise the programme's benefits.

# Individual-level correlates of active transportation among Queen's University employees

**Miss Megan Clemens<sup>1</sup>**, Dr. Patricia Collins<sup>2</sup>, Dr. Eun-Young Lee<sup>1</sup>

<sup>1</sup>School of Kinesiology and Health Studies, Queen's University, Kingston, Canada, <sup>2</sup>Department of Geography and Planning, Queen's University, Kingston, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Active transportation (AT) has dual benefits: population health benefits with increased physical activity and environmental sustainability with decreased carbon emissions. Despite the city's low geographic density, residents of Kingston, Canada use AT for 9.5% of trips, compared to the country's average of 6.9%. Additionally, employees of Queen's University demonstrate even higher rates of active commuting. The objective of this study was to identify individual-level correlates of AT engagement among Queen's University employees to inform promotion strategies in Canada and potentially regions worldwide with similar geographical and climatic characteristics.

**Methods:** Self-reported, annually repeated cross-sectional data were used from the 2013-2017 Surveys of Commute Patterns among Queen's University Employees (n=3530). To conduct a cross-sectional analysis, unique respondents' data were considered only from their most recent survey completion, from either 2017 (n=1921), 2016 (n=782), 2015 (n=545), 2014 (n=282), or 2013 (n=344). The average age of respondents was 46 years (SD = 12.27), ranging between the ages of 20-84 years, and 61.3% of the analytic sample was female. Respondents' primary mode of transportation from home to work was categorized as either passive, active, or a combination of modes and analyzed using logistic regressions.

**Results:** The proportion of participants engaging in passive, active, and a combination of passive and active modes were 49.5%, 27.8%, and 22.8%, respectively. Individuals were less likely to use AT with a higher commuting distance (OR: 1.05 per 1 km increase; 95%CI: 1.04-1.06); poorer general health (OR: 1.63; 95%CI: 1.37-1.95); better mental health (OR: 1.20; 95%CI: 0.72-0.96); a moderately (OR: 1.56; 95%CI: 1.06-2.30) or somewhat physically active job (OR: 1.39; 95%CI: 1.06-1.84); and a low (i.e., <\$75,000; OR: 1.91; 95%CI: 1.32-2.75) or moderate (i.e., \$75,000-\$134,999; OR: 1.84; 95%CI: 1.39-2.43) household income. The association between age or household structure with transportation mode was not statistically significant.

**Conclusions:** There was a considerable variability in transportation modes by different individual-level correlates and these correlates were mostly not modifiable at the individual level but requires macro-level changes. Public health strategies should be tailored to target the groups that are underutilizing AT to achieve dual benefits of health and sustainability.

# Association between sedentary behaviour and glucose intolerance in rural South Indians

**Dr. Ranjit Mohan Anjana<sup>1</sup>**, Dr. Rajendra Pradeepa<sup>1</sup>, Mrs. Natarajan Lakshmi<sup>1</sup>, Dr. Ulagamathesan Venkatesan<sup>1</sup>, Dr. Hari Rakesh<sup>2</sup>, Dr. Moneeza Kalhan Siddiqui<sup>3</sup>, Dr. Colin NA Palmer<sup>3</sup>, Dr. Viswanathan Mohan<sup>1</sup>  
<sup>1</sup>Madras Diabetes Research Foundation & Dr.Mohan's Diabetes Specialities Centre, Chennai, India,  
<sup>2</sup>Dr.Mohan's Diabetes Specialities Centre, Chunampet, India, <sup>3</sup>University of Dundee, Dundee, United Kingdom

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Sedentary behavior is considered as a major risk factor for many chronic diseases, including diabetes. This door-to-door population-based Telemedicine PROject for screENing Diabetes and its complications in rural Tamil Nadu (TREND) study assessed the prevalence of diabetes and its associated complications in rural south India. In this analysis we aimed to assess the association between sedentary behaviour and glucose intolerance among rural south Indians.

**Methods:** Of the 15091 individuals screened for diabetes/prediabetes between 2018-2021 in 30 villages of Chengalpattu/Kancheepuram districts of Tamil Nadu, 14,117 participants who had information on venous oral glucose tolerance test and physical activity were included for analysis. Individuals were categorized as having normal glucose tolerance (NGT), prediabetes or diabetes using WHO criteria. Physical activity was assessed using a validated questionnaire for use in India called the Madras Diabetes Research Foundation (MDRF) Physical Activity Questionnaire. The time spent in sedentary behaviour on 4 domains such as television (TV) viewing, leisure time activities (reading/sitting/listening to music etc), sitting at work and transport (commute by bus, car) were captured.

**Results:** Mean age was 44±15 years and 59% were women. Overall, 76.5% (Men:71.8%;Women:79.7%) had normal glucose tolerance (NGT), 9.0% (Men:10.9%;Women:7.7%) had prediabetes and 14.5% (Men:17.3%;Women:12.5%) had diabetes. Sedentary time (hrs/day) was higher in diabetes (9.2±2.9) than prediabetes (8.4±2.8) and NGT (8.1±2.9). Of all sedentary behaviour, TV viewing was most popular and accounted for most of the sedentary time (3.2±1.6hrs/day Men:3.2±1.6; Women:3.3±1.5, p=0.32). Most individuals did not spend more than an hour sitting during transportation (0.32±0.21hrs/day) which was significantly higher in men (Men:0.42±0.24; Women: 0.26±0.15, p<0.001). Men were also found to be more sedentary at work than women (Men:2.7±2.5; Women:2.3±2.2 p<0.001). The prevalence of diabetes significantly increased with increasing tertiles of sedentary time both among women (Q1-<5hrs/d:9.2%;Q2-5-8hrs/d:12.9%;Q3->8hrs/d:17.1%;p<0.001) and men (Q1-<5hrs/d:16.2%;Q2-5-8hrs/d:15.3%;Q3->8.0hrs/d:19.2%;p=0.004). Women who spent >8hrs/day in sedentary behaviour had 1.4(95% CI 1.1–1.7; p<0.001) times risk for developing diabetes even after adjusting for age, BMI, income and systolic blood pressure.

**Conclusions:** Sedentary behaviour of >8hrs/d increases the risk of diabetes among both sexes, particularly among women in rural India which emphasizes the need for physical activity in this population for the prevention of non-communicable diseases.

# Identifying online networks and social media influencers to promote healthy behaviors: the sugar sweetened beverages (SSB) case in Mexico.

**Miss Isabel Valero-Morales**<sup>1</sup>, Miss Regina Durán<sup>1</sup>, Miss Ximena Zárate<sup>1</sup>, Dr. Simón Barquera<sup>1</sup>

<sup>1</sup>Center for Nutrition and Health Research, National Institute of Public Health, Cuernavaca, Mexico

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

Study objectives were 1) to explore online networks related to sugar sweetened beverages (SSB) consumption on Twitter and Instagram in Mexico, and 2) to map health influencers who could be potential partners and establish a collaborative strategy with the Center for Nutrition and Health Research (a recognized center in Mexico conducting high-level research and policy implementation [CINyS]) on Instagram to discourage SSB consumption. Tweets related to SSB were systematically collected via Twitter application programming interfaces via Academic Twitter. A content analysis was run, and health-related perceptions and online networks were identified. Influencers were identified from public rank lists and from followers list of the CINyS account; potential reach was estimated from the last 5 posts uploaded. Influencers who declared not potential conflict of interest and with the greatest potential reach were contacted to receive a communication tool kit.

18,000 tweets related to SSB were retrieved, data spanned from October 19<sup>th</sup>, 2021, to January 20<sup>th</sup>, 2023.

10,755 users, 8,717 original tweets, 8,020 retweets, and 1,427 replies were identified. Top users accounts belong to sport teams, health professionals or personal accounts. Health-related perceptions of the top tweets were supporting SSB, promoting water consumption, and complaining about the effects of SSB production has on climate change. The community created on Twitter was unreadable, mainly due to a lack of connections. Coca-Cola official account was the central user retrieved.

160 potential health influencers were identified, however, only 11 met the inclusion criteria and were contacted.

All of them accepted to participate, and 9 influencers received the full kit (a physical health book, 13 digital infographics related to SSB, and an invitation to an obesity conference). The CINyS was tagged in 8 posts, 2 posts about the book after the influencers received it, 2 posts about other health topics, 2 posts with the digital infographics, total impressions generated were 68,500.

Exploring health-related perceptions on social media can help to tailor health promotion campaigns and identify collaborators can help to increase the CINyS reach. This study can be adopted to explore other health nutrition and establish new strategies to help discourage SSB consumption.

# A mixed methods study of dietary and anthropometric changes in graduate paramedics over two years since commencing shift work

**Ms. Angela B Clark<sup>1</sup>**, Prof. Alison M Coates<sup>2</sup>, Dr. Tammie Choi<sup>1</sup>, Dr. Ben Meadley<sup>3,4,5</sup>, Associate Professor Kelly-Ann Bowles<sup>3,5</sup>, Prof. Maxine P Bonham<sup>1</sup>

<sup>1</sup>Department of Nutrition, Dietetics and Food, Monash University, Melbourne, Australia, <sup>2</sup>Alliance for Research in Exercise, Nutrition and Activity, University of South Australia, Adelaide, Australia, <sup>3</sup>Department of Paramedicine, Monash University, Frankston, Australia, <sup>4</sup>Ambulance Victoria, Doncaster, Australia,

<sup>5</sup>Paramedic Health and Wellbeing Research Unit, Monash University, Frankston, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

The diets of shift workers are known to be negatively impacted by work schedules, however there is limited research demonstrating how and why dietary changes occur. This mixed methods study explored dietary behaviour changes in graduate paramedics over the first year of exposure to rotating shift work schedules while diet quality, energy intake and anthropometry were investigated for an additional year.

Participants from a graduate paramedic cohort in Australia were re-contacted for inclusion in this study. A convergent parallel mixed method study design was conducted; the qualitative component comprised of individual in-depth interviews to explore perceived dietary behaviour changes experienced over the first year of shift work. Interview transcripts were thematically analysed and guided by the COM-B (capability, opportunity, motivation and behaviour) model and theoretical domains framework (TDF). Changes to anthropometry (weight, waist circumference, body mass index (BMI)), diet quality and energy intake (using a food frequency questionnaire) were quantitatively assessed at baseline, one year and two years from commencing rotating shift work.

Eighteen participants were included in the study. From the interviews, participants reported; 1. food choices are driven by wanting to fit in with co-worker food habits, 2. food choices and meal times are unpredictable and 3. paramedics try to make healthy food choices but give in to less healthy options. Increases in weight ((mean difference (MD): 2.96kg; 95% CI: 0.89 – 5.04; p=0.003), waist circumference (MD: 5.07cm; 95% CI: 1.25 – 8.89; p=0.006) and BMI (MD: 1.07kg/m<sup>2</sup>; 95% CI: 0.26-1.87; p=0.006) were observed at two years. Daily energy intake and overall diet quality scores did not differ over the period whereas takeaway foods increased significantly from 7% to 10% of total daily energy (MD: 2.96%EI; 95% CI: 0.44 - 5.48; p=0.017).

This study contributes new information on dietary changes occurring in shift-working graduate paramedics. Providing access to healthier food choices is critical for intervening in the current early trajectory of unintentional weight gain and takeaway reliance among paramedics. Workplaces could invest in improving their food environments to include healthy food alternatives and better ambulance-based food storage facilities, to reduce the unintended metabolic consequences of rotating shift work.

# The impact of breaking up sitting during the nightshift on cognitive performance, sleepiness, hunger, and gastric upset

**Dr. Charlotte Gupta**<sup>1</sup>, Dr. Grace Vincent<sup>1</sup>, Prof. Corneel Vandelanotte<sup>1</sup>, Prof. Mitch Duncan<sup>2,3</sup>, Ms. Dayna Easton<sup>1</sup>, Associate Professor Philip Tucker<sup>4,5</sup>, Dr. Michele Lastella<sup>1</sup>, Prof. Sally Ferguson<sup>1</sup>

<sup>1</sup>Appleton Institute, Central Queensland University, SA, Australia, <sup>2</sup>School of Medicine & Public Health, The University of Newcastle, NSW, Australia, <sup>3</sup>Active Living Research Program, Hunter Medical Research Institute, NSW, Australia, <sup>4</sup>Psychology Department, Swansea University, Swansea, United Kingdom, <sup>5</sup>Stress Research Institute, Department of Psychology, Stockholm University, Stockholm, Sweden

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** The nightshift is associated with negative effects including cognitive impairments, increased sleepiness, disrupted hunger patterns, and gastric upset. A strategy to reduce these negative effects for day workers is to break up sitting with physical activity. However, it is unknown whether a physical activity intervention is effective at night, when the body is primed for sleep. This study investigated the impact of breaking up sitting during the nightshift on sleepiness, cognitive performance, hunger, and gastric upset.

**Methods:** 42 healthy adults (age M±SD: 24.3±4.6 years; 21 females) participated in a 7-day laboratory study, with 5 nightshifts (22:00-06:00). Participants were randomly allocated to a condition: Breaking up sitting (BUS; n=21) or Sedentary (SED; n=21). Every 30-min during the nightshift BUS completed 3-min bouts of light-intensity walking, while SED remained sitting. Each nightshift at 22:00, 00:00, 02:00, 04:00, participants completed the Karolinska Sleepiness Scale and 10-minute Psychomotor Vigilance Task (variables for analysis: reciprocal mean response time (mean RRT), and mean lapse count (lapse defined as reaction time greater than 500ms)). Participants consumed a lunch meal on the baseline day (13:00), and during each nightshift (01:00). Participants completed visual analogue scales of hunger, stomach upset, and bloating experienced during each nightshift.

**Results:** Linear mixed models showed significant interactions between nightshift (1-5) and time of night (2200-0600) for Mean RRT ( $p<0.001$ ), lapse count ( $p=0.02$ ), and subjective sleepiness ( $p<0.01$ ), such that cognitive performance was worse, and sleepiness was highest at 04:00 during nightshift 1. No significant interactions were found between condition and time of night or condition and nightshift. ANCOVA analyses adjusted for baseline showed no significant interactions between condition and nightshift for hunger ( $p=0.60$ ), stomach upset ( $p=0.65$ ), and bloating ( $p=0.46$ ).

**Conclusions:** Breaking up sitting with light-intensity walking did not reduce the impact of nightshift on cognitive performance, sleepiness, hunger, and gastric upset. Findings highlight the impairments associated with nightshifts, with cognitive performance and sleepiness worsening across the night, and acute impairments seen on the first nightshift. Future research should investigate the impact of breaking up sitting at night with physical activity of varied intensity and duration.

# Physical activity monitoring in rail driving: Are we on the right track?

**Dr. Stephanie Chappel**<sup>1</sup>, Prof. Anjum Naweed<sup>1</sup>, Associate Professor Janine Chapman<sup>1,2</sup>, Prof. Corneel Vandelanotte<sup>3</sup>, Prof. Andreas Holtermann<sup>4</sup>, Prof. Leon Straker<sup>5</sup>

<sup>1</sup>Appleton Institute, School of Health, Medical and Applied Sciences, Central Queensland University, Adelaide, Australia, <sup>2</sup>National Centre for Education and Training on Addiction, Flinders University, Adelaide, Australia,

<sup>3</sup>Physical Activity Research Group, Appleton Institute, Central Queensland University, Queensland, Australia,

<sup>4</sup>National Research Centre for the Working Environment, Copenhagen, Denmark, <sup>5</sup>School of Allied Health and enAble Institute, Curtin University, Perth, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** Little to no research has investigated rail drivers' physical activity (PA) levels, especially using objective methods. The complexity of the rail environment, particularly industrial sensitivities, may impact the amount of data and the collection methods used. The aim of this presentation is to explore rail drivers' experiences of a PA monitoring data collection process.

**Methods** As part of a larger, ongoing project, rail drivers within South Australia, Australia participated in an 8-day PA data collection. Drivers continuously wore a thigh-mounted Axivity AX3 device, that collects postural data as well, and completed a work logbook. This PA data collection took into consideration industrial sensitivities within the rail industry. After the data collection drivers participated in a de-brief to review and evaluate their experiences of PA monitoring. Data were assessed to identify drivers' experience and potential problems/changes required for future data collections within this population.

**Results** Thirty-one rail drivers completed the PA monitoring protocol. The majority of the drivers (n=30) found the activity monitor comfortable to wear and would wear the device again. Interestingly, 23 drivers stated they could wear the device for longer than 8-days, ensuring attachment materials were provided. Problems identified included the attachment area getting itchy, limited materials provided, some materials being too big, and unclear instructions for attachment. Although drivers found the work logbook easy to complete (n=30), they expected more information surrounding their activity outside of work, specifics on their work tasks, and their sleep habits to be collected. This information was excluded from the data collection to align with industrial sensitivities.

**Conclusions** Rail drivers found the activity monitor comfortable and the logbook easy to complete. However, several problems were identified and should be modified for future work. Interestingly, industrial sensitivity restrictions on the collection of information did not align with drivers' expectations, especially surrounding sleep information. This highlights the importance of considering industrial sensitivities when collecting PA data in complex work environments. Furthermore, to alleviate concerns and allow robust datasets to be collected, researchers working with these population need to provide better explanations as to why and how PA information should be collected.

# A systems map of interventions to improve dietary behaviours of pre-school children: a systematic scoping review

**Ms. Jacqueline Chan**<sup>1,2</sup>, Mr. Patrick Conroy<sup>2</sup>, Prof. Philayrath Phongsavan<sup>2,3</sup>, Prof. David Raubenheimer<sup>2,4</sup>, Prof. Margaret Allman-Farinelli<sup>1,2</sup>

<sup>1</sup>Nutrition and Dietetics Group, Sydney School of Nursing, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia, <sup>2</sup>Charles Perkins Centre, The University of Sydney, Sydney, Australia, <sup>3</sup>Prevention Research Collaboration, Sydney School of Public Health, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia, <sup>4</sup>School of Life and Environmental Sciences, The University of Sydney, Sydney, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The success of early childhood nutritional interventions may be limited unless we understand the complex associations between determinants across multiple systems. The aim of this literature review was to synthesise the evidence on interventions targeting dietary intake and eating behaviours in preschool children using a systems approach.

**Methods:** The review was conducted in accordance with the *Joanna Briggs Institute (JBI) Methodology for Scoping Reviews*. The search identified intervention studies targeting the dietary intake of preschool children aged 2-5 years in high income countries, published in English after January 2000. Screening of abstracts and titles were by one researcher with full texts screened in duplicate with a third reviewer to resolve conflicts. Data was extracted using a standardised form and interventions were categorised to the Determinants of Nutrition and Eating (DONE) Framework 2.0 for children developed and evaluated by experts across multiple fields. The framework maps and ranks 411 factors driving eating behaviours and nutrition and can be used to systematically summarise determinants. DONE ranks each determinant for its perceived research priority.

**Results:** The search yielded 21,369 articles. After title and abstract screening, 1066 full texts were reviewed with 160 primary studies meeting inclusion criteria. Most interventions targeted individual (55.6%, n=89) and interpersonal (64.4%, n=103) level determinants, with fewer targeting environmental (33.8%, n=54) and policy level (10.6%, n=17) determinants. The most frequently addressed determinants were Parental Resources and Risk Factors (n=85) at the interpersonal level, which included parental nutrition, food market and food product knowledge rated as medium to high priority for research by DONE. Children's Food Knowledge, Skills and Abilities (n=71) at the individual level and Parental Behaviours (n=53) at the interpersonal level were also well studied and rated as low to medium and medium priority respectively. Home Food Availability and Accessibility at the environmental level is classified as the highest research priority, however, only 15 of 160 interventions addressed these determinants.

**Conclusions:** This review highlights home food availability and accessibility as potential leverage points for future interventions to improve children's dietary intake and eating behaviours.

# Impact of COVID-19 on movement behaviors in overweight and obese adults

**Prof. Stephen Heung-Sang Wong<sup>1</sup>**, Dr. Chen Zheng<sup>1</sup>, Associate Professor Wendy Yajun Huang<sup>2,3</sup>, Dr. Xiangke Chen<sup>4</sup>, Associate Professor Fenghua Sun<sup>5</sup>

<sup>1</sup>Department of Sports Science and Physical Education, The Chinese University of Hong Kong, Hong Kong, China, <sup>2</sup>Department of Sport, Physical Education and Health, Hong Kong Baptist University, Hong Kong, China, <sup>3</sup>Dr. Stephen Hui Research Centre for Physical Recreation and Wellness, Hong Kong Baptist University, Hong Kong, China, <sup>4</sup>Department of Health Technology and Informatics, The Hong Kong Polytechnic University, Hong Kong, China, <sup>5</sup>Department of Health and Physical Education, The Education University of Hong Kong, Hong Kong, China

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Movement behaviors, including physical activity (PA), sedentary behavior (SB), and sleep, have been affected by the COVID-19 lockdown. This study examined the changes in movement behaviors among overweight and obese adults during the fifth wave of COVID-19 pandemic in Hong Kong and compared these behaviors between COVID-19 patients and healthy adults.

**Methods:** This is a retrospective study. Adults aged 18 years or above who stayed in Hong Kong during the fifth wave of COVID-19 (from February to April 2022) were invited. Participants self-reported their daily behaviors before and during the fifth wave of COVID-19. PA, SB, and sleep were assessed by International Physical Activity Questionnaire Short Form, sedentary behavior questionnaire, and Pittsburgh sleep quality index, respectively. The generalized linear model was used to analyze the difference between the groups (COVID-19 patients and healthy adults) and time (before and during the fifth wave), adjusting for sex, age, and body mass index (BMI).

**Results:** A total of 1587 overweight or obese adults (52.4% male, age:  $37.6 \pm 13.8$  years, BMI:  $26.2 \pm 3.0$  kg/m<sup>2</sup>) were recruited, and 571 were COVID-19 patients. Sleep duration was shorter during the fifth wave of COVID-19 in both COVID-19 patients ( $7.7 \pm 1.7$  vs.  $7.5 \pm 1.7$  h/day,  $p < 0.001$ ) and healthy adults ( $7.8 \pm 1.6$  vs.  $7.5 \pm 1.7$  h/day,  $p < 0.001$ ). COVID-19 patients had better sleep quality than healthy adults before the wave ( $5.8 \pm 3.1$  vs.  $6.1 \pm 3.2$ ,  $p = 0.001$ ). However, their sleep quality significantly reduced and was worse than healthy adults during the fifth wave ( $6.7 \pm 3.5$  vs.  $6.0 \pm 3.3$ ,  $p < 0.001$ ). During the COVID-19 wave, healthy adults have more moderate to vigorous PA than COVID-19 patients ( $37.2 \pm 53.4$  vs.  $35.4 \pm 50.4$  min/day,  $p = 0.04$ ). In addition, healthy adults reported a higher level of SB on weekends before ( $9.5 \pm 5.6$  vs.  $8.8 \pm 5.3$  h/day,  $p = 0.02$ ) and during ( $9.6 \pm 5.6$  vs.  $8.7 \pm 5.2$  h/day,  $p = 0.02$ ) the COVID-19 wave.

**Conclusions:** Worse sleep quality and less PA were observed during the COVID-19 outbreak, with a greater influence on COVID-19 patients. Long-term impact of COVID-19 pandemic warrants further investigation. Intervention studies are needed to improve movement behaviors among overweight and obese adults.

# Associations of movement behaviors with anxiety and depressive symptoms in COVID-19 patients

**Dr. Chen Zheng**<sup>1</sup>, Dr. Xiangke Chen<sup>2</sup>, Associate Professor Wendy Yajun Huang<sup>3,4</sup>, Prof. Stephen Heung Sang Wong<sup>1</sup>, Associate Professor Fenghua Sun<sup>5</sup>

<sup>1</sup>Department of Sports Science and Physical Education, The Chinese University of Hong Kong, Hong Kong, China, <sup>2</sup>Department of Health Technology and Informatics, The Hong Kong Polytechnic University, Hong Kong, China, <sup>3</sup>Department of Sport, Physical Education and Health, Hong Kong Baptist University, Hong Kong, China, <sup>4</sup>Dr. Stephen Hui Research Centre for Physical Recreation and Wellness, Hong Kong Baptist University, Hong Kong, China, <sup>5</sup>Department of Health and Physical Education, The Education University of Hong Kong, Hong Kong, China

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Twenty-four hours movement behaviors, including physical activity (PA), sedentary behavior (SB), and sleep, are associated with anxiety and depressive symptoms. The spreading of COVID-19 and the lockdown might increase those symptoms disorders. This study aimed to investigate the association between movement behavior before COVID-19 infection and anxiety and depressive symptoms in COVID-19 patients.

**Methods:** In this retrospective study, adults who were infected with COVID-19 in Hong Kong were invited to respond to an online survey from June to August 2022. Participants reported their PA, SB, and sleep before the infection using by International Physical Activity Questionnaire short form, sedentary behavior questionnaire, and Pittsburgh sleep quality index, respectively. The anxiety and depressive symptoms after the COVID-19 infection were assessed by the hospital anxiety and depression scale. The anxiety and depression score higher than 7 was treated as borderline abnormal. Generalized linear models were constructed to examine the relationships between movement behaviors and anxiety and depressive symptoms while controlling for sex, age, body mass index, education level, employment status, and vaccine dosage.

**Results:** The final analytic sample included 1542 adults (36.8% male) aged from 18 to 88 years old. One third and 29.2% of participants had the anxiety and depressive score higher than 7, respectively. Poor sleep quality was correlated with a higher anxiety score ( $B = 0.414$ , 95% confidence interval [CI]: 0.353 to 0.474). Daily SB was positively associated with anxiety score ( $B = 0.044$ , 95% CI: 0.005 to 0.084). Longer sleep duration ( $B = 0.129$ , 95% CI: 0.002 to 0.257) and poor sleep quality before COVID-19 infection were associated with worse depressive symptoms ( $B = 0.388$ , 95% CI: 0.324 to 0.452). More moderate to vigorous PA ( $B = -0.005$ , 95% CI: -0.009 to -0.000) and walking ( $B = -0.008$ , 95% CI: -0.012 to -0.003) were associated with a lower depression score.

**Conclusions:** Better sleep quality, less SB, and more PA were related to less anxiety and depressive symptoms among COVID-19 patients. The results provide a valuable reference for promoting healthy movement behaviors as protective factors for anxiety and depressive disorder.

# Physical activity, sedentary time, and public health care utilization in middle-aged individuals – A Northern Finland Birth Cohort 1966 Study

**Mr. Mikko Vaaramo**<sup>1,2</sup>, Dr. Anna-Maiju Leinonen<sup>1,3</sup>, Dr. Jaana Kari<sup>1,5</sup>, Mr. Iiro Nerg<sup>2</sup>, Dr. Sanna Huikari<sup>2</sup>, Prof. Raija Korpelainen<sup>1,3,4</sup>, Dr. Marko Korhonen<sup>2</sup>

<sup>1</sup>Department of Sports and Exercise Medicine, Oulu Deaconess Institute Foundation sr., Oulu, Finland,

<sup>2</sup>Department of Economics, Accounting and Finance, Oulu Business School, University of Oulu, Oulu, Finland,

<sup>3</sup>Research Unit of Population Health, Faculty of Medicine, University of Oulu, Oulu, Finland, <sup>4</sup>Medical Research Center, Oulu University Hospital and University of Oulu, Oulu, Finland, <sup>5</sup>Jyväskylä University School of Business and Economics, University of Jyväskylä, Jyväskylä, Finland

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** To study the individual-level association of physical activity (PA) and sedentary time (ST) with the public health care utilization among Finnish middle-aged individuals.

**Method:** The study utilized data from the 46-year follow-up of the Northern Finland Birth Cohort 1966 -study. PA and ST were measured with an accelerometer for 14 days. Register data on outpatient and mental health visits at health care centres, as well as hospital outpatient and inpatient visits were collected over a six-year period from PA and ST measurements onwards. Participants (N=4567) were divided into three categories based on both moderate-to-vigorous PA and ST. To avoid overdispersion due to zero counts, we utilize a two-part hurdle negative binomial model in the analysis.

**Results:** Compared with the lowest PA group, females with the highest PA group were 5.7 percentage points ( $P < 0.01$ ) less likely to have health care centre visits and 5.8 percentage points ( $P < 0.05$ ) less likely to have hospital inpatient visits. Males with the highest PA group had fewer health care centre visits (-2.8,  $P < 0.01$ ) and hospital inpatient stays (-0.6,  $P < 0.01$ ). Females and males with the highest PA group had fewer hospital outpatient visits (Females: -2.1,  $P < 0.05$ ; Males: -2.9,  $P < 0.01$ ) and days in hospital (Females: -4.8,  $P < 0.001$ ; Males: -5.2,  $P < 0.05$ ). Males with the highest ST group were 13 ( $P < 0.001$ ) and females 7.7 percentage points ( $P < 0.001$ ) less likely to visit a health care centre compared to the lowest ST group. Females with the highest ST group were also 5.1 percentage points ( $P < 0.05$ ) less likely to have a hospital outpatient and 5.6 percentage points ( $P < 0.05$ ) less likely to have a hospital inpatient visit. Females with the highest ST group had fewer health care centre visits (-2.8,  $P < 0.001$ ).

**Conclusions:** The results confirm that high PA is associated with the lower use of public health care. High ST appears also to be associated with the lower use of health care. This could reflect a relationship between high occupational sitting and occupational health care use while low PA might be a burden on public health.

# High-intensity Interval Training in Youth with Special Educational Needs: A Systematic Review

**Dr. Eric Tsz-Chun Poon<sup>1</sup>**, Dr. Waris Wongpipit<sup>2</sup>, Dr. Fenghua Sun<sup>1</sup>, Dr. Andy Choi-Yeung Tse<sup>1</sup>, Prof. Cindy Hui-Ping Sit<sup>3</sup>

<sup>1</sup>The Education University of Hong Kong, Hong Kong, Hong Kong, <sup>2</sup>Chulalongkorn University, Bangkok, Thailand, <sup>3</sup>The Chinese University of Hong Kong, Hong Kong, Hong Kong

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** High-intensity interval training (HIIT) has been promoted as a time-efficient exercise strategy to improve health and fitness in children and adolescents. However, there remains little consensus in the literature regarding its efficacy in children and adolescents with special educational needs (SEN). This study aimed to examine HIIT as a means of improving key health and fitness parameters in children and adolescents with SEN.

**Methods:** A systematic search was conducted on eight databases (MEDLINE, Embase, SPORTDiscus, Web of Science, Scopus, PsycINFO, CINAHL, and Cochrane Library). Studies were eligible if they 1) included an HIIT protocol, 2) examined parameters related to both physical and mental aspects of health and fitness, and 3) examined children and adolescents with SEN aged 5–17 years.

**Results/findings:** Of the 1727 studies yielded by the database search, 13 (453 participants) were included and reviewed. We found that HIIT generally improved body composition, physical fitness, and cardiometabolic risk biomarkers across a spectrum of SEN (e.g., attention deficit hyperactivity disorder, cerebral palsy, developmental coordination disorder, and mental illness). Improvements in mental health and cognitive performance following HIIT have also been observed.

**Conclusion:** This review provides up-to-date evidence for HIIT as a viable exercise strategy for children and adolescents with SEN. Further research investigating the benefits of HIIT in a wider range of SEN populations is warranted.

# Pregnant and postpartum women's experiences and perspectives on their dietary behavior based on semi-structured interviews

**Ms. Janine Faessen<sup>1</sup>**, Assistant Professor Indré Kalinauskaitė<sup>2</sup>, Dr. Desiree Lucassen<sup>1</sup>, Prof. Edith Feskens<sup>1</sup>, Assistant Professor Elske Brouwer-Brolsma<sup>1</sup>

<sup>1</sup>Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands,

<sup>2</sup>Julius Centre for Health Sciences and Primary Care, University Medical Centre Utrecht (UMCU), Utrecht, Netherlands

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose** – Healthy dietary habits are crucial to promote optimal development of the infant and prevent maternal complications during pregnancy and postpartum. Mobile health (mHealth) applications are promising approaches to improve dietary habits of women during these periods. Yet, to develop effective mHealth applications, first, insight in women's needs in dietary coaching is essential. Therefore, we aim to explore pregnant and postpartum women's experiences and perspectives on their dietary behavior.

**Methods** – Semi-structured interviews are being organized with 15 pregnant women and 15 women during the year postpartum or until data saturation is reached. Women living in the Netherlands who are able to understand and speak Dutch can participate. The results of the precedingly distributed questionnaire and the COM-B model were used to develop the interview guide. Postcards on eating related topics are used as probes to sensitize and contextualize women before the interview. The postcards are used during the interviews to start the conversation. Interviews elaborate on recent experiences with eating and related activities, such as grocery shopping, cooking and social activities, using the experience mapping method. Interviews are preferably performed offline and take about 45-60 minutes. Transcripts will be analysed via thematic content analyses by two researchers. Interviews will be inductively coded after which axial coding will be performed to determine overarching themes. These themes will be used to write a narrative including quotes to describe and analyse the results.

**Results** – Interviews are currently performed. Results of the interviews will be available by May 2023.

**Conclusion** – For interventions to be effective, it is important to determine what the target group's perspectives and requirements are with respect to dietary behavior change. This study will provide useful insights for designing an mHealth application for dietary coaching of pregnant women and women during the first year postpartum.

# The power of a bundling plant-based ingredients to reduce meat consumption in the supermarket

**Ms. Eileen Alexander<sup>1</sup>**, Prof. Wendy Van Lippevelde<sup>1</sup>, Prof. Hendrik Slabbinck<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Background:** Convincing people to change their eating habits to more healthy and sustainable consumption is becoming increasingly pressing. As a result, various government and commercial initiatives are currently being taken to promote more sustainable eating habits, particularly in Western countries, including more plant-based and less animal-based foods.

Changing food preferences and habits, on the other hand, is notoriously difficult since they are integral to an individual's lifestyle and socio-cultural environment. Given the importance of supermarkets in household food provision, they are in a unique position to steer both consumers and producers towards sustainable practices. This study examines the effectiveness of a multi-component nudge to shift animal-based to plant-based protein sources in a supermarket.

**Method:** We first determined which behavioral determinants this nudge should target based on a review of the literature. Previous research shows that habits, beliefs about meat consumption and lack of familiarity with alternative plant-based foods remain barriers to adopt a plant-based diet. Additionally, plant-based foods are often perceived inconvenient and less tasty. We argue that this is partly due to a lack of understanding about how to prepare and combine plant-based products into a delicious meal with high taste qualities.

Second, during a co-creative workshop with retailers and food and marketing experts, we designed a nudging intervention supported by this theory but that is also practical and financially feasible for retailers. As a result we propose that grouping plant-based products with other foods so that it forms a complete meal will encourage plant-based food purchasing. We add recipe cards with a catchy name to the bundled food items to increase attractiveness.

This strategy is being tested in a field-experiment in a Belgian supermarket. To evaluate the effectiveness of our intervention, results are benchmarked against a pre- and post-intervention period, as well as a control store of the same supermarket chain.

**Results:** Preliminary results will be available and presented at the conference.

**Conclusion:** The finding will give insights in the development, implementation and effect of interventions with a positive return on investment both for society and companies.

# Factors contributing to the perceived effectiveness of a Just-in-Time Adaptive Intervention targeting healthy eating

**Dr. Laura Winkens<sup>1</sup>**, Dr. Arend Ligtenberg<sup>2</sup>, Ms. Nieke Sonneveld<sup>1</sup>, Dr. Monique Simons<sup>1</sup>

<sup>1</sup>Chair group Consumption and Healthy Lifestyles, Wageningen University and Research, Wageningen, Netherlands, <sup>2</sup>Laboratory of Geo-information Science and Remote Sensing, Wageningen University and Research, Wageningen, Netherlands

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose.** A healthy lifestyle, especially healthy eating, can prevent the development of chronic diseases. However, the majority of people experience difficulties in adopting and maintaining healthy eating behaviors. Just-In-Time Adaptive Interventions (JITAs), a novel intervention design, shows promise for long-term behavior change as it adapts to variations in people and environments being sensed by smartphones/wearables and can provide personalized support. Despite the promising value of JITAs, research is still in its early stages and knowledge about the optimal design principles of JITAs is lacking. This study aims to provide an overview of factors relevant to app performance that future interventions should use for determining 'just-in time' and 'just in place'.

**Methods:** We developed a JITAI using geofencing techniques targeting healthy eating (i.e. eating more fruit and vegetables; eating less meat; less unhealthy snacking) to provide behavioral support at locations in the city of Wageningen where people make food decisions (e.g. the supermarket) and/or at times when people make these decisions (e.g. during lunch). From January to April 2023, a 1-week pilot will be conducted among approximately 20 residents of the city of Wageningen to gain insight into the places (just-in-place) and times (just-in-time) when people need support and are most receptive to support. Data is collected within the app: after receiving behavioral support, participants are asked about their current feeling/emotion, the perceived relevance of the message, and its location. Perceived effectiveness is measured by asking whether the message contributes to their chosen goal. The results will be analyzed using n-of-1 multivariate time series data. An aggregated analysis of the associations between location, time and emotion with perceived effectiveness is done using mixed models with participant ID as random factor and the elements as fixed factors.

**Results and conclusion:** The results of the pilot study will provide insight into factors that are important in developing JITAs aimed at healthy eating. JITAs are very promising given their ability to deliver individualized interventions. The JITAI we developed has great potential in directing behavioral support for healthy eating to the locations and times when people need it and are most receptive to it.

# Cross-sectional associations between general parenting and young children's vegetable and fruit consumption

**Ms. Jenna Rahkola**<sup>1</sup>, Dr. Carola Ray<sup>1,2</sup>, Dr. Reetta Lehto<sup>1,2</sup>, Dr. Ester van der Borgh-Sleddens<sup>3</sup>, Associate Professor Jessica Gubbels<sup>4</sup>, Dr. Henna Vepsäläinen<sup>2</sup>, Dr. Alissa Burnett<sup>5</sup>, Ms. Josefine Björkqvist<sup>1,6</sup>, Ms. Henna Launistola<sup>1</sup>, Prof. Maijaliisa Erkkola<sup>2</sup>, Prof. Eva Roos<sup>1,7,8</sup>

<sup>1</sup>Folkhälsan Research Center, Helsinki, Finland, <sup>2</sup>University of Helsinki, Department of Food and Nutrition, Helsinki, Finland, <sup>3</sup>Mondriaan Mental Health Center, Heerlen, Netherlands, <sup>4</sup>Maastricht University, Department of Health Promotion, NUTRIM School of Nutrition and Translational Research in Metabolism, Maastricht, Netherlands, <sup>5</sup>Deakin University, Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Sciences, Burwood, Australia, <sup>6</sup>University of Aberdeen, Aberdeen, United Kingdom, <sup>7</sup>Uppsala University, Department of food studies, Nutrition and Dietetics, Uppsala, Sweden, <sup>8</sup>University of Helsinki, Department of public health, Helsinki, Finland

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The Comprehensive General Parenting questionnaire (CGPQ) categorizes parenting into five constructs: nurturance, structure, behavioral control, inappropriate control, and overprotection. Nurturance, structure, and behavioral control are generally considered positive for child outcomes, whereas inappropriate control and overprotection potentially have adverse effects. Even though parenting assessed with different measures has been associated with children's fruit and vegetable consumption, studies examining these CGPQ constructs in relation to children's food consumption are scarce. Therefore, we explored associations of the five CGPQ constructs with vegetable and fruit consumption among preschool aged children.

**Methods:** A cross-sectional sample of 767 preschoolers (3–6 years old) from the DAGIS survey conducted in Finland in 2015–2016 was used. Parents completed a 22-item version of the CGPQ assessing all five parenting constructs. Children's food consumption of three days was assessed using a food record filled by parents at home and by early educators at preschool. Three-day mean of child's vegetable consumption (fresh, frozen, or canned vegetables, excluding potatoes and vegetables incorporated into mixed dishes) and of fruit consumption (fresh fruit and fresh and frozen berries) were computed as g/MJ, and the resulting variables were square root transformed. The associations between the parenting constructs and food consumption were analyzed using linear regression models adjusted for child's age and gender, and parental educational level.

**Results:** Higher overprotection was associated with lower vegetable consumption ( $B = -0.154$ , 95% CI =  $-0.294; -0.013$ ). The other constructs were not significantly associated with vegetable consumption, and no associations with fruit consumption emerged.

**Conclusions:** This study suggests that higher overprotection is associated with lower vegetable consumption among preschool aged children, which is in line with the only previous study – to our knowledge – assessing overprotection and children's vegetable consumption. Explanations for this association, which may include differential use of feeding practices, should be investigated. Furthermore, although no associations with the other constructs were found, they might have a moderating role in associations between feeding practices and children's food consumption, which calls for further research.

# Ultraprocessed food consumption and adequacy of energy, macronutrients and micronutrients recommended daily intake in young patients with celiac disease.

**Dr. Marta Flor-Aleman<sup>1,2</sup>**, Dr. Rafael Martín-Masot<sup>2,3</sup>, Ms. María Jiménez Muñoz<sup>3</sup>, Ms. Marta Herrador López<sup>3</sup>, Dr. Víctor Manuel Navas López<sup>3</sup>, Dr. Teresa Nestares<sup>1,2</sup>

<sup>1</sup>Department of Physiology, Faculty of Pharmacy, University of Granada, Granada, Spain, <sup>2</sup>Institute of Nutrition and Food Technology “José MataixVerdú” (INYTA), Biomedical Research Centre (CIBM), University of Granada, Granada, Spain, <sup>3</sup>Pediatric Gastroenterology and Nutrition Unit, Hospital Regional Universitario de Málaga, Málaga, Spain

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The nutritional adequacy of gluten-free diets (GFD) is a controversial issue, as the exclusion of gluten-containing cereals from the diet may lead to nutritional imbalances. Patients with celiac disease (CD) have lower intakes of micronutrients and greater intakes of total fat and simple and added sugars; however, whether these differences are explained by the ultra-processed food (UPF) intake of patients with CD is unclear. To assess the influence of UPF consumption on the adequacy of macronutrient and micronutrient recommendations in young patients with CD.

**Methods:** This cross-sectional study included 58 children with CD (age: 7.4±3.9 years; 60% female). Dietary intake was assessed through a three-day record (two on weekdays and one on weekends). The Evalfinut 2.0 software, was employed for analyzing all daily diaries. The Spanish population's recommended energy and nutrient intake levels and the European Food Safety Authority (EFSA) recommendations were taken as reference values. The NOVA classification, which categorizes foods according to the degree and purpose of industrial processing was employed.

**Results:** The mean % of total energy from UPF was 48%. The morning and afternoon snacks were the meals with the highest proportion of energy intake from UPF (66% and 76%, respectively), followed by breakfast (55%), dinner (44%) and lunch (21%). The group with the highest intake of energy from UPF (above 50% of total energy) showed lower adequacy to vitamin A ( $p=0.009$ ), calcium ( $p=0.027$ ), potassium ( $p=0.023$ ) and magnesium ( $p=0.046$ ) recommended daily intake. Those participants whose 50% or more of their energy intake comes from UPF showed lower adherence to the fat-recommended intake compared with their peers with lower UPF intake ( $p=0.048$ ). No differences were found regarding carbohydrate recommended intake ( $p=0.597$ ).

**Conclusion:** Overall, our results indicate that children who consumed more UPF presented more dietary imbalances (i.e., lower % of adequacy to vitamin A, calcium, potassium, magnesium, and fat recommended daily intake) which may contribute to inadequate nutritional adequacy to GFD. The % of energy intake from UPF should be closely monitored by nutritionists, especially in morning and afternoon snacks, to meet the macronutrients and micronutrient recommended daily intakes in patients following GFD.

# Physical activity, cognitive function, and classroom behaviour

**Dr. Chris Heemskerk<sup>1</sup>**

<sup>1</sup>University of Bern, Bern, Switzerland

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** To investigate the effect of acute PA on measures of executive functions (EF) and task-related behaviour in the classroom, and whether the effect of PA on behaviour is mediated by EF. These relations have been investigated in isolation, but not concurrently in the same sample. This may shed light on the mechanisms by which PA affects task-related behaviour in the classroom.

We hypothesised that: 1) EF correlate positively with on-task and negatively with off-task behaviours; 2) PA breaks positively affect on-task behaviour, inhibition and switching; 3) Inhibition and switching mediate the relationship between acute PA and behaviour.

**Methods:** We used a cluster-randomised experimental design. We collected data from 212 4<sup>th</sup> grade children (M=10.6years, 52.4% females). The experimental group had a 15-minute PA break, the control group continued classroom lessons as usual. Before and after, participants had normal classroom lessons, during which they were observed for 25 minutes and completed the Hearts and Flowers task (HF) to measure EF. Control variables were fluid intelligence, sex, and BMI z-score. We used spearman correlations between behaviour and EF, logistic multilevel models for effects of PA on behaviour, mixed ANOVA for effects of PA on EF, and structural equation models for mediation effects.

**Results:** At pre-test, fluid intelligence correlated with accuracy in the HF mixed block ( $\rho=.16$ ,  $p=.024$ ), and active off-task behaviour ( $\rho= -.15$ ,  $p=.030$ ). At post-test, accuracy in the mixed HF block correlated with BMI ( $\rho= -.23$ ,  $p=.005$ ). ANOVAs indicated no time-by-condition effects of PA on EF. Logistic regressions found increased off-task behaviour only in the control ( $d=0.22$ , small effect) but not the PA group ( $d=0.15$ ). Passive off-task and on-task behaviours were unaffected ( $d= -.04$  to  $-.11$ ). No mediation via EF was identified.

**Conclusion:** PA was found to reduce off-task behaviour in the 4<sup>th</sup> grade classroom. No correlations with or mediation by EF was found. This suggests that the effect of PA on task-related behaviour is not due to an increase in inhibitory control. This contributes to the growing literature on the mechanisms by which PA benefits cognitive skills and academic achievements in children.

# Effectiveness comparison of exercise strategies for bodyweight management among children and adolescents: A network meta-analysis

**Dr. Robin ST Ho<sup>1</sup>**, Mr. King Yin Chui<sup>1</sup>, Mr. Felix YC Kwok<sup>1</sup>, Prof. Stephen HS Wong<sup>1</sup>

<sup>1</sup>The Chinese University of Hong Kong, Hong Kong, China

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Exercises including aerobic exercise, resistance exercise, and combined aerobic and resistance exercise are current exercise strategies to be performed among children and adolescents for bodyweight management. Existing evidence on this research topic has been synthesized using direct head-to-head meta-analyses. However, these three main types of exercises have not been ranked comprehensively based on existing data from randomized control trials (RCTs) by network meta-analysis (NMA). We synthesized and analyzed the comparative evidence on these exercise strategies and ranking the best option using NMA using the most updated data from existing RCTs.

**Methods:** An overview of systematic reviews (SRs) and NMA (PROSPERO: CRD42022338829) was employed. A search for relevant literature published in English was conducted in four electronic databases from their inception until May 2022. SRs containing RCTs and fulfilling our pre-specified PICOS inclusion criteria were included. RCTs included were a comparison of exercise groups including aerobic exercise, resistance exercise, and the combination of both aerobic and resistance exercises among children and adolescents between 6 and 19. Effectiveness of reducing bodyweight, body fat percentage, waist circumference, cholesterol, and triglyceride were compared among exercise groups using both head-to-head pairwise meta-analyses directly and NMA indirectly.

**Results/findings:** Overall, 25 SRs were identified from the 2,749 screened citations. Of the eligible SRs, 366 citations were retrieved, and 37 RCTs were finally included. From the NMA results, five networks were constructed among five outcomes. Among the indirect comparison groups calculated by the cumulative probability as shown by the SCURA results, aerobic exercise was shown to be most effective option for reducing bodyweight (84.4%), waist circumference (88.3%), and triglyceride (89.6%), while combined aerobic and resistance exercise was to be the most effective option for reducing body fat (99.6%) and cholesterol (76.2%).

**Conclusions:** Aerobic exercise component is crucial in bodyweight management for designing exercise program for children and adolescents. Resistance exercise component might also be critical that it can be incorporated into aerobic exercise program to maximize the potential to reduce body fat and cholesterol among children and adolescents.

# Cross-device comparability for wrist-worn accelerometry in large-scale population-based cohort studies

**Dr. Laura Brocklebank**<sup>1</sup>, Dr. Scott Small<sup>2</sup>, Dr. Mikaela Bloomberg<sup>1</sup>, Prof. Andrew Steptoe<sup>1</sup>, Prof. Aiden Doherty<sup>2</sup>

<sup>1</sup>Department of Behavioural Science and Health, University College London, London, United Kingdom, <sup>2</sup>Big Data Institute, University of Oxford, Oxford, United Kingdom

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** Accelerometry is increasingly being used in large-scale population-based cohort studies to objectively measure movement behaviours, including physical activity, sedentary behaviour, and sleep. This free-living validation study aims to assess the comparability of movement behaviour quantification between Axivity AX3 and Matrix 003 wrist-worn accelerometers. The Axivity was used in the UK Biobank (UKB; ~100,000 participants) and, more recently, in the English Longitudinal Study of Ageing (ELSA; ~10,000 participants). The Matrix is a more economical, multimodal alternative (i.e., triaxial accelerometer, gyroscope, and heart rate monitor) recently developed for use in the China Health and Retirement Longitudinal Study (CHARLS; ~20,000 participants).

**Methods** A convenience sample of 75 British adults aged  $\geq 50$  years wore Axivity and Matrix accelerometers simultaneously in a random positional order on their dominant wrist 24 hours per day for 8 days. Raw accelerometer data were processed using the Biobank Accelerometer Analysis tool to extract meaningful movement behaviour outcomes, including overall acceleration - the foundational physical activity metric used in the UKB. Valid data were considered as having  $\geq 3$  days of wear and contribution in each 1-hour period of the 24-hour cycle. Agreement was assessed using pairwise intraclass correlation coefficients (ICC) with 95% confidence intervals (CI), 95% equivalence tests ( $\pm 10\%$  equivalence zone), and limits of agreement (LoA). Participants also wore an automated camera during waking hours for 1 day as the basis for future training of machine learning movement behaviour classification models.

**Results** 72 participants (63% female; mean age  $66.6 \pm 10.2$  years) contributed valid data. Preliminary analyses suggest equivalent overall acceleration between Axivity and Matrix accelerometers (ICC [95% CI] 0.96 [0.87-0.98]). The Axivity recorded slightly higher overall acceleration than the Matrix ( $28.2 \pm 9.3$  and  $26.7 \pm 8.9$  mg, respectively; mean bias [LoA] 1.49 mg [-2.64-5.72]).

**Conclusions** In preliminary analyses, the newly-developed Matrix 003 demonstrates functional equivalence to the previously-validated Axivity AX3 when measuring free-living physical activity over 7 days. Therefore, it is potentially a more attractive option for future large-scale population-based cohort studies, particularly those in low- and middle-income countries, and cross-cohort comparisons with large Axivity cohorts, such as UKB and ELSA, would be viable.

# Investigating homeworking experiences associative impact on health behaviours and wellbeing: A Network Analysis

**Mr. Samuel Keightley<sup>1</sup>**, Dr. Myanna Duncan<sup>1</sup>, Dr. Benjamin Gardner<sup>2</sup>

<sup>1</sup>King's College London, London, United Kingdom, <sup>2</sup>University of Surrey, Surrey, United Kingdom

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** The recent move towards hybrid and remote working has introduced evidence of the impact of such working practices on employee health behaviour and wellbeing. For example, a homeworker typically experiences a reduction in daily incidental physical movement as well as a blurring of work and non-work boundaries. Informed by previous qualitative findings, this study aimed to quantitatively understand the importance of identified homeworking experiences and to explore hypothesised associative impacts on health-related behaviours and wellbeing.

**Methods:** A cross sectional online survey was utilised to gather homeworking, wellbeing and health-related experiences of 491 participants (272 females & 218 males, age range 18 – 73y, M = 36.59, SD = 10.40). Drawn from a previous first stage qualitative to quantitative conversion study, ten homeworking experience constructs (25 items) were measured (e.g. 'ability to switch off from work'). Five validated health-related (e.g. physical activity) and seven wellbeing related (e.g. work-life conflict) constructs were also measured. Interrelations of homeworking, health-related and wellbeing-related experiences were examined through method of network, bridge node, and shortest path analyses. Centrality indices (e.g. *expected influence*) informed analyses throughout.

**Results:** Among the homeworking experiences, four interrelation clusters were identified (homeworking mastery, home-work transition, daily work pressure, & work-day forecast). In the observed network, homeworking experiences more closely related to wellbeing-related indicators as opposed to health-related indicators. Homeworking autonomy, daily workload manageability, ability to switch off from work, and 'work-day planning and organisation' demonstrated particularly important influential roles in the observed network, with notable interrelations with work-life conflict, job satisfaction, sleep trouble, and indicators of sedentary behaviour. General wellbeing, burnout, work-related physical activity, sleep trouble and break taking were identified to play key associative roles in the observed network, and were examined in relation to shortest and direct pathways in relation to homeworking experiences.

**Conclusions:** Results highlight and support the interplay between key aspects of homeworking experiences and indicators of health and wellbeing. Findings may inform further investigation towards the development of behavioural interventions for homeworkers. Our study points toward the potential for altering individual health and wellbeing by modifying workload, work autonomy and work-life conflict.

# School-based physical activity in relation to active travel among adolescents

**Ms. Lena Malnes**<sup>1</sup>, Prof. Sveinung Berntsen<sup>1</sup>, Prof. Elin Kolle<sup>2</sup>, Prof. Andreas Ivarsson<sup>1,3</sup>, Prof. Sindre M. Dyrstad<sup>4</sup>, Prof. Geir K. Resaland<sup>5</sup>, Dr. Runar Solberg<sup>2,6</sup>, Prof. Tommy Haugen<sup>1</sup>

<sup>1</sup>Department of Sport Science and Physical Education, University of Agder, Kristiansand, Norway, <sup>2</sup>Department Sports Medicine, Norwegian School of Sport Sciences, Oslo, Norway, <sup>3</sup>Center of Research on Welfare, Health and Sport, Halmstad University, Halmstad, Sweden, <sup>4</sup>Department of Public Health, University of Stavanger, Stavanger, Norway, <sup>5</sup>Center for Physically Active Learning, Western Norway University of Applied Sciences, Sogndal, Norway, <sup>6</sup>Centre for Epidemic Interventions Research, Norwegian Institute for Public Health, Oslo, Norway

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Background:** Active travel and school settings have been perceived as ideal domains to promote physical activity. Our aim was to determine whether increased physical activity in one setting leads to a compensatory change in another setting – more specifically if two weekly hours of extra school-based physical activity affected rates of active travel among Norwegian adolescents enrolled in the School In Motion (SciM) project.

**Method:** We included 9th-grade pupils (n = 2084) from the cluster RCT SciM project. Schools in the intervention group (n = 20) implemented 120 min of class-scheduled physical activity and physical education, in addition to the normal two hours of weekly physical education the schools in the control group (n = 10) performed, for nine months. Pupils who reported walking or cycling to school were defined as active transport, while motorized transport was pupils commuting by bus or car. Thereafter, the pupils were categorized as either maintaining active travel (active-active), maintaining motorized travel (motorized–motorized), changing to active travel (motorized–active), or changing to motorized travel (active–motorized) from pretest to posttest. Multilevel logistic regression was used to analyze the intervention effect on travel mode, adjusted for age, gender, ethnicity, parents' education, and location.

**Results:** In total, most participants used active travel at baseline and maintained their travel habits throughout the intervention period; n (%): active–active 1025 (73 %), motorized – motorized 271 (19 %), active–motorized 79 (6 %), motorized–active 31 (2 %). The likelihood of maintaining active travel or changing travel mode was not associated with the intervention; active–active (Odds ratio [95%CI]: 2.56 [0.46-6.48]), active–motorized (2.06 [0.82-3.95]) and motorized–active (1.58 [0.10-4.54]), with motorized–motorized as the reference group. The findings were consistent to and from school, during the winter and summer.

**Conclusion:** Active travel rates did not seem to be affected by the extra school-based physical activity among adolescents in the SciM project.

# Higher Healthy Diet Index associates with better eating competence and lower adiposity in two adult cohorts in Finland

**Miss Kirsikka Aittola<sup>1</sup>**, Dr. Leila Karhunen<sup>1</sup>, Dr. Tanja Tilles-Tirkkonen<sup>1</sup>, Dr. Elina Järvelä-Reijonen<sup>1</sup>, Prof. Marjukka Kolehmainen<sup>1</sup>, Prof. Ursula Schwab<sup>1,2</sup>, Dr. Jaana Lindström<sup>3</sup>, Prof. Arto Mannermaa<sup>4,5</sup>, Prof. Timo Lakka<sup>6,7,8</sup>, Prof. Jussi Pihlajamäki<sup>1,2</sup>

<sup>1</sup>School of Medicine, Institute of Public Health and Clinical Nutrition, University of Eastern Finland, Kuopio, Finland, <sup>2</sup>Department of Medicine, Endocrinology and Clinical Nutrition, Kuopio University Hospital, Kuopio, Finland, <sup>3</sup>Department of Public Health and Welfare, National Institute for Health and Welfare, Helsinki, Finland, <sup>4</sup>School of Medicine, Institute of Clinical Medicine, Clinical Pathology and Forensic Medicine, University of Eastern Finland, Kuopio, Finland, <sup>5</sup>Biobank of Eastern Finland, Kuopio University Hospital, Kuopio, Finland, <sup>6</sup>Institute of Biomedicine, School of Medicine, University of Eastern Finland, Kuopio, Finland, <sup>7</sup>Department of Clinical Physiology and Nuclear Medicine, Kuopio University Hospital, Kuopio, Finland, <sup>8</sup>Kuopio Research Institute of Exercise Medicine, Kuopio, Finland

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** A health promoting diet and eating behavior that supports it are crucial in the prevention of type 2 diabetes (T2D). Many valid indices have been created to measure diet quality, but few of them are used in clinical practice or health promotion, and more information is therefore needed of their usefulness. Biobanks offer a novel platform for prevention of T2D combining individual's health and clinical information, as well as genetic and lifestyle data. In this study, we investigated the associations of diet quality with eating competence (EC) and risk factors for T2D in two Finnish adult cohorts consisting of participants of T2D prevention and biobank studies.

**Methods:** A cross-sectional analysis of two cohorts, including the 3100 adult participants of the Stop Diabetes (StopDia) study, who were selected based on their increased T2D risk screened using the Finnish Diabetes Risk Score (FINDRISC) and 626 adult patients from the Biobank of Eastern Finland, was performed. Diet quality was measured with the Healthy Diet Index (HDI) and its 7 subdomains, a higher score indicating a healthier diet. A digital questionnaire was used to collect data on EC (assessed with the Satter Eating Competence Inventory 2.0<sup>TM</sup>), body mass index (BMI), and physical activity (h/wk) and in the Biobank cohort also T2D risk (assessed with FINDRISC). The HDI score was divided into tertiles in both study cohorts, and correlation and covariance analyses adjusted for age and sex were performed.

**Results/findings:** In both cohorts, EC ( $r=0.281$ ,  $p<0.01$  in StopDia;  $r=0.250$ ,  $p<0.01$  in Biobank cohort) and total physical activity ( $r=0.190$ ,  $p<0.01$ ;  $r=0.175$ ,  $p<0.01$ ) increased and BMI ( $r=-0.130$ ,  $p<0.01$ ;  $r=-0.148$ ,  $p<0.01$ ) decreased with increasing HDI. Of the subdomains of HDI, "Fruit and vegetables" and "Fish and meat" had the strongest associations with these risk factors. Moreover, the FINDRISC score was inversely associated with the HDI in the Biobank cohort ( $r=-0.101$ ,  $p<0.05$ ).

**Conclusions:** A higher HDI score was linearly associated with better EC, higher physical activity, and lower adiposity in two Finnish adult cohorts. The findings suggest that HDI is useful to evaluate and promote a healthy diet in clinical practice, health promotion and prevention of T2D.

# Urban mobility analysis for understanding health and well-being – Big data approach by mobile phone tracking

**Dr. Tiina Lankila**<sup>1,2</sup>, Associate Professor Ossi Kotavaara<sup>3</sup>, Dr. Terhi Ala-Hulkko<sup>1,3</sup>, Prof. Raija Korpelainen<sup>2,4,5</sup>, Associate Professor Harri Antikainen<sup>1</sup>

<sup>1</sup>University of Oulu, The Geography Research Unit, Oulu, Finland, <sup>2</sup>Department of Sports and Exercise Medicine, Oulu Deaconess Institute Foundation sr., Oulu, Finland, <sup>3</sup>Kerttu Saalasti Institute, University of Oulu, Oulu, Finland, <sup>4</sup>Research Unit of Population Health, Faculty of Medicine, University of Oulu, Oulu, Finland, <sup>5</sup>Medical Research Center Oulu, Oulu University Hospital and University of Oulu, Oulu, Finland

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** The aim of this study is to create spatially, and temporally accurate mobility indicators by differentiating between walking, biking, public transport, and private car-based mobility in urban environments based on mobile phone tracking data. We will develop a methodology to examine the modes of transport and the changes in mobility patterns over time utilizing mobile phone tracking data from four Finnish cities, Oulu, Rovaniemi, Kuopio and Helsinki, each located in a different part of the country.

**Methods:** The study is mainly based on Geographic Information Systems, statistics and information science, and in particular on network analytical frameworks, spatial-statistical modelling, and data management. We will analyse the movement of the population at the level of the urban structure and, based on optimal route selection in different mobilities, we will distinguish the share of the trips made by different modes of transport. The data will be analysed at multi-scale resolutions between 500x500 m and 16x16 km, and both weekday and weekend mobility dynamics will be studied. Particular attention will be paid to identification of the main changes in mobility before and during COVID-19.

**Results:** Approximate share of different active transport and motorised transport trips is distinguished from the mobile phone tracking data. From the data, we will identify those urban areas where mobility and mobility changes occurred before and during COVID-19. The information gained can later be connected to information on new investments in pedestrian, bicycle and public transport infrastructure as well as other urban environmental characteristics, and population-based Northern Finland Birth cohorts with extensive information on individual-level physical activity, physical and mental health, wellbeing and immunological health.

**Conclusions:** Mobility patterns have been reported to be changing partly due to the effects of remote working and education associated with COVID-19, as well as platform economies related to ridesharing, e-scooters, city bikes and e-bikes. By recognising the changes towards active mobility patterns, we can promote the design of more sustainable, equal and healthier urban structures. The transition to sustainable mobility should be supported by urban, regional and transport system planning.

# Evaluation of a Physical Activity Promotion Intervention for Community-Dwelling Manual Wheelchair Users: A single-case experimental design study.

**Dr. Kati Karinharju**<sup>1</sup>, Associate Professor Sean Tweedy<sup>2</sup>, Dr. Kelly Clanchy<sup>3</sup>, Dr. Sjaan Gomersall<sup>4</sup>

<sup>1</sup>Satakunta University of Applied Sciences, Pori, Finland, <sup>2</sup>University of Queensland, Human Movement and Nutrition Sciences, Brisbane, Australia, <sup>3</sup>Griffith University, School of Allied Health Sciences, Gold Coast, Australia, <sup>4</sup>University of Queensland. School of Health and Rehabilitation Sciences, Brisbane, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

Compared with the general population, manual wheelchair users (MWU) are profoundly inactive and at disproportionately greater risk of diseases of inactivity. The Adapted Physical Activity Program (APAP) is a community-based lifestyle PA intervention that is effective in ambulant people with brain impairment. This study aimed to evaluate whether APAP may also be effective for increasing habitual PA in MWU with spinal cord injury (SCI).

A multiple-baseline single case experimental design (SCED) study (A-B-maintenance) with replication was used to evaluate intervention effectiveness. Six community-dwelling MWU with SCI who were insufficiently active were randomised into two groups. Group 1 participants (n= 3) were randomised to complete either a 5, 7 or 9-week baseline period, prior to completing a 16-week intervention and a 16-week maintenance phase. Group 2 (N=3) completed a contemporaneous systematic replication of this trial. Three measures of the target behavior – daily habitual PA – were obtained : 1) daily upper body accelerations, measured using a wrist worn accelerometer; 2) daily manual wheelchair self-propulsion time, derived from accelerometer output and 3) daily manual wheelchair movement distance measured with a gyroscope-based device.

Kruskal-Wallis test indicated significant ( $p < 0.05$ ) increases for five out of six participants in at least one of the three outcomes of daily habitual PA across the intervention program. For upper body acceleration, the increase was significant ( $p \leq 0.05$ ) in five out of six, for daily self-propulsion time in two out of six, and for daily wheelchair movement distance in two out of six participants.

Findings provide sound evidence that APAP effectively promotes the adoption and maintenance of PA among MWU with SCI. This study used device-based measures as PA outcome measures, that have found to provide an acceptable estimate of habitual PA in MWU which is likely to be superior to self-report measurements alone which has been a limitation of the previous research in this area. However the most appropriate measure of PA varied depending on each individual's preferred PA mode and pattern of manual wheelchair use and future studies should use SCED designs to evaluate the APAP model of intervention using individually tailored PA measures.

# The Association between Parent–Child Nature Visits and Children’s Screen Time in Finnish 3–6-Year-Olds

**Miss Henna Launistola**<sup>1</sup>, Dr. Reetta Lehto<sup>1,2</sup>, Dr. Elina Engberg<sup>1,3</sup>, Ms. Josefine Bjorkqvist<sup>1,4</sup>, Miss Jenna Rahkola<sup>1</sup>, Prof. Carola Ray<sup>1,2</sup>

<sup>1</sup>Folkhälsan Research Center, Helsinki, Finland, <sup>2</sup>Department of Food and Nutrition, University of Helsinki, Helsinki, Finland, <sup>3</sup>Department of Psychology and Logopedics, University of Helsinki, Helsinki, Finland,

<sup>4</sup>Institute of Applied Health Sciences, University of Aberdeen, Aberdeen, United Kingdom

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Spending time in front of screens is a common sedentary behaviour among children. However, visiting nature and being outdoors are associated with higher physical activity levels and other positive health effects. Whether the frequency of visiting natural environments, such as forests, is associated with screen time is less studied in young children. The aim of this study was to examine the association between parent-child nature visits and children’s screen time (ST) in Finnish preschoolers.

**Methods:** The data was collected from children aged 3-6 years (n=801) who took part in baseline measurements of the DAGIS intervention study in preschools in 2017. Children’s ST was assessed with a parent-reported screen time diary. Average weekday, weekend day and weighted weekly ST (min/day) were calculated where data was available from at least 3 weekdays and 1 weekend day. Parents reported frequency of parent-child nature visits during the last month with five response options ranging from “not once” to “daily”, and the responses were transformed into median values (times/week) of each category and used as a continuous variable. Association between parent-child nature visits and children’s ST was examined by linear regression analysis adjusted with children’s age and gender, and parental education level.

**Results:** Mean age of the children was 5.19 years ( $\pm 1.05$ ) and 46.8 % of them were girls. After adjusting for background factors, more frequent parent-child nature visits were associated with less weekday ST ( $\beta=-0.096$ ,  $p=0.011$ ) and weekly ST ( $\beta=-0.076$ ,  $p=0.050$ ) but not with weekend ST ( $\beta=-0.027$ ,  $p=0.488$ ) among the children. The models explained 6.3 % of the variation in children’s weekday ST and 7.0 % in weekly ST.

**Conclusions:** The results suggest that frequency of parent-child nature visits might have a role in young children’s weekday and weekly ST but not in weekend ST. Using screens and visiting nature with parents might be competing activities for children, especially during weekdays. Promoting frequent parent-child nature visits could be a way of decreasing young children’s ST. Future studies should examine the length and purpose of nature visits associated with less ST in young children.

# Understanding Mechanisms of School-Based Preventive Intervention Implementation: A Systems Perspective on the Norwegian School Fruit Scheme—Insights from the FRESKO Project

**Ms. Mahshid Zolfaghari<sup>1</sup>**, Ms. Caroline Løvik Brandvik<sup>1</sup>, Dr. Biljana Meshkovska<sup>1</sup>, Prof. Knut Inge Klepp<sup>1</sup>, Prof. Birgit Kopainsky<sup>2</sup>, Associate Professor Hanne Cathrine Lie<sup>3</sup>, Prof. Nanna Lien<sup>1</sup>

<sup>1</sup>Department of Nutrition, University of Oslo, Oslo, Norway, <sup>2</sup>Department of Geography, System Dynamics Group, University of Bergen, Bergen, Norway, <sup>3</sup>Department of Behavioral Medicine, University of Oslo, Oslo, Norway

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Previous research has identified implementation determinants for nutrition interventions in schools, but a deeper understanding of their interplay within a system is needed. This study investigates the implementation of school-based health behavior change interventions from a systems perspective, using the Norwegian School Fruit Scheme (SFS) as a case.

**Methods:** We used Group Model Building (GMB), a participatory approach to develop and analyze system maps, to investigate the interplay between implementation determinants of SFS. We invited six schools from low and high socioeconomic neighborhoods in Oslo and rural areas, with varying degrees of SFS implementation. The implementation degree is defined as the proportion of pupils for whom schools order fruit. Two GMB sessions were held at each school between February and April 2023. With help of a facilitator, school personnel and pupils discussed the interconnectedness of various determinants and together we mapped these relationships. Each first session resulted in a system map, which was refined using audio recordings and notes before second sessions. In second sessions, the map was presented and reviewed, and participants discussed ways to reduce implementation barriers. We will compile a unified system map based on the individual school's map and evaluate it against implementation frameworks and empirical studies.

**Results:** Preliminary results from the first three schools shed light on three key mechanisms: As pupils eat fruit provided by SFS, school staff see how it improves students' school days and adjust the fruit order, resulting in more consistent fruit consumption than before the intervention. Ordering more fruit may not increase pupils' fruit consumption, since consumption is constrained by fruit quality and presentation. When pupils' expectations for fruit quality and presentation are not met, fruit consumption decreases prompting schools to reduce fruit orders to prevent waste. Improving fruit quality and presentation necessitates more resources, such as funding and personnel, which are limited. Insufficient resources, keep fruit quality and presentation below pupils' expectation, resulting in a suboptimal system.

**Conclusions:** The resulting system map will show a dynamic hypothesis that can help us understand how implementation determinants of the SFS interact and affect each other over time.

# The impact of COVID-19 lockdown on physical activity and sedentary behaviour in secondary school teachers: a prospective cohort study

**Assistant Professor Tom Deliens<sup>1</sup>**, Ms. Yanni Verhavert<sup>1</sup>, Dr. Lara Stas<sup>1</sup>, Associate Professor Elke Van Hoof<sup>1</sup>, Prof. Benedicte Deforche<sup>2</sup>, Assistant Professor Dirk Aerenhouts<sup>1</sup>, Prof. Peter Clarys<sup>1</sup>, Prof. Evert Zinzen<sup>1</sup>, Prof. Kristine De Martelaer<sup>1</sup>

<sup>1</sup>Vrije Universiteit Brussel, Brussels, Belgium, <sup>2</sup>Ghent University, Ghent, Belgium

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Mid-March 2020, Belgium went in lockdown to combat the COVID-19 pandemic, which resulted in drastic changes in people's work and lifestyle. Having to provide school-based day care as well as adapt to online teaching, secondary school teachers have been affected considerably, with a possible impact on their physical activity (PA) and sedentary behaviour (SB). This study investigates the impact of the first Belgian lockdown on PA and SB in Flemish secondary school teachers.

**Methods:** This prospective cohort study is part of a larger longitudinal study, assessing PA and SB levels of Flemish secondary school teachers throughout the 2019-2020 school year, which allowed us to compare one of our measurements conducted between March 23 and April 7, 2020 (five days after the installation of the lockdown measures) with a pre-lockdown (baseline) measurement, conducted between January 27 and February 11, 2020. Two other pre-lockdown measurements (September/October and November/December) and one other during-lockdown measurement (May/June) allowed us to control for confounding. Validated questionnaires were used to assess participants' PA and SB. Generalized linear mixed models were applied in R to evaluate the impact of the lockdown on PA and SB.

**Results:** Six hundred twenty four participants were included in the study. Significant increases were observed for total PA (+108 min/week;  $p=0.047$ ), moderate PA (+217 min/week;  $p=0.001$ ), domestic and garden PA (+301 min/week;  $p<0.0001$ ) and leisure-time PA (+130 min/week;  $p<0.0001$ ), whereas decreases were found for work-related PA (-275 min/week;  $p<0.0001$ ) and active transportation (-36 min/week;  $p<0.0001$ ). No differences over time were observed for walking ( $p=1.0$ ) and vigorous PA ( $p=0.570$ ). Significant increases were found for total SB (+972 min/week;  $p<0.0001$ ), work-related SB (+687 min/week;  $p<0.0001$ ) and leisure-time SB (+624 min/week;  $p<0.0001$ ), whereas a decrease was observed for transport-related SB (-290 min/week;  $p<0.0001$ ).

**Conclusions:** During the lockdown period, Flemish secondary school teachers showed increases in SB that were nine times as high as their PA increase. As a government, education network or school, it is crucial to sensitize, promote, and facilitate sufficient PA, but likewise to discourage SB, even in such difficult times of pandemic-induced lockdown measures.

# Motivation for Physical Activity in the Jordanian military: Correlates of physical activity in male and female recruits

**Mr. Ahmad Malkawi**<sup>1</sup>, Prof. Ree Meertens<sup>1</sup>, Prof. Stef Kremers<sup>1</sup>

<sup>1</sup>Maastricht University, Maastricht, Netherlands

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** B. Motivation and behavior change

**Introduction:** It is important to understand the correlates of physical activity among Jordanian males and females' military recruits to guide intervention development. Given the obligatory nature of physical fitness training in the military, it is especially an interesting question what kind of motivation recruits have. This study aims to assess the motivational correlates as suggested by self-determination theory in addition to other correlates such as screen time, BMI, exercise benefits and barriers and exercise self-efficacy.

**Methods:** The cross-sectional study included 216 (Median age = 19 years) military recruits during their basic training at two medical military colleges in Jordan. Physical activity and lifestyle behaviors were measured using the Arab Teens Lifestyle Study (ATLS). Psychosocial variables were assessed using the Exercise Self-Efficacy Scale (ESE), Behavioral Regulation Exercise Scale (BREQ-2) and Exercise Benefits/Barriers Scale (EBBS). The ethical approval was obtained from the Royal Medical Services in Jordan (3/2022).

**Results:** Recruits demonstrated good physical activity levels by achieving a median of around 2900 METs/week among males and 3100 METs/week among females. Males performed a total of around 210 minutes of moderate to vigorous activity per week, which was significantly more than females who performed around 160 minutes/week. Bivariate analysis revealed that the identified self-regulation, introjected regulation and exercise self-efficacy scores were positively associated with the total minutes/week of physical activity among the overall sample. The identified regulation, introjected regulation and exercise self-efficacy scores were associated with higher total METs/week among male recruits. Among females, only introjected regulation was associated with the total METs/week. Multivariate regression analyses showed that being a male was associated with higher minutes of physical activity among the overall sample (adjusted  $R^2 = 0.056$ ) and none of the motivational factors were significant contributors to the explained variance of the model. The identified self-regulation was only associated with total METs/week among male recruits (adjusted  $R^2 = 0.13$ ).

**Conclusions:** Results showed that identified regulation, introjected regulation and exercise self-efficacy are correlates of physical activity among males, while introjected regulation was a correlate among females. Interventions are advised to increase autonomous forms of motivation and exercise self-efficacy through structured enjoyable physical fitness programs.

# Promoting appetite awareness and eating regulation skills in preschools: Implementation outcomes and determinants from a pilot trial of the Appetite Toolbox in Singapore.

**Assistant Professor Keri McCrickerd**<sup>1,2</sup>, Dr. Kristy Lee<sup>2</sup>, Ms. Val Tan<sup>1</sup>, Ms. Nazihah Binte Mohamad Pauzi<sup>2</sup>, Ms. Stephanie Leo<sup>2</sup>, Ms. Esther Goh<sup>2,3</sup>, Dr. Cheryl Seah<sup>2,3</sup>, Prof. Bryce McLeod<sup>2,4</sup>, Prof. Robyn Mildon<sup>2,3</sup>  
<sup>1</sup>Singapore Institute for Clinical Sciences, Agency for Science, Technology and Research, Singapore, Singapore, <sup>2</sup>Yong Loo Lin School of Medicine, National University of Singapore, Singapore, Singapore, <sup>3</sup>Centre for Evidence and Implementation, Singapore, Singapore, <sup>4</sup>Virginia Commonwealth University, Richmond, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Variations in children's eating self-regulation skills are shaped by their early environment. This study describes the pilot implementation of a teacher-led intervention – the Appetite Toolbox (ATB) – comprising books, classroom activities, and mealtime practices designed to promote appetite awareness and eating regulation among children attending preschool childcare in Singapore.

**Methods:** Implementation outcomes and determinants were assessed as part of a pilot effectiveness-implementation trial with teachers of 3–6-year-old children across six childcare centres run by a single central operator. Twenty teachers delivered the ATB to over 300 children across six weeks either as part of a study group ( $n=11$ ) or a waitlist control ( $n=9$ ). The teachers identified as female, were aged 22 to 60 years old, and had 2 to > 10 years of teaching experience. Using established scales (Weiner et al. 2017), teachers self-reported ATB Acceptability, Appropriateness, and Feasibility immediately after a training workshop and again after delivery. Self-efficacy and intention to use the ATB were assessed at the same timepoints, and fidelity was assessed through logbooks and classroom observations. Implementation determinants were explored in group discussions at the end of the intervention and mapped to constructs from the Consolidated Framework for Implementation Research (CFIR).

**Results:** After implementing the ATB, all teachers either 'agreed' or 'completely agreed' that it was acceptable, appropriate, and feasible in their context. They also reported improvements in their perceived ability to promote appetite awareness and eating regulation skills in their classrooms. All of the teachers intended to continue with at least some of the ATB materials after delivery. However, ATB fidelity varied across classrooms, particularly for mealtime practices. Analysis of the group discussions supported implementation outcomes. Themes emphasised that teachers viewed the ATB as high quality, adaptable, and not too complex. A perceived need for the ATB over existing resources and practices, prioritisation from leadership, and alignment to the central curriculum and individual teaching values motivated staff to overcome implementation barriers, including time and space constraints.

**Conclusions:** High acceptability, appropriateness, and feasibility support the ATB in preschool childcare. Understanding implementation determinants will inform future implementation and evaluation efforts in Singapore's largest preschool operator.

# Health screening results of primary school first grade students and parents' views on health screening

**Assistant Professor Ayşegül ILGAZ**, Prof. Sebahat GÖZÜM

<sup>1</sup>Akdeniz University, Antalya, Turkey

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** It was aimed to explore the results of health screening performed on primary school first grade students and the views of parents on health screening.

**Methods:** In the descriptive study, the sample consisted of 227 primary school first grade students and 43 parents. Obesity screening, vision and hearing screening, hypertension and passive exposure to tobacco smoke were performed on the students. After the health screening, the parents of the children at risk were informed and the results were followed by being directed to the health institutions. The status of getting a diagnosis from the doctor was monitored post-doctor diagnosis status were followed.

**Results:** It was determined that 14.5% of the students were obese and 12% were overweight. It was determined that 5.3% of the students had vision problems in their right eye, 4.8% in their left eye and 5.3% in both eyes. Hearing problem was detected in only one student (0.4%). Some students had high systolic (14.1%) and high diastolic (14.9%) blood pressure. 27.3% of family members smoke and 25.6% of children are exposed to cigarette smoke.

Parents of children who were determined as risky according to health screening results were directed to health institutions, 65.1% of them (n=28) went to the doctors. Of the children referred for obesity, 14 students were evaluated as obese by the doctor. Obese children were referred to a dietitian and a pediatric endocrinologist. Seven of the students who went to the doctor because of vision problems were diagnosed as myopia. These children were given glasses. One student was diagnosed with otitis media and her treatment was started. Four students who went to the doctor were determined to have high blood pressure and follow-up was recommended.

**Conclusions:** The most common health problems in children are obesity and high blood pressure. It is recommended to conduct periodic health screenings, to raise awareness of parents, to direct them to health institutions, and to monitor the results. It is thought that there is a need for qualitative studies with parents whose health problems are determined and who do not go to the doctor.

# Adolescents' participation in school physical activity before and during COVID-19 pandemic

**Prof. Josef Mitáš<sup>1</sup>**, Prof. Karel Frömel<sup>1,2</sup>, Associate Professor Dorota Groffik<sup>2</sup>

<sup>1</sup>Palacký University Olomouc, Faculty of Physical Culture, Olomouc, Czech Republic, <sup>2</sup>The Jerzy Kukuczka Academy of Physical Education in Katowice, Katowice, Poland

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** N. Other

**Background:** High schools educate most adolescents, so they have the potential to deliver a significant proportion of their physical activity (PA), health-related fitness and sufficient physical literacy. To achieve these and other functions in high schools is dependent especially on the level of physical education (PE), comprehensive school PA programs, and schools' cooperation with sports clubs and parents.

**Aim:** The aim of this study was to identify the differences in PA and in meeting PA guidelines in a structure of weekly PA of adolescents with varying degrees of participation in school PA and different types of motivation for PA in habitual education before the pandemic and in distance education during the COVID-19 pandemic.

**Methods:** PA was assessed using the IPAQ-long form and motivation by using the MPAM-R questionnaire. Participants (N = 1,257) were divided into groups involved and not involved in school PA.

**Results:** During pandemic, the greatest decrease was observed in vigorous and moderate PA in boys (H = 98.52,  $p < 0.001$ ,  $\eta^2 = 0.179$ ) and girls (H = 56.86,  $p < 0.001$ ,  $\eta^2 = 0.075$ ) involved in school PA and in boys involved and not involved in school PA and in transportation PA.

**Conclusions:** PE teachers should focus on promoting vigorous PA and home PA for boys and girls in the post-pandemic period. One of the most important requirements is to increase the participation of boys and girls in PE classes and other forms of school PA. Student participation in school PA and an increase in overall PA should be supported through distance PE, which should be a mandatory part of PE programs and comprehensive school PA programs in high schools. Distance PE should focus on adolescents who are not involved in PE or school PA and encourage them to participate.

# Cost-consequence analysis of a mHealth obesity prevention intervention in Swedish primary child health care: the MINISTOP 2.0 trial

**Mrs. Christina Alexandrou**<sup>1,2</sup>, Prof. Marie Löf<sup>2</sup>, Dr. Victoria Brown<sup>3</sup>, Associate Professor Christine Delisle Nyström<sup>2</sup>

<sup>1</sup>Linköping University, Linköping, Sweden, <sup>2</sup>Karolinska Institutet, Stockholm, Sweden, <sup>3</sup>Deakin University, Melbourne, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Background:** The MINISTOP 2.0 parent-oriented app-based intervention promoting healthy lifestyle behaviors has previously been evaluated in a real-world effectiveness trial with positive statistically significant results on children's health behaviors. One major strength of the app is that it is available in Swedish, Somali, Arabic, and English, facilitating reach and inclusiveness, which is important for delivery at scale. However, first an economic evaluation of the intervention should also be conducted.

**Aim:** To evaluate the costs and effectiveness of the MINISTOP 2.0 intervention when delivered through Swedish child health care by means of a cost-consequence analysis.

**Methods:** A retrospective approach was utilized to collect data on all costs related to the MINISTOP 2.0 intervention, including costs for app and interface upkeep as well salary costs for introduction and dissemination of the app by child health care nurses. Costs were valued in Swedish krona 2022 and compared with previously published consequences (intake of fruits and vegetables, sweet and savory snacks, and sweet drinks (g/day); as well as physical activity and screen time (min/day)), estimated using linear regression.

**Results:** The total intervention cost was 437 439 SEK and the cost per participating family was 1 579 SEK. The cost for child health care nurses introducing and registering families for the app represented 9% of the total cost per family.

**Discussion:** The total cost for the MINISTOP 2.0 intervention was low in comparison to other similar childhood obesity interventions, particularly in terms of salary costs for staff. When scaling up interventions with high costs for salaries, the costs for many children will be very high. However, when scaling up the MINISTOP 2.0 intervention, where the major costs will be related to app and interface upkeep, the cost per child will likely be much lower when divided over a larger population.

**Conclusion:** Together with the positive results on children's health behaviors from the effectiveness evaluation, the MINISTOP app has the potential to be an affordable and effective primary preventive effort for promoting healthy lifestyle behaviors on a population level at scale.

# What do Stakeholders and Policymakers Think of Active Travel in Sao Paulo City, Brazil? Results of the ISA-Physical Activity and Environment Study

**Prof. Alex Antonio Florindo<sup>1,2,4</sup>**, Mr. Italo Vinicius Floriano Italo Vinicius Floriano de Paula<sup>1,4</sup>, Prof. Douglas Roque Andrade<sup>1,4</sup>, Prof. Leandro Martin Totaro Garcia<sup>3,4</sup>

<sup>1</sup>School of Arts, Sciences and Humanities - University of Sao Paulo, Sao Paulo, Brazil, <sup>2</sup>School of Public Health - University of Sao Paulo, Sao Paulo, Brazil, <sup>3</sup>Centre for Public Health; Queen's University Belfast, Belfast, United Kingdom, <sup>4</sup>Physical Activity Epidemiology Group - University of Sao Paulo, Sao Paulo, Brazil

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To investigate the opinions of Stakeholders and Policymakers about possible actions to increase active travel in Sao Paulo city, Brazil.

**Methods:** This survey is part of the ISA-Physical Activity and Environment cohort study, which follows a cohort of adults from Sao Paulo city, Brazil. The study is followed by a group of Stakeholders and Policymakers who voluntarily registered as “observers”. In 2022 we conducted an online survey to examine their opinions about ways to promote walking or bicycle for transportation in the city with 3 questions: which actions they believe would be most effective (Question 1) and more feasible/easier to implement (Question 2) to increase active travel levels in the city of São Paulo, and what actions they would like to see tested in a simulation model to have more information on what to do to change active travel levels (Question 3). The same list of 13 actions was presented in all questions, and respondents could choose up to 3 options in each question. We invited for the survey 45 people whose work was more closely related to active transportation promotion. Descriptive analysis was conducted.

**Results:** 18/45 (40%) Stakeholders and Policymakers completed the survey, 13 women (72%), with mean age of 47 years (sd = 11). Reducing motor vehicles speed was the most cited action in all questions. In Question 2, improving the distribution of jobs across the city bringing them closer to homes, and increasing the quantity and quality of sidewalks and bikepaths were the next most cited actions. In Question 3, increasing restrictions on individual motorized vehicles in the city center, with congestion charges at peak times, and increasing the quantity and the quality of bikepaths were also highly cited actions.

**Conclusions:** Stricter control of motor vehicles (speed and restriction in downtown), and increased and improved sidewalks and bikepaths were actions considered important to promote active travel in Sao Paulo city by Stakeholders and Policymakers.

**Funding:** FAPESP: 2017/17049-3.

# Using citizen science to promote physical activity in a low-SES neighborhood

**Dr. Berry van Holland<sup>1</sup>**, Miss Nikki Jepkema<sup>1</sup>, Dr. Johan de Jong<sup>1</sup>, Prof. Abby King<sup>2</sup>, Dr. Ann Banchoff<sup>2</sup>

<sup>1</sup>Hanze University of Applied Sciences, Groningen, Netherlands, <sup>2</sup>Stanford University School of Medicine, Stanford, CA, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

One neighborhood in Groningen, the Netherlands, is a neighborhood housing about 12,000 citizens with on average a low-SES background, showing a less healthy and active lifestyle. In the past, initiatives have been undertaken to promote active lifestyle by implementing outdoor facilities stimulating physical activity. However, use of facilities was poor due to lack of citizen involvement. Aim of this project was to engage citizens in the overall process of capturing, plan making and prototyping of concepts for an exercise-friendly physical and social environment.

From January 2020 till present day a Living Lab was run following the “Our Voice” citizen science method. Participatory citizen science was applied in which a community of stakeholders (public and private parties) and citizens was built. The community addressed the problem by creating more insight in promoting/degrading features in the neighborhood concerning an active lifestyle. Citizens used the Stanford Neighborhood Discovery Tool, which allowed for systematic observations of the physical environment. Additionally, emergent research walks gave extra information on neighborhood barriers/facilitators next to Discovery Tool data. Collected data allowed citizens to brainstorm on possible solutions in sessions facilitated by the researchers. Solutions were presented to local government and further developed for implementation and realization. Based on all data, new ideas were generated for improving exercise-friendliness. One idea was a walking route along art objects in the neighborhood. Furthermore, a citizens work group was formed which discussed this route, and other ideas and prototypes, with local government. This group was also involved in realization of prototypes. The route has been implemented and has been activated by several stakeholders and promotional activities.

Our project resulted in a citizen science approach which can be transferred to other neighborhoods. Use of Discovery Tool showed many benefits for neighborhood plan making. Early and continuous involvement of citizens has lead to more sustainable engagement and is a powerful method to create engagement around societal problems and social innovation in the field of health enhancing physical activity. Key feature in our method was integration of design thinking, citizen engagement, and use of digital tools.

# Acceptability of a 6-months exercise program including high intensity interval training in stroke patients: a qualitative study

Mrs. Thalia Lapointe<sup>1</sup>, Prof. François Trudeau<sup>1</sup>, Mrs. Amélie Bélanger<sup>1,2</sup>, **Prof. Julie Houle<sup>1,2</sup>**

<sup>1</sup>Université du Québec à Trois-Rivières (UQTR), Trois-Rivières, Canada, <sup>2</sup>Centre intégré universitaire de santé et services sociaux de la Mauricie et du Centre-du-Québec (CIUSSS MCQ), Trois-Rivières, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** This project aimed to describe the acceptability of the participation to a 6-month exercise program combining high intensity interval training (HIIT) and moderate intensity continuous training (MICT) in stroke patients. To implement such interventions, it is relevant to consider patient's acceptability. Previously, we conducted a project that demonstrated the effectiveness of this exercise program to improve health and cardiorespiratory fitness in stroke patients (Lapointe et al., 2023). The main research question is "How is described acceptability of this exercise program by participants?" Especially, based on Theoretical framework of acceptability, we wanted to describe three components such as affective attitude, perceived effectiveness, and intervention coherence.

**Methods:** A descriptive qualitative study was conducted. A convenience sample of 10 participants (8 men and 2 women aged 72± 10 years) who completed a 6-month combined exercise program including HIIT and MICT were recruited. In-depth semi-structured face-to-face interviews were conducted among those participants. The interviews were transcribed verbatim and analysed using a general inductive approach. All transcripts were read several times to identify emerging themes. Segments of one interview text were coded independently by T.L. and A.B using NVivo 15 software. The two researchers met to compare the labels applied and agree on a set of codes for all subsequent transcripts.

**Results:** The main finding reveals positive and motivational experiences to their participation. Three well appreciated aspects emerged: the social support, the follow-up and monitoring of health condition as well as the structure provided by the appointments and schedule of the program. Participants also perceived benefits in their physical fitness, daily living activities and psychological well-being. Moreover, participants reported an increase in their level of physical activity ascribed to the program. However, several participants reported a decrease in their level of physical activity at program cessation. High intensity level of exercise was not mentioned as a barrier.

**Conclusion:** This qualitative study demonstrated a good acceptability of a combined exercise program including HIIT among patients with prior ischemic stroke or TIA. It provides information that may be used to enhance motivation and improve implementation of exercise program with this population as well as benefits associated.

# ISA-Physical Activity and Environment Study: Advances and Challenges in a Cohort in Sao Paulo city, Brazil

**Prof. Alex Antonio Florindo**<sup>1,2,3</sup>, Miss Bianca Mitie Onita<sup>2,3</sup>, Miss Elayne Silva de Oliveira<sup>2,3</sup>, Dr. Rildo de Souza Wanderley Junior<sup>1,3</sup>, Miss Margarethe Thaisi Garro Knebel<sup>2,3</sup>

<sup>1</sup>School of Arts, Sciences and Humanities - University of Sao Paulo, Sao Paulo, Brazil, <sup>2</sup>School of Public Health - University of Sao Paulo, Sao Paulo, Brazil, <sup>3</sup>Physical Activity Epidemiology Group - University of Sao Paulo, Sao Paulo, Brazil

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** To describe some results, advances and challenges of a cohort in Sao Paulo, Brazil to examine the relationship between built environment (BE) and physical activity (PA).

**Methods:** Sao Paulo Health Survey (ISA in Portuguese) that was conducted between 2014/2015 with n=4,042 participants with 12 years or more by face-to-face interview and was used like baseline for the ISA-Physical Activity and Environment cohort study. The aim is to examine the relationship between BE changes and leisure-time and transportation PA. The secondary outcomes are obesity, mental health, and cardiovascular diseases. The IPAQ long version was applied to evaluate PA. Participants reported chronic diseases. BE facilities were evaluated by geographical information system according to household address in 500m, 1 km, and 1.5 km with official dataset of government, and microenvironment was evaluated with MAPS online. Observers from the public and private sectors and Non-Governmental Organizations are participating.

**Results:** The second wave was conducted by telephone interview due to COVID-19 in 2020/2021 with possible 3,993 adults eligible. The response rate was 35.9% (n=1,434), with 5% of refusals, and the main loss source identified was people not located (39.2%). We found an increase in leisure-time walking (from 21.5 to 38.2; p<0.01), and in transportation walking (from 60.2 to 71.0; p<0.01), but also an increase in obesity (from 21.1% to 27.0%; p<0.001) and hypertension (from 26.2% to 35.5%; p<0.001). The prevalence of depression in second wave was 12%. We geocoded bike paths, green areas, train/subway stations, recreation centers and walkability index from 2015 to 2020, and 1,434 routes were evaluated by MAPS in 24 months. The crime indicators and socioeconomic index were created and geocoded according to household address. Furthermore, an online survey was conducted with Stakeholders and Policymakers about possible actions to increase active travel.

**Conclusion:** We found increases in PA and chronic diseases. The future challenges include examining relationships between BE, PA and diseases in the second wave, increase the sample in the third wave with face-to-face and telephone interviews include accelerometers, built an agent-based model for active travel, and conduct the cost-effectiveness analysis.

**Funding:** FAPESP: 2017/17049-3.

# The role of diet for the prevention of type 2 diabetes in non-obese adults: A systematic review

**Dr. Mandy Ho<sup>1</sup>**, Miss Lee Wing Yiu<sup>1</sup>, Mr. Yu Hongjie<sup>1</sup>, Miss Hau Cheuk Lam Trammy<sup>2</sup>

<sup>1</sup>School of Nursing, the University of Hong Kong, Hong Kong, Hong Kong, <sup>2</sup>School of Public Health, the University of Hong Kong, Hong Kong, Hong Kong

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose** Type 2 diabetes (T2DM) is a major health problem. Current diabetes prevention strategies mostly focus on individuals who are overweight/obese and target for weight loss. The role diet/nutrition on diabetes risk in those without obesity has not been systematically reviewed. The aim of this systematic review was to assess the current evidence on the role of diet/nutrition for the prevention of T2DM in non-obese adults.

**Methods** We conducted a search from PubMed, EMBASE, CINAHL and Cochrane Library in 2021 to identify randomized controlled trials (RCT) and prospective cohort studies that examined the role of diet/nutrition for diabetes prevention in non-obese adults. The primary outcome of the systematic review was the incidence of T2DM. Two independent reviewers assessed abstracts and articles, and critically appraised the study quality.

**Results** Among 15 eligible studies (3 RCTs and 12 prospective cohort studies), 2 RCTs and 1 cohort study have explored the role of macronutrient contents (low fat diet, diet with high monounsaturated content, and low carbohydrate diets, respectively) on T2DM risks. It reported that a low-carbohydrate, high animal protein and fat diet was associated with an increased risk of T2DM. Three cohort studies have assessed the association of glycemic index (GI) and glycemic load (GL) with T2DM incidence and reported that a diet high in GI could increase risk of T2DM. There are 3 prospective cohort studies investigated the relationship between different types of dietary protein and the risk of T2DM. Among which, 2 reported no significant association between the dairy, animal and plant protein intakes and T2DM risk, and 1 reported that a high dietary acid load was associated with an increased risk of T2DM among non-obese Japanese men. There were 3 prospective cohort studies assessed nut, coffee and egg consumption in relation to T2DM risk, respectively. These studies reported that nut and egg consumption may lower T2DM risk, whereas coffee consumption may increase the risk of T2DM.

**Conclusion** More studies are required to confirm the role of diet for diabetes prevention in non-obese adults and to facilitate development of dietary guidelines and effective strategies for reducing diabetes risk in this population.

# Associations between sleep patterns and cardiometabolic risk factors in 9-year-old Swedish children

**Ms. Ellinor Nilsson<sup>1</sup>**, Prof. Marie Löf<sup>1</sup>, Dr. Jairo Hidalgo Migueles<sup>1</sup>, Associate Professor Christine Delisle Nyström<sup>1</sup>

<sup>1</sup>Karolinska Institutet, Stockholm, Sweden

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Background and aim:** Sleep is important for children's health, and poor sleep habits may influence children's cardiometabolic health in the short and long term. The sleep guidelines for 9-year-olds include sleeping 9-11 hours and having consistent bedtimes; however, bedtimes are not defined. Therefore, the aim of this study was to examine associations of sleep timing and duration with cardiometabolic risk factors in 9-year-olds.

**Methods:** This is a cross-sectional study utilizing data from three studies' follow-ups, where identical measures for all outcomes were conducted between 2016-2020 in Swedish 9-year-old children ( $n = 402$ ). Outcomes included anthropometrics, blood pressure, waist circumference, total cholesterol, high- and low-density lipoprotein cholesterol, triglycerides, glucose and insulin. HOMA-IR and a cardiometabolic risk score (MetS score) were calculated. Sleep was assessed with wrist-worn accelerometers and sleep logs. Children were categorized into four groups based on sleep timing, i.e., having a bedtime earlier or later than the median (21:39) and meeting or not meeting the sleep recommendations. ANCOVA was used to investigate associations between sleep patterns and cardiometabolic risk factors and Bonferroni correction was applied to investigate mean differences between sleep pattern groups.

**Results:** The group of children who met the sleep guidelines and had an early bedtime had lower MetS score ( $-0.15$  vs.  $0.42$ ,  $p = 0.029$ ), HOMA-IR ( $0.30$  vs.  $0.60$ ,  $p = 0.025$ ) and insulin levels ( $6.80$  vs.  $8.87$ ,  $p = 0.034$ ), compared to children with poorest sleep pattern. When adjusting for total sleep time, there were still associations to MetS ( $-0.19$  vs.  $0.50$ ,  $p = 0.014$ ) and HOMA-IR ( $0.30$  vs.  $0.60$ ,  $p = 0.041$ ).

**Conclusions:** Children meeting sleep guidelines and going to bed early had better MetS score and HOMA-IR than children not meeting sleep guidelines and going to bed late, even when adjusting for total sleep time. This finding indicates that not only sleep duration, but also sleep timing, has an overall impact on children's cardiometabolic health.

# Associations between anxiety disorders and depression symptoms are related to 24-hour movement behaviors among Brazilian adolescents

**Dr. Diego Augusto Santos Silva<sup>1</sup>**, Dr. Markus Joseph Duncan<sup>2</sup>, Dr. Nicholas Kuzik<sup>2</sup>, Dr. Mark Tremblay<sup>2,3</sup>

<sup>1</sup>Federal University of Santa Catarina, Florianopolis, Brazil, <sup>2</sup>Children's Hospital of Eastern Ontario Research Institute, Ottawa, Canada, <sup>3</sup>Department of Pediatrics, University of Ottawa, Ottawa, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Background:** Anxiety and depression are mental health comorbidities. Discovering effect modifiers across these conditions in the pediatric population is a constant challenge. We tested whether 24-hour movement behaviors modified the effect of the association between anxiety disorders and depression symptoms among Brazilian adolescents.

**Method:** This cross-sectional study included 4,141 adolescents aged 15 to 19 years (50.0% females) across all Brazilian geographic regions. Data were collected using a self-administered questionnaire. Using self-reported data, 4.4% (n=180) reported having been diagnosed with anxiety disorders and 95.6% (n=3,961) reported not having been diagnosed with anxiety disorders. We used the Patient Health Questionnaire (PHQ-9) to evaluate depressive symptoms of the participants. Accruing moderate-vigorous physical activity during leisure time,  $\leq 2$ /hours/day of recreational screen time, and good sleep quality were the exposures investigated. We evaluated interactions between anxiety and 24-hour movement behaviors in the association with depression symptoms adjusted by covariates (sociodemographic aspects and lifestyle behaviours). Robust regression models were built to estimate the unstandardized regression coefficients ( $\beta$ ) and 95% confidence intervals (95%CI).

**Results/findings:** Adolescents diagnosed with anxiety who met two ( $\beta$ : -4.93; 95%CI: -6.43; -3.44) or three ( $\beta$ : -5.71; 95%CI: -7.85; -3.57), and adolescents without diagnosis of anxiety who met one ( $\beta$ : -6.97; 95%CI: -8.15; -5.79), two ( $\beta$ : -8.21; 95%CI: -9.38; -7.03), or three ( $\beta$ : -8.46; 95%CI: -9.66; -7.27) of the 24-hour movement behavior targets had lower PHQ-9 scores for depression symptoms than adolescents diagnosed with anxiety who did not meet any of the 24-hour movement behavior targets. There was a significant interaction ( $\beta$ : -1.89; 95%CI: -3.24; -0.55,  $p=0.006$ ) between anxiety disorders status and meeting the 24-hour movement behavior targets.

**Conclusions:** Variations in meeting 24-hour movement behaviors modified the effect of the association between anxiety disorders status and depressive symptoms, with favourable modifications seen in adolescents who met one, two or three of the 24-hour movement behavior targets. Promoting adherence to 24-hour movement behaviors may assist in possible reduction in depression symptoms among adolescents with/without anxiety disorders.

# Impact of a school-based health promotion intervention in adolescents: primary results of the SI! Program cluster-randomized trial

Dr. Gloria Santos-Beneit<sup>1,2</sup>, **Dr. Juan Miguel Fernández-Alvira<sup>3</sup>**, Dr. Anna Tresserra-Rimbau<sup>4,5</sup>, Miss Patricia Bodega<sup>1,3</sup>, Miss Amaya de Cos-Gandoy<sup>1,3</sup>, Ms. Mercedes de Miguel<sup>1,3</sup>, Miss Sonia Leticia Ramírez-Garza<sup>4</sup>, Dr. Emily Pilar Laveriano-Santos<sup>4,5</sup>, Miss Camila Arancibia-Riveros<sup>4</sup>, Dr. Vanessa Carral<sup>1</sup>, Dr. Xavier Orrit<sup>1</sup>, Ms. Carla Rodríguez<sup>1</sup>, Ms. Isabel Carvajal<sup>1</sup>, Mr. Domènec Haro<sup>1</sup>, Mr. Jesús Martínez-Gómez<sup>3</sup>, Dr. Ramón Estruch<sup>5,6</sup>, Dr. Rosa María Lamuela-Raventós<sup>4,5</sup>, Dr. Rodrigo Fernández-Jiménez<sup>1,7,8</sup>, Dr. Valentín Fuster<sup>1,2,3</sup>

<sup>1</sup>Foundation for Science, Health and Education (SHE), Barcelona, Spain, <sup>2</sup>The Zena and Michael A. Wiener Cardiovascular Institute, Icahn School of Medicine at Mount Sinai, New York, USA, <sup>3</sup>Centro Nacional de Investigaciones Cardiovasculares (CNIC), Madrid, Spain, <sup>4</sup>Departament de Nutrició, Ciències de l'Alimentació, Institut de Nutrició i Seguretat Alimentària (INSA-UB), Universitat de Barcelona, Barcelona, Spain, <sup>5</sup>Consorcio CIBER, M.P. Fisiopatología de la Obesidad y Nutrición (CIBEROBN), Instituto de Salud Carlos III (ISCIII), Madrid, Spain, <sup>6</sup>Department of Internal Medicine, Hospital Clinic, Institut d'investigacions Biomèdiques August Pi i Sunyer (IDIBAPS), Universitat de Barcelona, Barcelona, Spain, <sup>7</sup>Centro de Investigación Biomédica en Red en enfermedades Cardiovasculares (CIVERVC), Madrid, Spain, <sup>8</sup>Hospital Universitario Clínico San Carlos, Madrid, Spain

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose** The aim of this study was to assess the impact of two multicomponent school-based educational health promotion strategies of differing duration and intensity on adolescents' cardiovascular health (CVH).

**Methods** The SI! Program for Secondary Schools cluster-randomized controlled trial enrolled 24 schools and 1326 adolescents (48.4% girls, mean age 12.5 ± 0.4 years) from Barcelona and Madrid (Spain). Participants were randomized to receive a health promotion intervention (SI! Program) over the 4 secondary school years (long-term intervention (LTI), 8 schools, 403 adolescents) or over the first 2 secondary school years (short-term intervention (STI), 8 schools, 490 adolescents) with similar content but different intensities or to receive the standard curriculum (control, 8 schools, 433 adolescents). The primary endpoint was the between-group difference at 2 and 4 years in the change in an overall CVH score from baseline (range 0 to 14 points). Intervention effects were tested with multi-level mixed-effects models.

**Results/findings** After 2 years, at half way through the LTI and at the end of the STI, the difference in the CVH score change was 0.44 points (95%CI: 0.06, 0.83; p=0.02) between the LTI and control groups and 0.17 points (95%CI: -0.21, 0.55; p=0.38) between the STI and control groups. At 4 years, differences for the LTI and STI groups vs control were 0.12 points (95% CI: -0.15, 0.40; p=0.39) and 0.13 points (95% CI: -0.14, 0.40; p=0.35).

**Conclusions** A 4-year school-based health promotion intervention for adolescents had a beneficial impact on overall CVH at a time point half-way through implementation. In contrast, the shorter but more intense 2-year intervention had no significant effect. At later follow-up, no significant effects were observed in either group. However, the COVID-19 lockdown affected the implementation of the last two years of the LTI, and thus the effectiveness might have been reduced. Although our findings suggest that the less condensed intervention was more effective, further research is warranted into the efficacy of school-based health promotion programs with different intensities and re-intervention strategies.

# Exploring variation in the behavioural composition and temporal distribution of upright events in 4213 middle-aged adults

**Mr. Joshua Culverhouse<sup>1</sup>**, Associate Professor Melvyn Hillsdon<sup>1</sup>, Dr. Richard Pulsford<sup>1</sup>

<sup>1</sup>University of Exeter, Exeter, United Kingdom

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Postural transitions, seated-to-upright and vice-versa, are associated with frailty, and the temporal distribution of transitions, such as interrupting sedentary time with upright events, with metabolic and vascular health. Upright events of a given duration can be qualitatively different, varying from sustained standing to sustained stepping or a combination of the two. Logically, the composition of upright events would be differentially associated with health outcomes, yet there is a paucity of evidence examining this. We present a novel characterisation of the composition and temporal distribution of these events.

**Methods:** Upright events were identified from accelerometer data (activPAL3) from 4213 participants of the 1970 British Cohort study. Metrics were computed to describe behavioural composition within events (intra-event characteristics) and between events (inter-event characteristics) of  $\geq 1$ -minute duration. Intra-event characteristics included: event duration, number of stepping bouts, stepping-to-standing ratio, steps-count, and weighted-mean cadence. Inter-event characteristics included: number of bouts, average durations, and metrics of temporal distribution of events including burstiness and active-to-sedentary transition probability (ASTP). We characterise the composition and temporal distribution of upright events for the whole cohort and population sub-groups.

**Results:** Both inter and intra-event characteristics varied significantly within and between participants. Participants averaged  $54.8 \pm 15.9$  (mean $\pm$ SD) upright events per day, with a median event duration of 4.7min [2.2, 11.0]. Median [IQR] stepping time per event was 1.3mins [0.7, 2.9]; with a stepping-to-standing ratio of 0.4 [0.2, 0.8]. Median number of steps per event was 90 [42, 206], with an average step-weighted mean cadence of  $75.4 \pm 19.7$  steps/min. Burstiness varied between ( $0.47 \pm 0.13$ ) and within ( $0.21 \pm 0.08$ ) participants; with considerable between ( $0.16 \pm 0.12$ ) and within ( $0.70 \pm 0.11$ ) variation also seen in ASTP. Importantly, variations in inter and intra-event characteristics were evident when frequency and duration of events were similar. Inter and intra-event characteristics differed according to demographic characteristics including sex and socioeconomic position.

**Conclusion:** We demonstrate considerable heterogeneity in composition (standing and stepping) and temporal distribution of upright events, which has implications for population surveillance, intervention design, and aetiological studies. Simply counting steps or the number of postural transitions may mask important associations between behaviour and health.

# Comparison of well-being perception between physical activity levels according with age in Luxembourg: Health Behavior in School-aged Children survey 2022

**Dr. Felipe G Mendes<sup>1</sup>**, Ms. Joana Lopes Ferreira<sup>1</sup>, Dr. Romain Brisson<sup>1</sup>, Dr. Caroline Residori<sup>1</sup>, Dr. Carolina Catunda<sup>1</sup>

<sup>1</sup>University of Luxembourg, Esch-sur-Alzette, Luxembourg

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Youth is a key life phase, as the behaviors established during this phase will mostly continue during adult life. Mental health is a state of well-being (WB) in which individuals realize their own abilities, can cope with the usual stresses of life, can work productively, and is able to contribute to their community. Physical activity (PA) is associated with the improvement of physical, cognitive, and mental health. This study aimed to analyze adolescents' state of WB in levels of PA across age, by gender in Luxembourg.

**Methods:** A representative sample of 8117 adolescents (11-to-18-years-old) took part in the Health Behavior in School Aged Children (HBSC) Luxembourg 2022 survey. WB was measured using the WHO-5 Well-being Index, and levels of PA were determined according to the time spend on and frequency of moderate-vigorous and vigorous PA (Highly active, Active, Low active and Not active). A two-way ANOVA stratified by gender was performed to analyze differences of the WB mean for PA levels and age group.

**Results:** For both girls and boys, those Highly active reported better WB than those Not active, in all age groups ( $p < 0.01$ , all age groups). For the intermediary levels of PA, different gender and age patterns were observed for the WB. While differences were observed between intermediary levels of PA among young girls, no statistically significant difference in mean WB was observed between intermediary levels of PA for girls aged 17 to 18 (highly active (mean=12.9, CI95%11.4-14.5), active (mean=12.4, CI95%11.8-12.9) and Low active (mean=11.80, CI95%11.3-13.2). In boys, only the age group 15-16 showed a difference between the highly active (mean=15.9, CI95%15.2-16.5) and active (mean=15.2, CI95%14.9-15.6) compared to the Low active (mean=13.3, CI95%12.8-13.9) and not active (mean=12.2, CI95%10.6-13.8).

**Conclusions:** Higher PA level is a protective factor for the WB of adolescents in Luxembourg in all ages. This study reinforces the importance of PA to maintain higher levels of well-being through adolescence in Luxembourg. To increase WB in Luxembourg future actions could be taken in order to reinforce the adherence to PA WHO recommendations in Luxembourg in younger ages and promote any level of PA for older ages.

# Involvement in the Carceral System and Dietary Risk: Results from a Scoping Review of the Literature

**Dr. Angela Odoms-Young<sup>1</sup>**

<sup>1</sup>Cornell University, Ithaca, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

With one of the highest incarceration rates in the world, over two million people are detained in jails, prisons, and detention centers in the United States (US) at any given time. People of color are disproportionately impacted by mass incarceration contributing to racial/ethnic disparities in individual, family, and community health. Dietary behaviors and conditions are key drivers of chronic disease morbidity and mortality and have significant implications for population health. Applying a liberation framework, we conducted a scoping review to examine the intersection between carceral system involvement and dietary outcomes in youth and adults. The review followed the procedures outlined in the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) extension for scoping reviews. From 2018-2023, a librarian-facilitated database search was conducted to systematically map the research exploring relationships between incarceration and diet-related experiences, including dietary behaviors, food insecurity, and food access. The search was conducted across the following databases: PubMed, Google Scholar, PsycINFO, Social Services Abstracts, Web of Science, and Scopus. We adjusted vocabulary and syntax as necessary across the databases. Peer-reviewed articles (n=75) published from 1980-2023, written in English, involving human participants, environmental audits, or menu analysis, and conducted in the United States, Canada, the UK, or Australia were included in the review. The review found that carceral setting involvement was related to significant dietary disadvantage among adults and youth and their families. Studies were categorized based on their time relative to incarceration, including before incarceration (poor diet and food insecurity risk factors for incarceration by contributing to poverty and trauma); during incarceration (poor healthy food availability in correctional facilities and the role of parental incarceration on food insecurity in families); and after incarceration (the role of incarceration in increasing the risk of food insecurity and poor diet-related health outcomes). The review also included findings from studies that target interventions during each period, including interventions to improve dietary and food choice behaviors among people who are incarcerated and dietary supplementation to improve cognitive function in youth. Research gaps and implications for public health research, practice, and policy will be discussed

# The influence of walkability on walking for transportation during the COVID-19 pandemic in the city of São Paulo, Brazil: a cohort study.

**Dr. Rildo de Souza Wanderley Júnior<sup>1</sup>**, Ms. Bianca Mitie Onita<sup>2</sup>, Ms. Margarethe Thaisi Garro Knebel<sup>2</sup>, Miss Elaynne Silva de Oliveira<sup>2</sup>, Prof. Alex Antonio Florindo<sup>1</sup>

<sup>1</sup>School of Arts, Sciences and Humanities-University of Sao Paulo, Sao Paulo, Brazil, <sup>2</sup>School of Public Health-University of Sao Paulo, Sao Paulo, Brazil

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The aim was to analyze the influence of walkability on walking for transportation in São Paulo residents in the periods 2014-2015 (baseline) and 2020-2021(2<sup>nd</sup> wave).

**Methods:** It was a cohort study (ISA-Physical Activity and Environment study) conducted with a sample of 1,434 individuals (35.5% of baseline) in São Paulo city, Brazil. At baseline information was collected by face-to-face interviews and at the 2<sup>nd</sup> wave by telephone interview. The outcomes analyzed were the weekly time spent on walking for transportation  $\geq 10$  minutes per week and  $\geq 150$  minutes per week, measured by the long version of the International Physical Activity Questionnaire (IPAQ). The walkability index was constructed using the variables net residential density, street connectivity, the mix of land use and slope, and then weighted by the percentage of the walkability value of the census sectors within the buffers network. The exposure was more walkable neighborhoods grouped into quartiles considering the walkability in the 500m and 1,000m network buffers. The covariates analyzed were sex, age group, and educational level. Multilevel mixed-effects logistic regressions were performed considering three models: 1) crude; 2) adjusted for time; and 3) adjusted for time, sex, age groups, and educational level.

**Results:** There was a significant increase in subjects who did not walk in the baseline and started walking in the 2<sup>nd</sup> wave  $\geq 10$  minutes per week (62.7; CI95%: 58.6-66.7;  $p < 0.01$ ) and  $\geq 150$  minutes per week (21.3; CI95%: 19.0-23.8;  $p = 0.02$ ). The multilevel models showed that subjects who were in more walkable neighborhoods in the 1,000m buffer were more likely to walk  $\geq 10$  minutes per week (OR=1.46; CI95%:1.10-1.93) and  $\geq 150$  minutes per week (OR=1.38; CI95%:1.08-1.76) for transportation, regardless of the covariates.

**Conclusions:** Living in more walkable neighborhoods can positively influence walking for transportation even in adverse scenarios such as the COVID-19 pandemic. It is important for health professionals to participate in the development of public policies for urban mobility.

**Funding:** São Paulo Research Foundation (FAPESP: 2017/17049-3; 2022/00692-9).

# Online grocery platform interventions and food-related behaviors: a scoping review

**Ms. Gabby Headrick<sup>1</sup>**, Ms. Carolyn Bresnahan<sup>1</sup>, Ms. Iris van Damme<sup>2</sup>, Mr. Fangzhe Han<sup>1</sup>, Dr. Alyssa Moran<sup>1</sup>, Dr. Neha Khandpur<sup>2</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA, <sup>2</sup>Wageningen University, Wageningen, Netherlands

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Few studies have systematically documented the range and effectiveness of interventions supporting healthy food behaviors in online grocery platforms. This review aimed to: (1) identify and catalogue healthy eating interventions that have been tested in online grocery environments; and (2) summarize their effectiveness in influencing food selection and purchase.

**Methods:** The scoping review protocol was made publicly available on Open Science Framework. Seven databases were searched using keywords that captured the settings, interventions, and study designs of interest. Peer-reviewed articles published in English until May 2022 were eligible for inclusion if they: (1) included an intervention conducted in an online grocery store or a platform that simulates the online shopping experience; (2) randomly assigned participants to intervention arm(s) with a control group; and (3) measured some aspect of consumer dietary behavior. The Covidence platform was used for screening (title and abstracts, n = 68; full text, n = 49) and data extraction (eligible studies only, n = 35).

**Results:** Most studies were based in the UK (n=8, 22.8%), the US (n=8, 22.8%), and Singapore (n= 6, 17.1%), and published between 2011 and 2022. While 17.1% of the studies were implemented in a real online grocery retail website, the majority utilized a simulated online grocery website. Nutrition (n = 27, 77.2%) and environmental (n = 8, 22.8%) interventions focused on: Promotion (e.g., advertisements, food labelling, n = 16, 45.7%), Price (e.g., taxation, price manipulation, n = 7, 20%), Product (e.g., suggested swaps, product reformulation, education, n = 7, 20%), and Placement (e.g., sorting based on health, placing items in certain areas of the aisle, n = 5, 14.3%). Nearly half (16%, 45.7%) of the interventions tested multiple strategies. Most interventions positively influenced the healthiness of foods selected (n = 28, 80%), the environmental sustainability of foods selected (n = 6, 17.2%), both healthfulness and environmental sustainability of foods selected (n = 1, 2.9%), and willingness to pay (n = 1, 2.9%), with only 7 studies showing null results.

**Conclusions:** The online grocery shopping platform supports a diversity of interventions to promote both human and planetary health.

# App-Supported Lifestyle Interventions in Pregnancy to Manage Gestational Weight Gain and Prevent Gestational Diabetes – A Scoping Review

**Mrs. Roxana Raab<sup>1</sup>**, Mrs. Kristina Geyer<sup>1</sup>, Prof. Hans Hauner<sup>1</sup>

<sup>1</sup>Institute of Nutritional Medicine, Else Kröner-Fresenius-Centre for Nutritional Medicine, School of Medicine, Technical University of Munich, Munich, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** There exists a large gap in implementing pregnancy lifestyle interventions into clinical practice. App-supported interventions might be able to overcome implementation barriers. To examine the current state of research in the field, this scoping review aimed to identify planned, ongoing and completed studies on eHealth and mHealth app-supported lifestyle interventions in pregnancy to manage gestational weight gain (GWG) and prevent gestational diabetes mellitus (GDM). The review assesses the breadth of literature in the field, identifies population, intervention, control, outcome, and study design (PICOS) characteristics of included studies and describes app functionalities.

**Methods:** The scoping review was conducted according to a pre-registered protocol (<https://osf.io/hjdc8/>) and followed the frameworks of Arksey and O'Malley, Levac et al., and the Joanna Briggs Institute. Four databases and two clinical trial registers were systematically searched and complementary searches were conducted. Published and unpublished quantitative and qualitative reports of app-supported lifestyle intervention studies in pregnancy were considered for inclusion. Eligible reports were included until June 2022. PICOS and app characteristics were extracted using a standardized, pre-tested template. Data was summarized in descriptive analysis and presented in narrative, tabular and graphical format.

**Results:** This review included qualitative and quantitative data of 43 lifestyle intervention studies. The number of published reports almost continuously increased in recent years, 40% of which accounted for trial register entries. Included studies varied in their PICOS characteristics. Studies were mostly conducted in high income countries, included women with overweight or obesity, delivered multicomponent interventions during pregnancy only, and focused on diet and physical activity. Eleven effectiveness and seven pilot trials had published results on GWG, of which six effectiveness trials observed significant intervention effects. None of the five trials reporting GDM results observed effects on GDM. Apps used were mostly mHealth apps, connected with physical activity and weight tracking devices and involved self-monitoring, goal setting, prompts, feedback and educational content.

**Conclusions:** Research in the field is emerging, while effectiveness and implementability of interventions has yet to be determined. Gaps in research exist on vulnerable groups, risk-adapted interventions involving social surrounding and mental health aspects, starting early and spanning from preconception to postpartum period.

# Neighborhood violence and adult obesity in Sao Paulo city, Brazil: a longitudinal study

**Ms. Bianca Mitie Onita**<sup>1,2</sup>, Ms. Margarethe Thaisi Garro Knebel<sup>1,2</sup>, Dr. Rildo de Souza Wanderley Júnior<sup>1</sup>, Dr. Marcelo Batista Nery<sup>3</sup>, Ms. Beatriz Oliveira de Carvalho<sup>3</sup>, Prof. Alex Antonio Florindo<sup>1</sup>

<sup>1</sup>Physical Activity Epidemiology Group (GEPAF) – School of Arts, Sciences and Humanities, University of Sao Paulo, Sao Paulo, Brazil, <sup>2</sup>Graduate Course in Nutrition in Public Health – School of Public Health, University of Sao Paulo, Sao Paulo, Brazil, <sup>3</sup>Center for the Study of Violence (NEV), University of Sao Paulo, Sao Paulo, Brazil

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** To assess the relationship between neighborhood violence and obesity incidence in adults from Sao Paulo, a megalopolis city in Brazil.

**Methods:** Prospective longitudinal study with data from ISA: Physical Activity and Environment. The sample had 929 adults aged 18 and over without obesity at baseline (2014/2015) that participated in the second wave of the study (2020/2021). The outcome was obesity incidence (yes, no) assessed through body mass index, calculated from self-reported height and weight, with cutoffs applied accordingly to age groups. The independent variables were terciles of violent crime records in 2019 (included vehicle, pedestrian and within public transportation theft, and intentional homicide) within 500m, 1000m and 1500m linear buffers (neighborhoods) from each participant residence at second wave (1<sup>st</sup> tercile as reference with less violent crime records), with official government dataset from the Center for the Study of Violence. Chi-square tests were used for bivariate analysis and applied multilevel logistic regression models, with individual and health administrative areas (central, north, east, west, southeast, south) as levels, with the associated independent variables – model1: crude analysis; model2: adjusted for age, sex, skin color, educational level; model3: model2 added perceived violence of neighborhood (very safe, fairly safe, somewhat violent, very violent) from the baseline questionnaire. Wald test was used to verify variables association in the models.

**Results:** Central area of Sao Paulo had higher proportions of violent crime across all buffers, and western area had the lower proportions. Obesity incidence was 15.1% in the period, and it was associated with living in neighborhoods with violent crimes at second wave within 1500m ( $p=0.021$ ) and 1000m ( $p=0.040$ ). The relationship remained significant in model3 for both neighborhoods, and people living in the higher tercile of violent crimes within 1000m had higher chances to develop obesity ( $OR=1.76$ ;  $CI95\%=1.11-2.78$ ;  $p\text{-value for trend}=0.015$ ).

**Conclusions:** This study showed that people exposed to a more violent neighborhood are also in higher risk to develop obesity, highlighting the importance of etiology beyond behaviors factors, like physical activity and diet, and its inclusion in prevention plans and actions such as neighborhood-level public policies.

**Funding:** Sao Paulo Research Foundation (FAPESP: 2017/17049-3; 2021/03277-0).

# UK caregiver attitudes to risky child play: differences by child and adult gender

**Dr. Andrea Smith<sup>1</sup>**, Dr. Esther van Sluijs<sup>1</sup>  
<sup>1</sup>MRC Epidemiology Unit, Cambridge, United Kingdom

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Background:** Risky play is a natural aspect of children's development, fun, rewarding, and can motivate children to be active. Some parents are more permissive of risky play than others and this impacts on children's play opportunities. This study explores gender differences in parental attitudes towards risky play to understand the perceived barriers which may constrain this type of play for 5-11-year-old children in the UK.

**Methods:** Cross-sectional analyses of the nationally-representative British Child Play Survey of caregivers with primary-school-aged children. Self-reported tolerance for risk in play was collected using the 31-item Tolerance for Risk in Play scale (TRiPS; scored 0-184) and the Risk Engagement and Protection Survey (REPS; scored 6-42). REPS captures caregiver 'Protection from Injury' (PIF) and 'Engagement with Risk' (EWR; scored 6-42) attitudes in relation to child play. Multiple linear regression was applied to compare caregiver gender differences for REPS and TRiPS, with parental and child sex as the independent variables and total scores of TRiPS, REPS PIF and REPS EWR as dependent variables, respectively.

**Results:** Participating caregivers (n=1919) were mostly female (54%), white (91%) and high/medium SES (59%). There were no caregiver gender differences in mean TRiPS (M=83.60, p=.64), REPS EWR (M=30.84, p=.66) and REPS PFI (M=26.05, p=.32). There were significant differences in the proportion of caregivers that tolerated individual TRiPS risky play activities (15/31 activities). Of these 15 activities, 10 were more tolerated by female caregivers (e.g., chasing other children) than males (e.g., allowing the child to play in the forest alone). Parent gender was not significantly associated with total TRiPS ( $\beta=.25$ (SE=1.75),  $p<.89$ ), REPS PFI ( $\beta=-.25$ (SE=0.25),  $p<.32$ ) or REPS EWR ( $\beta=.17$ (SE=0.24),  $p<.47$ ). However, caregivers of boys demonstrated greater tolerance of risk (TRiPS score ( $\beta=-4.5$ (SE=1.74),  $p<.01$ ), REPS PFI ( $\beta=-.33$ (SE=.25),  $p<.01$ ) and REPS EWR ( $\beta=-.62$ (SE=.23),  $p<.01$ )).

**Conclusions:** Gender-specific differences in tolerance were found to be targeted towards specific types of risks and were more frequently tolerated by female caregivers. Caregivers of boys showed more permissive attitudes and tolerance of risky play, irrespective of their own gender. These insights will aid the development of interventions to support caregivers in making informed decisions on how to encourage children's risky play.

# Children's Objectively Measured Physical Activity Pre/Post Covid-19: A Structured Days Approach.

**Dr. Ethan Hunt**<sup>1</sup>, Dr. Keith Brazendale<sup>2</sup>, Dr. Augusto Cesar De Moraes<sup>1</sup>, Mr. Raja Malkani<sup>1</sup>, Dr. Deanna Hoelscher<sup>1</sup>

<sup>1</sup>University of Texas Health Science Center School of Public Health Austin , Austin , USA, <sup>2</sup>University of Central Florida Department of Health Sciences, Orlando , USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Background:** The Structured Days Hypothesis (SDH) posits that children's physical activity is more favorable on days that contain more structure. With the closure of schools during COVID-19, we believe, the compounding impact of less structure from shutdowns and summer will negatively impact objectively measured physical activity among youth. The purpose of this study was to compare children's objective physical activity on school weekdays prior to COVID-19 restrictions versus during COVID-19 restrictions, and summer weekdays prior to COVID-19 restrictions versus during COVID-19 restrictions.

**Methods:** Data were received from the Adolescent Brain Cognitive Development (ABCD) study database in November of 2022. For this cross-sectional analysis, we pulled Fitbit data from the year-2 follow-up cohort of the ABCD study. Fitbits were employed to a sub-sample during this period for twenty-one days encompassing weekdays and weekends. Time-stamped Fitbit data allowed us to roughly differentiate pre-COVID-19 shutdowns, as well as the school year and summer months. Linear and Logistic Mixed effects models accounting for the nested nature of the data (i.e., days within children) assessed MVPA and steps per day, by group, adjusted for, sex, race/ethnicity, household income, and site location.

**Results:** Our final analytic sample included 7,371 children (48% female, 48% non-White, 11.6 yrs.). After controlling for demographic and site location variables, during COVID-19 restrictions, children engaged in significantly less daily average steps (Coef. -2,488 95%CI 2,647, 2,328) during school weekdays compared to school weekdays before COVID restrictions. During COVID-19 restrictions, children engaged in significantly less daily average steps (Coef. -1,592 95%CI 1,828, 1,355) during summer weekdays compared to summer weekdays before COVID restrictions. During COVID-19 restrictions, children were significantly less likely to meet MVPA recommendations (OR 0.54 95%CI 0.48, 0.60) during school weekdays compared to school weekdays before COVID restrictions. During COVID-19 restrictions, children were significantly less likely to meet MVPA recommendations (OR 0.68 95%CI 0.58, 0.81) during summer weekdays compared to summer weekdays before COVID restrictions.

**Discussion:** Children's MVPA and steps both declined significantly during periods of less structure. Further, it appears that the COVID-19 epidemic significantly exacerbated these findings. These findings will help better prepare youth-serving programs for the next epidemic.

# Adaptation and implementation of a tele-nutrition education intervention for Native American caregivers of young children living in remote rural communities

**Dr. Mical Shilts<sup>1</sup>, Dr. Lenna Ontai<sup>2</sup>**, Ms. Sonia Rodriguez<sup>3</sup>, Ms. Vicki Shively<sup>4</sup>, Ms. Jona Pressman<sup>3</sup>, Dr. Dennis Styne<sup>5</sup>, Dr. Dorina Espinoza<sup>6</sup>, **Dr. Karina Diaz Rios<sup>7</sup>**

<sup>1</sup>California State University, Sacramento, Sacramento, CA, USA, <sup>2</sup>University of California, Davis, Davis, CA, USA, <sup>3</sup>University of California Cooperative Extension, Oroville, CA, USA, <sup>4</sup>Round Valley Indian Health Center, Covelo, CA, USA, <sup>5</sup>University of California Davis Medical Center, Sacramento, CA, USA, <sup>6</sup>University of California Agriculture and Natural Resources, Eureka, CA, USA, <sup>7</sup>University of California, Merced, Merced, CA, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To adapt a nutrition education intervention for tele-nutrition delivery and relevance to Native American caregivers of young children living in remote rural communities, and to evaluate its acceptability.

**Methods:** Community-engaged dissemination and implementation science principles were applied in the adaptation and implementation of Healthy Kids Tele-Nutrition. This program consists of 7-weekly classes delivered remotely by a Cooperative Extension community nutrition educator. Consultation with a community advisory board of tribal members guided program adaptations for cultural relevance. An environmental scan was conducted to harmonize the class content—including food demonstrations—with food resources available in the community. Acceptability of the content and tele-nutrition delivery were explored via surveys completed by participants after each class. Class surveys were triangulated with a focus group conducted after the last session of the series. Validated tools were used to measure the intervention's limited efficacy in improving food-related behaviors and parenting practices at home.

**Results/findings:** The first series of classes was delivered in the Fall of 2022; one class was canceled due to a conflicting community event. Of the 22 women enrolled, 17 attended at least 4 classes; the majority identified as Native American (n=12). Unstable internet connectivity and audiovisual equipment issues that occurred throughout the series were troubleshooted by the onsite implementation partner team. Across class surveys, most participants indicated the nutrition topics (96%), parenting topics (98%), and goal-setting activities (95%) were useful; and agreed that they learned new information (95%), will apply what learned at home (94%), felt comfortable participating (96%), and that the tele-nutrition delivery was effective (93%). Preliminary qualitative and limited efficacy results indicate participants found the classes valuable to improve eating practices at home and appreciated the delivery format and class dynamics. Initial findings informed adaptations to the intervention.

**Conclusions:** Access to tele-nutrition resources can help mitigate nutrition disparities faced by residents of remote rural communities. Healthy Kids Tele-Nutrition appears to be an acceptable and promising approach to improve food-related behaviors and parenting practices in rural Native American homes. The updated intervention is being offered in the same community, and new partnerships are being explored for additional remote community delivery.

# The effects of interrupting sedentary behaviour with different frequencies of physical activity on cardiometabolic risk factors in healthy adults

**Mrs. Melina Meyer Magulas<sup>1</sup>**, Prof. Ulf Ekelund<sup>1</sup>, Prof. Jostein Steene-Johannessen<sup>1</sup>

<sup>1</sup>Norwegian School of Sports Sciences, Oslo, Norway

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose** From both a public health and clinical perspective it is important with early interventions affecting the modifiable risk factors that can contribute to prevent premature development of and death caused by cardiometabolic risk factors. Breaking up sitting with bouts of physical activity is associated with improved cardiometabolic profile in clinical populations. However, whether this extends to healthy adults is unclear. Thus, the aim was to examine whether breaking up sitting with different frequencies of PA bouts improves cardiometabolic profile in healthy adults compared to prolonged sitting.

**Methods** In this crossover study, 20 sedentary adults (9 men,  $33.4 \pm 4.7$  years, BMI  $25.8 \pm 3.4$ ,  $VO_{2max}$   $47 \pm 9.2$  ml/kg/min) were randomly assigned to the following conditions (7hr): 1) prolonged sitting (SIT), 2)  $\approx 5$  min of walking/jogging every 60 min (PA-60). 3) 3 min of walking/jogging every 30 min (PA-30) 4.)  $\approx 30$  min PA followed by sitting (PA-SIT). All PA bouts were conducted at 65% of  $VO_{2max}$ . Trial conditions were iso-caloric and the test meals had an average macronutrient content of  $34.4 \pm 1\%$  fat,  $46 \pm 4.5\%$  carbohydrates and  $20 \pm 1.7\%$  protein, respectively Fasting blood samples were drawn from the antecubital vein at baseline ( -1 hr and 1 hr), and then every 30 minutes over the remaining 6 hrs.

**Results: Data analysis plan** This study is currently ongoing and complete datasets will be included in due time for the annual meeting. Total area under the curve and positive incremental area under the curve for glucose, insulin, c-peptide and triglycerides will be calculated by the trapezoidal rule. Normality for the data will be checked. One-way ANOVA will assess between condition effects. Cohen's d effect sizes of 0.2 (small), 0.5 (medium) and 0.8 (large) will be calculated to describe the magnitude of differences between conditions. Data will be presented as mean (95 % CI). Significance accepted is  $<0.05$ .

**Discussion/Conclusion** The present study may add new evidence on the effects of different frequencies of interrupting sedentary behavior with PA on cardiometabolic risk factors in young, healthy adults, and thus contribute to shape quantitative advice on how to limit sedentary behavior.

# Development and validation of a screening questionnaire for early identification of pregnant women at risk for excessive gestational weight gain

**Mrs. Kristina Geyer<sup>1</sup>**, Mrs. Roxana Raab<sup>1</sup>, Prof. Hans Hauner<sup>1</sup>

<sup>1</sup>Institute of Nutritional Medicine, Else Kröner-Fresenius-Centre for Nutritional Medicine, School of Medicine, Technical University of Munich, Munich, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose** Excessive gestational weight gain (GWG) is associated with negative consequences for the health of mother and child. Lifestyle interventions to prevent excessive GWG in pregnancy should consider individual risk factors of expectant mothers. The aim of this study is to develop and validate a non-invasive screening questionnaire to identify a woman's risk of excessive GWG already at the beginning of pregnancy.

**Methods** The cohort of the German "Healthy Living in Pregnancy" (GeliS) trial was used for the development of a score predicting the risk of excessive GWG. Maternal data on socio-demographics, anthropometrics, smoking behaviour and mental health were collected before the 12<sup>th</sup> week of gestation. The calculation of GWG was based on the last and first weight measured during routine antenatal care. The data was randomly divided into a training and validation data set. The training data set was used to perform a multivariate logistic regression model with stepwise backward elimination. Based on the calculated  $\beta$ -coefficients, a score value was assigned to the final variables. The risk score was validated using the test dataset and an external dataset.

**Results** 1790 women were included in the analysis. Of these, 45.6% showed excessive GWG. A high pre-pregnancy body-mass-index, intermediate educational level, signs of depressive disorder, primiparity, smoking and being born in a foreign country were identified as risk factors for excessive GWG. The risk score ranged from 0-15 and categorised women's risk for excessive GWG into low (0-5), moderate (6-10) and high (11-15). Cross-validation and external validation revealed a moderate predictive power of the score with an area under the curve of 0.709 and 0.738, respectively.

**Conclusions** Our screening questionnaire is a simple, assistive, and validated tool for early identification of pregnant women at risk of excessive GWG, enabling targeted primary prevention lifestyle support. It addresses the current demand for translation of research findings into clinical practice in pregnant women.

# Associations of the daily and hourly variability of physical activity accumulation on indices of vascular function; evidence from the Maastricht study.

**Miss Rebecca Lear**<sup>1</sup>, Prof. Melvyn Hillsdon<sup>1</sup>, Dr. Brad Metcalf<sup>1</sup>, Dr. Bert Bond<sup>1</sup>, Prof. Hans Saveberg<sup>2</sup>, Dr. Bastiaan E. de Galan<sup>2</sup>, Dr. Tos Berendschot<sup>2</sup>, Dr. Carol Webers<sup>2</sup>, Associate Professor Alfons Houben<sup>2</sup>, Dr. Jeroen Kooman<sup>2</sup>, Dr. Coen D.A. Stehouwer<sup>2</sup>, Dr. Abraham A Kroon<sup>2</sup>, Prof. Hans Bosma<sup>2</sup>, Dr. Simone J.P.M. Eussen<sup>2</sup>, Ms. Evelien Vandercappellen<sup>2</sup>, Associate Prof. Annemarie Koster<sup>2</sup>, Dr. Richard Pulsford<sup>1</sup>  
<sup>1</sup>University of Exeter, Exeter, United Kingdom, <sup>2</sup>Maastricht University, Maastricht, Netherlands

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** The beneficial effects of physical activity (PA) on vascular function in the prevention of cardiovascular diseases are well characterised. However, existing studies focus on total or average volume/duration of daily moderate-vigorous PA (minutes). Little is known about how the daily and weekly PA patterns associate with vascular function.

**Methods:** Accelerometer-derived (activPAL3) 7-day stepping was analysed for 5199 participants in The Maastricht Study (50.4% women; 22.4% type 2 diabetes). Vascular function was assessed in the macrocirculation (cfPWV) and the microcirculation in the skin (heat-induced hyperaemia) and the eye (static and dynamic retinal vessel analysis). Multivariable regression models initially explored associations between stepping metrics; volume (step-count), duration (stepping time), and intensity (stepping time >and< 100 steps/min) with vascular function after adjustment for confounders and moderators. PA variability metrics (between-day and within-day variability, inter-daily stability, intra-daily variability, and the proportion of steps accumulated in the most active 2 days) were then added to the regression models to identify improvements in the prediction model ( $\Delta R^2$ ) beyond that of stepping metrics. Analyses were stratified by diabetes status if an interaction effect was present to explore effect modification by differences in metabolic health.

**Results:** All stepping metrics were significantly negatively associated with cfPWV, with a stronger association in those with type 2 diabetes (all  $P < 0.05$ ). Inter-daily stability was significantly associated with cfPWV ( $b = 0.504$  95%CI[0.028, 0.982]  $P = 0.038$ ,  $\Delta R^2 = 0.001$ ). In analyses of skin microcirculation there were significant positive associations with stepping metrics in those with diabetes, but interestingly a small negative association in those without diabetes ( $P_{\text{interaction}} < 0.001$ ). Inclusion of variability metrics did not significantly improve the prediction model. In analysis of retinal microvascular function there was no association with stepping metrics, however in static retinal analysis of venular diameters there were significant associations with between-day variability, within-day variability and inter-daily stability (all  $P < 0.05$ , overall  $\Delta R^2 = 0.009$ ).

**Conclusion:** Engaging in higher levels of PA is associated with improved macro- and some aspects of microvascular function, especially in those with diabetes. Daily or weekly patterns in which PA is accumulated may influence macro- and microvascular function, which may have implications for the prevention of disease.

# A Study of Body Image, Weight Stigma, and Disordered Eating Behaviors among LGBTQ+ Young Adults

Ms. Alexandra Hajek<sup>1</sup>, Ms. Jacey Poole<sup>2</sup>, Dr. Cassandra Johnson<sup>1</sup>, Dr. Jenifer Ross<sup>2</sup>, **Dr. Lauren Butler<sup>1</sup>**

<sup>1</sup>Texas State University, San Marcos, USA, <sup>2</sup>University of North Florida, Jacksonville, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Background:** Structural and social inequalities contribute to higher prevalence of eating disorders among lesbian, gay, bisexual, transgender and queer (LGBTQ+) adults compared to heteronormative adults. Body image concerns, weight stigma, and disordered eating behaviors (e.g. vomiting after meals) are risk factors for eating disorder development. Little is known about eating disorder risk factors, particularly, weight stigma, among LGBTQ+ persons. This study aimed to determine differences in body image, weight stigma and disordered eating among LGBTQ+ persons compared to their heteronormative counterparts. Findings can support inclusive clinical practice and behavioral nutrition research.

**Methods:** This cross-sectional study used survey data from a sample of university students (18-35 years old) in Jacksonville, FL, USA (N=255). Measures included the Weight Self-Stigma Questionnaire (weight stigma) and Body Appreciation Scale (body image). The Eating Attitudes Test-26, a valid and reliable tool for eating disorder referral, was used to assess disordered eating behaviors. Analyses of covariance was used to determine means and differences in outcomes between LGBTQ+ community members and heteronormative persons. Multivariable linear regression models were used to determine differences between persons from LGBTQ+ subgroups (e.g., lesbian, bisexual) and the comparison group.

**Results:** Nearly half of surveyed students (45.5%) reported LGBTQ+ community membership. Most individuals reported cis-gender, heterosexual orientation (i.e., heteronormative identification) (58.24%), followed by bisexual (17.58%), queer (6.23%) and lesbian (5.49%) sexual orientations. Compared to the heteronormative group, LGBTQ+ persons reported lower body appreciation (BA) ( $3.08 \pm 0.09$ ;  $p < 0.01$ ), and weight stigma (WS) ( $30.54 \pm 0.83$ ;  $p < 0.01$ ) scores. Disordered eating behavior scores did not differ between LGBTQ+ and referent groups and were subclinical on average. WS scores were higher among those reporting bisexual ( $6.08 \pm 1.72$ ;  $p < 0.01$ ) and polysexual ( $5.89 \pm 2.77$ ;  $p = 0.03$ ) orientations. BA scores were lower among those reporting bisexual ( $-0.32 \pm 0.15$ ;  $p = 0.03$ ) and polysexual ( $-0.62 \pm 0.24$ ;  $p = 0.01$ ) orientations compared to the heteronormative group.

**Conclusion:** This study is one of the first to highlight weight stigma within the LGBTQ+ community. Disordered eating behaviors were commonly reported. Clinicians and researchers might consider including weight stigma assessment, along with body image and disordered eating, for the treatment and prevention of eating disorders.

# Identification of behavioral components in m-Health to optimize engagement with a Physical Activity app

**Associate Professor Tina Dalager**<sup>1,2</sup>, Mrs. Linnea Marie Sjöbjerg<sup>1,3</sup>, Prof. Gisela Sjøgaard<sup>1</sup>, Mrs. Anne Kathrine Overgaard<sup>3</sup>, Mr. Thomas Kaarsted<sup>3</sup>, Associate Professor Lotte Nygaard Andersen<sup>1</sup>, Mrs. Anne Faber Hansen<sup>4</sup>, Prof. Karen Søgaard<sup>1</sup>

<sup>1</sup>Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark, <sup>2</sup>Department Clinical medicine, Aarhus University, Aarhus, Denmark, <sup>3</sup>Citizen Science Knowledge Center, University of Southern Denmark, Odense, Denmark, <sup>4</sup>Department of Research and Education, University Library, University of Southern Denmark, Odense, Denmark

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Strong epidemiological and clinical evidence demonstrates that physical exercise decreases the risk of more than 35 different disorders and should be prescribed as treatment for many chronic diseases. Yet, most adults are physically inactive. We have developed the Intelligent Physical Exercise Training (IPET) app, that designs individually tailored exercises based on information on work profile, physical capacity, musculoskeletal pain, and health. In more than 20 RCTs we demonstrated the effectiveness of IPET, but effect size is highly depending on the degree of adherence. Thus, the aim of this study is to identify and design behavioral components that integrated in IPET app potentially can increase engagement and adherence.

**Methods:** First part of the project, was to conduct a systematic literature search to identify relevant themes in optimizing use of m-Health. We performed the literature search in three scientific databases: Cinahl, Embase, and Scopus and structured it in 3 focus blocs; 1. describing user experience, engagement, or adherence; 2. describing m-health, smartphone applications or app designs; and 3. describing physical activity, training, or exercise.

Second part of the project is four co-creation workshops involving 70-110 participants (who beforehand have been introduced to the IPET app, and the themes identified in the systematic literature search) in fine-tuning the app with regards to motivation and daily use.

In the third part of the project the identified important behavioral components will be designed and implemented in the IPET app. For a period of 3 months, between 75-150 participants will pilot test the fine-tuned IPET app. It will be evaluated using questionnaire and focus group interviews.

**Results/findings:** The systematic literature search identified 1407 references, which after removal of duplicates left 929 references for title and abstract screening. Further analysis is ongoing. Second part of the project will take place in May, and pilot testing will run in autumn 2023.

**Conclusion:** We anticipate that 3-6 themes will emerge from the literature search, which the workshop participants will evaluate for importance in the design of the behavioral components in the IPET app. We hypothesizes that the fine-tuned IPET app will increase engagement and adherence, thus enhance health.

# An exploratory analysis of the extent to which Canadians correctly estimate their sodium intake

**Miss Alicia Tavares da Silva Gomes**<sup>1,2</sup>, Miss Shannon Brazel<sup>3</sup>, Miss Katherine Jefferson<sup>2</sup>, Mr. Noah Donaghy<sup>2</sup>, Mrs. Rola Al Ghali<sup>2</sup>, Dr. Beatriz Franco-Arellano<sup>2</sup>, Associate Professor JoAnne Arcand<sup>2</sup>

<sup>1</sup>University of São Paulo, São Paulo, Brazil, <sup>2</sup>Ontario Tech University, Oshawa, Canada, <sup>3</sup>St. Michael's Hospital, Toronto, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** A high sodium diet increases the risk of cardiovascular diseases. On average Canadians' sodium consumption is much higher than advised; and many people have misconceptions about the amount of sodium they consume. The purpose of this exploratory cross-sectional study among a select group of Canadians was to examine the extent to which people correctly estimated their sodium intake.

**Methods:** Participants in Durham (Ontario) were recruited from primary care clinics, a community centre and social media (2019-2022). Participants completed a questionnaire on sodium knowledge, attitudes and behaviors, where individuals ranked their sodium intake on a scale from "far too much" to "far too little" and "don't know". Participants who selected "far too much/too much" were classified as having "high" sodium intake self-perception; all others were considered as "low", except "don't know". Participants completed two 24-hour urine collections and were classified into a low ( $\leq 2300$  mg/day) or high ( $> 2300$  mg/day) sodium diet category. Fisher's exact and Kruskal-Wallis tests were used to compare groups.

**Results/findings:** Participants ( $n=92$ ) were 40-94 years old, 67% female, 97% Caucasian, and 3% had high blood pressure. There was no difference in the sodium intake among those that perceived their intake to be high (48%,  $2986 \pm 1086$  mg/day) versus low (42%,  $2737 \pm 1286$  mg/day) versus "don't know" (10%,  $2517 \pm 1055$  mg/day) ( $p=0.143$ ). Among participants who were following a high sodium diet (58%), 58% correctly classified their intake as high and 34% incorrectly classified as low. In contrast, 54% of participants who had a low sodium diet (42%) correctly classified their intake as low, 33% incorrectly classified as high. Self-perception and actual intake showed a significant association ( $p=0.049$ ). In comparing those who correctly and incorrectly assessed their intake as high, those who were actually following a high sodium diet were more likely to not be currently limiting their intake (55% vs 85%,  $p=0.089$ ) nor concerned about the amount of sodium they eat (81% vs. 85%,  $p=1$ ).

**Conclusions:** In this exploratory study, approximately one third of participants had an incorrect self-perception of their sodium intake. Further exploration in nationally representative sample is needed.

# Environmental and genetic contributions to device-based measures of physical activity in Swedish 9-year-olds

**Prof. Maria Ekblom**<sup>1,2</sup>, Prof. Örjan Ekblom<sup>1</sup>, Dr. Camilla Wiklund<sup>1,2</sup>, Associate Professor Rui Wang<sup>1,2</sup>

<sup>1</sup>The Swedish School of Sport and Health Sciences, GIH, Stockholm, Sweden, <sup>2</sup>Karolinska Institutet, Solna, Sweden

Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM

**SIG - Primary Choice:** G. Children and families

**Purpose** Physical activity (PA) levels among Swedish children are associated with familial socioeconomic status. However, it remains unclear what the driving determinant is: genes or environments. This study aimed to investigate environmental and genetic contributions to proportion of time spent in sedentary behaviour (SED) and PA at low medium and vigorous intensities (LPA, MPA and VPA) in children.

**Methods** We invited Swedish 9-year-old twins enrolled in the Swedish twin register to wear a GT3X accelerometer on their right hip for 7 days. A total of 465 twin pairs with known zygosity and 4-9 days of valid data were analysed. A univariate model was performed to estimate the relative contribution of genetic ( $a^2$ ), shared environment ( $c^2$ ), and unique environment ( $e^2$ ) factors contributing to the variation in % of awake time spent at different intensities. OpenMx was used to perform the analyses and we used Wald-type confidence intervals.

**Results** The twins spent on an average 63% of their awake time in SED, 9% in VPA, 7% in MPA and 20% in LPA. Boys spent a significantly higher % in VPA and MPA, but a lower % time in SED and LPA, compared to the girls. The contribution of genetic factors (heritability) was substantial (0.42 to 0.51) for all PA measures. *Table 1. Estimates and 95% confidence intervals 95% CI) of heritability ( $a^2$ ), shared ( $c^2$ ) and unique ( $e^2$ ) environment contribution to each PA measure.*

	%SED	%LPA	%MPA	%VPA
<b><math>a^2</math></b>	<b>0.48</b>	<b>0.51</b>	<b>0.42</b>	<b>0.51</b>
95% CI	(0.32, 0.64)	(0.33, 0.69)	(0.24, 0.60)	(0.35, 0.67)
<b><math>c^2</math></b>	<b>0.36</b>	<b>0.28</b>	<b>0.34</b>	<b>0.31</b>
95% CI	(0.20, 0.51)	(0.11-0.45)	(0.17, 0.50)	0.15, 0.46)
<b><math>e^2</math></b>	<b>0.17</b>	<b>0.21</b>	<b>0.24</b>	<b>0.18</b>
95% CI	(0.13, 0.20)	(0.17, 0.26)	(0.19, 0.29)	(0.14-0.22)

**Conclusion** Device-based measures of PA were explained to a substantial extent by genetic factors in the Swedish 9-year-olds. Interactions with sex and parental education will be further explored. Multi-level interventions may successfully increase average PA, but often fail to reduce variance. Our findings suggest that interventions aiming to reduce inequalities in PA in young children will have to overcome not only environmental but also substantial hereditary predictors of this modifiable lifestyle factor.

# Sleep and cardiovascular risk factors among workers of a public university

**Prof. Roberta Rodrigues<sup>1</sup>**, Dr. Carla Andrechuk<sup>1</sup>, Ms. Leila Pagamicce<sup>1</sup>, Ms. Mayza Neves<sup>1</sup>, Ms. Estefany Araujo<sup>1</sup>, Prof. Thais São-João<sup>2</sup>, Prof. Marilia Cornélio<sup>1</sup>, Dr. Maria Filomena Ceolim<sup>1</sup>

<sup>1</sup>University of Campinas, Campinas, Brazil, <sup>2</sup>University of Rhode Island, Kingston, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** to describe the duration and quality of sleep and the severity of insomnia as a function of cardiovascular risk factors. The study's contribution is innovative because it focused on a healthy population that did not undergo a systematic health assessment and was not aware of the relationship between sleep and cardiovascular risk factors.

**Methods:** cross-sectional study, with partial data from 415 workers (professors, researchers and administrative technicians) of a public university in the state of São Paulo, aged between 20 and 59 years, who participated in a broader study that aimed to evaluate the eight metrics (Life's Essential 8) as a first step toward designing theory-based interventions to promote optimal cardiovascular health. Step 1: the Instrument for sociodemographic and clinical characterization, the Pittsburgh Sleep Quality Index (PSQI) and the Insomnia Severity Index (ISI), were completed in digital format (REDCap). Step 2: anthropometric data, blood pressure and blood sample were collected in person. Sleep duration and the scores obtained in the PSQI and ISI were compared as a function of the categorical variables using the Mann-Whitney test.

**Results/findings:** Regarding sleep characteristics, short sleep (less than seven hours) was more prevalent during the week (25.7%), when compared to the weekend (7.1%), with a difference of 56 minutes between days of week and weekends. Sleep duration was significantly longer for females. The mean PSQI score was 6.7 ( $\pm 3.4$ ) and the ISI 8.2 ( $\pm 5.3$ ). The prevalence of poor sleep quality and mild insomnia was 55.8% and 39.3%, respectively. The scores obtained in the PSQI were significantly higher for smokers/ex-smokers, workers with arterial hypertension and those with increased waist circumference. Smokers/ex-smokers and individuals with increased waist circumference presented higher scores in the ISI compared to those who had never smoked and those without increased waist circumference.

**Conclusion:** insomnia and poor sleep quality were frequent among the analyzed workers and had a negative impact on cardiovascular health, corroborating the importance of investigating sleep with a view to preventing future harm.

# Development of an intervention to promote fruit consumption by children: a Behaviour Change Wheel approach

Mrs. Samantha Carvalho, Mr. Daisuke Hayashi-Neto, Mrs. Milena Sia Perin, **Mrs. Marília Cornélio**

<sup>1</sup>University of Campinas, Campinas, Brazil

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** This study aimed at identifying the determinants of parents' choice to offer 2 portions of fruits per day to their children aged 2 to 5 years old and selecting the intervention functions of a smartphone-based intervention using the Behaviour Change Wheel (BCW) as a framework.

**Methods:** We conducted semi-structured interviews based on the Theoretical Domains Framework (TDF) to identify barriers and facilitators experienced by parents when aiming to offer 2 portions of fruits per day to their children. Transcripts of phone-based interviews were coded into behavioural determinants and separated into domains of the TDF by two independent coders using content analysis; based on the behavioural determinants, the intervention functions were selected applying the APEASE criteria with a committee of experts to evaluate the affordability, practicability, effectiveness and cost-effectiveness, acceptability, side effects/safety, and equity. Written informed consent was obtained from all subjects.

**Results/Findings:** We interviewed 16 parents until saturation of themes was reached. The following themes (domains of behavioural determinants) were identified and classified based on the COM-B model and the TDF: physical capability (knowledge), physical opportunity (environmental context and resources), and reflective motivation (beliefs about capabilities). We identified education, training, environmental restriction, enablement, persuasion and modelling as potential intervention functions. Following the analysis of the APEASE criteria, the team of experts identified education, training, enablement and persuasion as the recommended intervention functions.

**Conclusions:** Theory-based interventions are more successful in promoting long-lasting behaviour change. This study, which employed the BCW as a guide, identified the behavioral determinants and established the intervention functions which will guide the choice of appropriate behaviour change techniques in a future smartphone-based intervention to increase parents' frequency of offering fruit to their children aged 2 to 5.

# Describing the Process of Adapting a Family-Based Healthy Lifestyle Program from Web to Mobile Using a “No-Code” App Builder

**Miss Amanda Willms<sup>1</sup>**, Mr. Cameron Trim<sup>1</sup>, Miss Bianca DeSilva<sup>2</sup>, Miss Celine Yan<sup>1</sup>, Dr. Sam Liu<sup>1</sup>

<sup>1</sup>University of Victoria, Victoria, Canada, <sup>2</sup>Childhood Obesity Foundation, Victoria, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Background:** The Generation Health Program (GHP) is a hybrid 10-week family-based lifestyle program for families with at least one child aged 8-12 to promote and improve lifestyle behaviours. Previously, the GHP involved live sessions and an online self-guided web-portal composed of content, challenges, and additional resources. In response to the COVID-19 pandemic and to increase accessibility, the GHP web-portal has been adapted to a mobile app for families to access the content in the palm of their hands.

**Objectives:** To describe the process of adapting an online web-portal to a mobile app.

**Methods:** The research team (n=5) followed a three-step iterative process from May-August 2022 to adapt the content from the web-portal to the mobile app using Pathverse, a no-code app builder. Content evaluation was the first step, which involved examining how the content on the web was organized, compiling this information, and mapping out how to display the content on the mobile app. The second step was uploading content using Pathverse, a no-code app builder, to repurpose the existing GHP content for optimal mobile use. Content testing was the third stage, where the research team conducted internal usability heuristics testing to uncover potential system errors and assess the design.

**Results:** We examined 10 weeks of content and additional resources, including external links and videos, from the web-portal and created an outline to explain how to upload the content to the mobile app. This outline broke down pages of text to include icons and less than 200 characters per app screen, a value determined by previous usability testing with Pathverse for optimal user experience. The team efficiently uploaded app content (estimated 180 hours) to prepare for internal usability heuristics testing. During the usability heuristics testing (n=5), we found minimal system errors, however, noted some text and design errors which were efficiently changed.

**Conclusion:** Using no-code app builders, such as Pathverse, enabled the research team to efficiently adapt a 10-week web-based program to a mobile app over 4 months. Tools such as Pathverse can be both cost and time-effective tools for researchers to create healthy lifestyle apps iteratively and efficiently.

# Health information “on the way”: Provision of information of health behavior in daily chores

**Ms. Tabea Thomas<sup>1</sup>, Prof. Antje Risius<sup>1</sup>**

<sup>1</sup>Working group for nutrition, health and sustainability; Institute of health sciences, University of Education Schwäbisch Gmünd, Schwäbisch Gmünd, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** This research addresses whether and how health interventions can be integrated in daily chores to different actors and recipient groups. Specifically, it analyses, discusses and case-study-tests, whether prevention measures, like nutrition education, physical education programs and anthropometric treatment may be easier to implement ‘to go’, hence, specifically focusing the social-ecologic setting at forefront, while still taking individual habits and chores into account.

**Methods:** As part of an exploratory study in a university setting, observation and interview protocols were conducted in the “health kiosk”, designed like a simple daily shopping opportunity (“kiosk”) in combination with existing information offerings (both paper and digital). In addition, satisfaction and criticism were surveyed on site using small feedback forms. Subsequently, a questionnaire was sent out to the entire university on experiences with and interest in this type of offering. Further testing of the approach in other settings is planned.

**Results/findings:** 170 visits were recorded. A high level of satisfaction among 68 participants in the on-site survey and majority interest in the questionnaire, which was answered by 143, indicate a demand for this type of offering. The reasons given for using the offer (in the future) in all survey approaches were interest in and importance of health topics, need for health information, improvement of health, low-threshold, free offers and social interaction.

**Conclusions:** The research assesses the perception of socio-ecological interventions, which target population ‘on the go’, so during the daily chores. Interest and need are emerging. The coordination problem will therefore be targeted at first and rolled out to people of all life-circumstances. The proliferation of the information content is left to the individual leaving the highest level of (health) sovereignty, which may be more effective in the long run than dogmatic health surveillance approaches.

**Acknowledgments:** The project in which this contribution is based was carried out in a research-oriented teaching and learning environment with the collaboration of students from the master’s program in Health Promotion and Prevention at the University of Education Schwäbisch Gmünd. We thank the students for their support.

# Assessing the construct validity of full and abbreviated versions of a food literacy measure among postsecondary students

**Mr. Martin Holmes<sup>1</sup>**, Ms. Mona Qutub<sup>1</sup>, Ms. Sanaa Hussain<sup>1</sup>, Ms. Elsie Azevedo Perry<sup>2</sup>, Dr. Heather Thomas<sup>3</sup>, Ms. Lauren Kennedy<sup>4</sup>, Ms. H. <sup>4</sup>Peterborough Public Health, Peterborough, Canada, <sup>5</sup>City of Hamilton Public Health Services, Hamilton, Canada, <sup>6</sup>Huron Perth Public Health, Stratford, Canada, <sup>7</sup>The Regional Municipality of York - Public Health, Community and Health Services, Newmarket, Canada, <sup>8</sup>University of South Carolina - Arnold School of Public Health, Columbia, USA, <sup>9</sup>Queensland University of Technology - School of Exercise and Nutrition Sciences, Brisbane, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** There is a growing focus on food literacy—the knowledge, skills, and self-efficacy to navigate food environments—as a possible lever to support eating patterns consistent with human and planetary health. The objectives of this study were to evaluate the construct validity of a food literacy measure among postsecondary students, and to develop an abbreviated measure.

**Methods:** Students (n=442) enrolled in university and college programs in Ontario, Canada were recruited to complete an online survey. The survey included a 49-item food literacy measure developed by public health nutritionists for use with young adults, along with questions to assess demographic and health characteristics. Techniques using Item Response Theory evaluated the difficulty and discrimination characteristics of each item in the food literacy measure to inform three potential abbreviated measures. ANOVA assessed whether scores on the full and abbreviated measures were higher among students in food/nutrition programs (n=112) vs. those who were not (n=330), and whether mean scores differed in hypothesized directions by age, gender identity, self-rated general and mental health, and health literacy. Correlation coefficients between scores on the full measure and each of the abbreviated measures were calculated.

**Results:** The mean food literacy score was 42 (SD=4.7) of 49 possible points (range = 25 to 49). Higher mean scores on the full measure were observed among students in food and nutrition programs (45, SD=4.4) versus those not (41, SD=3.4) ( $p < 0.01$ ). Differences in mean scores on the full measure in hypothesized directions were observed by gender identity, general and mental health status, and health literacy (all  $p < 0.01$ ). Similar results were observed for the abbreviated measures. Correlation coefficients between scores on the full measure and each of the abbreviated measures ranged from 0.71 to 0.83.

**Conclusions:** The findings suggest the measure has reasonable construct validity for measuring food literacy among postsecondary students. The abbreviated measure will be finalized in collaboration with the public health nutritionists who developed the measure, supporting assessment of food literacy in a range of contexts.

# Lessons Learned from Co-Designing a Just-In-Time Adaptive Intervention for a Family-Based Physical Activity App

**Miss Amanda Willms<sup>1</sup>**, Dr. Anna Sui<sup>1</sup>, Dr. Ryan Rhodes<sup>1</sup>, Dr. Sam Liu<sup>1</sup>

<sup>1</sup>University of Victoria, Victoria, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Background:** Just-in-time adaptive interventions (JITAI) are tailored to an individual's changing needs by adjusting the support provided based on their behavioural and environmental context. Research suggests that JITAI could be a more engaging and effective solution for promoting family-based physical activity (PA) than traditional non-tailored self-guided interventions. However, there are limited studies describing the process of co-designing JITAI apps for family-based PA interventions.

**Purpose:** To describe the lessons learned from co-designing a JITAI app with family-based PA interventions.

**Methods:** This study was conducted from August 2022- February 2023 and involved two rounds of semi-structured interviews. Parents of children aged 8-12 years old who were not meeting the PA guidelines were recruited via Facebook. The first round of semi-structured interviews gathered information to determine app features, while the second round reviewed app content to ensure a minimum viable product for feasibility testing was developed. Following the semi-structured interviews, data were transcribed and coded.

**Results:** Six parents were recruited for feedback on app features and content suggestions, which were coded into themes relating to app feature preferences, physical activity preferences, and content suggestions. Examples of feedback included videos demonstrating behaviours, varying types of physical activities, and gamification elements to encourage adherence. Key lessons learned during this process were: (1) understanding the tailoring variables needed with developing a JITAI, as families presented different requirements to prioritize, (2) initial recruitment for focus groups was a challenge due to scheduling issues, special considerations need to be considered when working with families and their schedules, and (3) granting user data permission from wearable data to tailor JITAI was a challenge to work across mobile platforms (iOS, Android). Despite these challenges, we created a minimum viable family-based JITAI intervention.

**Conclusion:** Co-designing a JITAI app has taught us how to streamline the future development of JITAI apps and important considerations for these interventions. Based on these findings, we propose the following framework for developing JITAI: (1) determine target user and their needs, (2) determine tailoring variable (PA, questionnaire, GPS), (3) determine variable trigger (value) and access to third-party wearables to trigger, (4) set the notification for triggering variable.

# The LUNCHBOX-MONITOR project: co-creation of an objective, non-stigmatizing research methodology and solutions for unhealthy and empty lunchboxes in primary school children

**Ms. Nele Claes**<sup>1</sup>, Ms. Amber Bovijn<sup>1</sup>, Prof. Dienneke Van de Sompel<sup>1</sup>, Dr. Coosje Dijkstra<sup>2</sup>, Dr. Jolien Plaete<sup>3</sup>, Prof. Benedicte Deforche<sup>1</sup>, Prof. Liselot Hudders<sup>1</sup>, Ms. Naomi Dries<sup>4</sup>, Ms. Katrien Verbeke<sup>5</sup>, Prof. Wendy Van Lippevelde<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Vrije Universiteit Amsterdam, Amsterdam, Netherlands, <sup>3</sup>Flanders Institute for Healthy Living, Brussels, Belgium, <sup>4</sup>Rikolto Belgium, Leuven, Belgium, <sup>5</sup>Let Us, Destelbergen, Belgium

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** A healthy diet is essential for the development, growth and academic performance of primary school children. Unlike other high-income countries, content analyses of lunchboxes to assess the nutritional quality and sustainability of what children bring to school for lunch and snacks have not yet been conducted in Flanders. Furthermore, official data on children's food insecurity in Flanders are lacking. The LUNCHBOXMONITOR project therefore aimed to develop a methodology via co-creation that can objectively register what children (9-12 years) bring in their lunchbox to school but also takes into account the sensitivity and stigmatisation that comes with measuring lunchboxes from children with a lower socio-economic background.

**Methods** Four primary schools were recruited by convenience sampling through the researchers' network. Third grade pupils (n= 90), parents (n=30) and school actors (n=30) co-created through brainstorming the circumstances in which a validated objective research methodology (digital photo method and weighing) can take place in respectively four, two and two co-creation sessions, delivered over a 8- week period (February-March 2023). Socio-demographic characteristics were obtained through a questionnaire. To evaluate the co-creation sessions, process evaluations were conducted at the end of each session through survey and interviews.

**Results** Preliminary results indicate that children accept the validated digital photo method and weighing of their home-brought food items. Special effects such as sounds while weighing or decorating the room would make the measurement more enjoyable. The children would like to investigate the contents of their lunchboxes themselves in the canteen. They experience the use of a checklist as complicated. Furthermore, the pupils do not wish to receive any comments from the researchers on what they bring to school to eat, nor that the research team touches their food. In addition, they underline discretion. Parents and school actors agree with the objective methodology and circumstances stated by the children in terms of feasibility and acceptability.

**Conclusions** We expect that the co-created context in which an objective measurement of what children bring in their lunchbox will allow us to get insight into the number of unhealthy and empty bread boxes in Flanders in a second phase of the project.

# Efficacy of individualized sensory-based mHealth interventions to improve distress coping in healthcare professionals: A Multi-Arm Parallel-Group randomized controlled trial

**Mr. Hannes Baumann<sup>1,2,3</sup>**, Mr. Luis Heuel<sup>3</sup>, Prof. Bettina Wollesen<sup>2</sup>

<sup>1</sup>Medical School Hamburg, Hamburg, Germany, <sup>2</sup>University of Hamburg, Hamburg, Germany, <sup>3</sup>Technical University Berlin, Berlin, Germany

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

The adverse impacts of prolonged distress on healthcare professionals are well established. However, the implementation and assessment of efficient interventions that target coping mechanisms for distress remain insufficient due to complex requirements in the healthcare sector. A promising approach involves individualized mHealth interventions utilizing sensory feedback to initiate sustainable health behavior change stage transitions. The primary objective of this research is to examine the effectiveness of individualized, sensor-based mHealth interventions, focussing on mindfulness and physical activity improving distress coping among healthcare-professionals with a specific emphasis on health-action-process-approach stage transitions. We utilized a multi-arm, parallel-group randomized controlled trial design to compare the outcomes of five intervention groups with varying levels of individualization (1: web-based-training only, 2: need-oriented web-based-training, 3: need-oriented web-based-training with telephone-coaching, 4: individualized app-based-training with biofeedback, 5: individualized app-based-training with biofeedback and health-report), to a control group. The study collected both self-reported questionnaire data (HAPA stages and Demographics) as well as sensory data from electrocardiography (RMSSD, SDNN, LF/HF, Beavsky-Index) and accelerometry (Step-counts, MVPA, Inactivity, Inactive-period disruption counts) at baseline and post-intervention (after eight weeks).

Of the 995 eligible participants, 170 (26%) completed the post-intervention measurement (1: N = 21; 2: N = 23; 3: N = 7; 4: N = 34; 5: N = 16; Control Group: N = 69). MANOVA results indicated small to moderate time-by-group interaction effects for physical activity-related outcomes, including moderate to vigorous physical activity ( $F(1,5) = 5.8$ ,  $p = \leq 0.001$ ,  $\eta^2p = 0.057$ ) and inactivity disruption ( $F(1,5) = 11.2$ ,  $p = < 0.001$ ,  $\eta^2p = 0.100$ ), in the app-based intervention groups, but not for step counts and inactivity and only very few stage transitions. No changes were observed in stress-related heart rate variability parameters over time.

Despite the sophisticated and high-quality study design, and numerous strategies implemented to enhance adherence, the attrition rate was substantial. Nonetheless, the individualized app-based interventions exhibited favorable initial effects on physical activity. Nonetheless, no noteworthy alterations in stress-related outcomes are very few stage transitions were apparent, implying that the duration of the intervention was inadequate to elicit physiological adaptations that could lead to improved coping with distress.

# Toward a national-level framework for food and nutrition surveillance in Canada: An umbrella review and environmental scan of indicators to monitor food environments and food systems

**Dr. Kirsten M. Lee**<sup>1</sup>, Ms. Julie Bates<sup>2</sup>, Ms. Karen C. Roberts<sup>2</sup>, Dr. Marisol Betancourt<sup>2</sup>, Ms. Michelle Hooper<sup>3</sup>, Ms. Sylvie St-Pierre<sup>3</sup>, Ms. Isabelle Massarelli<sup>4</sup>, Ms. Veronique Dorais<sup>4</sup>, Dr. Tarra L. Penney<sup>1</sup>

<sup>1</sup>Global Food Systems and Policy Research, School of Global Health, York University, Toronto, Canada,

<sup>2</sup>Centre for Surveillance and Applied Research, Public Health Agency of Canada, Ottawa, Canada, <sup>3</sup>Office of Nutrition Policy and Promotion, Health Canada, Ottawa, Canada, <sup>4</sup>Food Directorate, Health Canada, Ottawa, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Food and nutrition surveillance is a federal government priority in Canada, however, there is a critical need to advance current approaches by identifying indicators to monitor food environments and food systems. Food environments are key intervention points to support healthy eating, while food system activities influence the nutritional quality of the food supply. In partnership with the Public Health Agency of Canada and Health Canada, this project aims to develop a surveillance framework of indicators to monitor the impact of food environments and food systems on eating patterns and practices among Canadians.

**Methods:** An umbrella review (scoping review of reviews) was conducted to determine the scope of available food and nutrition indicators. Search strategies for MEDLINE, CINAHL, EMBASE, and Cochrane Database of Systematic Reviews were developed using keywords for eating patterns and practices, food environments, food systems, and surveillance. Two independent reviewers screened peer-reviewed literature published between 2000-2022. Reviews were included if a relationship between a food- and nutrition-related indicator and a chronic disease and health promotion outcome was reported. Quality of the review was assessed using the Joanna Briggs Institute Checklist for Systematic Reviews and Research Syntheses. Data on indicators and their definitions, measures to populate indicators, and gaps were extracted and summarized narratively. An environmental scan of national-level datasets was also conducted to determine feasibility of populating the indicators.

**Results:** A total of 352 articles were included in the umbrella review. Most articles (n=198) were focused on indicators of eating patterns and practices, with emphasis on consumption by food groups. Articles focused on food environments (n=120) included a wide array of indicators to monitor food environment determinants, such as the availability and affordability of healthy food in retail outlets and density of fast-food chains in urban settings. The smaller body of literature on indicators of food system determinants (n=34) was primarily focused on the environmental impact of food supply chain activities.

**Impact:** The findings of this review will inform the development of a conceptual surveillance framework to provide timely, reliable, and relevant evidence for policy and program development on chronic disease prevention and health promotion in Canada.

# A World of Difference: Effects of a World Foods College Course on Food Familiarity and Diet Quality

**Miss Marissa McKeague**<sup>1</sup>, Dr. Sarah Colby<sup>1</sup>, Mr. Michael O'Neil<sup>1</sup>, Ph.D., R.D.N Rahel Mathews<sup>2</sup>, Ph.D., R.D. Melissa Olfert<sup>3</sup>

<sup>1</sup>University of Tennessee, Knoxville, USA, <sup>2</sup>Mississippi State University, , USA, <sup>3</sup>West Virginia University, , USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** College is a time of changing food patterns and often establishes lifelong habits associated with chronic diseases; thus, there is a need to identify intervention strategies to improve students' dietary quality to promote health.

**Methods:** Undergraduate students in a World Foods nutrition course about foods from around the world (NUTR 216, n=410), a general nutrition course (NUTR 100, n=171), and an introduction to public health course (PUBH 201, n=166) at a Land Grant University in the Southeast United States completed online surveys at the beginning and end of the Spring 2022 semester. Surveys assessed diet quality using the short Healthy Eating Index and food familiarity using Likert scale questions about foods from around the world. An ANOVA was conducted to determine differences in diet quality scores and food familiarity scores between and within the three groups.

**Results/findings:** Across classes, pre to post, there were mean increases in diet quality scores ( $p=.002$ ,  $M=48.5\pm9.8$  vs.  $M=49.6\pm9.4$ ) and in familiarity scores ( $p<.001$ ,  $M=160.6\pm45.2$  vs.  $M=194.5\pm56.7$ ). Pairwise comparisons, pre to post, revealed a significant mean increase in diet quality in NUTR 100 ( $p=.031$ ,  $M=47.7\pm10.4$  vs.  $M=49.2\pm9.5$ ) and NUTR 216 ( $p=.008$ ,  $M=48.8\pm9.6$  vs.  $M=50.0\pm9.5$ ) and in familiarity in NUTR 100 ( $p<.001$ ,  $M=159.3\pm42.8$  vs.  $M=172.9\pm50.8$ ) and NUTR 216 ( $p<.001$ ,  $M=155.0\pm42.0$  vs.  $M=210.1\pm55.4$ ). PUBH 201 showed no significant change from pre to post in diet quality or food familiarity score ( $p=.308$ ,  $M=48.6\pm9.6$  vs.  $M=49.3\pm8.9$ ;  $p=.670$ ,  $M=176.7\pm51.3$  vs.  $M=178.3\pm54.0$ , respectively).

**Conclusions:** Having college students take either a World Foods or a general nutrition course can improve students' dietary quality. The World Foods class having no focus on individual dietary behavior indicates that a course focused on increasing familiarity to foods from around the world appears to be an effective strategy to improve diet quality among college students.

# Arenas for healthy and sustainable food system transformation – consumer perspectives

**Associate Professor Marianne S. Morseth**<sup>1</sup>, Mrs. Anne Lene Løvhaug<sup>1</sup>, Associate Professor Laura Terragni<sup>1</sup>, Miss Siri Bjerkheim<sup>2</sup>, Mrs. Ellen Bjørkum<sup>2</sup>, Mrs. Kaja Lund Iversen<sup>3</sup>

<sup>1</sup>Oslo Metropolitan University, Oslo, Norway, <sup>2</sup>The Consumer Council of Norway, Oslo, Norway, <sup>3</sup>Institute of Public Health, Oslo, Norway

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Successful transformation towards more sustainable food systems should consider consumer perspectives. Nutrient and sustainability profiling systems are tools that indicate the nutritional value and the environmental and social impact of foods. These can underpin interventions that may change food production and consumption patterns, including food labelling. To increase our understanding of where and how such profiling systems may be relevant for consumers, we conducted a survey to assess in which arenas consumers were concerned with sustainability when making food choices and further, how consumers prefer to see a potential label presented on products.

**Methods:** A cross-sectional web-based survey was conducted among a nationally representative sample (n=1004, 18-90 years) in Norway in February 2023, by YouGov for the Norwegian Consumer Council as part of the NewTools project.

**Results:** The arenas where most consumers reported to be somewhat or very concerned with environmental sustainability (e.g. greenhouse gas emissions, pesticides) when making food choices were local markets (75%) and grocery stores (61%), compared to 38% both in restaurants and kiosks/gas stations. For social sustainability (e.g., working conditions, animal welfare), the arenas mentioned by most were local markets (69%), canteens (58%) and home delivery of groceries (56%). For healthy food (low in added sugars, salt and saturated fat), the most frequently mentioned arenas were grocery stores and local markets (both 81%) and canteens (77%), while the corresponding number for kiosks/gas stations was 55%.

One summary label on each product encompassing various dimensions of sustainability (e.g. health, environmental sustainability and animal welfare) was preferred by 23% of the sample, 18% preferred two separate labels (one for health and one for social and environmental sustainability), while 17% preferred separate labels for each dimension.

**Conclusions:** The arenas where most participants answered that they were concerned with sustainability when making food choices vary slightly depending on which dimension of sustainability is addressed. These findings can be used to explore applications of food profiling systems in different contexts and arenas with the aim to promote healthier and more sustainable food consumption. Future analysis will assess the associations between preferred arenas and sociodemographic factors.

# Health in the eyes of the beholder: A pilot study of consumer response to front-of-package food labeling in Israel

**Ms. Or Avishai<sup>1</sup>**, Ms. Ron Bromiker<sup>1</sup>, Mr. Ilan Hadad<sup>1</sup>, Prof. Eyal Ert<sup>2</sup>, Prof. Aron Troen<sup>1</sup>

<sup>1</sup>Department of Biochemistry, Food Science and Nutrition, The Hebrew University of Jerusalem, Rehovot, Israel, <sup>2</sup>Department of Environmental Economics and Management, The Hebrew University of Jerusalem, Rehovot, Israel

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Background** Front-of-package-nutrition-labeling (FOPNL) are meant to better inform consumers and influence their behavior at the point of purchase. They are promoted by the World Health Organization as part of the international effort to contend with the global obesity epidemic. In January 2020, Israel implemented 3 new mandatory FOPNLs, yet two years into the reform it was only evaluated by self-reported subjective surveys. This lack of objective studies evaluating consumers' attention to FOPNL is apparent worldwide. We therefore conducted a pilot field study using eye-tracking glasses technology, to develop a feasible method to measure consumer attention to the labels and utilize it for evaluating their effect on consumer decision-making in the supermarket.

**Objectives** Analyze consumer perception and visual attention to the FOPNLs, compare objective eye-tracking data with subjective self-reported attention, and with self-reported attitudes and preferences.

**Methods** A convenience sample of 20 participants was instructed to choose products in designated supermarket aisles, while wearing Tobii pro 3 eye-tracking glasses, which record their exact gaze. Following this shopping task, participants completed a self-report questionnaire regarding their attitudes and preferences, their memory of the labels, and the products they chose.

**Results** We found eye-tracking in the supermarket to be a useful method for understanding consumer response to Israel's front-of-package nutrition labeling (FOPNL): There was a substantial mismatch between actual and self-reported visual attention to labels, demonstrating the need for objective evaluation of the FOPNLs effectiveness and the inherent bias of self-report data. Less than half of the participants viewed the labels, viewing duration varied from 0.5 to 1.5 seconds. Only half of the participants who viewed the label remembered its type correctly, which suggests that the labels did not inform the choices of a substantial proportion of the participants.

**Conclusions** Our findings demonstrate that the approach we developed can be readily applied to evaluate whether the assumption that FOPLs inform choices at the point of purchase is true.

**Implementation** This research sets the stage for comprehensive eye-tracking field studies to understand the psychological mechanisms through which FOPLs influence healthy food choices, which will provide a sound evidence base for policy development and refinement.

# Validating an Online Methodology for Food Affordability Monitoring

**Ms. Liza Boyar (corresponding author)**<sup>1</sup>, Ms. Mary Ellen Prange<sup>2</sup>, Ms. Lauren Kennedy<sup>3</sup>, Mr. Ivan Ho<sup>4</sup>, Ms. Bridget King<sup>5</sup>, Dr. Rachel Prowse<sup>6</sup>

<sup>1</sup>University of Waterloo, Waterloo, Canada, <sup>2</sup>City of Hamilton Public Health Services, Hamilton, Canada, <sup>3</sup>Peterborough Public Health, Peterborough, Canada, <sup>4</sup>Thunder Bay District Health Unit, Thunder Bay, Canada, <sup>5</sup>Public Health Sudbury & Districts, Sudbury, Canada, <sup>6</sup>Memorial University of Newfoundland, St. John's, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Price and affordability of food are key determinants of diet quality and nutrition-related population health. Globally, food cost is commonly monitored through “food baskets” which are made up of foods that represent a healthy diet and reflect the typical purchasing patterns of a population. In Canada, most provinces adapt the National Nutritious Food Basket to monitor regional food affordability and inform social and health policy and programming. Conventionally, local public health units collect food pricing information through annual in-store audits. Such an in-person approach is also common globally. With the advent of COVID-19 and the general high labour burden of food price data collection, practitioners and policymakers are becoming increasingly incentivized to consider novel pricing methods. Thus, the objective of this study was to evaluate the validity and reliability of an online methodology for monitoring food affordability in Ontario, Canada, using the adapted Ontario Nutritious Food Basket (ONFB).

**Methods:** Intra-/inter-rater reliability was tested using percent agreement and intra-class correlations (ICC) by pricing the ONFB online in 12 large multi-chain grocery stores. Afterward, the ONFB was priced in 28 stores both in-store and online to estimate food price differences using paired t-tests and Pearson's correlation for all (n=1708) and matched items (same product/brand and purchase unit) (n=1134).

**Results:** High intra-/inter-rater agreement (95.4%/81.6%; ICC = 0.972, F=69.9, p<0.001) was recorded. No significant differences were observed between the mean in-store and online prices for all items (t=0.504 p=0.614). Similarly, an almost perfect correlation was detected between mean prices in-store and online (fully matched: R=0.993 p<0.001; all items: R=0.967 p<0.001). On average, in-store prices were \$0.015 cheaper than online prices. The online monthly ONFB estimates for a family of four showed a strong correlation (R=0.937 p <0.001) with estimates calculated using in-store data.

**Conclusion:** The outcomes of an online food cost monitoring methodology were consistent with the gold-standard of in-person data collection. Online pricing is a reliable and valid method of food cost monitoring in large grocery chains located in the province of Ontario. Facilitating efficient data collection, this framework has the potential to modernize food affordability monitoring in Canada and internationally.

# Physical Activity and the Development of Declarative Memory and Hippocampal Volume in Early Childhood

**Dr. Christine St Laurent<sup>1</sup>**, Ms. Sanna Lokhandwala<sup>1</sup>, Ms. Tamara Allard<sup>2</sup>, Dr. Amanda Paluch<sup>1</sup>, Dr. Tracy Riggins<sup>2</sup>, Dr. Rebecca Spencer<sup>1</sup>

<sup>1</sup>University of Massachusetts Amherst, Amherst, USA, <sup>2</sup>University of Maryland College Park, College Park, USA

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

Memory improves markedly across early childhood and is dependent on the hippocampus. Physical activity (PA) benefits memory in adults, but few studies have explored associations with forms of declarative memory in children. Moreover, adults appear to have increased or retained hippocampal volume in response to exercise training. Early childhood is a period of substantial neural and behavioral development and thus, habitual PA may influence memory and hippocampal development.

**Purpose:** To determine if PA was associated with memory performance and hippocampal volume development in preschool children over six months and one year, respectively.

**Methods:** Four-year old children (n=49; 55.1% female) repeated measurements at enrollment and then again 6- and 12-months later. Wrist-based 24-hour actigraphy was used to estimate PA (counts/min). Declarative memory was assessed with a visuo-spatial learning task in the late morning and again after an afternoon nap opportunity and the following morning. Variables included immediate test accuracy and change in performance (same day delayed – immediate; next day delayed - immediate). Hippocampal volumes adjusted for intracranial volume (mm<sup>3</sup>: total, left and right hemispheric) were derived from a T1 weighted image. Memory outcomes included all three time points. Due to missing data, the first two time points were used for hippocampal measures. Multilevel models for each memory and hippocampal outcome included time-varying within- and between-person PA and were stratified by sex.

**Results/findings:** When males increased their PA, this was associated with higher immediate memory performance over time (B = 16.35, 95% CI: 1.1 to 31.6). When females increased their PA, this was associated with better next day memory recall (B = 13.17, 95% CI: 3.0 to 23.3) and higher left hippocampal volume over time (B = 1.3, 95% CI: 2.3 to 2.4). Females that were more active had lower next day memory performance over time (B = -7.79, 95% CI: -13.2 to -2.4).

**Conclusions:** Preschool children's PA was related to memory and hippocampal development for some measures, but effect sizes were small. Our mixed findings are reflective of the limited studies in preadolescents. Exploring contexts of PA and the role of cardiorespiratory fitness in future studies may be warranted.

# Changes in sleep duration and guideline adherence among adolescents in Canada: Examining the impact of COVID-19 in worsening inequity

**Dr. Markus Duncan**<sup>1,8</sup>, Miss Jessica Mitchell<sup>1</sup>, Dr. Negin Riazzi<sup>1,10</sup>, Dr. Emily Belita<sup>2</sup>, Dr. Leigh Vanderloo<sup>3,4</sup>, Dr. Sarah Carsley<sup>5,6</sup>, Prof. Valerie Carson<sup>7</sup>, Dr. Jean-Philippe Chaput<sup>8,9</sup>, Prof. Guy Faulkner<sup>10</sup>, Dr. Scott Leatherdale<sup>11</sup>, Dr. Karen Patte<sup>1</sup>

<sup>1</sup>Brock University, St. Catharines, Canada, <sup>2</sup>McMaster University, Hamilton, Canada, <sup>3</sup>The Hospital for Sick Children, Toronto, Canada, <sup>4</sup>ParticipACTION, Toronto, Canada, <sup>5</sup>Public Health Ontario, Toronto, Canada, <sup>6</sup>University of Toronto, Toronto, Canada, <sup>7</sup>University of Alberta, Edmonton, Canada, <sup>8</sup>Children's Hospital of Eastern Ontario Research Institute, Ottawa, Canada, <sup>9</sup>University of Ottawa, Ottawa, Canada, <sup>10</sup>University of British Columbia, Vancouver, Canada, <sup>11</sup>University of Waterloo, Waterloo, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The purpose of this study was to assess if adolescent sub-populations in Canada (i.e., based on race/ethnicity, sex/gender, socioeconomic status (SES), and urbanicity) experienced a larger change in sleep duration and adherence to the national sleep recommendation between 2019-2020 (pre-pandemic) and the 2020-2021 (mid-pandemic) school years.

**Methods:** Longitudinally-linked data from 2019-2020 (pre-pandemic) and 2020-2021 (mid-pandemic) of a prospective cohort study of secondary school students in Canada ( $M = 14.2$ ,  $SD = 1.3$  years,  $N = 8,209$ ) were used for analyses. Regression modelling tested the main effects of race/ethnicity, sex/gender, socioeconomic status, and urbanicity on changes in sleep duration as well as adherence to the sleep recommendation within the Canada's 24-hour Movement Guidelines (8-10 hours/night). Interactions between identity variables (race/ethnicity or sex/gender) and other main effect variables were subsequently tested.

**Results:** On average, females gained more sleep (mean [95% CI] = 4.5 [1.5, 7.5] min/day more) and had larger increases in recommendation adherence (OR = 1.16 [1.04, 1.30] compared to male. Adolescents who identified as Asian reported less sleep gain compared to those who identified as White (-10.1 [-19.4, -0.8]), but not recommendation adherence. Compared to rural, small, and medium urban areas, individuals in large urban areas gained less sleep and adhered less to the sleep recommendation (-21.4 [-38.5, -4.2] to -15.5 [-30.7, -0.2] min/day). Higher individual SES scores were associated with greater sleep gain (linear trend: 11.16 [1.2 – 21.1]). Discrepancies in sleep gain and guideline adherence between males and females were significantly modified by race/ethnicity and urbanicity.

**Discussion:** Increases in sleep duration may be one of the few benefits to adolescents during the COVID-19 pandemic but were not equally distributed across sub-populations. Efforts to promote better sleep adherence may need to account for sex/gender differences, especially in less urbanized areas and among certain racial/ethnic groups.

# Physical Activity and Recreational Screen Time Change Among Adolescents in Canada: Examining the Impact of COVID-19 in Worsening Inequity

**Dr. Markus Duncan**<sup>1,9</sup>, Dr. Negin Riazzi<sup>1,11</sup>, Dr. Emily Belita<sup>2</sup>, Miss Angelica Amores<sup>3</sup>, Dr. Leigh Vanderloo<sup>4,5</sup>, Dr. Sarah Carsley<sup>6,7</sup>, Dr. Valerie Carson<sup>8</sup>, Dr. Jean-Philippe Chaput<sup>9,10</sup>, Dr. Guy Faulkner<sup>11</sup>, Dr. Scott Leatherdale<sup>3</sup>, Dr. Karen Patte<sup>1</sup>

<sup>1</sup>Brock University, St. Catharines, Canada, <sup>2</sup>McMaster University, Hamilton, Canada, <sup>3</sup>University of Waterloo, Waterloo, Canada, <sup>4</sup>The Hospital for Sick Children, Toronto, Canada, <sup>5</sup>ParticipACTION, Toronto, Canada, <sup>6</sup>Public Health Ontario, Toronto, Canada, <sup>7</sup>University of Toronto, Toronto, Canada, <sup>8</sup>University of Alberta, Edmonton, Canada, <sup>9</sup>Children's Hospital of Eastern Ontario Research Institute, Ottawa, Canada, <sup>10</sup>University of Ottawa, Ottawa, Canada, <sup>11</sup>University of British Columbia, Vancouver, Canada

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The purpose of this study was to assess if sub-populations of adolescents in Canada (i.e., race/ethnicity, sex/gender, socioeconomic status, and urbanicity groups) experienced a larger change in physical activity and recreational screen time between 2019-2020 (pre-pandemic) and the 2020-2021 (mid-pandemic) school years.

**Methods:** Longitudinally linked data from 2019-2020 (pre-pandemic) and 2020-2021 (mid-pandemic) of a prospective cohort study of secondary school students in Canada ( $n = 8,209$ ) were used for these analyses. Regression modelling tested the main effects of race/ethnicity, sex/gender, socioeconomic status (SES), and urbanicity on changes in moderate-to-vigorous physical activity (MVPA) and recreational screen time duration as well as adherence to Canada's 24-hour Movement Guidelines. Interactions between identity variables (race/ethnicity or sex/gender) and other main effect variables were subsequently tested.

**Results:** Male participants' MVPA time decreased less compared to their female counterparts (mean [95% CI] = -16.3 [-13.5, -19.2] min/day), but also reported greater increases in screen time compared to females (23.7 [14.7, 32.8] min/day) during the same time period. The male-female sex/gender gap for MVPA outcomes were further influenced by race/ethnicity and urbanicity of school location. MVPA in White identifying adolescents decreased less than Asian identifying participants (-10.7 [-19.5, -1.9] min/day) with a similar non-significant pattern observed in Black and Latin participants. Generally speaking, adolescents in higher SES categories fared better on adherence to MVPA (highest vs. lowest OR = 1.41 [0.97, 2.06]) and screen time recommendations (highest vs. lowest AOR = 3.13 [0.91, 11.11]). A quadratic trend was apparent in urbanicity where medium urban areas added more screen time than rural and large urban areas. Individuals in large urban areas were also less likely to meet the MVPA recommendation (ORs = 0.54 [0.38, 0.76] to 0.65 [0.50, 0.85]).

**Discussion:** Results support the hypothesis that existing inequitable sociodemographic differences in MVPA participation and recreational screen time have worsened throughout the pandemic. Resulting evidence will help create targeted interventions aiming to address observed inequities.

# Cross-sectional examination of 24 hour Movement Behaviours Among School Children in Indonesia Aged 10 - 14 Years to 24-hour Movement Guidelines

**Mr. Ahmad Thohir Hidayat**<sup>1</sup>, Dr. Helda Khusun<sup>1,2</sup>, Dr. Grace Wangge<sup>3</sup>, Mr. Aziz Jati Nur Ananda<sup>1</sup>

<sup>1</sup>SEAMEO RECFON, Jakarta, Indonesia, <sup>2</sup>Universitas Muhammadiyah Prof.Dr.Hamka, Jakarta, Indonesia,

<sup>3</sup>Monas University Indonesia, Tangerang, Indonesia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Indonesia only has limited data on lifestyle behaviours, the lifestyle behaviours data is especially rare for school-aged children. To overcome this gap, we evaluate the lifestyle behaviour of school-age children using a web-based measurement tool called MEDAL and compare it with 24-hour movement guidelines.

**Methods:** working together with National University of Singapore (NUS) we utilise a validated web-based measurement tool called My E-Diary for Activities and Lifestyle (MEDAL). Children aged 10 to 14 years old are asked to self-report their daily activities on MEDAL over two weekdays and two weekend days. Median were calculated for daily moderate-to-vigorous physical activity (MVPA), screen-viewing and sleep duration. The median compared to the obedience to the Australian 24-hour movement guidelines which is defined as  $\geq 60$ min MVPA/day,  $\leq 2$ h screen-viewing/day, and 9–11h sleep/night. Socio-demographic and nutritional status variables and meeting of each activity guideline were examined for potential associations with guideline obedience using multivariable logistic regression.

**Results/findings:** Of 273 children, 244 children (89.3%) recorded two valid weekdays and two valid weekend days on MEDAL. Percentage of the children that engage MVPA, screen viewing and sleep recommendation according to the guidelines are 47.3%, 13.3% and 47% respectively. 6.5% met all the guidelines; and 31.2% did not meet any guidelines. Children who are from lower economic status were likely to meet the MVPA guideline. Children who did not meet the screen viewing guideline were less likely to meet the MVPA guideline and recommended sleep duration

**Conclusions:** The majority of children are at risk of poor growth outcomes due to their inability to meet the 24-hour movement guidelines. Our findings suggest that some groups are less likely to meet the guidelines, therefore a targeted intervention is required. Promotion of 24 h movement guidelines need to be established considering the unavailability of such guidelines for Indonesian children. Future interventions are needed to promote those guidelines, especially for screen-viewing, MVPA, and sleep duration among children of this age.

# Incorporating dental health into overweight and obesity prevention in early childhood: an integrative review of formula and bottle feeding interventions

**Ms. Heilok Cheng**<sup>1</sup>, Ms. Rebecca Chen<sup>1</sup>, Dr. Maxim Milosevic<sup>2</sup>, Ms. Chris Rossiter<sup>1</sup>, Associate Professor Amit Arora<sup>1,3</sup>, Prof. Elizabeth Denney-Wilson<sup>1</sup>

<sup>1</sup>The University of Sydney, Sydney, Australia, <sup>2</sup>Sydney Dental Hospital, Sydney, Australia, <sup>3</sup>Western Sydney University, Sydney, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Infant feeding behaviours with formula and bottles can cause overweight, obesity and early childhood caries (ECC). Such behaviours include non-responsive feeding for settling infants; overfeeding; exposure to cariogenic carbohydrate foods in bottles; and long-term bottle use. Bottle and formula cessation interventions currently exist in dental- and obesity-specific disciplinary silos. Carer beliefs about infant weight and baby teeth may be barriers to behaviour change. Combining ECC and obesity prevention messages may support an integrated approach to behaviour change. This integrative review aimed to identify interventions that support best-practice formula feeding or bottle cessation on feeding, oral health and weight outcomes.

**Methods:** Nine databases were searched in July-August 2020, for interventions that improved formula, bottle or caries-preventing practices, such as formula cessation or transition to cup use, with outcomes relating to feeding practice, infant anthropometry or carer knowledge. Studies were appraised with the Mixed Methods Appraisal Tool.

**Findings:** 27 studies (13 randomised controlled trials, 14 quasi-experimental studies) were included, with 18 involving populations at increased risk of overweight/obesity or ECC. Studies were heterogeneous for research design and outcomes. All studies used carer education. Seventeen studies distributed health-promoting resources. However, only six studies used behaviour change counselling, such as motivational interviewing; six used behaviour change theory in intervention design; and five described stakeholder engagement for program design. Study outcomes were mixed: 16 studies found short-term improvement or no significant change; eight found worse post-intervention outcomes. Only two studies reported longer term follow up, where cessation of program support or active intervention meant improvements were not sustained. Study quality was mixed, with high risk of bias in incomplete outcome data ( $\leq 80\%$  participant retention) and non-comparable study populations at baseline.

**Conclusion:** This integrative review found interventions that focused primarily on education and resource distribution. While studies were heterogeneous and unsuitable for meta-analysis, the findings indicate opportunities to strengthen intervention design; incorporate counselling to support behaviour change; engage stakeholders to develop strategies; and embed interventions into long-term clinical care. Interdisciplinary approaches to intervention design, such as distribution of drinking cups or nutrition to support healthy teeth and weight, can strengthen and focus preventative care.

# Epidemiological survey on adverse events and near-misses in public exercise facilities: a small prospective cohort study

**Mr. Akihiro Hrata**<sup>1,2</sup>, Dr. Yuko Oguma<sup>1,2</sup>, Dr. Yoshinobu Saito<sup>1,3</sup>, Mr. Tomoya Ito<sup>1,2</sup>, Mr. Keisuke Kondo<sup>4</sup>, Mr. Yoshiteru Takemoto<sup>4</sup>, Mr. Tatsunori Nishigaya<sup>4</sup>, Ms. Sachi Shiobara<sup>4</sup>

<sup>1</sup>Keio University Sports Medicine Research Center, Kanagawa, Japan, <sup>2</sup>Keio University Graduate School of Health Management, Kanagawa, Japan, <sup>3</sup>Nippon Sport Science University Faculty of Sport Management, Kanagawa, Japan, <sup>4</sup>Public Interest Incorporated Foundation for Mirai creation Fujisawa, Kanagawa, Japan

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** N. Other

**Objective:** This study aims to identify the demographics of new users of a training room in a public exercise facility in Fujisawa City, Kanagawa Prefecture, Japan, as well as determine the incidence and frequency of occurrence of adverse events and near-misses to users exercising in the training room.

**Methods:** This research involved a small prospective cohort study. The study period was from October 2021 to December 2022. The participants of the study were new users of training rooms in three public exercise facilities in Fujisawa City. A total of 1,235 subjects (739 men and 496 women) agreed to participate in the study and responded to the survey questionnaire. Assessment items included subject demographics (age, gender, height, weight, exercise habits, underlying medical conditions, and pre-workout health check created based on Physical Activity Readiness Questionnaire +: PAR-Q+), the frequency of use of training rooms, and the occurrence of adverse events and near-misses during exercise. Subject demographics were elicited at baseline using a questionnaire. Further, data on the frequency of use and adverse events/near-misses were reported by staff.

**Results:** The study found that 54.4% of male and 72.9% of female users of public exercise facilities did not have exercise habits. The proportion of individuals with underlying medical conditions and that of persons included in one of the categories in the seven-item pre-exercise health checkup were higher in older age groups compared to younger groups for both men and women. During the observation period, subjects did not experience any adverse events or near-misses. However, all training room users experienced a total of six adverse events, five of which were falls; among the five falls, four occurred in users aged 60 years or older.

**Funding:** This study was supported by the Japan Health Promotion and Fitness Foundation.

**Conclusion:** Among users of public training rooms, the percentages of those with underlying medical conditions and those who answered at least one question in the health check before exercise was higher in the older age groups for both men and women. The results suggest that older users may need to be considered when exercising.

# Nutrition questions of Texas WIC chatbot users: an exploratory content analysis

**Ms. Emily Stubblefield<sup>1</sup>**, Dr. Lesli Biediger-friedman<sup>1</sup>, Ms. Brittany Markides<sup>1,2</sup>

<sup>1</sup>Texas State University, San Marcos, USA, <sup>2</sup>Institute of Physical Activity and Nutrition, Deakin University, Melbourne, Australia

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Maya, the Texas WIC Chatbot, was developed to improve participant engagement and retention through increased clinic efficiencies. Launched in June 2020, Maya helps users ascertain WIC eligibility, begin applications, manage appointments, and more. Maya's question-and-answer (QnA) feature also allows users to ask questions and receive pre-programmed responses related to WIC programmatic access. Ongoing process evaluation of Maya suggests users may also be interested in using QnA to find nutrition information on the Texas WIC website. Creating engaging, usable technology requires deeply understanding users' needs. In this case, this includes gaining a better understanding of users' nutrition questions.

**Aim:** This exploratory study investigated whether users are currently seeking nutrition information from Maya and identified the nutrition-related topics of their questions through qualitative content analysis.

**Methods:** The starting dataset for this study included >62,000 questions posed to Maya's QnA between June 2020 and April 2022. Questions about nutrition were purposefully sampled in three steps: (1) Latent Dirichlet Allocation (LDA) organized questions into topic clusters; clusters defined by nutrition keywords were retained; (2) searches and filters were used to extract 200 potentially relevant questions; (3) these were manually reviewed for inclusion. Finally, questions underwent qualitative content analysis.

**Results:** LDA identified fifteen clusters, of which three were selected, yielding 6,212 questions. After filtering and searching, the manual review of step three yielded 71 questions seeking nutrition information. Content analysis revealed that questions mainly pertained to milk (n=32, 45%), introducing solid food (n=19, 27%), and breastfeeding (n=18, 25%). Other questions related to formula preparation, food safety, and allergies. Primary lines of inquiry were age-appropriateness of food (e.g., weaning or introducing solids or certain milk types) (n=27, 38%), breastmilk supply concerns (n=11, 15%), and how much milk or food their child needed (n=9, 13%).

## **Conclusions:**

This study highlighted specific nutrition topics of interest among Maya users, particularly milk, solid food, and breastfeeding. Although its exploratory nature has limitations, this study offers evidence that Maya chatbot users are currently seeking nutrition information, warranting further research to improve understanding of users' needs and develop appropriate nutrition-related content.

# Exercise and its impact on the mental health of Japanese community-dwelling older adults during the COVID-19 pandemic: a longitudinal study

**Ms. Natsue Doihara<sup>1</sup>**, Ms. Yuko Oguma<sup>1</sup>, Mr. Tomoya Ito<sup>1</sup>, Mr. Yoshinobu Saito<sup>2</sup>

<sup>1</sup>Keio University, Yokohama, Japan, <sup>2</sup>Nippon Sport Science University, Yokohama, Japan

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** The COVID-19 pandemic deeply impacted people's physical and mental health, especially the health of the older adult population. Since 2015, we have engaged in the 'Fujisawa +10 project', a community intervention project aimed at promoting physical activity among groups of older adults in Fujisawa City, Kanagawa, Japan. This study aimed to examine older adults' engagement in exercise by assessing their performance of the +10 Exercise program (+10-Exercise) before and during the COVID-19 pandemic, as well as the impact of exercise on their mental health.

**Methods:** This longitudinal study recruited 190 participants to partake in a survey that was conducted in 2019 (baseline). Of these, 76 (mean age, 77.8 years; standard deviation, 5.9 years; 47.4% men) responded to a similar questionnaire by mail (follow-up) in August 2020, namely, after the lifting of the first state of emergency regarding the pandemic in Japan. Their mental health status was assessed by the WHO-5 Well-Being Index (WHO-5). The respondents were also asked about whether they had performed +10-Exercise at follow-up. This 10-minute body weight exercise program that our project focused on, consists of dynamic and static stretching exercises, knee-ups, squatting or knee extensions, arm circle exercises, and body balance exercises in the standing or sitting positions. +10-Exercise was designed to be performed by a group of people who meet at least once a week, but could also be performed individually at home. WHO-5 scores were compared for the +10-Exercise implementation group and the non-implementation group, using t-test and multilevel regression analysis.

**Results:** Of the final sample 76, 81.6% engaged in +10-Exercise. In the +10-Exercise implementation group, the mean scores for the WHO-5 at baseline and follow-up were 71.7 and 73.8 ( $p=0.280$ ), respectively. In the non-implementation group, the mean scores were 79.1 and 65.4 ( $p=0.011$ ), respectively. The interaction effect of time and group on the score for the WHO-5 was significant ( $p=0.012$ ).

**Conclusions:** Exercise was associated with mental health, as while participants in the +10-Exercise implementation group maintained their scores regarding mental health, those in the group that was not exposed to the program showed a score decline.

# RE-AIM (Reach, Effectiveness, Adoption, Implementation, Maintenance) Framework to Evaluate the Western Cape on Wellness (WoW!) Health Promotion Initiative: Lesson Learned

**Prof. Estelle Lambert<sup>1</sup>**, Mr. Roger Woodruff<sup>1</sup>, Mrs. Joanna Pieterse<sup>2</sup>, Ms. Kelly Fortune<sup>2</sup>

<sup>1</sup>Research Centre for Health through Physical Activity, Lifestyle and Sport, University of Cape Town, Cape Town, South Africa, <sup>2</sup>Service Priorities Coordination Directorate Department of Health Western Cape Government, Cape Town, South Africa

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Background:** The Western Cape on Wellness (WoW!) programme, a health promotion initiative by the Western Cape Department of Health (DoH), engages volunteer “wellness champions” trained to support groups to activate or maintain healthy lifestyles, often in resource-challenged communities, workplaces, primary health care, and schools. DOH supports the programme through partnership meetings and telephonic, in-person, WhatsApp and social media communication with and from champions. WoW! used RE-AIM (Reach, Effectiveness, Adoption, Implementation, Maintenance) for ongoing evaluation as part of a continuous improvement model, and champions were asked to complete RE-AIM surveys quarterly.

**Aim:** We report on WoW! RE-AIM evaluation results for 2022 and lessons learned to improve programme implementation.

**Methods:** WoW! Champions from all registered groups (N>130) were invited to complete RE-AIM surveys over 2 quarters in 2022. Survey questionnaires administered online via Google Forms comprised Likert scales or similar devices, with some open-ended responses. Quantitative analysis of RE-AIM data was completed using non-parametric statistics.

**Results:** 81 wellness champions completed at least one survey (community=53%, worksite=33%), 20 of which completed for both quarters. Total number of respondents (N=81) completed 102 surveys. REACH: >50% of wellness groups had 10-30 members (NS between settings). EFFECTIVENESS: 55% of groups reported at least half of members underwent wellness screening (lowest uptake in worksites). >50% found that members reported adopting healthier eating and were regularly exercising. ADOPTION: At least 50% of groups reported wellness activities beyond their WoW! groups, and >55% introduced WoW! content or activities into existing programmes (mostly community settings). IMPLEMENTATION: Most WoW! groups planned to meet weekly (45%) or >once/month (24%), of which >50% reported being successful nearly all or at least half of the time. Most frequently offered group activities were group exercise or walks (75%). MAINTENANCE: Champions reported that training (68%), equipment (56%) and speakers for talks (50%) were needed to sustain their groups. Frequent challenges were change of circumstance (60%), lack of time (41%) and lack of a venue (37%).

**Conclusion:** Results suggest that the programme showed, at least in part, fidelity. RE-AIM may guide programme implementation design and co-creation, however, more representativity and a richer narrative may be needed for a more complete understanding, sustainability and scale-up.

# The effect of time-restricted eating on body composition and glycolipid profile in physically active and sedentary adults

**Miss Zihan Dai<sup>1</sup>**, Dr. Chen Zheng<sup>1</sup>, Prof. Stephen Heung-Sang Wong<sup>1</sup>

<sup>1</sup>The Chinese University of Hong Kong, Hong Kong, China

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Time-restricted eating (TRE) is a novel and popular intermittent fasting dietary pattern that confines the eating window to a specified number of hours per day. The effect of TRE has yet to be thoroughly investigated in physically active and sedentary adults. Thus, this meta-analysis aimed to evaluate the effect of TRE on body composition and glycolipid profile in physically active adults and compare the effectiveness with sedentary adults.

**Methods:** Web of Science, Medline, PubMed, Embase, SPORTDiscus, and the Cochrane Central Register of Controlled Trials electronic databases were searched for published studies of TRE on body composition and glycolipid profile in physically active and sedentary adults. Mean differences (MD) and Standardized MD (SMD) with 95% confidence intervals (CI) were calculated to analyze the total effect. Two reviewers independently extracted outcomes data on body composition and glycolipid profile, including body mass, fat mass, fat-free mass, fasting glucose, fasting insulin, HOMA-IR, triglycerides, LDL cholesterol, HDL cholesterol, and total cholesterol.

**Results:** The database search yielded 7785 articles, and 31 studies met the inclusion criteria. Thirteen studies focused on physically active adults, while the other 18 studies focused on sedentary adults. The overall effect of TRE determined greater weight loss and improved fasting glucose, fasting insulin, and HOMA-IR than control regimens. No difference in the lipid profile was found between TRE and the control group. The subgroup analysis showed that the fat-free mass remained unchanged in the physically active group while significantly decreased in the sedentary group (SMD: -0.93; 95%CI [-1.42, -0.44]). In the physically active group, LDL cholesterol significantly decreased after the TRE dietary pattern (SMD: -0.70; 95%CI [-1.37, -0.04]), while the sedentary group showed no difference.

**Conclusion:** TRE is an effective and promising nutrition plan for physically active and sedentary adults to lose body mass, fat mass and improve their glycolipid profile. Moreover, together with physical activity may help participants maintain fat-free mass and decrease LDL cholesterol. The current result provides practical information for promoting a healthy diet-activity lifestyle.

# How Czech Adolescents Perceive Their Physical Activity

**Dr. Ferdinand Salonna<sup>1</sup>**, Prof. Josef Mitáš<sup>1</sup>, Dr. Michal Vorlíček<sup>1</sup>

<sup>1</sup>Palacky University, Olomouc , Czech Republic

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

Adolescence is a critical stage in the development of an individual's physical activity habits and preferences. Adolescents' perceptions of physical activity can influence their motivation to engage in physical activity and, consequently, their overall level of physical activity.

Thus, our primary aim was to investigate whether Czech adolescents misperceive their peers' Moderate to Vigorous Physical Activity (MVPA) and Vigorous Physical Activity (VPA) and attitudes towards MVPA and VPA. Our dataset comprised cross-sectional data on 1586 adolescents aged 11–15 years. Basic descriptive statistics and correlation binomial regression models were used to analyze the data.

The results showed that most of the Czech adolescents misperceived the MVPA and VPA norms of their peers.

Our study points out that there is a discrepancy between the actual levels of MVPA and VPA and the perceived levels of peers' MVPA and VPA. Adolescents overestimate the prevalence of lack of sufficient MVPA and VPA, and thus perceived norms in MVPA and VPA are worse than objective norms. These findings indicate that there might be room for targeted intervention based on the social norms based approaches to increase the physical activity of adolescents or at least strengthen their actual positive behavior.

# Measurement properties of a short, web-based, daily physical activity questionnaire (PAQ24) for adults.

**Mr. Johannes Jaunig<sup>1</sup>**, Mr. Bernhard Novak<sup>1</sup>, Mr. Peter Holler<sup>2</sup>, Prof. Mireille N. M. van Poppel<sup>1</sup>, Dr. Matteo C. Sattler<sup>1</sup>

<sup>1</sup>University of Graz, Institute of Human Movement Science, Sport and Health, Graz, Austria, <sup>2</sup>FH Joanneum University of Applied Sciences, Institute of Health Management in Tourism, Bad Gleichenberg, Austria

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** To improve the feasibility and accuracy of physical activity (PA) self-reports, the combination of benefits of recalls, questionnaires and momentary ecological assessments (EMAs) may be warranted. The PAQ24 is a 6-item, web-based PA questionnaire, based on the International Physical Activity Questionnaire short-form, with a recall period of one day. This study aimed to investigate the feasibility and measurement properties of the instrument in healthy adults in Austria.

**Methods:** Of 63 invited individuals, a total of 59 (50.8% women, mean 34.9±11.1 years) had sufficient valid data points to be included. The participants completed the PAQ24 in the evening of 14 consecutive days while wearing a GENEActiv accelerometer for the first seven days on their non-dominant wrist. The Global Physical Activity Questionnaire (GPAQ) and six feedback items on the feasibility were completed online a week afterwards. Test-retest reliability for Total PA and sedentary behavior (SB) was assessed daily and weekly using intraclass correlation coefficients (ICC). Spearman correlation coefficients ( $\rho$ ) were calculated for relative agreement for daily and weekly variables. Bland-Altman plots were used for measurement error (limits of agreement).

**Results:** In the daily test-retest comparison, 93% of the PAQ24 variables showed ICC values of  $\geq 0.7$ . The weekly comparison showed high reliability for all variables (ICC=0.82–0.94). The Bland-Altman plots showed high measurement error. Daily relative agreements for PAQ24 and accelerometer ranged between  $\rho=0.30$ –0.56 for Total PA and  $\rho=0.36$ –0.69 for SB. The respective weekly relative agreement for Total PA was  $\rho=0.44$  and  $\rho=0.71$  for SB. Regarding PAQ24 and GPAQ, weekly relative agreements were  $\rho=0.41$  for Total PA and  $\rho=0.87$  for SB. Overall, daily and weekly absolute agreements were poor indicated in Bland-Altman plots by wide limits of agreement. Median completion time of the 824 PAQ24 assessments was 1:56 minutes.

**Conclusions:** The approach of combining the quick completion and intuitive usability of a web-based self-report may broaden the spectrum of previous day recalls and EMAs. With promising evidence for high reliability and moderate-to-high construct validity, the PAQ24 has the potential to evolve into app-based implementation and be combined with the fast-growing market of affordable motion sensors in smartphones or smartwatches.

# Contributions of changes in physical activity, sedentary time, diet and body weight to changes in cardiometabolic risk

**Prof. Eivind Andersen**, Prof. Eivind Andersen

<sup>1</sup>University of South-Eastern Norway, Åsgårdstrand, Norway

**Poster Session #3, June 17, 2023, 1:00 PM - 2:00 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Background:** Increased physical activity (PA), reduced time spent sedentary (SED), healthier diet and reduced body weight may all have a positive impact on cardiometabolic risk. The relative importance of change in each of these variables on cardiometabolic risk, however, is unclear. We therefore sought to investigate the relative contributions of changes in PA, SED, diet and body weight on cardiometabolic risk.

**Methods:** This is a secondary analysis of data collected from the EuroFIT RCT, which was a 12-week group-based lifestyle intervention for overweight middle-aged men delivered by coaches in football club stadia aiming to improve PA, SED, diet, and body weight. PA and SED were assessed by accelerometry, diet using the DINE. An overall cardiometabolic risk score was derived from combining z-scores for glucose, HbA1c, insulin, lipids and blood pressure. In total, 707 men with complete data for these variables at baseline and 12-month follow-up were included in the multivariable linear regression analyses.

**Results:** In multivariable analyses, change in number of steps (explaining 5.1% of  $R^2$ ) and dietary factors (together explaining 4.5% of  $R^2$ ), but not changes in standing time or SED, were significantly associated with change in body weight. Changes in number of steps ( $R^2 = 1.7\%$ ), fatty food score ( $R^2 = 2.4\%$ ), and sugary food score ( $R^2 = 0.4\%$ ) were significantly associated with change in cardiometabolic risk score in univariable models. However, in multivariable models which included changes in weight as well as changes in steps and dietary variables, change in weight explained a substantially larger proportion of the change in cardiometabolic risk score, explaining 14.1% of  $R^2$  (out of an overall model  $R^2$  of 19.0%). When baseline (as well as change) values were also included in the model, 38.8% of  $R^2$  for change in cardiometabolic risk score was explained overall, with 14.1% of  $R^2$  still explained by change in weight.

**Conclusion:** Change in body weight, together with baseline cardiometabolic risk explained most of the change in cardiometabolic risk. Thus, the benefits of increasing PA and improving diet on cardiometabolic risk appear to act largely via an effect on changes in body weight.

# Cardio-metabolic risk profiles of adult employees at eleven large worksites across india: findings from the india-works study

Shinu Koshy<sup>1, 2</sup>, **Dr. Harish Ranjani**<sup>3</sup>, Mary Beth Weber<sup>4</sup>, Alex Matthews<sup>1, 2</sup>, Elizabeth Rhodes<sup>4</sup>, Dr. Anjana Ranjit Mohan<sup>3</sup>, Mohammed, K Ali<sup>4</sup>, Viswanathan Mohan<sup>3</sup>, K.M. Venkat Narayan<sup>4</sup>, Dorairaj Prabhakaran<sup>2, 5</sup>, Jeemon Panniyammakal<sup>1, 2</sup>

<sup>1</sup>Achutha Menon Centre for Health Science Studies, Sree Chitra Tirunal Institute for Medical Sciences and Technology, Trivandrum, India, <sup>2</sup>Public Health Foundation of India, New Delhi, India, <sup>3</sup>Madras Diabetes Research Center/Dr. Mohan's Diabetes Specialities Centre, Chennai, India, <sup>4</sup>Global Diabetes Research Center, Rollins School of Public Health, Emory University, Atlanta, USA, <sup>5</sup>Centre for Chronic Disease Control, New Delhi, India

## Poster Session #3, June 17, 2023, 1:00 PM – 2:00 PM

**Purpose:** Chronic diseases such as diabetes and cardiovascular disease are major causes of morbidity and mortality in India. The age of onset of these diseases are seen to be a decade earlier in Asian Indians compared to other ethnicities thereby disproportionately affecting the working age group. This abstract describes the health and cardio-metabolic risk profiles of adult employees at 11 worksites across India. .

**Methods:** Using The Integrating Diabetes Prevention in Workplaces (INDIA-WORKS, clinicaltrials.gov NCT02813668) program targeted a high-risk population across 11 large (2,000-40,000 employees) worksites in India to implement a peer led lifestyle education model focusing on weight-loss and improvements in diet and physical activity behaviours to prevent diabetes and CVD. Employees who voluntarily participated in the INDIA -WORKS program were screened before being recruited. Self-reported data was collected using a pre-structured questionnaire which included questions on basic demographics, health history, lifestyle habits, quality of life etc. Anthropometric and biochemical measures were also taken. Multimorbidity was defined as co-existence of two or more chronic conditions. Means and standard deviations were used to summarise the continuous variables while categorical variables were presented as counts and percentages. .

**Results:** More than three-fourths of participants (N: men=5073, women=1192, mean age 42 years (SD: 10.7 years) were either overweight or obese. Maximum employees (72%) reported they were sedentary or doing mild physical activity. 2320 (37%) individuals had hypertension, of which only 35% were aware of their condition and only 15% had it under control. Out of the 612 participants (14.9%) with a raised HbA1c:  $\geq 6.5\%$  only 4% were aware that they had diabetes. Based on the Indian Diabetes Risk Score (IDRS), 46.4% of employees were at high risk of diabetes, with a higher proportion of women. 1 in 2 people suffered from at least 1 morbidity. The prevalence of multimorbidity was 18.1%. .

**Conclusions:** The high prevalence of multimorbidity among employees across the 11 Indian worksites and disturbingly low level of awareness regarding their hypertension and diabetes status warrants prompt action. Given the time spent at worksites, programs that facilitate physical activity and adoption of healthy eating habits can help improve health of the young Indian workforce. .

## A novel methodology for the assessment of child eating behaviours: Applying the Rasch model on the Child Eating Behaviour Questionnaire (CEBQ) using samples from Australia and Sweden

**Dr. Maria Somaraki**<sup>1,2</sup>, Dr. Anna Ek<sup>3</sup>, Dr. Pernilla Sandvik<sup>1</sup>, Dr. Rebecca Byrne<sup>4</sup>, Prof. Paulina Nowicka<sup>1,3</sup>

<sup>1</sup>Department of Food Studies, Nutrition and Dietetics, Uppsala University, Uppsala, Sweden, <sup>2</sup>MOISA, Université de Montpellier, CIRAD, CIHEAM-IAMM, INRAE, IRD, Institut Agro, Montpellier, France, <sup>3</sup>Division of Paediatrics, Department of Clinical Science, Intervention and Technology, Karolinska Institutet, Stockholm, Sweden, <sup>4</sup>Centre for Children's Health Research, School of Exercise and Nutrition Sciences, Faculty of Health, Queensland University of Technology, Brisbane, Australia

**S.1.01. - Novel approaches for assessing and analysing child eating behaviours, UKK - Main Hall (Level 6), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Child eating behaviour is considered a key component of obesity-related behavioural profiles. Yet, changes in child eating behaviours during early obesity treatment are rarely evaluated. While the Child Eating Behaviour Questionnaire (CEBQ) has undergone extensive psychometric evaluation and validation using classical test theory, the application of Rasch may identify and remove redundant items and, therefore, reduce participant burden. The present analyses aim to provide insights into the use of the CEBQ using the Rasch model and to assess child eating behaviours after obesity treatment.

**Methods:** First, Rasch-based fit statistics were applied on the CEBQ items as reported by Australian and Swedish mothers (n=1724) for their children aged 4-6 years. Secondly, changes in preschoolers' eating behaviours were examined in the More and Less RCT for obesity treatment (n = 177), which compared a parenting programme (with and without boosters) to standard treatment. Parents completed the CEBQ at four time points over 12-months. Linear mixed models were applied to estimate treatment effects on the CEBQ, refined according to Rasch, over time.

**Results:** The validity of CEBQ was confirmed after removing 4 items (item fit statistics outside range 0.5–1.5), namely 'My child gets full up easily', 'My child refuses new foods at first', 'My child is interested in tasting foods s/he hasn't tasted before'(reversed), and 'My child decides that s/he doesn't like a food, even without tasting it'. The refined CEBQ was used in the RCT evaluation and no differences in parental reports of changes in children's eating behaviours were shown between the parenting programme and standard treatment (group-by-time interactions  $p > 0.05$ ). However, in the total sample food approach behaviours decreased while fussy eating behaviours increased ( $p < 0.05$ ).

**Conclusion:** The refined CEBQ proved to be a valid tool for examining parent-reported child eating behaviours. A shorter version of the CEBQ can facilitate routine assessments of child eating behaviours in research and/or clinical settings, which can inform tailored interventions for childhood obesity. Early obesity treatment may decrease eating behaviours associated with higher child weight. Future research should address the associations between changes in child weight status and eating behaviours.

# Characteristics of eating behavior profiles among preschoolers with low-income backgrounds: a person-centered analysis

**Prof. Jennifer Fisher<sup>1</sup>**, Prof. Sheryl Hughes<sup>2</sup>, Dr. Alison Miller<sup>3</sup>, Dr. Mildred Horodyski<sup>4</sup>, Dr. Holly Brophy-Herb<sup>4</sup>, Dr. Dawn Contreras<sup>5</sup>, Dr. Niko Kaciroti<sup>6</sup>, Dr. Karen Peterson<sup>3</sup>, Dr. Katherine Rosenblum<sup>6</sup>, Dr. Danielle Appugliese<sup>7</sup>, Dr. Julie Lumeng<sup>6</sup>

<sup>1</sup>Temple University, Philadelphia, USA, <sup>2</sup>USDA/ARS Children's Nutrition Research Center, Baylor College of Medicine, Houston, USA, <sup>3</sup>University of Michigan, Ann Arbor, USA, <sup>4</sup>Michigan State University, East Lansing, USA, <sup>5</sup>Michigan State University Extension, East Lansing, USA, <sup>6</sup>University of Michigan Medical School, Ann Arbor, USA, <sup>7</sup>Appugliese Professional Advisors, LLC, North Easton, USA

**S.1.01. - Novel approaches for assessing and analysing child eating behaviours, UKK - Main Hall (Level 6), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Individual differences in eating behaviors among young children are well-established, but the extent to which behaviors aggregate within individuals to form distinct eating behavior profiles remains unknown. Our objectives were to identify eating behavior profiles among preschool-aged children and evaluate associations with temperament and weight.

**Methods:** A secondary, cross-sectional analysis of baseline data from 2 cohort studies was conducted involving 1004 children aged 3-4 years and their parents with low-income backgrounds. Children's eating behaviors and temperament were assessed by parental report. Body mass index z-scores and weight status were calculated using measured heights and weights. Latent profile analysis (LPA) was used to generate profiles and bivariate analyses were used to evaluate associations with temperament and weight status.

**Results:** LPA revealed the presence of 3 eating behavior profiles among children. Children with High Food Approach profiles (21.2%) had lower temperamental inhibitory control and the highest percent of children with obesity relative to the other profiles. Children with High Food Avoidant profiles (35.6%) had lower temperamental impulsivity and lower BMI z-scores relative to the other profiles, whereas children with Moderate Eating profiles (intermediary levels of all behaviors; 43.2%) had higher temperamental inhibitory control and lower anger/frustration, than other profiles.

**Conclusions:** Young children's eating behaviors appear to aggregate within individuals to form empirically distinct profiles reflecting food approach, food avoidance, and moderate approaches to eating that are differentiated by aspects of temperament and weight. Future work should seek to understand the extent to which health promotion and obesity prevention approaches should be tailored to take into account children's fundamental dispositions towards eating.

# An epigenome-wide association study of child eating behaviours and DNA methylation

**Dr. Harris Holly**<sup>1, 2, 3</sup>, Dr. Pauline Jansen<sup>1, 2, 3</sup>, Dr. Janine Felix<sup>2, 4</sup>, Dr. Rosa Mulder<sup>2, 4</sup>

<sup>1</sup>Erasmus MC, University Medical Center, Department of Child & Adolescent Psychiatry/Psychology, Rotterdam, Netherlands, <sup>2</sup>Generation R Study Group, Erasmus MC, University Medical Center, Rotterdam, Netherlands, <sup>3</sup>Erasmus University Rotterdam, Department of Psychology, Education & Child Studies, Rotterdam, Netherlands, <sup>4</sup>Department of Pediatrics, Erasmus MC, University Medical Center Rotterdam, Rotterdam, Netherlands

**S.1.01. - Novel approaches for assessing and analysing child eating behaviours, UKK - Main Hall (Level 6), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Eating behaviours (or appetitive traits) are phenotypes expressed through complex gene-environment interactions and contribute to variability in weight-gain. Early-life epigenetic processes, such as DNA methylation, may be involved in the developmental programming of appetite regulation expressed in childhood. However, this is yet to be systematically explored. The current study is an epigenome-wide association study (EWAS) exploring associations between cord blood DNA methylation (DNAm) and child eating behaviours.

**Methods:** Data were from the population-based Generation R Study. Children with available cord blood DNAm and eating behaviour data at 4 years were included in the study ( $n=1086$ ). DNAm profiles of autosomal methylation sites were generated using the Illumina Infinium HumanMethylation450 BeadChip. Parents reported on their child's food responsiveness, emotional overeating, emotional undereating, satiety responsiveness and food fussiness using the Child Eating Behaviour Questionnaire. Multiple regression models were used to examine the association between DNAm (predictor) at the site- and regional- level and each eating behaviour (outcome), adjusting for covariates. Within each model, a Bonferroni-correction was applied based on the number of probes ( $p < 1.20 \times 10^{-7}$ ).

**Results:** Mothers were on average 32.5 ( $\pm 4.0$ ) years at study inclusion and most reported never smoking (80.5%). No associations were found between DNAm at the individual sites and any appetitive trait. Regional analysis showed DNAm at a region on chromosome 8 was associated with food responsiveness ( $p = 5.00 \times 10^{-08}$ ). This region encompasses three CpG sites, cg04943741, cg11402303, and cg27657489, located in the gene body of *VPS28*. Further replication and meta-analysis of results in two other studies is planned and will be presented.

**Conclusions:** This is the first EWAS examining DNAm in cord blood and associations with child eating behaviours. Findings from this study provide preliminary support for early programming via DNAm processes in children's expression of food responsiveness, which is consistently associated with higher weight status. In line with the Behavioural Susceptibility Theory, this finding provides some initial evidence for behaviorally-mediated mechanisms linking genetic risk and environmental exposure to weight gain. Investigating differential DNA methylation associated with eating behaviours could be an important first step in identifying biological pathways underlying the development of these behaviours.

# Mapping an urban food system, sector by sector, to identify transformative interventions benefiting human and planetary health: the Mandala programme

**Dr. Alexia Sawyer<sup>1</sup>**, Dr. Kelly Parsons<sup>1</sup>, Dr. Catrin Pedder Jones<sup>1</sup>, Prof. Martin White<sup>1</sup>

<sup>1</sup>MRC Epidemiology Unit, University of Cambridge, Cambridge, United Kingdom

**S.1.02 - The methodological challenges of understanding and transforming systems to promote healthier dietary and physical activity behaviours: lessons from the LIKE and Mandala programmes, UKK - Level 6 Foyer, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** Food systems generate huge external costs, including for the environment (e.g. climate change impacts) and health (e.g. non-communicable disease risks). Transformative interventions are urgently needed to reduce these negative externalities. The Mandala consortium aims to systematically generate evidence on urban food system transformation by co-producing interventions with stakeholders and undertaking rigorous evaluations of system impacts. Here we aim to share the complex methodological and practical challenges, and achievements of an emergent research process.

**Methods** To identify interventions with transformative potential, we worked with food system actors in the city of Birmingham, UK. We used solution scanning to identify long-lists of potential food system interventions. We interviewed stakeholders to understand the opportunities and challenges of intervening in the food system. Working with stakeholders, we mapped food systems conceptually and generated a causal loop diagram (CLD), drawing on Group Model Building methods, for each food system sector, identifying leverage points and potential interventions. We developed and applied criteria to prioritise interventions with stakeholders, incorporating existing theory and evidence in our decision-making. We used qualitative methods to document processes and outcomes.

**Results** Interviews with stakeholders yielded rich insights, which informed subsequent stages. We developed a set of criteria to prioritise interventions, including the importance of population reach, impacts on health-related food supply, dietary changes and sustainability outcomes, including carbon emission, water depletion and biodiversity loss, and the policy coherence and viability of interventions for stakeholders. We developed five CLDs for supply chains, grocery, out of home, institutional catering and informal food sectors, and identified multiple leverage points for interventions within each CLD. We explored the overlaps and connections between the five CLDs, and identified and prioritised interventions for delivery, working iteratively with stakeholders.

**Conclusion** Understanding complex adaptive systems, such as urban food systems, and identifying and prioritising interventions for delivery demands close collaboration with stakeholders, interdisciplinary scientific inputs, and considerable time and resources. What seemed sensible in theory, did not necessarily work in practice. In particular, engaging commercial stakeholders in transformative interventions to promote health and sustainability is highly challenging, and demands a negotiated process that seeks common ground.

# Development of a dynamic action programme to promote healthy behaviour in adolescents: a system dynamics approach

**Ms. Angie Luna Pinzon<sup>1</sup>**, Dr. Karien Stronks<sup>1</sup>, Dr. Wilma Waterlander<sup>1</sup>

<sup>1</sup>Department of Public and Occupational Health, Amsterdam UMC, University of Amsterdam, Amsterdam, Netherlands

**S.1.02 - The methodological challenges of understanding and transforming systems to promote healthier dietary and physical activity behaviours: lessons from the LIKE and Mandala programmes, UKK - Level 6 Foyer, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** There is growing recognition for the value of applying system dynamics approaches in public health research. To date, most of this research has focused on systems mapping. However, there is limited practical guidance available on what intervention programmes taking a system dynamics approach could or should look like as well as how system changes could be operationalised.

**Methods** Using the Lifestyle Innovation based on Youth Knowledge and Experience (LIKE) programme as a case study; we illustrate how a previously obtained understanding of the pre-existing system of obesity-related behaviours in adolescents was used to operationalise the identification of leverage points and subsequently develop a widely supported action programme within a system dynamics approach. This case study was set in ethnically diverse neighbourhoods in the city of Amsterdam, the Netherlands. The identification of system levers and action development process was conducted from a stakeholders-led approach (representing academia, policy and practice) and an adolescents-led approach.

**Results** In October 2022, the LIKE action programme consisted of a total of 26 actions. The action programme targeted a total of eleven leverage points which were roughly distributed over the different system levels ranging from system functioning (deeper levels of the system) to system structure (most visible levels of the system).

**Conclusion** This study illustrates how a system understanding can be translated and operationalized into identifying leverage points which can subsequently inform the development of an action programme. We achieved this by building upon the previously developed understanding and analysis of the pre-existing system of obesity-related behaviours in adolescents

# Evaluating a system dynamics obesity prevention programme: the application of Ripple Effects Mapping

Assistant Professor Wilma Waterlander<sup>1</sup>, Ms. Angie Luna Pinzon<sup>1</sup>, Prof. Karien Stronks<sup>1</sup>, Mrs. Jillian O'mara<sup>1</sup>

<sup>1</sup>Department of Public and Occupational Health, Amsterdam UMC, University of Amsterdam, Amsterdam, Netherlands

**S.1.02 - The methodological challenges of understanding and transforming systems to promote healthier dietary and physical activity behaviours: lessons from the LIKE and Mandala programmes, UKK - Level 6 Foyer, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** Systems thinking embraces the complexity of public health problems and aids in understanding how factors are interrelated, and subsequently can be targeted to produce favourable changes in a system. There is a growing call for systems approaches in public health research, yet limited practical guidance is available on how to evaluate public health programmes within complex adaptive systems.

**Methods** Building on our previously published Evaluation of Programmes in Complex Adaptive Systems (ENCOMPASS) framework, we applied Ripple Effects Mapping (REM) methods to measure the intended and unintended effects of the Lifestyle Innovations Based on Youth Knowledge and Experience (LIKE) programme in the City of Amsterdam, the Netherlands. Three REM workshops were held in 2022; focusing on the overall LIKE programme and specifically focusing on the actions that were developed. Subsequently, in-depth interviews were held with involved stakeholders.

**Results** REM provided in-depth insight into how actions developed over time within a system dynamics action programme. For example, actions that were initially developed to co-create a healthier food environment within supermarkets, evolved into a lobbying initiative to achieve policy impact within the food environment. Similarly, actions targeting the physical activity environment evolved into developing methods for co-creation of public spaces with youth. In particular, REM data revealed the importance of involving the right stakeholders as well as barriers and opportunities in targeting deeper levels of the system.

**Conclusion** A dynamic action programme changes over time and it is difficult to measure its immediate impact. REM is a valuable method to identify intended and unintended consequences of such an action programme and thereby providing insight into its effectiveness as well as ways to further adapt the programme.

# Household food insecurity and the EU Farm to Fork strategy

**Dr. Wesley R. Dean<sup>1</sup>**, Dr. Lukar Thornton<sup>2</sup>

<sup>1</sup>Department of Food and Resource Economics, University of Copenhagen, Copenhagen, Denmark, <sup>2</sup>Food Purchasing and Environments, Department of Marketing, University of Antwerp, Antwerp, Belgium

**S.1.03 - Food insecurity in context: Capturing lived experiences and exploring implications for research and policy, UKK - Hall B (Level 3), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** The purpose of this study is to examine norms embedded in the concepts of food security and food insecurity, describe how socio-political context influences values, and identify implications for measurement and policy within the European Union (EU). Food insecurity is a multi-level concept that describes deficiencies in food supply, access, and affordability; food security “exists whenever the availability of nutritionally adequate and safe foods or the ability to acquire acceptable foods in socially acceptable ways is limited or uncertain (Anderson 1990).” Food insecurity is an explicitly normative concept. Normative language such as “availability”, “adequacy”, “safety”, and “acceptability” are embedded in concepts, and operationalization of the concepts in measurement constructs, and in policy implementation. For example, the long-standing measures of household food insecurity, used by FAO and USDA, define these norms as largely economic values. In turn, policies that employ these measures are framed to account for economic capabilities. Efforts to implement new measurements that are relevant to the EU context should account for values embedded in the EU policy framework, many which extend beyond accessibility defined in economic terms to include rights-based approaches. One place where these values are articulated is the European Commission’s *Farm to Fork Strategy* (F2F).

**Methods:** Critical discourse analysis was used to identify the values embedded in this system-oriented conceptualization of food (in)security within the F2F framework and the varying interpretations of values on food access in the EU context, based on the nascent research literature.

**Results:** Findings applied a contemporary lens to create a reimagined perspective on food (in)security and explored implications for the measurement of household food (in)security.

**Conclusions:** This presentation will detail how the F2F framework and affiliated literature define food (in)security at all levels as the necessary outcome of a sustainable food system. The F2F vision of food access is embedded in a model that integrates agricultural production, distribution, food acquisition, and consumption practices into a systems framework. These are guided by ecological, economic, and social values including equitable and fair outcomes for actors at all stages of the food system, that are currently not operationalized as measures in public health.

# Managing household food security in the U.S.: perspectives of heritage-diverse Latinx caregivers of children

**Dr. Amanda C. McClain<sup>1</sup>**, Dr. Cassandra M. Johnson<sup>2</sup>, Dr. Kate L. Dickin<sup>3</sup>

<sup>1</sup>School of Exercise and Nutritional Sciences, San Diego State University, San Diego, California, USA,

<sup>2</sup>Nutrition and Foods Program, Texas State University, San Marcos, Texas, USA, <sup>3</sup>Department of Public Health & Ecosystem Health, Cornell University, Ithaca, New York, USA

**S.1.03 - Food insecurity in context: Capturing lived experiences and exploring implications for research and policy, UKK - Hall B (Level 3), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** We aimed to elucidate the lived experiences of managing household food security among low-income, heritage-diverse Latinx caregivers of children ( $\leq 18$  years) in the U.S and identify possible future directions for measurement and policy.

**Methods:** We conducted in-depth exploratory cognitive interviews, based on the U.S. government food security survey instrument, via telephone or Zoom with 62 Latinx caregivers in rural, urban, and suburban areas of California, New York, and Texas. The multi-site research team recruited eligible caregivers through community partners and in-person events at partner sites. Verbatim transcripts were coded in NVivo to identify emergent themes related to food insecurity experiences, coping strategies, interpretation of the food security measure, and cultural perspectives.

**Results:** Participants identified as Mexican, Dominican, Puerto Rican, Ecuadoran, and Central/South American heritage, and 58% reported being born outside the U.S. Similarities and distinctions in food insecurity experiences and coping strategies emerged across sites and by nativity and heritage. Participants across sites described challenges in maintaining food security due to the COVID-19 pandemic and inflation, including inability to leave the house to access food (i.e., quarantine), limited availability of food at stores, and increasing food and gas prices. Across sites, participants described prioritizing their children's food security over their own and routinely relying on emergency food systems, such as food pantries, as a coping strategy even if they were unable to procure their preferred foods. As a result, many participants answered survey items as though their households were food secure, despite financial hardship and reliance on food assistance. Some participants described difficulties in qualifying and maintaining participation in government food assistance programs. Reliance on family members and desire to provide children with culturally-preferred foods appeared to vary by site and heritage.

**Conclusions:** Heritage-diverse U.S. Latinx caregivers of children demonstrated similarities and distinctions in their experiences managing household food security status. Many reported coping strategies appeared to be normalized such that caregivers did not perceive their households to be food insecure, despite their descriptions suggesting otherwise. Findings underscore the need to consider the socioecological context of Latinx households in the U.S. to more accurately measure and address food insecurity.

# **‘Politicians, stop putting people in survival mode!’ Preferred solutions to food insecurity identified by families with a lived experience**

**Dr. Sabine Baker**<sup>1</sup>, Dr. Danielle Gallegos<sup>1</sup>

<sup>1</sup>Woolworths Centre for Childhood Nutrition Research, Queensland University of Technology, Brisbane, Australia

**S.1.03 - Food insecurity in context: Capturing lived experiences and exploring implications for research and policy, UKK - Hall B (Level 3), June 15, 2023, 8:15 AM - 9:30 AM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** This paper describes a portfolio of solutions that inform policy and service delivery as recommended by adult carers of children aged 0-12 who struggle to put food on the table.

**Methods:** Feeding Families in Tough Times (FFiTT) is a mixed-method program of research that aims to build a rich understanding of food insecurity in Australian families. Families were recruited primarily through food relief and community support organisations. 43 semi-structured interviews were carried out in person or via zoom. Interviews were informed by life narratives and the Family Adjustment and Adaptation model. Audio-recordings were transcribed and analysed using reflexive thematic analysis.

**Results:** Participants identified key barriers to food security as cost-of-living increases, unstable housing, precarious income, domestic and family violence, racism, adverse childhood experiences, disability and chronic health problems, as well as difficulty navigating government systems. Parents identified solutions that were aimed at reducing the impact of financial hardship, cognitive load and food insecurity, at the individual, family, community and policy level. Solutions could be themed as: income optimisation; system navigation; in-time place-based health care; and food availability/affordability.

**Conclusions:** The data provides insight into interactions with support networks and services and highlights policy level short falls and gaps in the Australian response to food insecurity. The interviews highlight the need for government-led action that addresses the underlying determinants of food insecurity. Solutions need to be multifaceted and should draw on the lived experience of families doing their absolute best to feed their families under extremely demanding circumstances.

# The Current State of Global Surveillance of Physical Activity Among Children and Adolescents

**Dr. Salome Aubert<sup>1</sup>**

<sup>1</sup>Active Healthy Kids Global Alliance, Avignon, France

**S.1.04 - The Quest for a Valid and Reliable Global Adolescent and Child Physical Activity Questionnaire – introducing the GAC-PAQ Project, UKK - Hall C (Level 3), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** The enhancement of data systems and capabilities at national levels to support regular population surveillance of physical activity (PA) was identified as a priority in the World Health Organization Global Action Plan on Physical Activity 2018–2030. We reviewed the existing major international studies/surveillance initiatives on PA for children and adolescent to (i) summarize global findings; (ii) identify methodological limitations and inconsistencies, surveillance, and research gaps; (iii) propose recommendations for improvement.

**Methods:** Intercontinental PA surveillance initiatives for children and adolescents were identified by experts and through non-systematic literature searches. Prevalence of meeting PA guidelines by country, gender, and age were extracted when available. Methods and prevalence meeting PA guidelines were compared across data/studies and against the methodological/validity/translation differences.

**Results:** Methods and PA definition inconsistencies were observed across and within PA international surveillance initiatives, resulting in different estimated national prevalence of meeting PA guidelines, and initiatives contradicting each other's cross-country comparisons. Three findings were consistent across international surveillance initiatives: insufficient level of PA of children and adolescents across the world; lower levels of PA among girls; and attenuation of PA levels with age. The dose (frequency, intensity, and duration) of children's and adolescents' PA domains (i.e., organized sport, active transportation, active play, physical education, chores and occupation) was generally not assessed. Resource-limited countries; younger children; and children and adolescents not attending school, with disability or chronic conditions, and from rural areas were generally under/not represented.

**Conclusions:** Substantial inconsistencies were observed across/within included initiatives, resulting in varying prevalence estimates of PA among children and adolescents at the global, regional, and national levels - questioning the validity of current PA surveillance systems. The development of a new PA measurement instrument that would be globally accepted and harmonized has become a global priority to help improve the validity and reliability of global surveillance and to inform the development of effective PA policies.

# The Global Adolescent and Child Physical Activity Questionnaire Development Project

**Dr. Richard Larouche**<sup>1</sup>, Prof. Mark Tremblay<sup>2,3</sup>

<sup>1</sup>University of Lethbridge, Lethbridge, Canada, <sup>2</sup>CHEO Research Institute, Ottawa, Canada, <sup>3</sup>University of Ottawa, Ottawa, Canada

**S.1.04 - The Quest for a Valid and Reliable Global Adolescent and Child Physical Activity Questionnaire – introducing the GAC-PAQ Project, UKK - Hall C (Level 3), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Global efforts to address the physical inactivity crisis are limited by the use of questionnaires that do not capture all domains of physical activity (PA) and have not been sufficiently adapted to low- and middle-income countries (LMICs). This undermines between-country comparisons of PA indicators that could identify potential solutions to promote PA. In this context, we will develop and assess the reliability and validity of the new app-based Global Adolescent and Child Physical Activity Questionnaire (GAC-PAQ) among 5- to 17-year-olds and their parents from 14 low-, medium-, and high-income countries across 6 continents.

**Methods:** This ongoing project involves 8 successive stages in all 14 countries: 1) review of the content coverage, strengths, and limitations of existing PA instruments; 2) development of the first version of the GAC-PAQ by our team of >25 researchers and knowledge users; 3) assessment of the content validity of the GAC-PAQ with expert groups; 4) cognitive interviews with children and parents; 5) development of the app and a revised version of the GAC-PAQ in English; 6) translation in the official languages of the participating countries; 7) pilot-study with 10 child-parent dyads per country; and 8) main study with a sex-balanced sample of 500 children and youth per country, stratified by age and level of urbanization. In the main study, participants will be recruited in schools and other settings (e.g., community centres, faith places), and asked to complete the GAC-PAQ twice to assess 1-week test-retest reliability, and to wear an ActiGraph accelerometer for one week (as comparison measure).

**Results:** This presentation will provide a comprehensive overview of the GAC-PAQ methods. We developed an integrated knowledge translation plan to share study findings with researchers and knowledge users and facilitate its integration in PA surveillance studies.

**Conclusions:** The GAC-PAQ project will facilitate the comparison of PA indicators between and within countries, which can highlight novel solutions to address the physical inactivity crisis. It will also help develop capacity to strengthen the surveillance of PA, particularly in LMICs. We anticipate that the app-based format will facilitate completion of the questionnaire by younger children and people with lower literacy levels.

# Early Findings from the GAC-PAQ Project Across 14 Countries

**Prof. Olga Sarmiento**<sup>1</sup>, Dr. Richard Larouche<sup>2</sup>, Prof. Mark Tremblay<sup>3,4</sup>

<sup>1</sup>Universidad de los Andes, Bogota, Colombia, <sup>2</sup>University of Lethbridge, Lethbridge, Canada, <sup>3</sup>CHEO Research Institute, Ottawa, Canada, <sup>4</sup>University of Ottawa, Ottawa, Canada

**S.1.04 - The Quest for a Valid and Reliable Global Adolescent and Child Physical Activity Questionnaire – introducing the GAC-PAQ Project, UKK - Hall C (Level 3), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** The purpose of this presentation is to discuss preliminary findings from the Global Adolescent and Child Physical Activity Questionnaire (GAC-PAQ) project across 14 low-, medium-, and high-income countries from all continents.

**Methods:** We searched the literature to identify: 1) questionnaires employed in previous multi-country studies on PA in children and youth, and 2) systematic reviews on the psychometric properties of existing PA questionnaires. We extracted information about the location of individual studies, age group, validity, reliability, coverage of the domains of PA, and strengths and limitations.

**Results:** Our literature review revealed that the questionnaires used in previous multi-country studies did not capture all domains of PA. Furthermore, the majority of PA questionnaires have been developed in high-income countries, often with children in schools in urban samples, and tend to focus more extensively on the types of PA that are common in those countries (e.g., organized physical activity and sports, physical education, recess). Conversely, few questionnaires included items about active play, household-, and work-related PA. Previous reviews concluded that few questionnaires had good reliability and validity. The Physical Activity Questionnaire for Children was recommended in some previous reviews. Its format informed the initial structure of the GAC-PAQ, but the items were revised to enhance content coverage. The initial version of the GAC-PAQ was developed by our team of >25 researchers and knowledge users and will be shared for comment. Findings of the content validation with expert groups and the cognitive interviews (planned for the winter of 2023) will be presented at the symposium.

**Conclusions:** The sequential and collaborative development process will generate a questionnaire that provides broader coverage of all the domains of PA and better represents the types of PA that are common in LMICs. This will help increase the validity and usefulness of global comparisons of physical activity indicators, such as the Active Healthy Kids Global Alliance's Global Matrix project, as platforms to track changes over time in PA indicators and identify potential solutions to the childhood physical inactivity crisis.

# The effect of reallocating sedentary time with short bouts of physical activity: a compositional isothermal substitution analysis

**Mr. Jonah Thomas**<sup>1</sup>, Dr. James Sanders<sup>1</sup>, Dr. Dale Esliger<sup>1</sup>, Prof. Amanda Daley<sup>1</sup>

<sup>1</sup>Loughborough University, Loughborough, United Kingdom

**S.1.04 - The Quest for a Valid and Reliable Global Adolescent and Child Physical Activity Questionnaire – introducing the GAC-PAQ Project, UKK - Hall C (Level 3), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Previous studies have shown that replacing sedentary time with moderate to vigorous intensity physical activity (MVPA) was positively associated with a range of cardiometabolic health markers including adiposity. However, it is unclear how replacing sedentary behaviour with different bout durations of MVPA impact cardiometabolic health markers. Therefore, this analysis aimed to predict the change in cardiometabolic health markers when accelerometer-measured physical behaviours were reallocated.

**Method:** Adults (n=8795) were included in the analysis from NHANES 2003-2004 and 2005-2006. Waist worn Actigraph data were re-analysed to determine sedentary time, light physical activity, minutes of MVPA accumulated in less than five minutes in duration (short bouts) and minutes of MVPA accumulated in bouts lasting longer than five minutes in duration (longer bouts). Isothermal substitution models were generated to estimate the predicted change in cardiometabolic health markers with a given reallocation of accelerometer measured daily time use.

**Results:** When examining measures of body composition, reallocating 20 minutes of sedentary time to 20 mins of MVPA accumulated in short bouts predicted a 1.44kg/m<sup>2</sup> [95% CI: -1.62, -1.27] decrease in BMI and a 4.86cm decrease in waist circumference [95% CI: -5.06, -4.11]. When examining blood pressure, systolic blood pressure was predicted to decrease by 2.71mmHg [95%CI: -3.19, -2.23] and a decrease in diastolic blood pressure of 2.49mmHg [95% CI: -2.92, -2.06]. A decrease in total cholesterol (-0.17 [ 95% CI: -0.20, -0.14]) and LDL cholesterol (-0.13 [95%CI: -0.17, -0.09]).

**Conclusion:** Replacing sedentary time with short bouts of physical activity may lead to improvements in cardiometabolic health markers. Short bouts of physical activity may be an appropriate intervention to promote improvements in cardiometabolic health markers.

# Differences in Objective and Subjective Sedentary Time among Working and Non-Working Adults

**Dr. Emily Erlenbach**<sup>1</sup>, Ms. Revati Malani<sup>1</sup>, Dr. Edward McAuley<sup>1</sup>, Dr. Neha Gothe<sup>1,2</sup>

<sup>1</sup>University of Illinois Urbana Champaign, Urbana, USA, <sup>2</sup>Northeastern University, Boston, USA

**S.1.05 - Measurement and Trends in Physical Activity and Sedentary Time Among Middle Aged and Older Adults in the US and CZ, UKK - Hall D (Level 2 - main floor), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Background:** As interest in studying adults' sedentary time (ST) has expanded, more objective and subjective tools have been developed to measure this behavior. While both types of measurement approaches have innate pros and cons, one important consideration when deciding which to use should be the population of interest's employment status. How ST is accumulated among working and non-working adults may vastly differ, affecting how it is recalled and thus the accuracy of self-report measures. We present data comparing objective- and subjective-measured ST among working and non-working adults to further the understanding of how to best measure ST among these groups.

**Methods:** Baseline data was combined from two physical activity-based trials (N=250). Objective ST was collected via Actigraph-GT3X accelerometers. Subjective ST was assessed via the Sedentary Behavior Questionnaire (SBQ), an 18-item survey asking participants to report the amount of time spent engaged in various sedentary activities on weekdays and weekend-days. A score of average minutes/day sedentary was then computed. Participants also reported their employment status, which was categorized into three groups: full-time, part-time and retired/non-working. Paired t-tests compared objective- and subjective minutes/day of ST among the three employment groups.

**Results:** Our sample consisted of 156 full-time ( $M_{age}=58.26$ ), 30 part-time ( $M_{age}=64.43$ ) and 64 retired/not working adults ( $M_{age}=65.67$ ). Paired samples t-test revealed retired/not working adults significantly *underestimated* their daily ST when self-reporting compared to objective measures ( $t(63)=2.513$ ,  $p=0.015$ ), as this population reported an average of 487.90 minutes/day of ST on the SBQ but recorded an average of 542.85 minutes/day on accelerometers. There were no significant differences of self-report and accelerometer-measured ST among full-time and part-time working adults.

**Discussion:** Our findings suggest the SBQ is valid tool used to assess ST among full-time and part-time working adults. Due to the nature of their work schedules, these populations may have more structured ST (i.e., sitting at a desk, commuting) that allow for easier recall on subjective measures. Retired/non-working adults likely have more fluidity in their daily schedules, making it harder to accurately recall ST on questionnaires. Thus, accelerometers may be the preferable way to measure ST among this population.

# Objective and Subjective Measures of Physical Activity related to Brain Health in Late Adulthood

**Dr. Audrey Collins<sup>1</sup>**, Dr. Kirk Erickson<sup>1</sup>

<sup>1</sup>AdventHealth, Orlando, USA

**S.1.05 - Measurement and Trends in Physical Activity and Sedentary Time Among Middle Aged and Older Adults in the US and CZ, UKK - Hall D (Level 2 - main floor), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Background:** Physical activity (PA) is one of the most promising approaches for preventing and attenuating age and disease-related declines in brain health outcomes. However, heterogeneity in PA measurement has limited conclusions on how this behavior may influence brain health. Preliminary baseline data from the Investigating Gains in Neurocognition in an Intervention Trial of Exercise (IGNITE) randomized clinical trial examining the impact of PA on brain health in older adults will be used to evaluate various methods for measuring PA and their relationship with cognitive function.

**Methods:** Baseline data were collected from participants across three sites within the United States (N=610, Age= 69.76±3.71 years, 70.50% Female, Years of education=16.30±2.21 years) prior to randomization. Objective PA was measured using the ActiGraph GT9X Link (average of minutes per day). Self-reported PA was measured using the Godin-Shephard Leisure-Time Physical Activity Questionnaire (GSLTPA) resulting in a calculated total leisure activity score. Cognitive processing speed was assessed using the total correct score of the Digit Symbol Substitution Test (DSST). Relationships between objective levels of PA and GSLTPA score were assessed with Spearman's correlations. Multiple linear regressions examined the association between PA using various methods and DSST performance controlling for age, sex, and years of education.

**Results:** Preliminary analyses show that on average, participants performed 822.04±101.97 minutes, 139.46±44.49 minutes, and 49.47±29.62 minutes of sedentary, light (LPA), and moderate-to-vigorous (MVPA) activities per day. The average GSLTPA score was 16.16±17.11, which reflects moderately active behaviors. Measures of LPA and MVPA were weakly correlated with GSLTPA score ( $r_s = 0.149$ ;  $r_s = 0.084$ ). Mean DSST total raw score was 47.30±9.44, with a higher score reflecting better processing speed. When controlling for age, sex, and education, greater amounts of LPA, MVPA, and GSLTPA score were all significantly associated with faster processing speed as measured by DSST performance ( $p<0.001$ ;  $p<0.001$ ;  $p<0.001$ ).

**Conclusions:** Although the current trial is ongoing and blinding to group assignment prevented the authors from conducting group-based or pre-post analyses, our findings suggest that both accelerometer and self-report measures of PA may provide meaningful information to support the link between PA and cognitive and brain health in late adulthood.

# Comparing Objective and Subjective Measures of Physical Activity in a Prospective Cohort of Czech Active Runners and Inactive Adults

**Ms. Lenka Knapova<sup>1</sup>**, Mr. Michal Sebera<sup>1</sup>, Ms. Barbora Kastovska<sup>1</sup>, Ms. Denisa Blaschova<sup>1</sup>, **Prof. Steriani Elavsky<sup>1</sup>**

<sup>1</sup>University of Ostrava, Ostrava, Czech Republic

**S.1.05 - Measurement and Trends in Physical Activity and Sedentary Time Among Middle Aged and Older Adults in the US and CZ, UKK - Hall D (Level 2 - main floor), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Background:** In large prospective cohort studies on the links between physical activity (PA) and health outcomes, it is often not feasible to utilize research-grade devices due to their high costs. Commercial devices offer a more affordable way to objectively capture behavior, albeit with lower accuracy. This study aimed to evaluate the alignment between Fitbit-derived measures and self-report measures of PA in a large cohort study and whether it differs by activity status, age, and gender.

**Methods:** The study uses data from participants in the 4HAIE study ( $N=1314$ , age 18-65) which involved prospective monitoring of PA using Fitbit Charge 3 monitors across 12 months and self-report measures (ACLS, LTEQ, LASA) of PA/SB at baseline, month 6 and 12 of the study. The data collection concluded at the end of September 2022.

**Results:** The sample ( $M_{age}=38.62\pm12.57$ ) consisted of 747 active runners, 567 inactive adults, 53.7 % were men. Preliminary analyses of baseline data indicate that the correlations between Fitbit-derived measures (steps, fairly and very active minutes) and ACLS scores for the entire sample were low ( $r_s=0.155-0.300$ ). Middle-aged (40+) had a significantly stronger correlation for steps than younger adults ( $r_s=.443$  versus  $.238$ ,  $p<.001$ ). No other significant differences were found by gender or age, with a stronger correlation for steps indicated for men ( $r_s=.347$  versus  $.265$ ,  $p=0.12$ ). Differences based on activity status, albeit not significant, were indicated for very active minutes (runners:  $r=0.135$ , inactive:  $r=0.054$ ,  $p=0.15$ ) and for steps (runners:  $r=0.193$ , inactive:  $r=0.093$ ,  $p=0.08$ ). The associations will be further evaluated for LTEQ, LASA, and for 6 and 12-month data.

**Discussion:** The low correspondence between Fitbit-derived measures of PA and ACLS suggests that they capture different aspects of activity and might be affected by biased self-reports. Older adults are supposedly better at self-reporting their stepping behaviors. Inactive participants might not be able to adequately evaluate their vigorous activity levels since they have less experience with engaging in such PA unlike runners. Also, low correlations at baseline might be due to the different time ranges evaluated in the questionnaire (past month prior to study start) and for Fitbit data (the first 2 weeks of the study).

# Methodological opportunities and adaptations in the measurement of the built and food environment in four African cities

**Dr. Yves Wasnyo<sup>1</sup>**, Dr. Tiago Canelas<sup>2</sup>, Dr. Louise Foley<sup>2</sup>, Dr. Tolu Oni<sup>2</sup>, Dr. Victor Onifade<sup>3,4</sup>, Miss Damilola Odekunle<sup>3</sup>, Dr. Taibat Lawanson<sup>3,4</sup>, Dr. Feyisayo A. Wayas<sup>5</sup>, Dr. Estelle Victoria Lambert<sup>5</sup>, Dr. Motlatso Godongwana<sup>6</sup>, Dr. Lisa Micklesfield<sup>6</sup>, Dr. Adalberto Aparecido dos Santos Lopes<sup>7</sup>, Dr. Larissa Lima<sup>7</sup>, Dr. Waleska Teixeira Caiaffa<sup>7</sup>, Dr. Felix Assah<sup>1</sup>

<sup>2</sup>Global Diet and Activity Research Group and Network (GDAR), MRC Epidemiology Unit, University of Cambridge, Cambridge, United Kingdom, <sup>3</sup>Department of Regional and Urban Planning, University of Lagos, Lagos, Nigeria, <sup>4</sup>Center for Housing and Sustainable Development, University of Lagos, Lagos, Nigeria,

<sup>5</sup>Research Centre for Health through Physical Activity, Lifestyle and Sport (HPALS), Cape Town, South Africa,

<sup>6</sup>Developmental Pathways for Health Research Unit (DPHRU), University of Witwatersrand, Johannesburg, South Africa, <sup>7</sup>Belo Horizonte Observatory for Urban Health (OSUBH), Federal University of Minas Gerais (UFMG), Belo Horizonte, Brazil

**S.1.06 - Measuring health-related features of the natural, built and food environments in low- and middle-income countries: a syndemic approach, UKK - K1 (+K2) (Level 3), June 15, 2023, 8:15 - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** To describe and discuss the methodological and logistical opportunities and adaptations of applying existing audit tools to measure environmental features relevant to physical activity and diet in four African cities. Additionally, we reflect on the adaptations required to collect meaningful data in a context underrepresented in the literature.

**Methods:** Environmental audits of small areas (approx. 4km<sup>2</sup>) were conducted during August and October of 2022 in Yaoundé, Cameroon; Soweto and Cape Town, South Africa; and Lagos, Nigeria. We used the Microscale Audit of Pedestrian Streetscapes (MAPS-Global) and the Environmental Profile of a Community's Health Part 1 (EPOCH) to assess the built and food environments, respectively. Each site had one week of training and piloting in which local researchers discussed the adequacy, wording, and feasibility of each instrument. Data were collected using the REDCap mobile app. In the sampled small areas, 25% of the total street network was audited.

**Results:** For Yaoundé, MAPS-Global and EPOCH were translated for the first time into French. The instruments were successfully introduced into REDCap, but concurrent paper-based data collection was necessary. As we were using both MAPS-Global and EPOCH, we used the same routes for both, from households to local points of interest (~500m length), rather than sampling exclusively around commercial areas for EPOCH. Some redundant sections of the tools were combined to improve efficiency. Adaptations or changes were kept to a minimum, but were sometimes necessary in order to collect meaningful information. For example, local understanding of what constituted fast food differed by country, the tools did not adequately account for unpaved roads, and questions regarding cycle lanes were retained but these were not present at any site.

**Conclusions:** The four cities which have all grown rapidly in the last decade, are economical hubs and are larger cities in their country. However, there are noticeable differences between them that make collecting comparable data difficult. The instruments were validated but they required local knowledge to be applied in the African context.

# Spatial variation of environmental features relevant to physical activity and diet by area-level deprivation in four African cities

**Dr. Tiago Canelas**<sup>2</sup>, Dr. Louise Foley<sup>2</sup>, Dr. Victor Onifade<sup>3,4</sup>, Miss Damilola Odekunle<sup>3</sup>, Dr. Taibat Lawanson<sup>3,4</sup>, Dr. Feyisayo A. **S.1.06 - Measuring health-related features of the natural, built and food environments in low- and middle-income countries: a syndemic approach, UKK - K1 (+K2) (Level 3), June 15, 2023, 8:15 - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** To describe the features of the built and food environment relevant to unhealthy diets and physical inactivity at a small area level and their spatial heterogeneity by deprivation in four African cities.

**Methods:** Environmental audits conducted in small areas (approx. 4km<sup>2</sup>) were conducted during August and October 2022 in Yaoundé, Cameroon, Soweto and Cape Town, South Africa, and Lagos, Nigeria. We used the Microscale Audit of Pedestrian Streetscapes (MAPS-Global) and the Environmental Profile of a Community's Health (EPOCH) to assess the built and food environments, respectively. Each site categorised their city's small areas into different levels of deprivation and selected a few, preserving deprivation variation (higher vs lower). We sampled 25% of the street network within each small area. We created routes from households to local points of interest (~500m in length) and audited MAPS-Global and EPOCH on the same routes. Data were collected using REDCap, statistically analysed in R, and spatially analysed using QGIS. The MAPS-Global items were grouped into subscales and classified into positive and negative effects on PA. ANOVA was used to analyse the differences among small areas. Each route was assigned a score for the built and food environments and mapped.

**Results:** A total of 23 small areas, 680 routes and approximately 180000 data points were collected from the four cities. Each audit took between one and two hours depending on the accessibility of the small area, with the assessment of the grocery store taking the longest to collect. In preliminary results for MAPS-Global, the lack of parks in the small areas was noted. For example, in the ten small areas of Yaounde, only one park was recorded. Emerging findings suggest walkability features were less common in highly deprived small areas across cities. Restaurant data were collected only 50% of the time.

**Conclusions:** The data showed the spatial distribution of environmental features relevant to diet and physical activity behaviours, drawing attention to the inequalities faced by fast-growing cities. Representing large amounts of data in single maps could inform strategies of improving the environments to promote healthy diets and physical activity.

# Assessing the reliability of virtual assessment tools for measuring features of the built environment relevant to physical activity

**Dr. Motlatso Godongwana**<sup>6</sup>, Dr. Tiago Canelas<sup>2</sup>, Dr. Louise Foley<sup>2</sup>, Dr. Tolu Oni<sup>2</sup>, Dr. Victor Onifade<sup>3,4</sup>, Miss Damilola Odekunle<sup>3</sup>, Dr. Taibat Lawanson<sup>3,4</sup>, Dr. Feyisayo A. Wayas<sup>5</sup>, Dr. Estelle Victoria Lambert<sup>5</sup>, Dr. Adalberto Aparecido dos Santos Lopes<sup>7</sup>, Dr. Larissa Lima<sup>7</sup>, Dr. Waleska Teixeira Caiaffa<sup>7</sup>, Dr. Felix Assah<sup>1</sup>, Dr. Yves Wasnyo<sup>1</sup>, Dr. Lisa Micklesfield<sup>6</sup>, Muhammad Rabiul Balarabe<sup>2</sup>, Vongani Maluleke<sup>6</sup>, Khulu Gama<sup>6</sup>

**S.1.06 - Measuring health-related features of the natural, built and food environments in low- and middle-income countries: a syndemic approach, UKK - K1 (+K2) (Level 3), June 15, 2023, 8:15 - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Traditional methods of repeated field audits are resource intensive and virtual approaches are an alternative, particularly in resource-constrained settings. However, there is little evidence of the validity of virtual assessments of the built environment in LMICs, and existing studies are largely based on field audits. Valid and reliable virtual audit tools in these contexts would be a cost-efficient way to capture environmental changes.

**Methods:** Field and virtual audits were conducted in small areas of Soweto, South Africa, and Cambridge, UK. Each small area was classified as higher or lower deprivation, preserving the variation in deprivation. The first phase consisted of field auditing 25% of the street network in small areas. We created routes from households to local points of interest (~500m in length) and audited them using Microscale Audit of Pedestrian Streetscapes (MAPS-Global). For the second phase, we used aerial imagery and Google Street View imagery to virtually audit a fraction of the routes previously audited. We followed the same route as for the field audits. The intraclass correlation coefficient (ICC) statistic was used to quantify the level of consistency between the MAPS-Global scores derived from the virtual assessment and the field audit. To assess the importance of local knowledge in virtual audits, the raters that conducted the field audits will perform the virtual in the other city (Soweto - Cambridge), and the results were compared with the local rater.

**Results:** Virtual audits are currently in progress and study findings will be presented and reflected upon, with particular emphasis on the validity, according to area-level deprivation and by site.

**Conclusions:** Insights will be provided into the value of virtual audits as a cost-efficient method of understanding health related features of the built environment.

# “Take your brain for a walk”: a randomized controlled trial to evaluate the effectiveness of a cognitively enriched walking program for older adults

**Ms. Pauline Hotterbeex**<sup>1,2</sup>, Dr. Melanie Beeckman<sup>2</sup>, Prof. Greet Cardon<sup>2</sup>, Prof. sebastien Chastin<sup>2,3</sup>, Prof. Jannique Van Uffelen<sup>1</sup>

<sup>1</sup>Department of Movement Sciences, Research Group Physical Activity, Sports & Health, KU Leuven, Leuven, Belgium, <sup>2</sup>Department of Movement & Sports Sciences, Research Group Physical Activity & Health, Ghent University, Ghent, Belgium, <sup>3</sup>School of Health and Life Sciences, Glasgow Caledonian University, Glasgow, United Kingdom

**S.1.07 - Cognitively enriched physical activity interventions for healthy ageing, UKK - K3+4 (Level 3), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Given the rising prevalence of dementia, developing preventive strategies to promote healthy cognitive ageing is considered a priority. Physical activity (PA) is a modifiable risk factor for dementia and experimental studies have demonstrated its effects on cognitive function. Interestingly, recent research has suggested that cognitive activity (CA) combined with PA can have even greater effects on cognitive functioning than PA alone. Studies of combined PA and CA have, however, mostly been conducted in controlled laboratory settings. There is thus a need for real-life, community-based interventions combining PA and CA. Therefore, we developed a cognitively enriched walking program for adults (65+ years) using co-creation. In a randomized controlled trial (RCT), we investigated the effectiveness of this program to boost cognitive functioning and mental wellbeing.

**Methods:** Cognitively and physically healthy older adults were recruited in two major cities in Belgium. Cognitive functioning (CANTAB test battery and Cognitive Failures Questionnaire), physical activity (accelerometer) and psychosocial wellbeing (questionnaires for depressive symptoms, positive wellbeing, social support and loneliness) were assessed at baseline, and three months, six months and twelve months follow-ups are planned. After the baseline measurements, participants were randomly assigned to one of three intervention arms: 1) cognitively enriched walking program (PA+CA), 2) walking program (PA only) or 3) passive control group. Both walking programs consist of bi-weekly supervised group-based walking sessions, for a duration of six months. Group session duration is one to one and a half hours in which distances of three to five kilometers are covered. Each PA+CA session includes two cognitive tasks targeting different cognitive functions. Participants in both the PA only and the PA+CA groups are additionally asked to complete one individual session a week.

**Results:** At baseline, 148 participants were included. The mean age of the participants was 70.18 and 71.8% was female. Preliminary results on the effectiveness of the program for cognitive function and wellbeing will be presented.

**Conclusions:** To our knowledge, this is the first real-life community based cognitively enriched walking program developed through a co-creation process. Findings will inform future programs simultaneously focusing on PA and CA for older adults in real-life settings.

# Effects of Physical and Cognitive Training on Gait Speed and Cognition in Older Adults: A Randomized Controlled Trial

**S.1.07 - Cognitively enriched physical activity interventions for healthy ageing, UKK - K3+4 (Level 3), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Walking speed is a measure of health and functioning among older people. Physical and cognitive determinants of walking are amenable to interventions, but best practices remain still unclear. We investigated the effects of a 12-month physical and cognitive training (PTCT) intervention on walking speed, dual-task cost in walking speed, and executive functions (EFs) compared to physical training alone (PT) (ISRCTN52388040).

**Method:** Community-dwelling older adults aged 70 to 85 and who did not meet physical activity recommendations were recruited from the population register of the city of Jyväskylä (n=314). PT included supervised walking and dynamic balance (once weekly) as well as resistance and balance training (once weekly), home exercises (2-3 times weekly) and moderate aerobic activity 150 minutes/week in bouts of >10 minutes. PTCT included the PT and computer training (CT) targeting EFs 15-20 minutes, 3-4 times per week. The primary outcome was walking speed. Secondary outcomes were 6-minute walking distance, dual-task cost in walking speed, and EF (Stroop and Trail Making B-A).

**Results:** The mean age of the participants was 74.5 (SD3.8) and 60% were women. The trial was completed by 93% of the participants. Mean adherence to supervised sessions was 59-72% in PT and 62-77% in PTCT group. Home exercises and CT were performed on average 1.9 times per week. Weekly minutes spent in aerobic activities were 188 (median 169) in PT and 207 (median 180) in PTCT group. No significant interactions were observed for walking speed (PTCT-PT, 0.02; 95%CI -0.03, 0.08), walking distance (-3.8; 95%CI -16.9, 9.3) or dual-task cost (-0.22; 95%CI -1.74, 1.30). Stroop improvement was greater after PTCT than PT (-6.9; 95%CI -13.0, -0.8).

**Conclusions:** Complementing physical training with EFs training is not essential for promotion of gait speed. For executive functions, complementing physical training with targeted cognitive training provides additional benefit.

# Cognition interacts with physical fitness during aging: Evidence from COVEPIC trials investigating the effects of home-based physical exercise and cognitive training on cognitive and physical functions in older adults

**S.1.07 - Cognitively enriched physical activity interventions for healthy ageing, UKK - K3+4 (Level 3), June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** A. Ageing

**Purpose.** Confinement during the COVID-19 pandemic increased physical inactivity and a sedentary lifestyle, which are known to negatively affect physical and mental health, including cognition. Physical activity and cognitive training could help prevent these collateral impacts, especially when combined within the same intervention, due to their potential synergetic effect on brain functions. However, little is known about how the interaction of cognition and physical fitness affects functional aging. Also, the added benefits of cognitive training on physical exercise for cognitive functioning need to be further addressed.

This work aims to document 1/ whether the level of cardiorespiratory fitness moderates the age-related interdependence between functional mobility and cognition and 2/ the added benefits of a home-based intervention involving cognitive training and physical exercise on cognition compared to physical exercise alone.

**Methods.** All analyses were performed on data from COVEPIC (NCT04635462), and COVEPICARDIO (NCT04661189) registered studies. Each trial enrolled 122 older adults (>50 years old), with and without cardiac diseases, randomly assigned to take part in one of the two following arms (1:1): 1/ Combined physical and cognitive home-based training intervention or 2/ home-based physical training alone. Participants completed videoconference assessments of their cognitive and physical functioning prior to the intervention (T0), mid-intervention (T1) (3 months), post-intervention (T2) (6 months), and 6-month follow-up (T3).

**Results.** A three-way moderation analysis performed on baseline data demonstrated that cardiorespiratory fitness interacts with age to moderate the association between executive functioning and mobility. At lower levels of physical fitness (<19.16 ml/min/kg), executive functioning significantly influences the mobility of individuals more than 65 years old. Then, an ANOVA performed with follow-up data suggests that participants who completed the combined intervention showed larger improvements in dual-task performance, notably the task set cost between 0-3 months of training.

**Conclusions.** These results show that the interaction between physical fitness and cognition affects functional aging and demonstrate the complementarity of cognitive training and physical exercise intervention to improve specific aspects of cognition. Together, these observations suggest the added value of the multidomain

approach to prevent age-associated loss of autonomy and support the idea of personalizing the proposed intervention to individual needs.

# A bibliographic review of sustainability research output and research investment in physical activity and nutrition in the public health setting

Dr. Alix Hall<sup>1,2,3</sup>, Prof. Luke Wolfenden<sup>1,2,3</sup>, Mr. Adam Shoesmith<sup>1,2,3</sup>, Dr. Cassandra Lane<sup>1,2,3</sup>, Associate Professor Rachel C. Shelton<sup>4</sup>, Ms. Carly Gardner<sup>1,2</sup>, Dr. Tameka McFadyen<sup>1,2,3</sup>, Ms. Brydie McEvoy<sup>1,2</sup>, Mr. Daniel Chun Wei Lee<sup>1,2</sup>, Ms. Karly Austin<sup>1,2</sup>, **Dr. Nicole Nathan<sup>1,2,3</sup>**

<sup>1</sup>University of Newcastle, Callaghan, Australia, <sup>2</sup>Hunter New England Population Health, Wallsend, Australia,

<sup>3</sup>Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>4</sup>Columbia University, New York, USA

**S.1.08 - Supporting sustainment of nutrition and physical activity interventions in schools, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To explore the extent to which public health research, in particular studies focusing on PA and nutrition, assess sustainability and whether this has changed over time.

**Methods:** We undertook a repeat cross-sectional bibliographic review of research published within a purposive sample of leading public health journals across three time periods (2010, 2015 and 2020/2021). Studies were eligible if they were: a databased study or review article and published in one of the 10 selected journals in one of the three time periods. Each study was assessed for whether it focused on sustainability, which could include issues relating to the long-term benefits or delivery of an intervention. Type of research, study design, setting, and public health focus were extracted. Logistic regression was used to assess whether there was an association between time period and the proportion of studies that focused on sustainability.

**Results:** 10,588 databased articles were identified, of which 1.3% (n=136) focused on sustainability. The percentage of original research articles that focused on sustainability increased slightly over time: 0.3% (95% CI: 0.1%, 0.7%) in 2010, 1.4% (95% CI: 1.0%, 1.9%) in 2015 and 1.6% (95% CI: 1.3%, 1.9%) in 2020/2021, with a statistically significant association identified between time period and sustainability research (p=0.0007). PA was the most predominant public health issue addressed in the studies assessing sustainability (n=30, 22%), followed by child/youth health and wellbeing (n=28; 21%) and then nutrition (n=25; 18%). The percentage of sustainability research addressing PA and nutrition increased from the earliest time period 2010 (17% and 0%, respectively) to the most recent time periods where rates seem to stabilise (26% and 14% in 2015; and 20% and 22% in 2020/2021). No studies that focused on PA or nutrition assessed the effect of sustainability strategies.

**Conclusions:** These findings suggest only a small amount of research has been dedicated specifically to sustainability and the percentage specific to PA and nutrition interventions remains low. More public health research on the sustainability of PA and nutrition interventions, particularly on identifying strategies effective in sustaining their implementation is needed.

# Enhancing sustainability of school wellness initiatives: Lessons learned from ongoing dissemination

**Assistant Professor Gabriella M. McLoughlin**<sup>1,2</sup>, Ms. Laura Liechty<sup>3</sup>, Prof. Joey Lee<sup>4</sup>, Dr. Richard Rosenkranz<sup>5</sup>, Ms. Rachel Sweeney<sup>3</sup>, Prof. Greg Welk<sup>3</sup>

<sup>1</sup>Temple University, Philadelphia, USA, <sup>2</sup>Washington University, St. Louis, USA, <sup>3</sup>Iowa State University, Ames, USA, <sup>4</sup>University of Colorado Colorado Springs, Colorado Springs, USA, <sup>5</sup>Kansas State University, Manhattan, USA

**S.1.08 - Supporting sustainment of nutrition and physical activity interventions in schools, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To provide two examples of how sustainability is being measured and evaluated in school wellness initiatives. Policies can be an effective way to enhance sustainability, but implementation of such policies is poorly understood, specifically the degree to which implementation disparities occur, posing implications for health equity.

**Methods:** For the empirical example, a mixed methods implementation study grounded in the Consolidated Framework for Implementation Research (CFIR) was conducted to evaluate key outcomes, determinants, and nuanced relationships between these factors among schools in the 2019–2020 cycle of SWITCH. Determinants were investigated through in-depth qualitative interviews and readiness surveys with implementation leaders. Evaluation approaches followed recommended data collection and analytic methodologies of the CFIR. The second example highlights how these steps are being integrated into a measures development study that aims to combine health equity with implementation science approaches in measurement of school wellness policy.

**Results:** Distinguishing factors between experienced and inexperienced schools were Readiness for Implementation (inner setting) and Self-efficacy (characteristics of the individuals) ( $p < 0.05$ ). Strategies found to enhance sustainability of SWITCH programming were increasing student awareness/advocacy, focusing on a small number of key elements, and integrating programming into school culture.

**Conclusions:** Findings provide specific insights related to SWITCH implementation and sustainability but more generalised insights about the type of support needed to help schools implement and sustain school wellness programming. Further research is needed to operationalise sustainment and test the relative effectiveness of different strategies to enhance the sustainability of capacity-building interventions such as SWITCH. Implications and next steps for measuring sustainability will be discussed by providing an overview of the measurement tool development protocol.

# Application of a theoretical framework to design strategies supporting schools' sustainment of a physical activity program

**Dr. Nicole Nathan**<sup>1,2,3</sup>, **Mr. Adam Shoesmith**<sup>1,2,3</sup>, Prof. Luke Wolfenden<sup>1,2,3</sup>, Mr. Edward Riley-Gibson<sup>1,2,3</sup>, Dr. Cassandra Lane<sup>1,2,3</sup>, Associate Professor Rachel C. Shelton<sup>4</sup>, Dr. Rachel Sutherland<sup>1,2,3</sup>, Ms. Nicole McCarthy<sup>1,2,3</sup>, Dr. Alix Hall<sup>1,2,3</sup>

<sup>1</sup>University of Newcastle, Callaghan, Australia, <sup>2</sup>Hunter New England Population Health, Wallsend, Australia,

<sup>3</sup>Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>4</sup>Columbia University, New York, USA

**S.1.08 - Supporting sustainment of nutrition and physical activity interventions in schools, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To describe factors that influence sustainment of a school PA program and the application of the Theoretical Domains Framework and Integrated Sustainability Framework (ISF) in the development of an intervention to sustain its implementation.

**Methods:** A multi-strategy intervention was co-developed with health and education policy makers and practitioners using the following steps:

1. Identification of barriers and facilitators to sustainment via: i) systematic reviews of the school staff barriers/facilitators to sustaining PA programs; ii) quantitative surveys with 240 classroom teachers; and iii) observations and interviews with school staff.
2. Identification of potential strategies: barriers were organised according to the ISF. Potential strategies to address these barriers were identified through surveys with over 200 teachers.
3. Strategies were then reviewed by key stakeholders to ensure their feasibility and acceptability to school communities. The final strategies were described according to the sustainment-explicit Expert Recommendations for Implementing Change (ERIC) glossary.

**Results:** The systematic review and surveys identified that the primary barriers to sustainment of the PA program were lack of organisational leadership and support, organisational readiness and resources, staff turnover, perceived policy alignment and workplace socio-cultural factors. Survey and interview data found strategies most accepted by teachers were: the provision of PA equipment packs that enable class time PA (85%); the provision of an information pack to upskill new staff (78%); and creating a whole school PA plan outlining the school's steps to ensure PA policy adherence (78%). Following theoretical mapping a multi-component intervention was developed which included: (i) centralized support; (ii) reminders; (iii) principal mandates; (iv) sharing local knowledge; (v) building coalitions to share resources (vi) distributing educational materials; and (vii) involving end-users. The feasibility and acceptability of the strategies were reviewed by an advisory group which resulted in minor modifications of strategies.

**Conclusions:** This will be one of the first studies to test the effectiveness of a multi-component intervention to support the sustainment of a school PA program, creating seminal evidence for the field of sustainability science.

# Event-based ecological momentary assessment to explore the environmental and social context of physical activity in older adults: results and lessons learned

**Ms. Julie Delobelle<sup>1,2</sup>**, Dr. Sofie Compennolle<sup>1,2</sup>, Dr. Tomas Vetrovsky<sup>3</sup>, Prof. Delfien Van Dyck<sup>1</sup>

<sup>1</sup>Ghent University, Gent, Belgium, <sup>2</sup>Research Foundation Flanders, Brussels, Belgium, <sup>3</sup>Charles University, Prague, Czech Republic

**S.1.09 - The need for and feasibility of using ecological momentary assessment and just-in-time adaptive interventions in vulnerable groups, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** D. e- & mHealth

**Background:** Event-based ecological momentary assessment (EMA) is an innovative data collection method to assess experiences, emotions and contexts during or following a specific event (e.g., short bout of PA). The purpose of this study was to explore associations between individual factors and the environmental and social contexts of PA, using event-based EMA. Since this data collection method is novel within this research domain, the most important learned lessons to conduct event-based EMA studies will be provided.

**Methods:** An observational event-based EMA study was conducted, using a convenience sample of 75 healthy older adults (65+). Each participant completed a questionnaire to assess socio-demographic variables. Participants were monitored using a Fitbit (i.e., Inspire 2 or Ionic), triggering a questionnaire on a smartphone application (i.e., Health React) after a short bout (5 consecutive minutes) of sustained walking ( $\geq 60$  steps/minute). During seven consecutive days, participants answered smartphone-based questions regarding the environmental and social context, emotions and physical complaints they experienced during/immediately after PA. A maximum of 6 prompts per day was set, with minimum 60 minutes between two prompts. Afterwards, a semi-structured interview was conducted to assess how the participants experienced the study, which will be analyzed using a deductive approach in NVivo. Moreover, descriptive and regression analyses will be conducted to explore associations between individual factors (e.g., age, sex, loneliness, social support, physical complaints) and the contexts of PA.

**Results:** Preliminary analyses (N=35) showed that 79.5% of the prompts were triggered outdoors (36.42% in a public green environment) and when being alone (60.3%). In addition, older adults who felt lonely performed more PA alone ( $p < 0.001$ ). Importantly, 20% of the participants were never prompted during the entire study (due to physical inactivity, Fitbit synchronization delays or noncompliance with the prompting rules). Further quantitative and qualitative analyses will be conducted and results will be presented at the conference.

**Conclusion:** This study provides practical considerations for future event-based EMA studies. In addition, gaining insight in the association between individual factors and contexts of PA will have important implications for just-in-time adaptive interventions to increase PA by initializing real-time supportive messages adapted to an individual's state.

# Predictive within-day associations of emotions, physical complaints, intention and self-efficacy with subsequent accelerometer-assessed physical activity in older adults: a time-based EMA study

**Miss Iris Maes**<sup>1</sup>, Dr. Lieze Mertens<sup>1</sup>, Dr. Louise Poppe<sup>1,2</sup>, Dr. Tomas Vetrovsky<sup>3</sup>, Prof. Geert Crombez<sup>1</sup>, Dr. Femke De Backere<sup>1</sup>, Prof. Delfien Van Dyck<sup>1</sup>

<sup>1</sup>Ghent University, Gent, Belgium, <sup>2</sup>Research Foundation Flanders, Brussels, Belgium, <sup>3</sup>Charles University, Prague, Czech Republic

**S.1.09 - The need for and feasibility of using ecological momentary assessment and just-in-time adaptive interventions in vulnerable groups, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose.** Health behavior change interventions often do not focus on contextual and time-varying determinants, which might limit their effectiveness. However, before dynamic tailoring of interventions can be developed, one should know which time-dependent determinants are associated with physical activity (PA) and how strong these associations are. In the research field of PA some research has been done to examine these associations, but research in older adults is limited. Therefore, the aim of the current study was to examine predictive within-day associations between multiple determinants of the COM-B framework assessed using ecological momentary assessment (EMA), and accelerometer assessed light physical activity (LPA), moderate-to-vigorous physical activity (MVPA), and total physical activity performed in the 15, 30, 60 and 120 minutes after the EMA trigger.

**Methods.** Observational data were collected in 64 older adults (56.3% men; mean age  $72.1 \pm 5.6$  years). Participants were asked to answer a time-based EMA questionnaire 6 times per day which assessed emotions (i.e., relaxation, satisfaction, irritation, feeling down), the physical complaint fatigue, intention, and self-efficacy. An Axivity AX3 was worn to objectively capture participants' PA. Multilevel regressions analyses in R were performed to examine these within-day associations.

**Results.** Satisfaction, irritation, feeling down, intention and self-efficacy were positively associated with subsequent LPA and/or MVPA in the 15, 30 and 60 minutes after the trigger, while relaxation and fatigue were negatively associated.

**Conclusions.** Multiple associations were found in the current study. This knowledge in combination with the time-dependency of the determinants is valuable information for future interventions, so that suggestions to be active can be provided when the older adult is most receptive.

# Implementation of a just-in-time adaptive intervention (JITAI) in patients with type 2 diabetes and prediabetes recruited in primary care: a process evaluation

**Mr. Jan Novak<sup>1</sup>**, Dr. Jitka Kuhnova<sup>2</sup>, Ms. Andrea Jaklova<sup>1</sup>, Dr. Marketa Pfeiferova<sup>1</sup>, Dr. Norbert Kral<sup>1</sup>, Dr. Richard Cimrner<sup>2</sup>, Prof. Tom Yates<sup>3,4</sup>, Ms. Charlotte Wahlich<sup>5</sup>, Prof. Tess Harris<sup>5</sup>, Prof. Bohumil Seifert<sup>1</sup>, Dr. Tomas Vetrovsky<sup>1</sup>

<sup>1</sup>Charles University, Prague, Czech Republic, <sup>2</sup>University of Hradec Kralove, Hradec Kralove, Czech Republic, <sup>3</sup>University of Leicester, Leicester, United Kingdom, <sup>4</sup>University Hospitals of Leicester NHS Trust and the University of Leicester, Leicester, United Kingdom, <sup>5</sup>St George's University of London, London, United Kingdom

**S.1.09 - The need for and feasibility of using ecological momentary assessment and just-in-time adaptive interventions in vulnerable groups, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Just-in-time adaptive interventions (JITAI) can potentially improve sedentary adults' physical activity levels. Whether JITAI can be successfully applied to patients with chronic conditions in healthcare settings is unknown. This study aimed to develop and evaluate the implementation of a JITAI to increase physical activity and reduce prolonged sitting in type 2 diabetes and prediabetes patients recruited in primary care.

**Methods:** The JITAI was developed with the involvement of pre/diabetes patients according to the mHealth development and evaluation framework. The resulting JITAI consisted of prompts to interrupt sitting after 30 mins of zero steps (sedentary prompts) and to increase walking pace after 5 mins of 60–100 steps (walking prompts). The prompts were triggered by the HealthReact system contingent on step count detected by the Fitbit tracker and delivered as text messages. The evaluation of the JITAI's implementation was informed by the Medical Research Council guidance for process evaluation of complex interventions and included the intervention's reach, fidelity, and dose.

**Results:** *Reach:* Of 335 patients randomly selected from among 18 general practices, 59 (18%) were ineligible due to not being mobile phone users, and 25 (7%) declined to wear the Fitbit tracker. *Fidelity:* In the reference 7-day period, of 52 patients assigned to the JITAI, 16 (31%) did not sync their Fitbit data, mainly due to internet access difficulties and technical issues. Of the remaining 36 patients, 29 (81%) triggered at least one sedentary prompt, and 16 (44%) triggered at least one walking prompt. Irregular sync due to a lack of a mobile data plan was the principal reason for not triggering any prompt. *Dose:* Among those who received at least one prompt, the median was 4 (IQR 1–4) sedentary and 2 (IQR 1–3) walking prompts per week.

**Conclusions:** In pre/diabetes patients recruited in primary care, the JITAI had reasonable reach, with only 1 in 4 patients unable or unwilling to participate. Lack of internet access and technical issues remained the main obstacles to desired intervention fidelity in this population. Further analyses will explore the proximal effect of the JITAI's prompts and patients' views of the intervention.

# Development of a healthcare provider screening tool to make patient-tailored referrals for exercise in cancer care, both during and after treatment

**Mrs. Renée Bultijnck**<sup>1,2</sup>, Mrs. Noëmi Borrey<sup>3</sup>, Mr. Johan De Munter<sup>4</sup>, Mrs. Marijke Quaghebeur<sup>4</sup>, Dr. Inge Bru<sup>3</sup>, Dr. Michael Saerens<sup>5</sup>, Prof. Karen Geboes<sup>4,5</sup>, Dr. Celine Jacobs<sup>5</sup>

<sup>1</sup>Ghent University, Faculty of Medicine and Health Science, Department of Human Structure and Repair, Ghent, Belgium, <sup>2</sup>Ghent University Hospital, Department of Radiation Oncology, Ghent, Belgium, <sup>3</sup> Ghent University Hospital; Department of Physical and Rehabilitation Medicine, Ghent, Belgium, <sup>4</sup>Ghent University Hospital, Cancer Center, Ghent, Belgium, <sup>5</sup>Ghent University Hospital, Department of Gastroenterology, Ghent, Belgium

**S.1.10 - Implementing exercise and lifestyle support in individuals living with and beyond cancer: a patient-centred approach, Clarion Hotel Gillet - Room Swedenborg, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose** To develop a screening tool for healthcare providers (HCP) enabling them to refer patients during and after cancer treatment to the most appropriate exercise setting with patient tailored supervision.

**Methods** A step-wise approach with a two round Delphi method was employed for development of this tool. Twenty experts were recruited via our TACTIC (Tailored Activity during and after Treatment In Cancer patients) project consortium and research network. REDCap, a web application for managing surveys and databases was used for our Delphi surveys. First, a provisional list of screening items was constructed based on literature review and expert opinion of our research team. This list was used during the first round and items were scored based on their relevance. The second round captured the items to score measures and corresponding actions to take. Consensus about final scoring items and actions was reached during a last expert meeting. Finally, a pilot test was conducted. Eleven HCP used the tool and based on their feedback the tool was further adjusted and optimised.

**Results** Twenty experts participated in our Delphi survey: seven physical therapists, one psychologist, three specialist cancer nurses and nine physicians from different specialties. The final tool consists of nine items that HCP should score: patient performance status, tumour location and stability, lymphoedema, cardiovascular and respiratory morbidity, diabetes, weight, fall risk and osteoporosis, feelings of anxiety and depression. Patients are scored to one of three categories, according to a traffic light system: green, meaning exercise can safely be performed in a primary care setting, without specialized physiotherapist; orange, exercise is preferably started with guidance of a specialized physiotherapist (either in hospital or community setting) and can be done without supervision after a positive evaluation, or red, meaning a medical screening is recommended on one or more items (comorbidities) before start of an exercise program under supervision.

**Conclusion** We developed a nine-item screening tool for HCP to refer patients during and after cancer treatment to physical rehabilitation. It is a dynamic traffic light system to support HCP in patient suitability for exercise. After evaluation patients can shift towards another category.

# STart Exercising, keeP exercisiNg (STEP-IN): A toolkit for physiotherapists to support exercise maintenance among cancer survivors after supervised exercise interventions.

**Dr. Carla Agasi-Idenburg**<sup>1,2</sup>, Dr. Caroline Kampshoff<sup>3</sup>, Dr. Meeke Hoedjes<sup>4</sup>, Dr. Laurien Buffart<sup>5,6</sup>, Dr. Martijn Stuiver<sup>2,7</sup>

<sup>1</sup>Instituut voor Bewegingsstudies, Hogeschool Utrecht, Utrecht, Netherlands, <sup>2</sup>Center for Quality of Life and Division of Psychosocial Research and Epidemiology, Netherlands Cancer Institute, Amsterdam, Netherlands, <sup>3</sup>Nivel, Netherlands Institute for Health Services Research, Utrecht, Netherlands, <sup>4</sup>Center of Research on Psychological and Somatic disorders, Department of Medical and Clinical Psychology, Tilburg University, Tilburg, Netherlands, <sup>5</sup>Department of Physiology, Radboud Institute of Health Sciences, Radboud University Medical Center, Nijmegen, Netherlands, <sup>6</sup>Exercise Medicine Research Institute, Edith Cowan University, Perth, Australia, <sup>7</sup>Faculty of Health, Center of Expertise Urban Vitality, Amsterdam University of Applied Sciences, Amsterdam, Netherlands

**S.1.10 - Implementing exercise and lifestyle support in individuals living with and beyond cancer: a patient-centred approach, Clarion Hotel Gillet - Room Swedenborg, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Exercise has important health benefits for people living with or beyond cancer. Supervised exercise interventions are generally effective on short term outcomes. To maintain and further improve health benefits, physical activity behavior should be continued after the supervised program. Yet, cancer survivors experience difficulties to keep exercising after finishing supervised interventions. While current standards and professional guidelines for physiotherapists emphasize 'exercise maintenance' as a treatment goal, physiotherapists lack practical tools to guide patients in achieving this. Consequently, support of exercise maintenance is insufficient. STEP-IN aims to develop a toolkit for physical therapists, to support exercise maintenance of cancer survivors.

**Methods:** The STEP-IN project has a mixed-method design and is guided by intervention mapping methodology and the double diamond design process. STEP-IN started with a needs assessment, followed by a systematic review of the literature to identify targets for action and determinants of change, and selection of strategies to support exercise maintenance. Toolkit materials were then developed by the co-creation team. A key element is the active engagement of cancer survivors and physiotherapists as a 'co-creation team'. Furthermore, each development phase is supported by an expert advisory board.

**Results:** The main findings of the needs assessment indicated that physiotherapist typically lacked a strong theoretical basis related to behavior change techniques, and required practical support for integrating such techniques into their treatment. Also, physiotherapists valued easily accessible, reliable resources supporting behavioral change, for themselves and for their patients. The STEP-IN project has resulted in a ready-for-practice toolkit for physiotherapists to meet those needs. The cornerstone of this toolbox is a decision tool that aims to improve patient- therapist interaction for selecting (cognitive and/or behavioral) targets for treatment, which can be revisited and evaluated periodically.

**Conclusions:** The STEP-IN toolkit provides practical instruments and resources for physiotherapists to help them support exercise maintenance among cancer survivors, which is essential for high quality care. The toolkit will be made available in print and electronic form, and courses will be organized to train physiotherapists in its use.

# Co-designed weight management intervention for women recovering from primary breast cancer treatment

**Prof. John Saxton**<sup>1</sup>, Dr. Katie Pickering<sup>2</sup>, Dr. Sarah Wane<sup>3</sup>, Ms. Helen Humphreys<sup>4</sup>, Dr. Helen Crank<sup>4</sup>, Prof. Annie Anderson<sup>5</sup>, Mr. Henry Cain<sup>6</sup>, Dr. Judith Cohen<sup>7</sup>, Prof. Robert Copeland<sup>2</sup>, Prof. Joanne Gray<sup>8</sup>, Dr. Jackie Hargreaves<sup>9</sup>, Dr. Richard McNally<sup>10</sup>, Dr. Caroline Wilson<sup>11</sup>

<sup>1</sup>School of Sport, Exercise & Rehabilitation Sciences, University of Hull, Hull, United Kingdom, <sup>2</sup>Advanced Wellbeing Research Centre, Sheffield Hallam University, Sheffield, United Kingdom, <sup>3</sup>Department of Sport, Exercise & Rehabilitation, Northumbria University, Newcastle upon Tyne, United Kingdom, <sup>4</sup>Academy of Sport and Physical Activity, Sheffield Hallam University, Sheffield, United Kingdom, <sup>5</sup>Division of Population Health & Genomics, Ninewells Hospital and Medical School, University of Dundee, Dundee, United Kingdom, <sup>6</sup>Newcastle upon Tyne Hospitals NHS Foundation Trust, Newcastle upon Tyne, United Kingdom, <sup>7</sup>Hull Heath Trials Unit, Hull York Medical School, University of Hull, Hull, United Kingdom, <sup>8</sup>Department of Nursing, Midwifery & Health, Northumbria University, Newcastle upon Tyne, United Kingdom, <sup>9</sup>Carnegie School of Sport, Leeds Beckett University, Leeds, United Kingdom, <sup>10</sup>Population Health Sciences Institute, Newcastle University, Newcastle upon Tyne, United Kingdom, <sup>11</sup>Department of Oncology and Metabolism, The Medical School, University of Sheffield, Sheffield, United Kingdom

**S.1.10 - Implementing exercise and lifestyle support in individuals living with and beyond cancer: a patient-centred approach, Clarion Hotel Gillet - Room Swedenborg, June 15, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Background:** Weight gain is commonly observed during and after breast cancer treatment and is associated with poorer survival outcomes, particularly in women with oestrogen receptor-positive disease. The aim of this study was to co-design (with patients) a programme of tailored, personalized physical activity and dietary support to help female breast cancer patients (BCPs) develop the skills and confidence for sustainable weight loss.

## **Methods:**

Guided by the Behaviour Change Wheel, a theoretically-informed weight management intervention was developed on the basis of co-designed strategies to overcome physical and emotional barriers to physical activity and dietary behaviour change. A linked focus group study with BCPs (N=16) and healthcare professionals (HCPs; N=21) first explored the challenges of dietary and physical activity behaviour change during and beyond the breast cancer care pathway. Two groups of BCPs (N=4 and N=5) from different regions of the UK then participated in a two-stage co-design process. The stage 1 and stage 2 co-design workshops were held two weeks apart and were approximately 2 h in duration.

## **Results:**

Four overarching themes were identified from the focus group study: Treatment; Support for lifestyle behaviour change; Information availability for BCPs; Knowledge of current evidence amongst HCPs. Building onto these themes through the co-design process, BCPs were instrumental in developing all key features of the intervention, in terms of *Capability* (e.g., evidence-based information, peer-support and shared experiences), *Opportunity* (e.g., flexible approach to weight management based on core principles) and *Motivation* (e.g., appropriate use of goal-setting and high-quality resources, including motivational factsheets) for behaviour change.

**Conclusion:** This co-design approach enabled the development of a theoretically-informed intervention with a content, structure and delivery model that has the potential to address the weight management challenges faced by BCPs. Future research is required to evaluate the effectiveness of the intervention for eliciting clinically-important and sustainable weight loss in this population.

# Lessons learned to recruit Hispanic fathers for Papas Saludables, Niños Saludables Efficacy Trial

**Associate Professor Teresia M. O'Connor<sup>1</sup>**, Miss Alicia Beltran<sup>1</sup>, Miss Tatyana Garza<sup>1</sup>, Miss Oriana Perez<sup>1</sup>, Assistant Professor Erica G Soltero<sup>1</sup>, Prof. Elva M Arredondo<sup>2</sup>, Associate Professor Justin Zachariah<sup>3</sup>, Assistant Professor Jaime Rueda<sup>4</sup>, Associate Professor Salma M Musaad<sup>1</sup>, Prof. Tom Baranowski<sup>1</sup>, Dr. Anna Rayward<sup>5,6</sup>, Prof. Philip Morgan<sup>5,6</sup>

<sup>1</sup>USDA/ARS Children's Nutrition Research Center, Baylor College of Medicine Houston, Texas, USA, <sup>2</sup>Institute for Behavioral and Community Health, San Diego State University San Diego, California, USA, <sup>3</sup>Pediatrics – Cardiology, Baylor College of Medicine Houston., Texas, USA, <sup>4</sup>General Medicine, Baylor College of Medicine, Houston, Texas, USA, <sup>5</sup>University of Newcastle, Centre for Active Living and Learning, School of Education, College of Human and Social Futures, Callaghan, Australia, <sup>6</sup>Active Living Research Program, Hunter Medical Research Institute, New Lambton Heights, Australia

**S.1.11 - Adaptation of a healthy lifestyle program for fathers and their children (Healthy Dads Healthy Kids) across different countries, settings and cultures., UKK - Main Hall, June 15, 2023, 4:15 - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** A culturally adapted version of Healthy Dads Healthy Kids for Hispanic fathers and children, Papas Saludables, Niños Saludables (PSNS), was found feasible among Hispanic families in Houston, Texas. Here we describe lessons learned on recruiting Hispanic fathers from the feasibility study and an ongoing efficacy trial.

**Methods:** The efficacy trial of PSNS plans to enroll 332 Hispanic father-figures and their children (5-11 years old) in eight waves across 3.5 years. The feasibility study and initial protocol for the efficacy trial included a partnership with Texas Children's Health Plan, a Medicaid and CHIP provider as the recruitment sample and potential site for future program delivery. At least one of the children from each family had to be a TCHP member. Process evaluations of the feasibility trial and the on-going efficacy trial tracked recruitment strategies to identify barriers and facilitators for recruiting Hispanic men and their children.

**Results:** As previously reported, the feasibility study enrolled 36 Hispanic fathers and children within a four-month period, 90% of target recruitment. In-person recruitment at a TCHP clinic and their health-fairs proved most successful. Hispanic men were typically recruited through the mothers who brought information about the study to the father. In the efficacy trial, TCHP deemed the research team functioned as "agents" of TCHP, and meant research staff had to follow Texas laws governing contacting TCHP members about TCHP sponsored programs. This prevented in-person recruitment at any of the pediatric clinics. These barriers resulted in only 10 Hispanic fathers and their children enrolling during wave 1 over five months, 24% of the planned enrollment for that wave. TCHP membership inclusion criteria was lifted for wave 2, allowing in-person recruitment at clinics and presence at community events to recruit any qualifying Hispanic father and their children. On-going process evaluation will continue to track recruitment in the efficacy trial.

**Conclusions:** Recruitment of Hispanic men to studies is challenging. Partnership with community entities, such as a Medicaid Health Plan, may provide opportunities for sustaining and disseminating interventions, but add unique barriers for recruitment based on state laws intended to protect families.

# Insights and preliminary pilot findings for adapting HDHK for fathers and children in the multicultural city of Bremen, Germany

Dr. Dorothea M I Schönbach<sup>1</sup>, **Dr. Heide Busse<sup>1</sup>**, Dr. Mirko Brandes<sup>1</sup>, Prof. Philip Morgan<sup>2,3</sup>, Dr. Tilman Brand<sup>1</sup>  
<sup>1</sup>Department of Prevention and Evaluation, Leibniz Institute for Prevention Research and Epidemiology – BIPS., Bremen, Germany, <sup>2</sup>University of Newcastle, Centre for Active Living and Learning, School of Education, College of Human and Social Futures, Callaghan, Australia, <sup>3</sup>Active Living Research Program, Hunter Medical Research Institute, New Lambton Heights, Australia

**S.1.11 - Adaptation of a healthy lifestyle program for fathers and their children (Healthy Dads Healthy Kids) across different countries, settings and cultures., UKK - Main Hall June 15, 2023, 4:15 - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** In Germany, men and women are equally affected by adiposity but more men than women are overweight. Despite this gender difference, there are just a few programs targeting overweight men in particular and their participation in such programs is rather low. Besides, children are at high risk of becoming physically inactive and overweight when entering primary school. Therefore, the promising healthy lifestyle program Healthy Dads, Healthy Kids developed in Australia will be adapted, implemented and evaluated among a multicultural population in Northern Germany.

**Methods:** The adaptation process followed the ADAPT guidance (v1.0), which included the following components: (a) identification of the problem, (b) finding an appropriate intervention, (c) building a team of the target group and different stakeholders for adaptations (including focus groups), (d) adaptations of material, (e) recruitment, training, and support of implementers, and (f) conducting a nine-week pilot trial with ten families (including an effect and process evaluation).

**Results:** Focus groups will start end of 2022, followed by adaptations, and a pilot trial will be conducted early 2023. Preliminary results from this adaptation process will be presented at the conference.

**Conclusions:** This study provides insights into the comprehensive adaptation process of the Australian Healthy Dads, Healthy Kids intervention for fathers and primary school children in a multicultural city located in Northern Germany. The adaptation process is necessary for identifying needs of families in the German context, ensuring feasibility of the adapted intervention, and obtaining first indications on the intervention's effectiveness in order to conduct a main trial mid of 2023 and, in case of proven effectiveness, ensure sustainability.

# The cultural adaptation of Healthy Dads Healthy Kids (HDHK) for Aboriginal fathers and their children living on Darkinjung Country, Australia.

**Mr. Jake MacDonald**<sup>1</sup>, Associate Professor Kathleen Butler<sup>2</sup>, Dr. Myles Young<sup>3,4,5</sup>, Mr. Nathan Towney<sup>1</sup>, Dr. Lee Ashton<sup>4,5</sup>, Miss Briana Barclay<sup>4,5</sup>, Prof. Philip Morgan<sup>4,5</sup>

<sup>1</sup>University of Newcastle, Office of Indigenous Strategy and Leadership, The Chancellery, Callaghan, Australia,

<sup>2</sup>University of Newcastle, Wollotuka Institute, Indigenous Education and Research, Birabahn building,

Callaghan, Australia, <sup>3</sup>University of Newcastle School of Psychological Sciences College of Engineering,

Science and Environment, Callaghan, Australia, <sup>4</sup>University of Newcastle, Centre for Active Living and

Learning, School of Education, College of Human and Social Futures, Callaghan, Australia, <sup>5</sup>Active Living Research Program, Hunter Medical Research Institute, New Lambton Heights, Australia

**S.1.11 - Adaptation of a healthy lifestyle program for fathers and their children (Healthy Dads Healthy Kids) across different countries, settings and cultures., UKK - Main Hall June 15, 2023, 4:15 - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Colonisation has devalued the unique critical role that Aboriginal fathers play in child-rearing. There is also a significant gap in published research on culturally appropriate parenting interventions for Aboriginal fathers, which is indicative of the limited support available. To address this, this paper will describe the cultural adaptation process of Healthy Dads Healthy Kids (HDHK) for Aboriginal fathers and their children living on Darkinjung Country, Australia.

**Methods:** To ensure the adapted HDHK program meets the needs of participants, we are completing an extensive cultural adaptation process. This includes the establishment of the following two panels who will provide feedback on the program, informed by their expertise, community relationships and lived experience: i) *Expert Panel* (University and community representatives), and ii) *Community panel* (Yerin Aboriginal Medical Services Men's Group). By consulting with the community panel in a series of yarning circles, we will ensure that Aboriginal fathers can define their own objectives and indicators of success for the program. The expert panel will guide the adaptation process ensuring that the tailored HDHK program is culturally appropriate ahead of a feasibility trial to be conducted in 2023.

**Results:** The expert and community panels are able to influence the content, design, location, and methodologies of the culturally tailored HDHK program. It is considered that empowering the local Aboriginal community to influence the design of the HDHK intervention will contribute to program success. This presentation will present preliminary findings from the yarning circles to be conducted in early 2023.

**Conclusions:** There is a need to consult with Aboriginal fathers to design a culturally tailored intervention that meets the needs of Aboriginal fathers and their children. Findings from this presentation will highlight the considerations and processes to work effectively with Aboriginal fathers on Darkinjung Country, Australia. Preliminary insights and themes arising from yarning sessions will be shared, such findings are intended to inform culturally appropriate ways to research with Aboriginal fathers and their children in the family-based lifestyle intervention field.

# The CO-CREATE Project: Co-creating policies and research with young people

**Prof. Knut Inge Klepp**<sup>1</sup>, Other The CO-CREATE Consortium

<sup>1</sup>Division of Mental and Physical Health, Norwegian Institute of Public Health, Oslo, Norway, <sup>2</sup>The CO-CREATE Project, Oslo, Norway

**S.1.12 - Experiences of policy and research co-creation with young people: Learnings from the COCREATE Project, UKK - Level 6 Foyer, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Youth involvement in the design or implementation of policies is an emerging area of research, with increasing practical implications across public health and wider policy areas. This presentation will draw on the experiences of the CO-CREATE study which, through the lens of obesity prevention, aims to advance the investigation of systems-based research that incorporates youth involvement.

**Methods:** The CO-CREATE study adopted a multi-faceted approach and range of methods, including monitoring and benchmarking of relevant policies; systematic literature reviews; epidemiological surveillance; linking observed overweight and obesity trends to observed policy landscapes; group model building to identify the views of adolescents on interrelated drivers of overweight and obesity; alliance-building with adolescents; dialogue with stakeholders; system dynamics modelling to explore the potential impact of co-created policy options; and the application of diverse communication approaches.

**Results:** The presentation will reflect on the outcomes of the study to date, including the tools that have been developed for facilitating policy ideas and investigation of prevention strategies with young people. This includes policy databases, system maps of drivers of overweight and obesity, protocols for organising youth alliances, intergenerational policy dialogue tool, and system dynamic models exploring the impact of co-created policy ideas.

**Conclusions:** These outcomes are seen as critical in building a pan-European infrastructure for designing and evaluating policies, and to provide youth with the opportunity to make their voices heard when policy measures are being debated and decided upon. While much of the work has focused on obesity prevention, nutrition and physical activity, there is scope to apply learnings to other areas of public health.

This submission is made on behalf of the CO-CREATE consortium.

# Policy co-creation with youth through a novel dialogue tool

**Ms. Claire Bouillon**<sup>1,2</sup>, Ms. Samantha Nesrellah<sup>1,2</sup>, Other The CO-CREATE Consortium<sup>2</sup>

<sup>1</sup>EAT, Oslo, Norway, <sup>2</sup>The CO-CREATE Project, Oslo, Norway

**S.1.12 - Experiences of policy and research co-creation with young people: Learnings from the COCREATE Project, UKK - Level 6 Foyer, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** The CO-CREATE project aims to educate and empower youth to develop policies that promote healthy food and physical activity environments for young people across Europe. Facilitating meaningful dialogue between young people and relevant stakeholders, particularly decision makers, in order to discuss and refine policy ideas is a key component of this.

**Methods:** As part of the CO-CREATE project, an interactive 'Dialogue Forum Tool' was developed to facilitate dialogue between stakeholders and youth, particularly decision makers. The Dialogue Forum Tool design has a particular focus on promoting leadership and ensuring equal representation for young people and is available in both a digital and physical format, ensuring engagement is widespread and cost-efficient. From June 2020 to March 2022, 20 Dialogue Forums were hosted with participants from over 55 countries. In addition to five regional/international Dialogues Forums, the CO-CREATE countries (the Netherlands, Norway, Poland, Portugal, the United Kingdom) held local level and/or national level Dialogue Forums.

**Results** The process of implementing and evaluating 20 Dialogue Forums has provided unique insight into best practices for establishing multi-actor Dialogues, for engaging youth in policy dialogue and for intergenerational, action-oriented discussion. From this, eight recommendations to ensure meaningful engagement is achieved during the planning, execution and follow-up phases of a Dialogue have been devised. These recommendations can be used by anyone looking to hold a Dialogue Forum, but are particularly relevant for youth looking to engage decisionmakers and conversely, decisionmakers looking to meaningfully engage youth.

**Conclusions:** The Dialogue Forum Tool, and accompanying recommendations, provide a mechanism by which to facilitate meaningful engagement with young people. While the Tool was originally developed in the context of youth engagement in obesity prevention policies, it can be applied to a wide range of contexts and can serve a wide range of functions for ensuring meaningful engagement of different actors.

# Associations between social media, adolescent mental health and diet: a systematic review

Ms. Laurence Blanchard<sup>1</sup>, **Ms. Kaitlin Conway-Moore<sup>1</sup>**, Mrs. Anaely Aguiar Rodriguez<sup>3</sup>, Furkan Onal<sup>3</sup>, Prof. Harry Rutter<sup>2</sup>, Dr. Arnfinn Helleve<sup>4</sup>, Emmanuel Nwosu<sup>5</sup>, Jane Falconer<sup>1</sup>, Dr. Natalie Savona<sup>1</sup>, Prof. Emma Boyland<sup>6</sup>, Prof. Cecile Knai<sup>1</sup>

<sup>1</sup>Faculty of Public Health Policy, London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>2</sup>Department of Social & Policy Sciences, University of Bath, Bath, United Kingdom, <sup>3</sup>System Dynamics Group, University of Bergen, Bergen, Norway, <sup>4</sup>Division for Mental and Physical Health, Norwegian Institute of Public Health, Oslo, Norway, <sup>5</sup>Department of Human Biology, University of Cape Town, Cape Town, South Africa, <sup>6</sup>Department of Psychology, University of Liverpool, Liverpool, United Kingdom

**S.1.12 - Experiences of policy and research co-creation with young people: Learnings from the COCREATE Project, UKK - Level 6 Foyer, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose** Social media use is integral to many adolescents' lives. While it can bring new opportunities for information sharing and interpersonal connection, it can also have detrimental effects on physical and mental health. We previously conducted a qualitative systems mapping exercise with 16-18-year-olds in six countries. Mental health was identified as a risk factor for adolescent obesity, acting as a mediator between social media (including social media influencers) and both dietary intake and physical activity. In the present study, we further interrogate the relationship between social media, mental health and dietary outcomes in adolescents.

**Methods** We conducted a systematic review examining associations between social media use, adolescent mental health (including body image, self-esteem, stress, interpersonal relationships/loneliness, anxiety, and depressive symptoms) and dietary outcomes. Eleven databases were searched for quantitative studies published between 2019 and 2023. Risk of bias was appraised using ROBINS-E. Data was narratively synthesised by type of outcome, PROGRESS-Plus health equity characteristics, and related to social media influencers.

**Results/findings** Twenty-one studies were included, representing 12 countries and sample sizes ranging from 62 to 244,250 participants. Most studies assessed body image (n=11) and disordered eating symptoms (n=13). Overall, there is evidence supporting the presence of a significant association between social media use and body image, depressive symptoms, and disordered eating in general, as well as anxiety, compulsive overeating, and weight loss/control behaviours, though with a higher risk of bias. Five studies suggested that body image, self-esteem, or anxiety act as moderators between social media use and dietary outcomes. Sex and/or gender was the only equity characteristic assessed (n=8), with mixed evidence. Only one study examined the role of influencers, reporting an association between influencers and both social appearance anxiety and social media addiction in adolescents.

**Conclusion** As social media platforms and marketing become increasingly sophisticated, policy interventions addressing the impact of social media on adolescent mental health and diet—and body image and disordered eating in particular—are needed. Further research on causal pathways, the role of influencers, equity impacts, and the best tools for measuring key outcomes are also needed.

# Longitudinal associations between movement behaviours and development among infants using compositional data analyses

**Prof. Valerie Carson**<sup>1</sup>, Dr. Zhiguang Zhang<sup>1</sup>, Miss Madison Predy<sup>1</sup>, Dr. Lesley Pritchard<sup>1</sup>, Dr. Kylie Hesketh<sup>2</sup>  
<sup>1</sup>University of Alberta, Edmonton, Canada, <sup>2</sup>Deakin University, Geelong, Australia

**S.1.13 - The latest insights in measurement and analysis of 24-hour movement behaviors in the early years – definitions, measurement tools and analysis, UKK - Hall B, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** To use compositional data analyses to examine the combined and relative longitudinal associations of sleep time, restrained time, back time, and tummy time with development in a sample of infants.

**Methods:** Participants were a subsample of 94 parent-infant dyads from the Early Movers project in Edmonton, Canada. At 2, 4, and 6 months of age, parents completed a 3-day time-use diary. Time spent in four mutually exclusive movement behaviours were calculated representing sleep (i.e., sleep time), sedentary behaviour (i.e., restrained time, back time), and physical activity (i.e., tummy time). Communication, fine motor, gross motor, personal-social, problem solving, and total development were measured at 2, 4, and 6 months of age with the Ages and Stages Questionnaire (ASQ-3). Gross motor development was also measured by a physiotherapist using the Alberta Infant Motor Scale (AIMS) at 6 months. Parents reported the dates six major gross motor milestones (i.e., independent sitting, crawling, assisted standing, assisted walking, independent standing, independent walking) were acquired in the first 18 months of life according to World Health Organization criteria. The ages of milestone achievements were calculated.

**Results:** Approximately half of infants were female (56%) and approximately one third were identified as a race/ethnicity other than Caucasian. Additionally, 30% of parents had an education below a Bachelor's degree and 20% of parents were born outside of Canada. Compositional descriptive statistics will be calculated. Average minutes per day spent in each movement behaviour will be calculated through a series of steps that recognize the four included movement behaviours do not make up the full 24-hour period (i.e., 1440 minutes). Compositional linear mixed models will be created for each developmental outcome that includes movement behaviour variables that have undergone an isometric log-ratio transformation.

**Conclusions:** Most movement behaviour research has been: cross-sectional, focused on isolated movement behaviours, and in age groups that are typically independently mobile. Movement behaviours in the first 6 months of life are unique to other age groups and compositional data analysis is a novel method to understand the longitudinal associations with development that take into account the co-dependent nature of these behaviours.

# Physical activity in early childhood, a terminology consensus project

**Dr. Sanne Veldman<sup>1</sup>**, Dr. Jessica Gubbels<sup>2</sup>, Dr. Lyndel Hewitt<sup>3</sup>, Dr. Valerie Carson<sup>4</sup>, Dr. Zhiguang Zhang<sup>5</sup>

<sup>1</sup>Mulier Institute, Department of Public and Occupational Health, Amsterdam Public Health Research Institute, Amsterdam, Netherlands, <sup>2</sup>Maastricht University, NUTRIM School of Nutrition and Translational Research in Metabolism, department of Health Promotion, Maastricht, Netherlands, <sup>3</sup>Illawarra Shoalhaven Local Health District, Wollongong Hospital, Wollongong, Australia, <sup>4</sup>Faculty of Kinesiology, Sport, and Recreation at the University of Alberta, Edmonton, Canada, <sup>5</sup>Faculty of Education, Beijing Normal University, Beijing, China

**S.1.13 - The latest insights in measurement and analysis of 24-hour movement behaviors in the early years – definitions, measurement tools and analysis, UKK - Hall B, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Interest in physical activity (PA) research in early childhood has increased rapidly over the last decade. However, existing studies use a large variety of operational definitions and measures of PA. Definitions are for example based on the intensity of PA (e.g. light, moderate, vigorous) or type of PA (e.g. tummy time, rolling, grasping objects). The quickly changing and developing motor skills of young children further complicate operationalization and assessment of PA. This terminology consensus project aims to establish an agreed set of key terms and definitions of PA in early childhood.

**Methods:** A literature review was completed to identify key terms and definitions used in PA research in children aged <5 years. Based on these key terms and definitions a leadership team proposed a set of key terms and definitions. In the next step, a project team consisting of international researchers with expertise on early childhood PA research will be invited to review and provide feedback on these proposed terms and draft definitions through an online survey. Finally, a broader group of early childhood researchers will be asked to give feedback on final key terms and definitions.

**Results:** Based on preliminary analyses, we included 87 studies in the literature review, with most studies conducted in preschoolers (ages 3-5 years). Fifty studies provided a definition of PA and 37 studies provided no definition. Key terms used include (overall/total) PA, tummy time, active play and outdoor play. Thirty-three out of 50 studies measured PA using accelerometers, and provided definitions based on cut-points for light, moderate and vigorous PA. In the symposium we will present the list of key terms and definitions that is agreed on by the project team.

**Conclusions:** Our literature review confirmed the large variation in key terms and definitions of PA in early childhood research. The final list of agreed key terms and definitions will result in standardized terminology that is widely supported and adopted among researchers in the field of PA in early childhood. The use of these agreed key terms and definitions will advance future research, interventions, policies, and practices related to PA in early childhood.

# Involving end-users in the development of an application to assess 24-hour movement behaviors in 0- to 4-year-old children: My Little Moves

**Mr. Jelle Arts<sup>1</sup>**, Prof. Mai Chin A Paw<sup>1</sup>, Dr. Jessica Gubbels<sup>2</sup>, Prof. Arnoud Verhoeff<sup>3,4</sup>, Miss Annette Brons<sup>5</sup>, Dr. Sanne Veldman<sup>1</sup>, Miss Annelinde Lettink<sup>1</sup>, Dr. Teatske Altenburg<sup>1</sup>

<sup>1</sup>Amsterdam UMC, Vrije Universiteit Amsterdam, Amsterdam, Netherlands, <sup>2</sup>Maastricht University, Maastricht, Netherlands, <sup>3</sup>Public Health Service Amsterdam, Amsterdam, Netherlands, <sup>4</sup>University of Amsterdam, Amsterdam, Netherlands, <sup>5</sup>University of Applied Sciences, Amsterdam, Netherlands

**S.1.13 - The latest insights in measurement and analysis of 24-hour movement behaviors in the early years – definitions, measurement tools and analysis, UKK - Hall B, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** F. Early care and education

**Background** All 24-hour movement behaviors are important for optimal health in young children. Currently, there are no proxy-report tools available with acceptable reliability and validity to assess these behaviors in children below 5 years old. Potential reasons for this include the lack of involvement of end-users in the development and evaluation of the tool. Therefore, this study aimed to develop a mobile application (app)-based proxy-report tool to assess 24-hour movement behaviors in 0- to 4-year-old children, involving parents, professionals, and researchers.

**Methods** First, we used concept mapping to identify the activities 0- to 4-year-olds engage in. Parents (n = 58) and professionals working with young children (n = 21) generated a list of activities, sorted related activities, and rated how frequently children perform the activities. Second, based on the created activity categories, we developed the first version of the My Little Moves app in collaboration with a software developer. Third, we examined the content validity of the app together with parents (n = 14) and researchers (n = 6) using focus group- and individual interviews.

**Results** The app has a timeline format, in which parents can proxy-report the activities of their child. Eight activity categories are included: personal care, eating and drinking, active transport, passive transport, playing, screen time, sitting/lying quietly, and sleeping. Examples of activities are included to explain the activity categories. In addition, 1-4 follow-up questions provide information on the intensity (e.g., posture) or context (e.g., location). In general, participants considered filling in the app feasible, taking 10-30 minutes per day. Some follow-up questions were considered irrelevant and could be removed. The activity categories were considered comprehensive, but alternative examples were suggested to increase the comprehensibility and relevance. These suggestions were adopted in the second version of the My Little Moves app.

**Conclusion** Involving end-users in the development of the My Little Moves app resulted in a tailored tool to assess 24-hour movement behaviors in young children, which is promising for monitoring these behaviors in large samples. In future studies, the measurement properties of the app will be further evaluated to conclude on the quality of the tool.

# To BMI but Renovations Needed: The Potential and Possibilities of Body Mass Index as a Measure of Health (Debate)

**Dr. Carmen Byker Shanks<sup>1</sup>**

<sup>1</sup>Gretchen Swanson Center for Nutrition , Omaha, USA

**S.1.14 - BMI or Not to BMI? Weighing the Value of Body Mass Index as a Measure of Health (Debate), UKK - Hall C (Level 3), June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** While BMI has experienced widespread use, a fiery debate about BMI's applicability to diverse body types has persisted. This side of the debate, in favor of BMI measurement, will explore potential possibilities, and changes needed for BMI as a continued measure in the toolkit for health.

**Methods:** This presentation will account the history of BMI measurement, describe benefits and challenges to implementation of BMI as a measure of health in diet and physical activity research, monitoring, and surveillance, and the renovations needed to effectively apply it in public health work. The extensive evidence-base about BMI measures will be explored, as well as proposed changes for the future. A case study of this nuanced support for BMI measures will be discussed from work gleaned from the United States Department of Agriculture (USDA's) National Institute of Food and Agriculture (NIFA) Gus Schumacher Nutrition Incentive Program's (GusNIP) National Training, Technical Assistance, Evaluation, and Information Center (NTAE).

**Results:** Body mass index (BMI) standards were set by the National Institutes of Health in 1998 and have been used as a measure to predict health risk associated with weight. The US Centers for Disease Control and Prevention have used the BMI calculation to report obesity rates over time. In diet and/or physical activity behavioral interventions, BMI has been widely applied as a standardized measure that can track participant progress and overall effectiveness. Epidemiological data suggest that higher BMI is tied to greater health risks, such as chronic diseases and COVID-19 hospitalizations. BMI holds potential as a standardized, comparable measure to predict health risks associated with weight, yet renovations are needed to ensure its applicability for diverse body types. Specific strategies for improvements will be discussed, including that the BMI table should be derived from diverse individuals, such as sex, race, and ethnicity. In addition, its application in individual and population health will be explored for reducing health disparities while reducing weight bias.

**Conclusions:** BMI is an important measure of health with a storied history, and warrants updating for the widest application and use in public health work, including for diet and/or physical activity interventions.

# Not to BMI: Body Mass Index Perpetuates Inequalities and has Limited Effect on Health Behavior Promotion (Debate)

**Dr. Meg Bruening<sup>1</sup>**

<sup>1</sup>Penn State University, Department of Nutritional Sciences, University Park, USA

**S.1.14 - BMI or Not to BMI? Weighing the Value of Body Mass Index as a Measure of Health (Debate), UKK - Hall C (Level 3), June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Body mass index (BMI) is a measure, developed from a homogenous population, is used as diagnostic and outcome measurement tool internationally and across the life span. However, the widespread use of BMI may perpetuate health inequities. A focus away from weight status and towards health behaviors and more sensitive outcomes are needed. This side of the debate will argue against BMI measurement.

**Methods:** The development and implementation of BMI as a measure while also applying a diversity, equity inclusion lens will be presented. Specifically, limitations exist for BMI that make it an inappropriate tool to apply to diverse populations and there is recent and growing dissent in its accuracy and application, which suggest potential de-implementation of BMI as a measure of health.

**Results:** BMI is a poor predictor of adiposity for some populations). As a tool, focusing on BMI is insensitive and may perpetuate inequalities for indigenous populations and communities of color who tend to have higher BMI scores relative to white, lower income populations. Research has indicated that lean populations can be at risk for metabolic diseases based on genetic, lifestyle, and environmental factors. Indeed, healthful behaviors and outcomes can be possible at every size. BMI scores results in differential care and programming (e.g., medical weight loss interventions where behavioral interventions on stress reduction and lifestyle interventions may be needed). Given the limitations and challenges, a focus on BMI may result in inefficient and ineffective health promotion strategies. Further, those with high BMIs face increased levels of stigma and shame, which can result in unhealthy eating and lower physical activity.

**Conclusions:** BMI should be used minimally as a primary research outcome. An emphasis on health behaviors and more sensitive measures of adiposity and health outcomes are needed to tailor interventions and minimize harm, especially for low-income, underrepresented populations.

# Does co-creating an implementation plan with school staff improve the implementation of a school-based sleep intervention?

**Ms. Janneke de Boer**<sup>1,2</sup>, Ms. Lea Delfmann<sup>1,2</sup>, Prof. Maïté Verloigne<sup>1</sup>, Prof. Benedicte Deforche<sup>1</sup>, Prof. Teatske Altenburg<sup>3,4,5</sup>, Ms. Ann Vandendriessche<sup>1</sup>, Prof. Greet Cardon<sup>2</sup>

<sup>1</sup>Faculty of Medicine and Health Science, Department of Public Health and Primary Care, Ghent University, Ghent, Belgium, <sup>2</sup>Faculty of Medicine and Health Science, Department of Movement and Sports Sciences, Ghent University, Ghent, Belgium, <sup>3</sup>Amsterdam UMC Location Vrije Universiteit Amsterdam, Public and Occupational Health, Amsterdam, Netherlands, <sup>4</sup>Amsterdam Public Health, Methodology, Amsterdam, Netherlands, <sup>5</sup>Amsterdam Public Health, Health Behaviors & Chronic Diseases, Amsterdam, Netherlands

**S.1.15 - Let us sleep! Promoting adolescent sleep health: sharing experiences of co-creating sleep health interventions in Belgium and the Netherlands, UKK - Hall D (Level 2 - main floor), June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** The success of school-based interventions to promote health behaviour in youth partly depends on whether school staff feel capable to implement the intervention. Thus, successful implementation is determined by the degree of training school staff receive. This study compares two different approaches to implement a sleep intervention at school, i.e. co-creation of the implementation plan with school staff, and standard implementation plan. Moreover, it investigates how these approaches are experienced by school staff and whether they have an impact on the successful implementation of the intervention.

**Method:** A sleep intervention will be implemented in two secondary schools in Flanders, Belgium. In the co-creation school an action group of school staff (n=6) will be composed to develop an implementation plan using a co-creation approach. This enables school staff to tailor the implementation to their needs and embed the intervention in the school curriculum. In the standard implementation school, school staff will receive one training and a manual designed by researchers to implement the intervention. Questionnaires will be completed at different timepoints (baseline, pre-implementation, post-implementation) in both schools to measure changes in motivation, empowerment, barriers for implementation, and general knowledge about sleep in school staff educating students from the 6th and 7th Grade. Furthermore, focus groups will be conducted to evaluate the co-creation process and the implementation process including its specific intervention materials. Focus groups will be audio-taped and coded using NVivo 12, questionnaires will be analysed using R.

**Results:** We expect that active involvement of school staff during the co-creation of the implementation plan is beneficial for the implementation of school-based interventions, as it fulfills the needs of the implementers. This project will start in November 2022 and will finish in June 2023. The results from the co-creation process to design the implementation plan will be presented at the conference.

**Conclusions:** This study will indicate whether designing an implementation plan together with school staff using a co-creation approach is beneficial for successful implementation. Moreover it will highlight important aspects of the implementation process.

# Scaling an existing co-created intervention to promote healthy sleep using a shortened co-creation process – a process evaluation.

**Ms. Lea Delfmann**<sup>1,2</sup>, Ms. Janneke de Boer<sup>1,2</sup>, Prof. Benedicte Deforche<sup>1</sup>, Prof. Greet Cardon<sup>2</sup>, Ms. Ann Vandendriessche<sup>1</sup>, Prof. Maïté Verloigne<sup>1</sup>

<sup>1</sup>Faculty of Medicine and Health Science, Department of Public Health and Primary Care, Ghent University, Ghent, Belgium, <sup>2</sup>Faculty of Medicine and Health Science, Department of Movement and Sports Sciences, Ghent University, Ghent, Belgium

**S.1.15 - Let us sleep! Promoting adolescent sleep health: sharing experiences of co-creating sleep health interventions in Belgium and the Netherlands, UKK - Hall D (Level 2 - main floor), June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Because of the high prevalence of poor sleeping behavior among adolescents, effective interventions are needed. Co-creation, i.e. knowledge production through collaboration with the target group and several key stakeholders, has been established as a promising approach to intervention development. However, co-created interventions are in nature localized and their development is time- and resource consuming. The cascade model to scale up co-created interventions suggests a shortened co-creation process to transfer interventions to another context, but it has yet to be investigated how adolescents experience this process. Therefore, this study evaluates the scaling up of an existing co-created healthy sleep intervention for adolescents (aged 11-13) to a new context using a shortened co-creation process.

**Methods:** Eight students from one secondary school in Flanders were selected to form an action group. The shortened co-creation process will consist of eleven sessions, starting with a needs assessment. Adolescents' goals and expectations for the intervention will be discussed, after which the existing intervention will be introduced. The majority of sessions will be reserved for the adaptation of existing intervention components. The remaining sessions will be used to discuss the implementation plan together with other relevant stakeholders, i.e., school staff and parents. Lastly, one session will be used to discuss the evaluation of the scaled-up intervention. Adolescents' experiences, feelings of ownership, empowerment, self-efficacy, and wellbeing will be assessed using interviews, focus groups, and questionnaires. Qualitative data will be analyzed in NVivo, and quantitative data will be analyzed using the statistical package R.

**Results:** The co-creation process started in October 2022 and will be finished in February 2023. Results of the process evaluation will be presented. Based on previous research, it is expected that adolescents participating in a co-creation process report increased feelings of empowerment, ownership, and self-efficacy.

**Conclusion:** If our hypotheses can be confirmed, this provides initial evidence that participation in a shortened co-creation process to scale up a healthy sleep intervention can increase feelings of ownership, empowerment, and self-efficacy in adolescents.

# Charge Your Brainzzz: Applying participatory system dynamics to co-produce a whole systems approach promoting adolescent sleep health

**Ms. Danique Heemskerk<sup>1,2</sup>**, Dr. Maartje van Stralen<sup>1</sup>, Prof. Jessica Piotrowski<sup>3</sup>, Dr. Carry Renders<sup>1</sup>, Dr. Vincent Busch<sup>2</sup>

<sup>1</sup>Faculty of Science and Amsterdam Public Health Research Institute, Department of Health Sciences, Vrije Universiteit Amsterdam, Amsterdam, Netherlands, <sup>2</sup>Sarphati Amsterdam, Municipal Health Service Amsterdam, Amsterdam, Netherlands, <sup>3</sup>Amsterdam School of Communication Research ASCoR, University of Amsterdam, Amsterdam, Netherlands

**S.1.15 - Let us sleep! Promoting adolescent sleep health: sharing experiences of co-creating sleep health interventions in Belgium and the Netherlands, UKK - Hall D (Level 2 - main floor), June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Inadequate sleep health is a tremendous problem among Dutch adolescents which can have detrimental effects on their physical and mental well-being. Systems thinking is acknowledged as a promising approach to understand and respond to this complex health problem. This study aims to apply participatory system dynamics in designing a 'whole systems approach' promoting sleep health of Dutch adolescents, thereby expanding the knowledge on how to apply systems methodologies in designing health interventions in complex systems.

**Methods:** This study applied participatory system dynamic methods (i.e. combining system dynamics and participatory methods) to co-design actions based on points of leverage within the system influencing adolescent sleep health. Five (multi)stakeholder co-creation sessions were held with adolescents (N=40, 12-15 years), parents (N=11) and professionals (N=10). When co-designing actions, we used the Action Scale Model (ASM) to create a coherent whole systems approach that is evidence-based, feasible, has potential to change the system, and that can be sustainably implemented. Thereafter, three sessions with Public Health Services (GGD) from several Dutch regions as well as organizations that act on a national level were held using the World Café Methodology to identify agents of change and to create an implementation plan for the prospective whole systems approach promoting adolescent sleep health.

**Results:** The initial Causal Loop Diagram (CLD) of our previous study that was created to map the 'system' of adolescent sleep health was expanded with actions targeting potential leverages of change, end-products and agents of change that are able to influence those levers. These were distributed across the six identified subsystems within the CLD around the following themes: (1) School environment; (2) Mental health; (3) Screen use & social media; (4) Family & Home environment; (5) Lifestyle behaviors & Leisure activities; (6) Personal & biological determinants.

**Conclusions:** This study expands knowledge on how participatory systems methodologies can be applied in designing a whole systems approach promoting sleep health. Combination of these approaches is recommended for designing health interventions in complex systems as it increases understanding in the needs of adolescents, parents, and professionals. The expanded CLD served as a logic model informing the development of a whole systems approach.

# Exploring the impacts of food retail policies and actions for public health through a systems approach

**Dr. Alexandra Morshed<sup>1</sup>**, Dr. Melissa Tracy<sup>2</sup>, Dr. Megan Winkler<sup>1</sup>

<sup>1</sup>Emory University Rollins School of Public Health, Atlanta, USA, <sup>2</sup>University at Albany School of Public Health, Rensselaer, USA

**S.1.16 - Leveraging Systems Science to Improve Nutrition and Obesity-Related Policy and Actions, UKK - K1 (+K2) (Level 3), June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Retail food environments (RFEs) and their relationships to healthy purchasing represent complex systems—they consist of multi-level and interdependent causal factors, heterogeneous actors who shape them, and feedback mechanisms. Agent-based modeling is well-suited to realistically characterize how these spatial and social environments generate dynamic and potentially unexpected behaviors of consumers and retail actors, and thus is a necessary tool for framing and analyzing interventions within these systems. In this presentation, we first present as a case study a model of sugar-sweetened beverage (SSB) purchasing in small urban food stores that compared the impacts from a range of policy scenarios. Then, using examples from RFE modeling to date, we highlight additional modeling strategies that can be instrumental in this early, formative stage of intervening in these systems.

**Methods:** In the case study, we used agent-based modeling to develop a simulation that captures the spatial distribution of small food stores, their in-store consumer environments, supply-side decision-making, and customer purchasing of SSBs and healthier beverages in Minneapolis-St. Paul, USA. The model structure, parameters, and mathematical functions representing model dynamics are based on analyses of retail data, review of existing literature, and key stakeholder interviews with small store managers and beverage companies. Additional modeling strategies used for policy analysis were informed from prior systematic reviews and other literature.

**Results:** The case study model represents small food stores and their customers in a representative spatial grid, where each week, customers decide to visit small stores, purchase beverage products at each visit, and update their body mass index and beverage preferences within a period of 5 years. Multiple intervention scenarios (e.g., healthy checkout ordinance, SSB taxes) were simulated to evaluate independent and combined impacts on beverage selections across different customer groups (e.g., socio-economic status) as well as on store behavior. Additional strategies effective to understanding complex RFE problems and informing solutions included participatory modeling, casual loop diagramming, and engaging stakeholders.

**Conclusions:** Agent-based modeling and additional modeling strategies are important tools to frame and prioritize action for RFEs-- a key precursor for effective policy design aimed to reduce the public health burden of unhealthy purchasing.

# Applying systems thinking to strengthen food policy and nutrition actor networks

Dr. Yeeli Mui<sup>1</sup>, Dr. Steven Allender<sup>2</sup>, Dr. Atif Adam<sup>3</sup>, Other Raychel Santo<sup>3</sup>, Other Karen Bassarab<sup>3</sup>, Other Anne Palmer<sup>3</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA, <sup>2</sup>Deakin University Global Centre for Preventive Health and Nutrition, Geelong, Australia, <sup>3</sup>Johns Hopkins Center for a Livable Future, Baltimore, USA

**S.1.16 - Leveraging Systems Science to Improve Nutrition and Obesity-Related Policy and Actions, UKK - K1 (+K2) (Level 3), June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Developing effective nutrition support can be facilitated by understanding the roles and relationships between institutional networks and actors and the system that can support political commitment. The objective of this presentation is to showcase different systems science approaches, focusing on the role of key stakeholders in the development and adoption of policies and actions to support food and nutrition security.

**Methods:** In Study 1, social network analysis was used to understand the network structures of food policy councils (FPCs; n=195) across the United States and explore how FPCs' relationships with partners enabled them to pivot their work toward responding to food-related needs in the COVID-19 pandemic. Specifically, we 1) characterized the network of actors and relationships within FPCs; and 2) evaluated how FPCs' network characteristics (e.g., network size, density) relate to programmatic, policy, and advocacy actions. In Study 2, a system science theory of change for community-based interventions is introduced and insights about the role of key actors are demonstrated. Examples are presented from practice and a system dynamic model of how role models impact water and sugar sweetened beverage consumption in one obesity prevention trial.

**Results:** In Study 1, government agencies and food supply chain actors were identified as core features of FPC networks. Regarding FPCs' network characteristics, we also found that FPC network density had the largest effect on FPCs taking any action but especially for advocacy actions. In Study 2, multiple system models demonstrate the interrelationship among different forms of political commitment and the factors (e.g., key actors, resources, political context) that shape the effectiveness of nutrition actor networks in generating political commitment for nutrition. These models helped to generate insights into how political commitment could be strengthened to support nutrition policy and action.

**Conclusion:** Leveraging different systems science approaches sheds light on network structures (i.e., the 'what') and factors that shape the effectiveness of nutrition actor networks (i.e., the 'why'), providing unique insights into strategies to advance food and nutrition security.

# Using Agent Based Modeling to Evaluate Public Health Intervention Strategies Targeting Obesity and Related Behaviors in Young Children from Low-Income Households

**Dr. Megan Mueller<sup>1</sup>**, Dr. Roch Nianogo<sup>2</sup>, Dr. Kurt Kreuger<sup>3</sup>, Dr. Nathaniel Osgood<sup>3</sup>, Dr. May Wang<sup>2</sup>

<sup>1</sup>Colorado State University College of Health and Human Sciences, Fort Collins, USA, <sup>2</sup>University of California Fielding School of Public Health, Los Angeles, USA, <sup>3</sup>University of Saskatchewan Department of Computer Science, Saskatoon, Canada

**S.1.16 - Leveraging Systems Science to Improve Nutrition and Obesity-Related Policy and Actions, UKK - K1 (+K2) (Level 3), June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The influx of funding, multiple co-occurring intervention efforts, and complex, multi-factorial nature of childhood obesity make it difficult to evaluate intervention and policy impacts using traditional epidemiological approaches. Here, we discuss the use of systems science methods, specifically agent-based modeling, in retrospectively evaluating policies and other community interventions targeting obesity, nutrition, and physical activity in young children from low-income households enrolled in the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) in Los Angeles (LA).

**Methods:** The model was developed iteratively using a community-based modeling approach. The top intervention strategies implemented in LA were classified as using micro- level (e.g., home visitation programs) or macro-level (e.g., business practices) approaches. We simulated a population of 1500 children enrolled in WIC, with specific diet, physical activity, breastfeeding behaviors and body mass index z-scores (BMIz), following them from age 2 to 5 years. Intervention strategies were tested individually and in combination.

**Results:** Breastfeeding interventions that employed both micro-level and macro-level strategies appeared to be moderately effective, reducing BMIz by 0.03 (95% CI -0.05, -0.01). Home visitation programs and business practices targeting obesity-related behaviors, also appeared to be moderately effective at reducing BMIz by 0.04 (95% CI -0.06, -0.02) and 0.02 (95% CI -0.04, 0.00), respectively. Contrary to expectation, combining all micro and macro interventions appeared to have no impact or moderately increased the proportion of obesity/overweight among children.

**Conclusions:** This simulation model provided insight into intervention strategies that may have resulted in reductions in obesity among WIC participants. Results suggest that interventions targeting breastfeeding were the most effective at reducing BMIz when both micro- and macro-level strategies were implemented. Home visitation interventions and business practice interventions (like menu labeling or product placement) were also effective at reducing BMIz. Findings also highlighted the potential difficulties of shifting obesity trajectories through diet and physical activity interventions alone, especially in populations living in low-income households that are disproportionally exposed to other social determinants of health that impact overall risk. Systems science approaches are a useful tool to retrospectively evaluate multi-level interventions and policies that can dynamically impact health behavior and health outcomes.

# Uptake and implementation of machine learning techniques with wearable devices: Lack of innovation or diffusion failure?

**Prof. Stewart Trost<sup>1</sup>**

<sup>1</sup>University of Queensland, QLD, Australia

**S.1.17 - Novel insights on physical behaviour and non-communicable disease from the UK Biobank: A unified physical activity, posture, and sleep framework, UKK - K3+4, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** The application of wearable devices such as accelerometer-based motion sensors to objectively measure free-living physical activity, sedentary behaviour, and sleep is common in public health research. However, the research potential of accelerometers has been severely under-utilised, with analysis restricted to the application of simple cut-points or linear regression models based on proprietary activity counts.

**Methods:** Machine learning approaches to accelerometer data reduction have emerged as a more accurate and versatile alternative to cut-point methods. However, the uptake of machine learning methods by clinical and public health researchers has been limited, in part, due to the difficulties of implementation, the concern that models trained on data from laboratory-based activity trials do not generalize well to free-living environments, and the lack of studies demonstrating the relative advantage of machine learning approaches over traditional cut-point methods.

**Results:** Diffusion of innovation theory provides a useful conceptual framework for understanding the process of developing and deploying new approaches to accelerometer data processing. Diffusion is defined as the process by which an innovation is communicated through certain channels over time among members of a social system. An innovation is an idea, program, or practice that is perceived as new by an individual or group. Therefore, machine learning approaches to accelerometer data reduction can be viewed as an innovation that must be successfully “diffused” or translated into practice over time.

**Conclusions:** This presentation will focus on the application of machine learning accelerometer data processing methodologies for human activity recognition. Diffusion of innovation theory will be used to identify points of dissemination failure and potential solutions. It will explore the advantages of machine learning methods relative to cut-point methods and introduce deployment tools that enable health researchers without specialist training in data science to implement machine learning physical activity classification and energy expenditure estimation algorithms.

# Prospective associations of daily step counts and intensity with mortality, and incident cardiovascular disease, cancer, and dementia

**Associate Professor Borja del Pozo Cruz<sup>1</sup>**, Dr. Mathew Ahmadi<sup>2</sup>, Prof. I-Min Lee<sup>3,4</sup>, Prof. Emmanuel Stamatakis<sup>2</sup>, Prof. Sharon Naismith<sup>2</sup>

<sup>1</sup>University of Southern Denmark, Odense, Denmark, <sup>2</sup>University of Sydney, NSW, Australia, <sup>3</sup>Harvard Medical School, Boston, USA, <sup>4</sup>Brigham and Women's Hospital, Boston, USA

**S.1.17 - Novel insights on physical behaviour and non-communicable disease from the UK Biobank: A unified physical activity, posture, and sleep framework, UKK - K3+4, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Increasing daily steps is often advocated as an important part of chronic disease and premature mortality prevention. Recommendations for the number of steps per day may be easier to enact for some people than current time and intensity-based physical activity guidelines, but the evidence to support steps-based goals is limited.

**Methods:** This population-based prospective cohort study included adults 40 to 79 years old in England, Scotland, and Wales who wore an accelerometer on their wrist for up to 7 consecutive days. In our studies, we assessed the associations and mean rate of change (MRC) between daily step counts and intensity with incident cardiovascular disease (CVD), Cancer, and dementia and all-cause and cause-specific mortality.

**Results:** We included 78,500 participants over a median follow-up 7.0 years, of whom 664 died due to CVD and 1,325 due to cancer (total deaths 2,179). There were 10,245 incident CVD events, 2,813 cancer incident events, and 864 dementia cases over the observation period. More daily steps were associated with a lower risk of all-cause (MRC [95%CI]= -0.08 [-0.11 to -0.06]), CVD (-0.10 [0.15 to -0.06]), and cancer (-0.11 [-0.15 to -0.06]) for up to approximately 10,000 steps. Similarly, accruing more daily steps was associated with lower incident disease. The optimal dose (ie, exposure value at which the maximum risk reduction was observed) was 9,826 steps (hazard ratio= 0.49 [0.39 to 0.62]) for dementia risk. Peak-30 cadence was consistently associated with lower risks across all outcomes, beyond the benefit of total daily steps.

**Conclusions:** More steps per day up to the popular ~10,000 steps/day target may be associated with lower risk of mortality and CVD, cancer, and dementia incidence. Steps performed at higher cadence may be associated with additional risk reduction, particularly for incident disease.

# Association of wearable device-measured vigorous intermittent lifestyle physical activity with mortality

**Dr. Matthew Ahmadi<sup>1</sup>, Prof. Emmanuel Stamatakis<sup>1</sup>**, Prof. Peter Katzmarzyk<sup>2</sup>, Prof. I-Min Lee<sup>3</sup>, Prof. Jason Gill<sup>4</sup>, Prof. Cecilie Thøgersen<sup>5</sup>, Associate Professor Borja del Pozo Cruz<sup>5</sup>, Prof. Aiden Doherty<sup>6</sup>, Prof. Mark Hamer<sup>7</sup>

<sup>1</sup>University of Sydney, NSW, Australia, <sup>2</sup>Pennington Biomedical Research Center, Louisiana, USA, <sup>3</sup>Harvard Medical School, Boston, USA, <sup>4</sup>University of Glasgow, Glasgow, United Kingdom, <sup>5</sup>University of Southern Denmark, Odessa, Denmark, <sup>6</sup>University of Oxford, Oxford, United Kingdom, <sup>7</sup>University College London, London, United Kingdom

**S.1.17 - Novel insights on physical behaviour and non-communicable disease from the UK Biobank: A unified physical activity, posture, and sleep framework, UKK - K3+4, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Wearable devices can capture unexplored movement patterns such as brief bursts of vigorous intermittent lifestyle physical activity (VILPA) that is embedded into everyday life, rather than being done as leisure-time exercise. Currently, there is a very limited understanding of the minimal and optimal amounts of vigorous physical activity in relation to mortality and disease incidence.

**Methods:** A prospective study in 25,241 non-exercising adults and 71,893 adults in the general population (median age [IQR] 62.5 years [55.3, 67.7]) from the UK Biobank cohort with wrist-worn accelerometry. We examined the association of VILPA with all-cause, cardiovascular disease (CVD) and cancer mortality. We also examined VPA volume (min/week) and frequency of short VPA bouts ( $\leq 2$  min) in the general population sample.

**Results:** Over an average follow-up of 6.9 years, during which 852 deaths occurred, VILPA was inversely associated with all three of these outcomes in a near-linear fashion. As compared to participants who engaged in no VILPA, participants who engaged in VILPA at the sample median frequency of three VILPA bouts per day (lasting up to one or up to two minutes each) showed a 38-40% reduction in all-cause and cancer mortality risk and a 48-49% reduction in CVD mortality risk. Moreover, the sample median duration of 4.4 VILPA minutes per day was associated with a 26-30% reduction in all-cause and cancer mortality risk and a 32-34% reduction in CVD mortality risk. We obtained similar results when repeating the above analyses for vigorous physical activity (VPA) in 71,893 adults in the general population.

**Conclusions:** These results indicate that small amounts of vigorous non-exercise physical activity are associated with substantially lower mortality. VILPA in non-exercisers appears to elicit similar effects to VPA in exercisers, suggesting that VILPA may be a suitable physical activity target, especially in people not able or willing to exercise. The presenter will also share results of two analogous studies with incident cancer and incident CVD related outcomes.

# The Kahnawà:ke Schools Diabetes Prevention Program – An Exemplar of Indigenous Health Promotion in Action

Mrs. Brittany Mcbeath<sup>1</sup>, **Dr. Brittany Jock**<sup>3</sup>, Other KSDPP Team<sup>2</sup>, Dr. Lucie Lévesque<sup>1</sup>

<sup>1</sup>Queen's University, Kingston, Canada, <sup>2</sup>Kahnawà:ke Schools Diabetes Prevention Program, Kahnawà:ke, Canada, <sup>3</sup>McGill University, Montreal, Canada

**S.1.18 - Indigenous Health Promotion - A Distinct and Decolonial Approach to Promoting Health Led by Indigenous Communities, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Indigenous communities are reclaiming control of their physical, cultural, social, and emotional health and wellness with Seven Generations<sup>[1]</sup> in mind. Indigenous Health Promotion is led by Indigenous communities; it centers Indigenous knowledge systems in its planning, implementation, and evaluation. The Kahnawà:ke Schools Diabetes Prevention Program (KSDPP) is an award-winning community-driven participatory research partnership and recognized best practice for type 2 diabetes prevention within Indigenous communities in Canada. This presentation will present KSDPP as an exemplar of Indigenous Health Promotion in action.

**Methods:** KSDPP utilizes a community-driven participatory approach to implement and study community-led health promotion efforts specifically related to type 2 diabetes prevention. The KSDPP intervention model employs a robust socioecological design based upon Haudenosaunee values and principles to promote and support healthy lifestyles among Kanien'kehá:ka children and the community to prevent type 2 diabetes Seven Generations into the future. Through conversational methods and storytelling, the KSDPP team will share the origin story, and future directions of the project. Through the analogy of a Strawberry Story, we will discuss how a successful Indigenous community-led model of type 2 diabetes prevention can bear fruit and propagate for over a quarter century.

**Results:** Within Indigenous Health Promotion and related research, the process is seen as equally important as the products in effecting change and producing knowledge. Over 27 years, the KSDPP program has evolved from localized health promotion community mobilization and research within Kahnawà:ke, to sharing intervention and research knowledge and expertise with other communities across Turtle Island through community mobilization training and community-to-community mentorship. The KSDPP intervention framework, community mobilization program theory and related research will be highlighted to demonstrate how health promotion efforts are best grounded within Indigenous culture and values.

**Conclusions:** To achieve health equity and social justice for Indigenous peoples, Indigenous Health Promotion calls for collective community mobilization founded on Indigenous values and epistemologies. The tenets of health promotion cannot be achieved until this occurs.

---

<sup>[1]</sup> The Seven(th) Generation Principle from The Great Law of the Iroquois Confederacy is based on the philosophy that decisions we make today consider the impact seven generations into the future.

# A realist evaluation of FEHNCY Community Engagement and Mobilization for knowledge translation: centering cultural safety and traditional foods in engaging communities

**Dr. Brittany Jock<sup>1</sup>**, Ms. Jolian Wong<sup>1</sup>, Assistant Professor Dave Bergeron<sup>2</sup>

<sup>1</sup>McGill University, St-Anne-de-Bellevue, Canada, <sup>2</sup>L'Université du Québec à Rimouski, Rimouski, Canada

**S.1.18 - Indigenous Health Promotion - A Distinct and Decolonial Approach to Promoting Health Led by Indigenous Communities, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Although community engagement is required for research with Indigenous peoples in Canada, there is an absence of research that examines how community engagement supports knowledge translation. The Food, Environment, Health and Nutrition of First Nations Children and Youth (FEHNCY) study is a nationally representative survey of First Nations (FNs) communities. The goal of FEHNCY is to inform the development of policies and programs that address the health needs of FNs children and youth. The Community Engagement and Mobilization component aims to facilitate meaningful engagement of FNs communities by facilitating community partnerships, supporting cultural safety, and engaging youth and broader community members to achieve knowledge translation. This study examines how, for whom, and in what circumstances the FEHNCY Community Engagement and Mobilization impacts knowledge translation.

**Methods:** We used a realist evaluation methodology to develop a middle-range theory of community engagement and mobilization. Eighteen in-depth interviews and two Talking Circles were conducted to understand community partner and study researcher perspectives on the study's community engagement. In-depth interviews explored participant perspectives on engagement processes and Talking Circles were conducted to confirm and clarify our preliminary findings. A combined inductive and deductive coding approach was used to identify contexts, interventions, mechanisms, and outcomes (CIMO) and CIMO configurations.

**Results:** We found that the community socio-political context, switch to virtual engagement during the pandemic, and study design were highly influential contextual factors. Participants highlighted the importance of in-person gatherings, sharing traditional foods, having youth-friendly engagement activities, and integrating local culture, values, and language as vital aspects of engagement activities. Building trusting relationships, centering community champions, and facilitating community ownership were essential mechanisms to trigger key outcomes including increased awareness of health issues, development of relevant health information for communities, and changing practices and programs.

**Conclusion:** Our research identified CIMO subthemes and is the first to develop a middle-range theory for community engagement for knowledge translation. This research advances understanding of essential community engagement approaches for supporting knowledge translation. This research can inform the future planning, implementation, and evaluation of community engagement and mobilization approaches to strategically support knowledge translation.

# The role of Indigenous knowledge in enhancing physical activity research, practice, and tertiary education

**Dr. Isaac Warbrick<sup>1</sup>, Mr. Robert Hogg<sup>1</sup>**

<sup>1</sup>Auckland University of Technology, Auckland , New Zealand

**S.1.18 - Indigenous Health Promotion - A Distinct and Decolonial Approach to Promoting Health Led by Indigenous Communities, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Indigenous knowledge enabled our ancestors to survive and thrive for generations in challenging environments and situations, prior to European colonisation. Although physical activity and improved nutrition are major contributors to improving health in Indigenous peoples, public health interventions, health promotion, and health research, often lack cultural relevance and/or input from Indigenous peoples and communities. This presentation will discuss key principles of engaging at the interface of Indigenous and Western approaches to physical activity research, highlighting examples of this approach translated into practice in New Zealand. The presentation will also outline the creation and delivery of a tertiary course recently launched at Auckland University of Technology, underpinned by Māori knowledge and uniquely Indigenous forms of physical activity.

**Methods:** Led by narratives, values, and perspectives handed down through generations, our network of Māori researchers is working with Māori communities to design culturally relevant physical activity initiatives and community-driven research projects to achieve health outcomes that best reflect the aspirations of Indigenous communities.

**Results:** In addition to increasing the uptake of physical activity, these projects have highlighted the role of physical activity to reconnect Indigenous people with ancestral lands and sites of significance, rejuvenate ancestral narratives, and strengthen cultural identity.

**Conclusions:** Indigenous peoples can be cautious of scientific institutions and Western researchers because of the harms done in past research and the negative portrayal of Indigenous peoples within colonial discourse and media. Accordingly, participation and engagement of Indigenous peoples in research, particularly relating to physical activity, can be low, and research outcomes and aims may not reflect the aspirations of Indigenous people. Nevertheless, Indigenous research teams and projects in various countries have highlighted the value of a uniquely Indigenous perspective, Indigenous knowledge, and values in understanding physical activity and providing meaningful health outcomes for Indigenous and non-Indigenous peoples alike.

# A community-based online intervention to improve fundamental movement skills in children with obesity in Singapore

**Dr. Elaine Chew<sup>1</sup>, Ms. Khairunisa Khaider<sup>1</sup>**, Dr. Courtney Davis<sup>1</sup>, Dr. Cody Neshteruk<sup>2</sup>, Dr. Sarah Armstrong<sup>2</sup>  
<sup>1</sup>KK Women's and Children's Hospital, Singapore, Singapore, <sup>2</sup>Duke University School of Medicine, Durham, USA

**S.1.19 - The Power of Parks: The role of parks and recreation spaces in promoting youth physical activity, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Children with overweight have fundamental movement skills (FMS) difficulties, which may hinder their participation and enjoyment in physical activity. In collaboration with Sport Singapore, we developed a multicomponent intervention for young children with overweight to improve physical activity and FMS. Sport Singapore is the national sport agency in charge of community recreational centers with its mission to encourage Singaporeans to be more active. Physical activity sessions were co-designed with staff from Sport Singapore and focused on the development of FMS. The aim of this study was to estimate the effectiveness of the intervention on perceived and actual FMS.

**Methods:** A two arm randomized controlled trial was conducted with children, aged 4-7 years old, with overweight and obesity. Participants were randomized to either the online intervention or a usual care control group. Physical activity sessions were delivered three times per week via Zoom over three months by Sport Singapore coaches. Activities included different sports such as gymnastics, athletics and basketball to introduce FMS to participants. Objective gross motor skills were assessed using the Test of Gross Motor Development-Third Edition (TGMD-3) and participants' perceived motor competence was assessed using the Perceived Movement Skill Competence (PMSC) at baseline and 6 months.

**Results:** Intervention participants showed no significant improvements in their perceived locomotor skills ( $20.4 \pm 2.9$  vs  $17.8 \pm 3.9$ ;  $p=0.13$ ) and ball skills ( $22.0 \pm 21.5$ ;  $p=0.13$ ) as compared to the control. Using TGMD, intervention participants had no significant improvements in their locomotor scores ( $32.0 \pm 6.7$  vs  $27.0 \pm 7.2$ ;  $p = 0.243$ ) or ball skills ( $22.9 \pm 5.5$  vs  $20.6 \pm 5.7$ ;  $p = 0.343$ ). However, there were significant improvements in jump ( $0.8 \pm 2$  vs  $-0.9 \pm 1.8$ ;  $p = 0.022$ ) and underhand throw ( $1.2 \pm 1.4$  vs  $-0.4 \pm 1.7$ ;  $p = 0.014$ ) in intervention compared to control participants.

**Conclusions:** Children in the online intervention demonstrated trend towards greater improvement in their actual and perceived locomotor and ball skills compared to children in the control. This suggest that a community-based online physical activity programme focusing on FMS may be useful in developing FMS in children with overweight.

# Feasibility of Going Places: A Park-Based Active Transportation Toolbox to Promote Youth Physical Activity and Access to Healthy Community Spaces

**Dr. Emily D'Agostino**<sup>1</sup>, Mr. Jason Jones<sup>2</sup>, Ms. Annette Smith<sup>2</sup>, Ms. Advika Kumar<sup>3</sup>

<sup>1</sup>Duke University School of Medicine, Durham, USA, <sup>2</sup>Durham Parks and Recreation, Durham, USA, <sup>3</sup>Duke University, Durham, USA

**S.1.19 - The Power of Parks: The role of parks and recreation spaces in promoting youth physical activity, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose** Going Places is a novel park-based active transportation intervention that aims to promote youth physical activity and access to parks and health promoting spaces. Co-developed with Durham Parks and Recreation in Durham, North Carolina, USA, Going Places draws on community assets and provides a toolbox including transportation equity workshops for youth and families, field trips, mentorship, park neighborhood audits, and transportation passes. We pilot tested the feasibility of implementing Going Places for minority, low-income youth.

**Methods** We recruited participants, ages 12-18 years, from park sites serving minority youth residing in low-income areas. Feasibility was assessed based on recruitment of the target population, retention, engagement with community stakeholders, and curriculum delivery. Baseline surveys, workshops, and one focus group were administered.

**Results** Nineteen youth were recruited from two park sites. Youth were 15.9 years old on average. All participants were Black or African American and 73.7% male. Seventeen participants completed baseline surveys, and 17 transportation equity workshops were provided. Three youth, one parent, and two staff participated in a focus group. Seven Garmin accelerometers were administered to youth. Mean (SD) 7-day step count across the six participants was 8170 (3099) steps per day. Surveys showed more than half of youth did not use active transportation and most reported low levels of physical activity. Mapping exercises, surveys and focus group results demonstrated barriers to active transportation including safety concerns, accessibility, and social factors.

**Conclusions** This study demonstrated feasibility for Going Places to recruit minority, low-income youth, administer surveys and accelerometers, engage with community stakeholders, and deliver transportation equity workshops. This work also provides preliminary evidence to guide program development for parks and recreation organizations in support of positive youth physical activity habits and lifelong health.

# A randomized trial of an integrated clinic-community intervention in children and adolescents with obesity

**Dr. Cody Neshteruk<sup>1</sup>**, Dr. Asheley Skinner<sup>1</sup>, Dr. Jennifer Li<sup>1</sup>, Dr. William Kraus<sup>1</sup>, Dr. Svati Shah<sup>1</sup>, Dr. Mary Story<sup>1</sup>, Dr. Nancy Zucker<sup>1</sup>, Dr. Sarah Armstrong<sup>1</sup>

<sup>1</sup>Duke University School of Medicine, Durham, USA

**S.1.19 - The Power of Parks: The role of parks and recreation spaces in promoting youth physical activity, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Access to effective treatment for childhood obesity remains low, especially among racial/ethnic minority and low wealth populations. One solution is partnering healthcare systems with community organizations. In this clinic-community model, healthcare providers screen for obesity, provide counseling, and treat co-morbidities while recreation centers provide intensive health behavior and lifestyle treatment in community settings. The aim of this study was to evaluate the effectiveness of the clinic-community model of obesity of treatment.

**Methods:** A sample of 255 youth aged 5-17 years with obesity were enrolled in a randomized controlled trial to compare the clinic-community model of child obesity treatment against clinical care alone. Youth in the Hearts & Parks intervention received clinical care as well as access to a community program delivered at a local parks and recreation site. The community program was offered five days per week. It included structured physical activity (5 times/week) and nutrition education (1 time/week). Outcome measures, collected at baseline and 6-months, included youth BMI relative to the 95<sup>th</sup> percentile, cardiorespiratory fitness assessed via the YMCA submaximal bench stepping test, and self-reported quality of life. Generalized linear models adjusted for sex, age, and race/ethnicity were used to assess changes from baseline to 6-months between intervention and control groups.

**Results:** The mean age of participants was 10.0 (3.0) years and the majority were Hispanic (38.9%) or non-Hispanic Black (38.0%). Change in BMI from baseline to 6-months was greater for the intervention compared to the control ( $\beta=-0.67$ , 95% CI: -5.50, 4.16), although findings were not significant. Change in cardiorespiratory fitness from baseline to 6-months showed greater improvements in the intervention compared to the control at 3 minutes ( $\beta=-9.66$ , 95%CI: -16.67, -2.64), 4 minutes ( $\beta=-7.35$ , 95%CI: -13.35, -1.34), 5 minutes ( $\beta=-4.95$ , 95%CI: -10.95, 1.06), and resting ( $\beta=-5.90$ , 95%CI: -11.00, -0.80). Quality of life significantly improved in the intervention compared to the control ( $\beta=4.71$ , 95%CI: 0.11, 9.31).

**Conclusion:** The clinic-community obesity treatment model improved children's fitness, which even in the absence of weight loss has important cardiovascular benefits. Furthermore, this study showed that clinic-community partnerships are effective for improving child health, especially among populations that often are underserved by the healthcare system.

# A systematic scoping review of the interpersonal determinants of diet quality and eating behaviours in young people.

**Ms. Tanya Braune**<sup>1</sup>, Ms. Laura Kudlek<sup>1</sup>, Dr. Holly Harris<sup>1</sup>, Ms. Erin Fitzsimons-West<sup>2</sup>, Ms. Hao Tang<sup>1</sup>, Dr. Jean Adams<sup>1</sup>, Dr. Eleanor Winpenny<sup>1</sup>

<sup>1</sup>MRC Epidemiology Unit, University of Cambridge, Cambridge, United Kingdom, <sup>2</sup>School of Clinical Medicine, University of Cambridge, Cambridge, United Kingdom

**S.1.20 - The changing influence of social and physical environments on diet quality across adolescence and early adulthood, Clarion Hotel Gillet - Room Swedenborg, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** This review aims to provide an overview of the literature on the interpersonal determinants (as guided by the “Determinants of Nutrition and Eating” (DONE) framework) of diet quality and eating behaviours in young people aged 13-30 years. This will help identify which determinants of the DONE framework have been studied and where future research is needed to better understand how young people’s diets are established.

**Methods:** We searched seven literature databases in February 2022: Medline, Embase, PsychINFO, Web of Science, SCOPUS, ASSIA, and Global Health. Retrieved papers were screened against the eligibility criteria: 1) interpersonal determinants as the exposure(s), 2) diet quality or eating behaviours as the outcome(s), and 3) ages 13-30 years. Data were extracted following published guidelines for scoping reviews and analysed to map the literature onto the DONE framework interpersonal categories.

**Results:** 307 papers were included following screening. Over 60% of studies were in ages 13-15 years (n=192). Determinants were grouped into eight categories: 1) social influences (n=102), 2) social support (n=73), 3) parental behaviours (n=67), 4) family structure (n=57), 5) family meals (n=57), 6) parental feeding practices (n=39), 7) living arrangement (n=39), and 8) parenting style (n=21). Categories 1-4 and 6 overlap with some of the DONE framework categories and 5,7-8 are newly identified determinants outside of the framework. Fruit and/or vegetable and sugar-sweetened beverage intake were the most commonly measured diet outcomes (n=81 and n=71, respectively). Diet quality scores (n=40) included established indices and scores created by the authors. Eating behaviour outcomes included breakfast consumption (n=38), fast food intake (n=30) and snack intake (n=29).

**Conclusions:** This review shows the wide range of interpersonal determinants, both family and peer related, that have been studied in association with diet quality and eating behaviour in young people. The literature is focussed on younger adolescents and there are fewer studies in older adolescents and young adults. Additionally, DONE framework categories including family food culture, parental resources and risk factors and parental attitudes and beliefs are less present in the literature. The review also uncovered new determinants outside of the DONE framework that may need further investigation.

# Family and neighborhood environmental correlates of adolescent sugar-sweetened soft drink intake and mediators of differences by parental level of education

**Mr. Teferi Mekonnen**<sup>1</sup>, Dr. Eleni Papadopoulou<sup>2</sup>, Prof. Nanna Lien<sup>1</sup>, Prof. Lene Frost Andersen<sup>1</sup>, Dr. Maria Pinho<sup>3</sup>, Ms. Hanne Havdal<sup>1</sup>, Mr. Oddbjørn Andersen<sup>4</sup>, Dr. Mekdes Gebremariam<sup>5</sup>

<sup>1</sup>Department of Nutrition, University of Oslo, Oslo, Norway, <sup>2</sup>Norwegian Institute of Public Health, Oslo, Norway, <sup>3</sup>Department of Epidemiology and Data Sciences, Amsterdam UMC, Amsterdam, Netherlands,

<sup>4</sup>Department of Sports Medicine, Norwegian School of Sport Sciences, Oslo, Norway, <sup>5</sup>Department of Community Medicine and Global Health, University of Oslo, Oslo, Norway

**S.1.20 - The changing influence of social and physical environments on diet quality across adolescence and early adulthood, Clarion Hotel Gillet - Room Swedenborg, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Existing evidence suggests that the intake of sugar-sweetened beverages (SSB) among adolescents remains a public health concern and that socioeconomic differences in intake exist. Tackling these challenges requires identifying the factors associated with SSB intake and mediators of socioeconomic differences in adolescent SSB intake. Thus, this study aimed to explore (i) factors including neighborhood food environmental characteristics associated with intake of carbonated drinks with added sugar (hereafter called soft drink) intake, (ii) mediators of the association between parental education and soft drink intake and (iii) the moderation of indirect effect of parental education on adolescents' soft drink intake by neighbourhood-level income.

**Methods:** Data from 826 7th graders in Oslo, Norway, who participated in the TACKLE cross-sectional study were used. Multiple logistic regression analyses and mediation analyses were conducted. Moderated mediation analyses were used to explore whether an indirect effect of parental education on adolescents' soft drink intake through potential mediators varies across neighbourhood income.

**Results:** Perceived accessibility of soft drink at home, parental modelling for soft drink intake, and frequency of food/drink purchased from the neighbourhood store were significant factors associated with higher soft drink intake among adolescents. Perceived and objectively measured neighbourhood environmental factors were not significantly associated with adolescents' soft drink intake. Perceived accessibility of soft drink at home, parental modelling for soft drink intake and frequency of food/drink purchased were significant mediators of the association between parental education and soft drink intake among adolescents. A significant moderation of the indirect effect of parental education on adolescent soft drink intake through perceived accessibility of soft drink at home by neighbourhood income was found.

**Conclusions:** The present study identified modifiable factors that could be targeted in public health interventions designed to reduce the intake of soft drinks in general and to tackle socioeconomic inequalities in soft drink intake among adolescents. We found a significant moderation of the indirect effect of parental education on adolescent soft drink intake; this effect went through perceived accessibility of soft drink at home among children of the lower educated parents only.

# Do food-related capabilities, opportunities and motivations of adolescents mediate the association between socioeconomic position in adolescence and diet quality in early adulthood?

**Dr. Katherine Livingstone<sup>1</sup>**, Dr. Dana Olstad<sup>2</sup>, Prof. Sarah McNaughton<sup>1</sup>, Ms. Sara Nejatnamini<sup>2</sup>, Dr. James Dollman<sup>3</sup>, Prof. David Crawford<sup>1</sup>, Prof. Anna Timperio<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition, Deakin University, Geelong, Australia, <sup>2</sup>Department of Community Health Sciences, University of Calgary, Calgary, Canada, <sup>3</sup>Alliance for Research in Exercise, Nutrition and Activity, University of South Australia, Adelaide, Australia

**S.1.20 - The changing influence of social and physical environments on diet quality across adolescence and early adulthood, Clarion Hotel Gillet - Room Swedenborg, June 15, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Socio-economic position (SEP) in adolescence may influence diet quality over the lifecourse. However, knowledge of whether individual and environmental determinants of diet quality mediate the longitudinal association between SEP and diet quality is limited. This study examined whether and to what extent food-related capabilities, opportunities and motivations of adolescents mediated the longitudinal association between SEP in adolescence and diet quality in early adulthood.

**Methods:** Longitudinal data (annual surveys) from 776 adolescents (16.9 years at baseline; 76% female) from ProjectADAPT (T1 (baseline), T2, T3) were used. SEP in adolescence (T1) was operationalized as highest level of parental education and area-level disadvantage (based on postcode). The Capabilities, Opportunities and Motivations for Behavior (COM-B) model was used as a framework to inform the analysis. Determinants in adolescence (T2) included food-related activities and skills (Capability), home availability of fruit and vegetables (Opportunity) and self-efficacy (Motivation). Diet quality in early adulthood (T3) was calculated using a modified version of the Australian Dietary Guidelines Index based on brief dietary questions on intake of foods from eight food groups. Structural equation modelling was used to estimate the mediating effects of adolescents' COM-B in associations between adolescent SEP and diet quality in early adulthood. Standardized beta coefficients ( $\beta$ ) and robust 95% confidence intervals (CI) were generated, adjusted for confounders (T1 age, sex, diet quality, whether still at school, and living at home) and clustering by school.

**Results:** There was evidence of an indirect effect of area-level disadvantage on diet quality via Opportunity ( $\beta$ : 0.021; 95% CI: 0.003 to 0.038;  $p=0.024$ ), but limited evidence for parental education ( $\beta$ : 0.018; 95% CI: -0.003 to 0.039;  $p=0.09$ ). Opportunity mediated 49% of the association between area-level disadvantage and diet quality. There was no evidence of an indirect effect via Capability or Motivation for either area-level disadvantage or parental education.

**Conclusions:** Using the COM-B model, the home availability of fruit and vegetables (Opportunity) of adolescents explained a large proportion of the association between area-level disadvantage in adolescence and diet quality in early adulthood. Interventions to address poor diet quality among adolescents with a lower SEP should prioritize environmental determinants of diet quality.

# Explanatory variables of objectively measured 24-hour movement behaviors in patients with type 2 diabetes mellitus: a systematic review

**Ms. Lotte Bogaert<sup>1</sup>**, Miss Iris Willems<sup>1,2</sup>, Dr. Vera Verbestel<sup>1</sup>, Mr. Boyd Strumane<sup>1</sup>, Miss Margot Van Daele<sup>1</sup>, Mrs. Marga Decraene<sup>1</sup>, Miss Manon Kinaupenne<sup>1</sup>, Prof. Bruno Lapauw<sup>1</sup>, Prof. Patrick Calders<sup>1</sup>, Assistant Prof. Marieke De Craemer<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Research Foundation Flanders, Brussels, Belgium

**S.1.21 - Move, sit, sleep: the co-dependence of physical activity, sedentary behavior and sleep in adults with (pre)diabetes, Clarion Hotel Gillet - Room Swedenborg, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Physical activity (PA), sedentary behavior (SB) and sleep (i.e., 24-hour movement behaviors (24h-MBs)) have an impact on health indicators of type 2 diabetes mellitus (T2DM) patients. Nevertheless, most these patients do not meet the guidelines of the movement behaviors. Therefore, this systematic review aimed to summarize the influencing factors of PA, SB and sleep T2DM patients. This information could inform future interventions regarding the factors that could be targeted to change patients' 24h-MBs.

**Methods:** A systematic search of four databases (PubMed, Web of Science, Scopus & Embase) was conducted. Following studies were included: (1) adults with T2DM, (2) all age ranges from 18 years, (3) PA, SB or sleep objectively measured, (4) associations with at least one explanatory variable and (5) full text and written in English. The influencing factors of the movement behaviors were classified across three different domains using the socio-ecological model: individual, interpersonal and environmental variables. Based on the findings that support an association (+, -, indeterminate or no association), an influencing factor of PA, SB or sleep was determined.

**Results:** A total of 54 studies were included in the systematic review of which the majority investigated PA. Sex was studied in all movement behaviors but was only associated with MVPA and LPA. Being male was positively associated with MVPA but negatively with LPA. Age was negatively associated with all levels of PA (LPA, MVPA and total PA). Body Mass Index (BMI) and waist circumference (WC) were negatively associated with MVPA and total PA. A positive association was found BMI and WC on the one hand and SB on the other hand.

**Conclusion:** Across all behaviors, most studied influencing factors are located at the individual level. Almost no factors were investigated at the interpersonal and environmental level despite the dynamic interrelations between individual, interpersonal and environmental levels. Additionally, information about influencing factors of sleep and LPA is scarce while these behaviors are easier to influence within behavior change interventions compared to MVPA. Finally, the results of this review underscore the lack of focus on the interrelationship of 24h-MBs within studies.

# Cross-sectional associations between 24-hour movement behaviors and cardiometabolic health parameters among adults with type 2 diabetes according to weight status

**Miss Iris Willems**<sup>1,2</sup>, Dr. Vera Verbestel<sup>1</sup>, Prof. Patrick Calders<sup>1</sup>, Prof. Bruno Lapauw<sup>1</sup>, Miss Lotte Bogaert<sup>1</sup>, Dr. Marieke Blom<sup>3</sup>, Assistant Professor Femke Rutters<sup>3</sup>, Dr. Nicole den Braver<sup>3</sup>, Assistant Professor Marieke De Craemer<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Research Foundation Flanders, Brussels, Belgium, <sup>3</sup>Vrije Universiteit Amsterdam, Amsterdam, Netherlands

**S.1.21 - Move, sit, sleep: the co-dependence of physical activity, sedentary behavior and sleep in adults with (pre)diabetes, Clarion Hotel Gillet - Room Swedenborg, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** A population which is known to struggle with a high prevalence of overweight and obesity is the group of adults with type 2 diabetes mellitus (T2DM). The combination of T2DM and overweight or obesity has a detrimental health effect, which in turn makes these adults a high risk group where secondary prevention is important. Therefore, striving for a better cardiometabolic health is important and this is mostly dependent on all movement behaviors that one conducts during a 24-hour day (physical activity (PA), sedentary behavior (SB), sleep). The aim of this study is to compare the 24-hour movement behaviors (24h-MBs) of adults with T2DM regarding their weight status (i.e. normal weight, overweight or obese) and to explore associations with cardiometabolic health within each weight status group.

**Methods:** This study used data of 718 adults with T2DM (151 adults had normal weight, 311 adults were overweight, 256 adults were obese). During the waking day, participants wore an Actigraph GT3X to measure PA and SB and sleep data were collected using a sleep diary. The following cardiometabolic health parameters were collected: HbA1c, fasting glucose, triglycerides, cholesterol, blood pressure, body mass index, and waist circumference. A compositional data analysis approach was conducted to analyze the data.

**Results:** A significant difference in 24h-MBs was found among adults with T2DM for different weight states ( $p < 0.001$ ). The obese T2DM group slept less (510.88 min/day), were more sedentary (720.61 min/day), and performed less light PA (202.37 min/day) and moderate to vigorous PA (6.14 min/day) compared to the normal weight T2DM group (i.e. 531.08; 659.94; 241.10; 7.88 min/day) or overweight T2DM group (i.e. 521.48; 679.70; 230.66; 8.17 min/day). Additionally, these 24h-MBs compositions were significantly associated with adults' cardiometabolic health. Predictions based on time reallocations into more PA by reducing SB while keeping sleep duration unchanged seemed to be beneficial for body mass index, waist circumference, HDL-cholesterol and triglycerides.

**Conclusion:** These results suggest that reallocations of time into a more optimal 24h-MBs composition may be effective for different cardiometabolic health parameters. However, longitudinal and experimental studies are required to confirm these results.

# Application of time-use approaches to study associations of physical activity and sedentary behavior with cardiometabolic risk factors in people with type 2 diabetes and prediabetes

**Dr. Jenny Rossen<sup>1</sup>**, Miss Kristina Larsson<sup>1</sup>, Prof. Maria Hagströmer<sup>1,2</sup>, Prof. Unn-Britt Johansson<sup>1</sup>, Dr. Philip Von Rosen<sup>2</sup>

<sup>1</sup>Sophiahemmet University, Stockholm, Sweden, <sup>2</sup>Karolinska Institutet, Stockholm, Sweden

**S.1.21 - Move, sit, sleep: the co-dependence of physical activity, sedentary behavior and sleep in adults with (pre)diabetes, Clarion Hotel Gillet - Room Swedenborg, June 15, 2023, 2:15 PM - 3:45 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Waking time in sedentary behavior (SB), light physical activity (LIPA), and moderate-to-vigorous physical activity (MVPA) are interrelated. To consider this interrelationship of time in different behaviors it has become recognized that physical activity should be regarded from a time-use approach. We explored the associations of physical activity and SB with cardiometabolic risk factors in people with type 2 diabetes and prediabetes with two time-use approaches.

**Methods:** Cross-sectional data from individuals with prediabetes and type 2 diabetes was used. MVPA, LIPA and SB during the awake time were measured with ActiGraph GT1M accelerometer. Two time-used approaches, isothermal substitution analysis, and compositional data analysis (CoDa) were applied to explore the associations of physical activity and SB with cardiometabolic risk factors such as anthropometrics, glucose metabolism and lipids.

**Results:** Data was provided for 124 participants in the isothermal and 175 participants in the CoDa analyses. Of these 50 respectively 42% were female, mean age was 64 years in both samples. The findings showed strong positive associations with cardiometabolic risk factors for time spent in MVPA and negative associations of time spent in SB relative to time spent in the other behaviors. Theoretically, reallocating time from SB to MVPA was beneficially associated with BMI, waist circumference, and HDL cholesterol. When applying CoDa reallocation of 19 minutes MVPA to SB or to LIPA was associated with a 17% and 17% larger sagittal abdominal diameter, 39% and 36% larger HOMA-IR values, and 3% and 2% lower levels of HDL, respectively.

**Conclusion:** In conclusion, our analyses from two different time-use perspectives showed similar results. The findings support the current evidence of device-measured physical activity and sedentary time. A high proportion of SB is devastating for cardiometabolic health. Maintaining or increasing time in MVPA are the most important features of the time-use behaviors in adults with prediabetes and type 2 diabetes.

# Stranger Danger or Good Samaritan? Examining correlates of parental tolerance of risk among Canadian parents

**Prof. Guy Faulkner**<sup>1</sup>, Ms. Julia McKenna<sup>1</sup>, Mr. Matthew Fagan<sup>1</sup>, Prof. Mariana Brussoni<sup>2</sup>, Prof. Mathieu Belanger<sup>3</sup>, Associate Professor Katie Gunnell<sup>4</sup>, Prof. Mark Tremblay<sup>5,6,7</sup>, Dr. Richard Larouche<sup>8</sup>

<sup>1</sup>School of Kinesiology, University of British Columbia, Vancouver, Canada, <sup>2</sup>Faculty of Medicine, University of British Columbia, Vancouver, Canada, <sup>3</sup>Faculté de médecine et des sciences de la santé, Université de Sherbrooke, Sherbrooke, Canada, <sup>4</sup>Department of Psychology, Carleton University, Ottawa, Canada, <sup>5</sup>Healthy Active Living and Obesity Research Group, CHEO Research Institute, Ottawa, Canada, <sup>6</sup>Department of Pediatrics, University of Ottawa, Ottawa, Canada, <sup>7</sup>Department of Health Sciences, Carleton University, Ottawa, Canada, <sup>8</sup>Faculty of Health Sciences, University of Lethbridge, Lethbridge, Canada

**S.2.21 - Parental perceptions of risk and safety: Do they undermine child and youth physical activity, and can they be reframed?, UKK - Main Hall (Level 6), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Independent mobility (IM; i.e., a child's freedom to move around in public space without adult supervision) is consistently associated with increased levels of active travel, outdoor play and physical activity. However, negative parental perceptions of risk may restrict children's opportunities for IM. Excessively minimizing children's exposure to risks in their environment may have a range of developmental consequences. The purpose of this study was to investigate correlates of parental tolerance of risk among a large sample of Canadian parents.

**Methods:** This is a secondary data analysis using baseline data collected in December 2020 from an ongoing national longitudinal study assessing changes in movement behaviours and IM among children over time. A sample of 2,291 parents of 7-12 year olds completed online questionnaires assessing sixteen potential individuals (e.g., gender), social (e.g., neighbourhood cohesion), and environmental (e.g., walkability) correlates of parental tolerance of risk (Tolerance of Risk in Play Scale). Logistic regressions were created to assess the odds of individual, social, and environmental factors being associated with the most risk averse quartile. The logistic regression was built in hierarchical steps relying on the AIC and pseudo  $R^2$  to inform model progression.

**Results:** The final model had a pseudo  $R^2$  of 0.16. Three correlates were significantly associated with risk aversion in parents. Concerns about stranger danger were found to increase the odds of risk aversion (OR=2.54, CI[2.12, 3.07]). A higher number of children in the home was found to lessen the odds of risk aversion in parents (OR=0.78, CI[0.68, 0.90]). Finally, children of parents born outside of Canada had higher odds of being risk averse compared to parents born in Canada (OR=2.26, CI[1.64, 3.11]).

**Conclusions:** Concerns about stranger danger persist despite occurrences of stranger abduction being extremely rare. Tailored interventions that reframe perceptions of risk of IM for parents are needed. However, such interventions may be challenged in effectively helping parents focus on likelihood rather than the potential of emotionally charged negative events happening. A complementary focus on examining how cultural background influences risk perceptions is needed in future research.

# Is adolescent independent mobility to school influenced by parental sociodemographic characteristics and perceptions?

**Dr. Francisco Javier Huertas-Delgado<sup>1</sup>**, Dr. Manuel Herrador-Colmenero<sup>1,2</sup>, Associate Professor Palma Chillón<sup>2</sup>

<sup>1</sup>La Inmaculada Teacher Training Centre, University of Granada, Granada, Spain, <sup>2</sup>PROFITH "PROmoting FITness and Health through Physical Activity" Research Group, Sport and Health University Research Institute (iMUDS), Department of Physical Education and Sports, Faculty of Sport Sciences, University of Granada, Granada, Spain

**S.2.21 - Parental perceptions of risk and safety: Do they undermine child and youth physical activity, and can they be reframed?, UKK - Main Hall (Level 6), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Independent mobility (IM) has been related to higher physical activity levels, as well as greater autonomy and a better understanding of safety issues in adolescents. Parental sociodemographic characteristics and their perceptions are related to adolescents' mode of commuting behaviours. The purposes of this study were to analyze the sociodemographic characteristics and perceived barriers towards active commuting between mobility groups (independent versus not) and parental sociodemographic characteristics and perceptions.

**Methods:** A total of 365 adolescents, 192 (52.6%) girls, mean age 14.08 ( $\pm 1.02$ ) years old, and their parents from Granada, Valencia, Jaen and Toledo (Spain) participated in this study. Adolescents reported their mode of commuting behaviours, and their parents reported their gender, age, educational level, socioeconomic status and perceived barriers. Educational level, gender and parental barrier differences between the independent and dependent mobility groups were analyzed using the chi-square test, and the age and socioeconomic status differences between independent and dependent mobility groups were analyzed using T-student test. A binary logistic regression model with stepback analysis was fitted to analyze the associations between the IM and the parental sociodemographic characteristics and perceptions that differed between mobility groups, controlled by the adolescents' age and gender, and the distance from home to school.

**Results:** Parents with higher socioeconomic status showed lower levels of IM in their adolescents than those with lower socioeconomic status ( $p=0.001$ ); however, there were not significant associations between parental educational level, gender, and age with the adolescents' IM. The parents of adolescents with IM reported higher importance to crime and the absence of bike lanes (both  $p<0.05$ ), whereas the parents of adolescents who reported dependent mobility to school reported higher importance to distance, walking and cycling convenience (all  $p<0.05$ ). When all the variables were included in the same model, lower socioeconomic status ( $OR=0.700$ ,  $CI=0.500-0.981$ ), higher parental perception about the absence of bike lanes ( $OR=1.420$ ,  $CI=1.135-1.777$ ), lower perception of convenience ( $OR=0.681$ ,  $CI=0.529, 0.876$ ) as barriers were associated with higher IM.

**Conclusions:** Parental concerns about safety were not important in this adolescent sample. Developing programs that focus on overcoming barriers related to parental convenience and developing active travel infrastructure are needed.

# Parent and play ambassador perceptions of ‘risky’ and ‘unstructured’ play. An evaluation of a community-based outdoor ‘loose parts’ play program

**Prof. Patricia Doyle-Baker**<sup>1,2,3</sup>, Ms. Calli Naish<sup>4,5</sup>, Ms. Meghan Ingstrup<sup>5</sup>, Associate Professor Gavin McCormack<sup>1,2,3,4,5,6</sup>

<sup>1</sup>University of Calgary, Calgary, Canada, <sup>2</sup>School of Planning, Architecture, and Landscape, University of Calgary, Calgary, Canada, <sup>3</sup>Alberta Children’s Hospital Research Institute, University of Calgary, Calgary, Canada, <sup>4</sup>Department of Communication, Media and Film, Faculty of Arts, University of Calgary, Calgary, Canada, <sup>5</sup>Department of Community Health Sciences, Cumming School of Medicine, University of Calgary, Calgary, Canada, <sup>6</sup>Faculty of Sport Sciences, Waseda University, Tokyo, Japan

**S.2.21 - Parental perceptions of risk and safety: Do they undermine child and youth physical activity, and can they be reframed?, UKK - Main Hall (Level 6), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Loose parts (LP) play involves providing children with a variety of synthetic typical/atypical and natural materials with which they interact, physically and cognitively, in a self-directed manner. LP offers children with unstructured play opportunities that can facilitate physical activity and social interaction, build confidence and independence, and encourage risk-taking. We explored perspectives of ‘unstructured’ and ‘risky’ play among parents of children who participated in, and among play ambassadors who facilitated a recreational facility-led LP program (Vivo Recreation Play Hubs). The play hubs provided free, supervised unstructured play in six local parks in Calgary (Canada). Vivo implemented the program between autumn 2019 and summer 2022.

**Methods:** We conducted semi-structured telephone interviews on two occasions to gather in-depth information about perceptions of play (10 parents/ambassadors in 2020 and 12 ambassadors only in 2022). Interview questions covered a range of topics related to play and participation in the program, including participant perceptions and experiences in facilitating ‘risky play’. We conducted thematic analysis, but separately on the 2020 and 2022 interview data.

**Results/findings:** Four themes emerged from the 2020 (parents/ambassadors) interviews, revealing commonalities in their perceptions of play and the program: (1) *The importance of play*; (2) *Perceptions of the play environment*; (3) *Facilitating unstructured play*, and; (4) *Community impacts of the play events*. Three themes emerged from the 2022 (ambassadors only) interviews: (1) *Experiences supporting unstructured play*; (2) *Learning to take risks in play*, and; (3) *Value of the play hubs*. Notably, parents and ambassadors recognized the importance of ‘risky’ play for child development and for identifying their physical limits, ability to assess risky situations, and to develop confidence and problem-solving skills. Ambassadors described how their perception of risk changed as they learned about risky and unstructured play, how they supported risky play, and how they educated parents who were hesitant about risky and unstructured play offered at the play hubs. Parents also described the need for balancing risk and safety during play.

**Conclusions:** Strategies for increasing parent awareness about the benefits of risky play and more community programs that offer safe ‘risky’ play may be beneficial for supporting child development.

# Association of perceived home and community environment with adolescent sedentary behaviour

**Dr. Ranjit Mohan Anjana**<sup>1,2</sup>, Dr. Harish Ranjani<sup>1,2</sup>, Dr. Rajendra Guha Pradeepa<sup>1,2</sup>, Prof. Ester Cerin<sup>3,4</sup>, Prof. Anthony Barnett<sup>3</sup>, Prof. Jo Salmon<sup>5</sup>, Prof. Cindy Sit<sup>6</sup>, Prof. Delfien Van Dyck<sup>7</sup>, Dr. Terry Conway<sup>8</sup>

<sup>1</sup>Madras Diabetes Research Foundation, Chennai, India, <sup>2</sup>Dr. Mohan's Diabetes Specialities Centre, Chennai, India, <sup>3</sup>Mary MacKillop Institute for Health Research, Australian Catholic University, Melbourne, Australia, <sup>4</sup>Australia School of Public Health, The University of Hong Kong, Hong Kong, Hong Kong, China, <sup>5</sup>Institute for Physical Activity, Deakin University, Melbourne, Australia, <sup>6</sup>Department of Sports Science and Physical Education, The Chinese University of Hong Kong, Hong Kong, China, <sup>7</sup>Department of Movement and Sport Sciences, Ghent University, Ghent, Belgium, <sup>8</sup>Department of Family Medicine and Public Health, University of California, San Diego, USA, San Diego, USA

**S.2.22 - Relation of home and neighbourhood environments to adolescent physical activity and sedentary behaviour: The IPEN- Adolescent study, UKK - Level 6 Foyer, June 16, 2023, 8:15 - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Understanding environmental correlates of sedentary behaviour among young people is important because children and adolescents tend to have less behavioral autonomy and may be more influenced by environments around them. This paper aims to estimate the associations between perceived home and neighbourhood environments with objective measures of adolescent sedentary behaviour from 14 countries.

**Methods:** Data from the International Physical activity and the Environment Network (IPEN) Adolescent (11-19 years) study were used. Participants wore an accelerometer for seven days, and completed a questionnaire assessing home and neighborhood environment and sedentary behaviours. Accelerometry-assessed sedentary time [ST] was available in 3,982 participants. We estimated the total effect (here defined as an exposure-outcome association unadjusted for environmental mediators) and direct effect (exposure-outcome association adjusted for potential environmental mediators) of each environmental attribute on ST.

**Results:** Having electronic devices at home (especially in the bedroom) was linked to more ST in boys ( $b:1.7$ ;  $CI:0.5,2.9$ ;  $p=0.005$ ) vs. girls ( $b:-0.7$ ;  $CI:-2.0, 0.6$ ;  $p=0.281$ ) who tended to accumulate more sedentary time during out-of-school periods on school days. Having own social media accounts was positively related to reported screen time in all countries ( $b:39.6$ ;  $CI:29.2,50.0$ ;  $p<0.001$ ). A significant inverse association was found between accessibility to walking facilities and ST ( $b:-12.8$ ;  $CI:-19.4, -6.2$ ;  $p<0.001$ ). Parent-perceived access to recreational facilities ( $b:-1.9$ ;  $CI:-3.6, -0.2$ ;  $p=0.033$ ) and pedestrian infrastructure and safety ( $b:-2.1$ ;  $CI:-4.1, -0.01$ ;  $p=0.049$ ) showed significant negative associations with ST during out-of-school periods on school days in the total-effect models, and park proximity ( $b:1.69$ ;  $CI:0.04,3.35$ ;  $p=0.045$ ) showed a positive association in the direct-effect models. A negative association between transit stop proximity and perceived neighbourhood/home environment with ST was observed among girls both in the direct ( $b:-3.1$ ;  $CI:-5.8, -0.4$ ;  $p=0.026$ ) and total-effect ( $b:-3.2$ ;  $CI:-5.8, -0.7$ ;  $p=0.014$ ) models.

**Conclusions:** Our findings indicate both home and neighborhood environment features are related to sedentary time in adolescents, and associations differ by sex. Environmental modifications should be considered to help reduce sedentary time among adolescents globally.

# Association of perceived home and community environment with adolescent sedentary behaviour

A significant inverse association was found between accessibility to walking facilities and ST ( $b:-12.8$ ;  $CI:-19.4,-6.2$ ;  $p<0.001$ ). Parent-perceived access to recreational facilities ( $b:-1.9$ ;  $CI:-3.6,-0.2$ ;  $p=0.033$ ) and pedestrian infrastructure and safety ( $b:-2.1$ ;  $CI:-4.1,-0.01$ ;  $p=0.049$ ) showed significant negative associations with ST during out-of-school periods on school days in the total-effect models, and park proximity ( $b:1.69$ ;  $CI:0.04,3.35$ ;  $p=0.045$ ) showed a positive association in the direct-effect models. A negative association between transit stop proximity and perceived neighbourhood/home environment with ST was observed among girls both in the direct ( $b:-3.1$ ;  $CI:-5.8,-0.4$ ;  $p=0.026$ ) and total-effect ( $b:-3.2$ ;  $CI:-5.8,-0.7$ ;  $p=0.014$ ) models.

**Conclusions:** Our findings indicate both home and neighborhood environment features are related to sedentary time in adolescents, and associations differ by sex. Environmental modifications should be considered to help reduce sedentary time among adolescents globally.

# Evaluating performance of spatial indicators of destinations and land-use mix in international analyses of adolescents' physical activity

**Prof. Ester Cerin**<sup>1</sup>, Dr. Terry Conway<sup>2</sup>, Ms. Kelli Cain<sup>2</sup>, Dr. Marc Adams<sup>3</sup>, Associate Professor Anthony Barnett<sup>1</sup>, Prof. Poh-chin Lai<sup>4</sup>, Prof. Scott Duncan<sup>5</sup>, Dr. Ana Queralt<sup>6</sup>, Prof. James Sallis<sup>1,2</sup>

<sup>1</sup>Mary MacKillop Institute of Health Research, Australian Catholic University, Melbourne, Australia, <sup>2</sup>Herbert Wertheim School of Public Health and Human Longevity Science, University of California San Diego, La Jolla (CA), USA, <sup>3</sup>College of Health Solutions, Arizona State University, Phoenix (AZ), USA, <sup>4</sup>Department of Geography, The University of Hong Kong, Hong Kong, Hong Kong, <sup>5</sup>School of Sport and Recreation, Auckland University of Technology, Auckland, New Zealand, <sup>6</sup>AFIPS Research Group, Department of Nursing, University of Valencia, Valencia, Spain

**S.2.22 - Relation of home and neighbourhood environments to adolescent physical activity and sedentary behaviour: The IPEN- Adolescent study, UKK - Level 6 Foyer, June 16, 2023, 8:15 - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Destination and land-use mix can be operationalised in numerous ways using Geographic Information Systems (GIS). The utility of various GIS-based spatial indicators of destinations and land-use mix for explaining adolescents' physical activity (PA) internationally is yet to be established. This study will describe a range of GIS destinations and land-use measures, examine how they vary across countries, and establish their criterion/content and construct validity in relation to adolescents' PA.

**Methods:** We employed data from 12 cities across nine countries participating in the IPEN Adolescent study. GIS data were used to characterise adolescents' (11-19 years; N~5000) neighbourhoods defined as 1-km street-network buffers around their homes. Eleven categories of spatial indicators of destinations and land-use mix were computed for each participant. Adolescents wore an accelerometer for a week. Average daily minutes of accelerometry-assessed PA and moderate-to-vigorous PA across the whole week and during non-school periods were estimated. Adolescents self-reported the distance of their school from home, active travel to/from school and other types of destinations, and out-of-school PA. Parents of adolescents reported the proximity of 26 types of facilities to home.

**Results:** Descriptive statistics of spatial indicators of destinations and land-use mix will be provided for each city to examine between-city variations. To assess criterion/content validity of the spatial indicators, we will estimate their associations with composite measures of parent-reported proximity to relevant destinations. To assess construct validity of the spatial indicators, we will examine their associations with measures of adolescents' PA. Each PA outcome will be regressed onto each of the indicators after adjusting for potential confounders. Self-reported distance to school will be included as a moderator of the relations of spatial indicators with active transport to school and accelerometry-assessed overall PA. We will also examine the extent to which spatial indicator-PA associations vary across cities.

**Conclusions:** Constructing comparable measures of destinations and land-use mix that can be used to examine environment-PA associations internationally can be challenging. Analyses and results from this study will identify the strengths and limitations of various spatial indicators of destinations and land-use mix available in the IPEN Adolescent study and will inform future studies.

# Parental perceptions of neighbourhood environments and active transport to/from school among adolescents

**Prof. Anna Timperio**<sup>1</sup>, Prof. Scott Duncan<sup>2</sup>, Dr. Muhammad Akram<sup>3</sup>, Dr. Javier Molina-García<sup>4</sup>, Prof. Delfien Van Dyck<sup>5</sup>, Prof. Anthony Barnett<sup>3</sup>, Dr. Ferdinand Salonna<sup>6</sup>, Dr. Anjana RM<sup>7</sup>, Prof. James F Sallis<sup>3,8</sup>, Prof. Ester Cerin<sup>3,9</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition (IPAN), Deakin University, Geelong, Australia, <sup>2</sup>Auckland University of Technology, Auckland, New Zealand, <sup>3</sup>Australian Catholic University, Melbourne, Australia, <sup>4</sup>University of Valencia, Valencia, Spain, <sup>5</sup>Ghent University, Ghent, Belgium, <sup>6</sup>Palacky University, Olomouc, Czech Republic, <sup>7</sup>Madras Diabetes Research Foundation, Chennai, India, <sup>8</sup>Herbert Wertheim School of Public Health, University of California San Diego, La Jolla, USA, <sup>9</sup>School of Public Health, The University of Hong Kong, Hong Kong, Hong Kong

**S.2.22 - Relation of home and neighbourhood environments to adolescent physical activity and sedentary behaviour: The IPEN- Adolescent study, UKK - Level 6 Foyer, June 16, 2023, 8:15 - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Active transport to and from school (ATS) may be an important source of physical activity for adolescents. However, most studies examining correlates of ATS focus on children. This study aimed to estimate associations of parent-perceived neighbourhood environment characteristics with self-reported ATS among adolescents from 15 countries.

**Methods:** Observational cross-sectional design. Data were from the IPEN-Adolescent study and included adolescents (n=6302, mean age 14.5±1.7 years, 54% girls) from 16 diverse cities. Adolescents self-reported the number of days/week they usually travelled to school and from school by walking and by bicycle, as well as the time it would take to walk. Parents completed items from the NEWS-Youth scale, and scores were computed for 13 aspects of the built environment. Latent profile analyses were conducted to identify distinct profiles based on frequency of walking and of cycling to and from school. Generalised additive mixed models were used to estimate associations with 1) any active transport to/from school, 2) regular (5-10 times/week) walking and 3) cycling to/from school and 4) profiles of ATS.

**Results:** Overall, 58.7% reported any ATS, 39.9% regularly walked, 7.7% regularly cycled, and four profiles of ATS were identified: walk to and from school; walk from school; cycle to and from school; no ATS. Distance to school was negatively associated with all outcomes except regular cycling to/from school. Land use mix – diversity was positively related to all ATS outcomes except those pertaining to cycling. Residential density and accessibility and walking facilities were positively associated with any ATS, regular walking to/from school, and walking to and from school vs. no ATS. Residential density was also negatively related to regular cycling to/from school. Positive associations were observed between traffic safety and any ATS, and between safety from crime, aesthetics and the odds of regular cycling to/from school.

**Conclusions:** Parent perceptions of indicators of compact, mixed use development, walking facilities and both traffic and crime-related safety were important supportive correlates of a range of ATS outcomes among adolescents and should be prioritized in shaping neighbourhoods to better support active and environmentally friendly modes of transport. Correlates of walking and cycling differed.

# Development, Validation, and Reliability of a Sex- and Gender-Based Analysis Tool for Health Research

**Mx. Andrew Putman<sup>1</sup>**, Dr. Shilpa Dogra<sup>1</sup>

<sup>1</sup>University of Ontario Institute of Technology, Oshawa, Canada

**S.2.23 - Sex and Gender Based Analysis: Understanding the Landscape and Improving our Approach, UKK - Hall B (Level 3), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** The purpose of this talk is to describe the process of developing and testing a newly designed tool to support researchers with integrating sex- and gender-based analysis in their research.

**Methods:** Development and testing of the tool included three stages. In stage 1, a literature review was performed to inform the development and to confirm the face validity of the tool. An initial draft of the tool was presented to two groups of health researchers for feedback. In stage 2, a Delphi consensus study was undertaken with health researchers from across Canada to confirm content validity. The researchers who participated in the study were identified by their institutions as health researchers. The Delphi study consists of a minimum of three rounds and is completed if all of the items in the tool are validated with a consensus of >75% or if the inter-class correlation between rounds is >75%. In stage 3, external reliability will be assessed using a test-retest design with at least 50 participants in the fall of 2023. Participants will be asked to complete the tool on two separate occasions, at least 4 weeks apart.

**Results:** Based on the literature, the tool consists of a categorical indicator of biological sex at birth, and 4 questions pertaining to aspects of gender that affect health. The 4 gender constructs addressed by the tool are: identity, expression, roles, and relations. The Delphi consensus is underway; results and the updated tool will be presented.

**Conclusions:** There is a dire need for the development of a simple tool for sex and gender-based analysis that can be easily implemented in research studies assessing health and health behaviour outcomes. We present a new tool that will be freely accessible and will enable researchers to better understand the effects of gender on health and health behaviour.

# Quantifying intersectionality in large-scale, population-based studies

**Dr. Eun-Young Lee**, Dr. Lee Airton, Mr. Heejun Lim, Ms. Eun Jung

<sup>1</sup>Queen's University, Kingston, Canada

**S.2.23 - Sex and Gender Based Analysis: Understanding the Landscape and Improving our Approach, UKK - Hall B (Level 3), June 16, 2023, 8:15 AM - 9:30 AM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** To develop and validate a landmark survey tool that will quantify intersectionality in large-scale, population-based sample surveys, using intersectionality-based experiences of physical activity participation as its developmental terrain.

**Methods:** The project is divided into three methodological phases. During Phase 1, questionnaire was developed based on a series of literature reviews on five modules.

- Module 1: Sex, gender identity, gender expression (5 items)
- Module 2: Sexual orientation, sexuality (10 items)
- Module 3: Race, ethnicity, religion, (im)migration, language, Indigeneity (5 items)
- Module 4: (Dis)ability, health and physical status (3 items)
- Module 5: Class, socioeconomic status (4 items)

The questionnaire is currently being reviewed by a panel of experts (Phase 2), following the Delphi method. Phase 3 will establish validity and reliability of the questionnaire. This will involve a pilot study to examine content and construct validity, internal consistency, and test-retest reliability. An online survey program will be used for data collection and will engage the easily accessible population of students in post-secondary institutions as survey participants.

**Results:** The outcome of the developed questionnaire and its psychometric properties will be presented during the symposia.

**Conclusions:** As the Global population continues to diversify, single-variable approaches to studying social participation (including but not limited to physical activity) are increasingly insufficient. Our research corrects for this insufficiency by developing and validating a tool for quantifying intersectionality. This will help various sectors to develop and also justify quality policies and programs that meet the needs of varying social groups in a constantly shifting and increasingly polarized social landscape. This research also innovates in relation to the study of gender in large-scale data sets by operationalizing inter- and intra-categorical gender diversity in lieu of collecting binary sex-based data, and renders both gender identity and gender expression as intersectional variables. Our questionnaire will provide researchers and policymakers with the means to create evidence-based studies and programs that enhance quality of life across an ever-expanding gender spectrum which includes (transgender or non-transgender) women and men, as well as nonbinary people, while refusing the over-simplification of these categories that has long characterized large-scale research.

# Association of wearable device-measured vigorous intermittent lifestyle physical activity with mortality, incident cardiovascular disease and cancer

**Prof. Emmanuel Stamatakis<sup>1</sup>**, Dr. Matthew Ahmadi<sup>1</sup>, Prof. Jason Gill<sup>2</sup>, Prof. Cecilie Thøgersen-Ntoumani<sup>3, 4</sup>, Prof. Martin Gibala<sup>5</sup>, Prof. Aiden Doherty<sup>6</sup>, Prof. Mark Hamer<sup>7</sup>

<sup>1</sup>The University of Sydney, Camperdown, Australia, <sup>2</sup>The University of Glasgow, Glasgow, United Kingdom,

<sup>3</sup>University of Southern Denmark, Odense, Denmark, <sup>4</sup>Curtin University, Bentley, Australia, <sup>5</sup>McMaster University, Hamilton, Canada, <sup>6</sup>Oxford University, Oxford, United Kingdom, <sup>7</sup>University College London, London, United Kingdom

**S.2.24 - Time-efficient accumulation of sufficient physical activity: Vigorous Intermittent Lifestyle Physical Activity (VILPA), UKK - Hall C (Level 3), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** This talk will present results from 3 UK Biobank studies (1 published, two unpublished) examining the associations of VILPA with prospective outcomes in a sample of 25,241 non-exercisers, i.e., people who do not do leisure-time exercise and do not walk regularly for recreation (mean age 61.8 years, 14,178 women/11,063 men).

**Methods & Results:** The first study, which will be published in Nature Medicine in December 2022, examined the association of VILPA with all-cause, cardiovascular disease (CVD) and cancer mortality. Over an average follow-up of 6.9 years, during which 852 deaths occurred, VILPA was inversely associated with all three of these outcomes in a near-linear fashion. As compared to participants who engaged in no VILPA, participants who engaged in VILPA at the sample median frequency of three VILPA bouts per day (lasting up to one or up to two minutes each) showed a 38-40% reduction in all-cause and cancer mortality risk and a 48-49% reduction in CVD mortality risk. Moreover, the sample median duration of 4.4 VILPA minutes per day was associated with a 26-30% reduction in all-cause and cancer mortality risk and a 32-34% reduction in CVD mortality risk.

**Conclusions:** These results indicate that small amounts of vigorous non-exercise physical activity are associated with substantially lower mortality. VILPA in non-exercisers appears to elicit similar effects to VPA in exercisers, suggesting that VILPA may be a suitable physical activity target, especially in people not able or willing to exercise. The second study will examine the associations of VILPA with major adverse cardiovascular events and the third with incident cancer.

# Deriving an empirical definition of vigorous intermittent lifestyle physical activity (VILPA)

**Dr. Matthew Ahmadi<sup>1</sup>**, Prof. Cecilie Thøgersen-Ntoumani<sup>2</sup>, Prof. Emmanuel Stamatakis<sup>1</sup>

<sup>1</sup>The University of Sydney, Camperdown, Australia, <sup>2</sup>University of Southern Denmark, Odense, Denmark

**S.2.24 - Time-efficient accumulation of sufficient physical activity: Vigorous Intermittent Lifestyle Physical Activity (VILPA), UKK - Hall C (Level 3), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** This talk will present a study to provide empirical evidence for VILPA bout length definitions in future studies.

**Methods:** 58 adults (mean age 55.7 (SD=10.1) years) completed five activities of daily living while wearing an indirect calorimetry unit (Cosmed K5) and Polar heart-rate monitor. The activities included: 1) Walking on a flat surface at a self-selected “very fast” pace; 2) Walking on a flat surface whilst carrying shopping-like bags equivalent to 5% of body weight at a self-defined “fast” pace; 3) Walking on a flat surface whilst carrying shopping-like bags equivalent to 10% of body weight at a self-defined “fast” pace; 4) walking at 2.5% gradient at a self-defined “very fast” pace (treadmill); 5) walking at 7.0% gradient at a self-defined “very fast” pace (treadmill). The sequence of activities was randomised for each participant and counterbalanced across participants to prevent biases due to residual fatigue accumulating during the protocol.

**Results:** Participants performed each activity until vigorous intensity was reached for two out of three criteria: 1) %VO<sub>2</sub>max ( $\geq 64\%$ ); 2) %HRmax ( $\geq 77\%$ ); 3) Rating of perceived exertion (Borg Scale)  $\geq 15$ . For %VO<sub>2</sub>max and %HRmax, the threshold had to be met for at least 30 consecutive seconds to minimise the effects of noise. VO<sub>2</sub>max was calculated using the Ebbeling treadmill test and heart rate max was calculated using the Tanaka equation. Between activities, participants had 5 minutes of seated recovery, or until heart rate and breathing returned to resting levels. Resting VO<sub>2</sub> and heart rate were measured at the beginning of each session with the participant lying supine using 5 minutes of steady-state (%CV  $\leq 10\%$ ). The mean time required to reach vigorous intensity in two of the above three physiological intensity indices was 73.5(SD=26.2) seconds across all activities. These results suggest up to 1 minute and up to 2 minute bouts can be used to measure VILPA in free living conditions.

**Conclusion:** This study presents an empirically derived definition for VILPA bout lengths that can be applied in future trials and cohort studies that examine the health-enhancing effects of VILPA.

# A co-design behaviour change intervention to promote Vigorous Intermittent Lifestyle Physical Activity in adults transitioning to retirement

**Miss Bingyan Pang<sup>1</sup>**, Dr. Joanna Moullin<sup>1</sup>, Dr. Craig Thompson<sup>1</sup>, Prof. Cecilie Thøgersen-Ntoumani<sup>1,2</sup>, Prof. Emmanuel Stamatakis<sup>3</sup>, Associate Professor Joanne McVeigh<sup>1,4</sup>

<sup>1</sup>Curtin University, Bentley, Australia, <sup>2</sup>University of Southern Denmark, Odense, Denmark, <sup>3</sup>The University of Sydney, Camperdown, Australia, <sup>4</sup>Wits University, Johannesburg, South Africa

**S.2.24 - Time-efficient accumulation of sufficient physical activity: Vigorous Intermittent Lifestyle Physical Activity (VILPA), UKK - Hall C (Level 3), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** This presentation will provide an overview and systematic outline of applying a theoretical behaviour change framework in developing an intervention to promote Vigorous Intermittent Lifestyle Physical Activity (VILPA) in adults transitioning to retirement.

**Methods:** A circular development process was used to guide the intervention development co-designed with 30 insufficiently active adults transitioning to retirement and 20 healthcare professionals. The Behaviour Change Wheel (BCW) framework was used to 1) seek existing evidence on barriers and enablers to participation in vigorous lifestyle physical activity in adults aged 55 to 75 via a systematic search of literature; 2) understand the barriers and enablers to participation in VILPA via focus groups with adults transitioning to retirement; 3) identify board intervention categories with the research team; and 4) identify intervention content and implementation options with the collaboration of health professionals.

**Results:** Barriers and enablers to participation in VILPA identified through focus groups with adults transitioning to retirement were mapped to the Theoretical Domains Framework (an expansion of the BCW), resulting in the selection of six broad intervention categories. The broad intervention categories are *Education, Persuasion, Incentivisation, Environmental Restructure, Modelling and Enablement*. A literature review and participant focus groups informed the selection of relevant intervention techniques (e.g., self-monitoring of behaviour, social reward, and action planning). Twenty health professionals were asked to consider the clinical utility and practicality of the proposed intervention. They provided peer review of the intervention techniques to refine intervention content and mode of delivery.

**Conclusions:** We present a co-designed, theoretically informed, in-depth and systematic approach to developing an intervention to promote VILPA in adults transitioning to retirement. The feasibility and preliminary efficacy of this intervention will be examined.

# Longitudinal association between retirement-induced changes in 24-h movement behaviors and obesity indicators: compositional data analysis

**Dr. Kristin Suorsa<sup>1</sup>**, Dr. Nidhi Gupta<sup>2</sup>, Dr. Tuija Leskinen<sup>1</sup>, Prof. Lars L Andersen<sup>2</sup>, Mr. Jesse Pasanen<sup>1</sup>, Miss Jaana Pentti<sup>1,3</sup>, Prof. Jussi Vahtera<sup>1</sup>, Prof. Sari Stenholm<sup>1</sup>

<sup>1</sup>University of Turku, Turku, Finland, <sup>2</sup>National Research Centre for the Working Environment, Copenhagen, Denmark, <sup>3</sup>University of Helsinki, Helsinki, Finland

**S.2.25 - Data-driven and compositional data analysis for profiling and assessing the associations of 24-hour movement behaviors and cardiometabolic health, UKK - Hall D (Level 2 - main floor), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Retirement changes 24-h movement behavior composition towards more passive behaviors, especially sleep, in relation to physical activity, but it is not known how these changes affect obesity indicators. This study aimed to investigate longitudinal associations between changes in 24-h movement behaviors and obesity indicators in relation to the transition from work to retirement.

**Methods:** The study population included 213 retiring public sector workers (mean age 63.5 years, standard deviation 1.1) from the Finnish Retirement and Aging study. Daily time spent in sedentary behavior (SED), light physical activity (LPA) and moderate-to-vigorous physical activity (MVPA) were estimated with a thigh-worn Axivity accelerometer which participants wore for at least four days per measurement before retirement and again one year later, when they had retired. Participants' sleep time per 24-h day was estimated using daily logs, in which participants filled in bed times and waking times for each measurement day. Participants' BMI and waist circumference were measured at the same time points. Compositional regression analysis and compositional isotemporal substitution analysis were used to study associations between changes in 24-h movement behaviors and changes in obesity indicators.

**Results:** Increasing MVPA in relation to sleep, SED and LPA was associated with decreasing BMI ( $\beta=-0.60$ ,  $p=0.04$ ) and waist circumference ( $\beta=-2.14$ ,  $p=0.05$ ). Moreover, increasing sleep in relation to SED, LPA and MVPA was associated with increasing BMI ( $\beta=1.30$ ,  $p=0.03$ ). Reallocating 60 min from MVPA to SED and sleep was estimated to increase BMI by on average  $0.8-0.9 \text{ kg/m}^2$  and waist circumference by 3.0 cm during one year. In general, estimated effects of reallocating time away from MVPA on obesity indicators were larger than effects of reallocating time to MVPA.

**Conclusions:** In the transition from work to retirement, changes in MVPA and sleep in relation to the remaining behaviors were associated with changes in obesity indicators. Retirees should be encouraged to maintain or increase their MVPA levels after retirement to prevent weight gain.

# Joint profiles of sedentary time and physical activity in adults and their associations with markers of cardiometabolic health

**Dr. Vahid Farrahi<sup>1</sup>**, Mr. Mehrdad Rostami<sup>1</sup>, Dr. Dot Dumuid<sup>2</sup>, Prof. Sebastien F. M. Chastin<sup>3,4</sup>, Dr. Maisa Niemelä<sup>1,5,6</sup>, Prof. Raija Korpelainen<sup>1,5,6</sup>, Prof. Timo Jämsä<sup>1,5</sup>, Dr. Mourad Oussalah<sup>1</sup>

<sup>1</sup>University of Oulu, Oulu, Finland, <sup>2</sup>University of South Australia, Adelaide, Australia, <sup>3</sup>Glasgow Caledonian University, Glasgow, United Kingdom, <sup>4</sup>Ghent University, Ghent, Belgium, <sup>5</sup>Oulu University Hospital, Oulu, Finland, <sup>6</sup>Oulu Deaconess Institute Foundation, Oulu, Finland

**S.2.25 - Data-driven and compositional data analysis for profiling and assessing the associations of 24-hour movement behaviors and cardiometabolic health, UKK - Hall D (Level 2 - main floor), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Robust evidence exists that, regardless of accumulation patterns, moderate-to-vigorous physical activity (MVPA) could be beneficial for cardiometabolic health. However, how the patterns and variations of sedentary time and light-intensity physical activity (LPA) contribute to adults' cardiometabolic health is unclear. This study aimed to identify and characterize joint profiles of sedentary time and physical activity among adults and investigate how these profiles are associated with markers of cardiometabolic health.

**Methods:** The participants included 3,702 of the Northern Finland Birth Cohort 1966 at age 46 years, who wore a hip-worn accelerometer during waking hours and provided 7 consecutive days of valid data. Sedentary time, LPA, and MVPA on each valid day were obtained, and a data-driven clustering approach ("KmL3D") was used to characterize joint profiles of sedentary time and physical activity intensities. Participants self-reported their sleep duration and performed a submaximal step test with continuous heart rate measurement to estimate their cardiorespiratory fitness (peak heart rate). Linear regression was used to determine the association between the profiles with cardiometabolic health markers, including adiposity markers and blood lipid, glucose, and insulin levels.

**Results:** Four distinct groups were identified: "Active couch potatoes" (n=1,173), "Sedentary light movers" (n=1,199), "Sedentary exercisers" (n=694), and "Movers" (n=636). Although sufficiently active, Active couch potatoes had the highest daily sedentary time (>10 hours) and lowest LPA. Compared to Active couch potatoes, Sedentary light movers, Sedentary exercisers, and Movers spent less time in sedentary by performing more physical activity at light-intensity upward and had favorable differences in their cardiometabolic health markers after accounting for sleep duration, cardiorespiratory fitness, and other potential confounders (1.1%–25.0% lower values depending on the health marker and profile).

**Conclusions:** Regardless of sleep duration and cardiorespiratory fitness, accommodating more physical activity at light-intensity upward in the waking activity behavior composition could benefit cardiometabolic health in adults.

# Daily physical activity patterns and their associations with cardiometabolic biomarkers: The Maastricht Study

**Dr. Tuija Leskinen<sup>1</sup>**, Dr. Valéria Lima Passos<sup>2,3</sup>, Dr. Pieter C. Dagnelie<sup>2,4</sup>, Dr. Hans H.C.M. Savelberg<sup>2</sup>, Dr. Bastiaan E. de Galan<sup>2,4,5</sup>, Dr. Simone J.P.M. Eussen<sup>2</sup>, Dr. Coen D.A. Stehouwer<sup>2,4</sup>, Prof. Sari Stenholm<sup>1</sup>, Associate Professor Annemarie Koster<sup>2</sup>

<sup>1</sup>University of Turku, Turku, Finland, <sup>2</sup>Maastricht University, Maastricht, Netherlands, <sup>3</sup>Royal College of Surgeons in Ireland, Dublin, Ireland, <sup>4</sup>Maastricht University Medical Center+, Maastricht, Netherlands,

<sup>5</sup>Radboud University Medical Center, Nijmegen, Netherlands

**S.2.25 - Data-driven and compositional data analysis for profiling and assessing the associations of 24-hour movement behaviors and cardiometabolic health, UKK - Hall D (Level 2 - main floor), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** The 24-hour accelerometer measurements provide data to study heterogeneity in the daily patterns of physical activity. This study aimed to identify joint daily physical activity patterns over weekdays and weekend days among middle-aged and older adults, and examine their association with cardiometabolic biomarkers in a cross-sectional design.

**Methods:** Overall 6072 participants (mean age 60.2 years (SD 8.6), 50% women) from The Maastricht Study provided daily physical activity data collected with thigh-worn activPAL3 accelerometers (mean 6.5 days, SD 0.7). The patterns of daily physical activity over weekdays and weekend days were identified by using Group Based Trajectory Modeling which clusters individual repeated measurements to identify latent trajectory groups with similar developmental paths. Cardiometabolic biomarkers included measured body mass index (BMI), waist circumference, office blood pressure, and, laboratory assessed glucose, HbA1c, and cholesterol levels. Associations between the physical activity patterns and cardiometabolic outcomes were examined using the analyses of covariance adjusted for sex, age, education, smoking, and diet. Because of statistically significant interaction, the analyses were stratified by type 2 diabetes status.

**Results:** Overall, seven physical activity patterns were identified: consistently inactive (21% of the participants), consistently low active (41%), active on weekdays (15%), early birds (2%), consistently moderately active (7%), weekend warriors (8%), and consistently highly active (6%). The consistently inactive and low active patterns had higher BMI, waist, and glucose levels compared to the consistently moderately and highly active patterns, and these associations were more pronounced for participants with type 2 diabetes. The more irregular patterns accumulated lower daily total activity levels compared to the more consistent patterns but their cardiometabolic profiles were rather similar.

**Conclusions:** The cardiometabolic profile among the patterns accumulating moderate to high levels of daily total physical activity was similar suggesting that the amount rather than the pattern of daily physical activity is more important for cardiometabolic health.

# Cultural adaptations and methodological innovations in developing systemic interventions to combat malnutrition in all its forms in China and Southeast Asian countries through Group Model Building – the SYSTAM CHINA SEACS project

**Dr. Bai Li**<sup>1</sup>, Prof. Boyd Swinburn<sup>2</sup>, Prof. Poh Bee Koon<sup>3</sup>, Prof. Steve Allender<sup>3</sup>, Dr. Zouyan He<sup>5</sup>, Dr. Remco Peters<sup>1</sup>, Dr. Weiwen Zhou<sup>6</sup>, Prof. Yunfeng Zou<sup>5</sup>

<sup>1</sup>University of Bristol, Bristol, United Kingdom, <sup>2</sup>University of Auckland, Auckland, New Zealand, <sup>3</sup>Universiti Kebangsaan Malaysia, Kuala Lumpur, Malaysia, <sup>4</sup>Deakin University, Geelong, Australia, <sup>5</sup>Guangxi Medical University, Nanning, China, <sup>6</sup>Guangxi Centre for Disease Prevention and Control, Nanning, China

**S.2.26 - Is it feasible to apply a systems approach to nutrition interventions in non-western, low- to middle-income countries? Sharing empirical experience from China, Southeast Asia, South Pacific, and the Middle East., UKK - K1 (+K2) (Level 3), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** Different forms of malnutrition share common causes and solutions. They also co-exist at individual-, family-, community- and country-level. However, over- and under-nutrition interventions around the world are often developed in an isolated manner. To effectively tackle the double burden of malnutrition, which is a leading public health crisis in China and Southeast Asian (SEA) countries, this MRC-funded project explored whether and how Group Model Building (GMB) can be applied successfully to develop double-duty nutrition interventions in these countries.

**Methods** Collaborating with national, regional, and local governments in China and Southeast Asian countries, we made cultural adaptations and methodological innovations to the standard GMB process to successfully co-develop double-duty interventions with leaders from 16 governmental departments and the food industry within a pilot city in China. Examples of cultural adaptations were including leaders of a similar seniority in the same workshop to avoid power dynamic issues; and providing hand boards for individual participants to express opposing views friendly. Examples of methodological innovations included development of hybrid methods for the GMB process; and expanding the 3-stage GMB process to include 9 stages. We hosted a high-level, online international forum to 1) share the pilot work with 26 Ministry of Health senior officials from 10 SEA countries, and 2) discuss the feasibility of applying the piloted approach in their countries through three focus groups (in breakout rooms).

**Results** The culturally adapted, hybrid GMB process led to 1) collective prioritisation of inter-sectoral interventions targeting common drivers of over- and under nutrition in the pilot city within 2 themes: environmental pollution and the food supply chain. It also led to the establishment of local Action Groups consisting leaders of various governmental departments for sustainable intervention implementation. Senior SEA officials believe it is feasible to apply the piloted systems approach in their countries, and suggested country-specific issues (e.g. targeting the right level of authority and technical training) to be addressed to maximise success.

**Conclusion** It is feasible to apply a systems approach to developing double-duty nutrition interventions in China and SEA countries. Country-level cultural adaptations and the hybrid GMB process are recommended for SEA countries.

# Lessons from Systems Approaches to Childhood Obesity Prevention Interventions across the South Pacific

**Prof. Steve Allender<sup>1</sup>**

<sup>1</sup>Deakin University, Geelong, Australia

**S.2.26 - Is it feasible to apply a systems approach to nutrition interventions in non-western, low- to middle-income countries? Sharing empirical experience from China, Southeast Asia, South Pacific, and the Middle East., UKK - K1 (+K2) (Level 3), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Childhood obesity represents a global health priority which has proven resistant to prevention efforts. This intransigence flows from the complex relationships of cause and effect which include non-linear effects, operating over different time scales, impacted by multiple external influences resulting in multiple unintended consequences. System science represents a suite of approaches that support the capture of this complexity and the deliberate use of this understanding in the development, evaluation, and evolution of efforts to improve child obesity prevention initiatives. This presentation summarises lessons from 20 years of community-based childhood obesity prevention from countries across the South Pacific, including countries such as Fiji, Tonga and Australia. Comparative reflections on practical differences between countries within this region will be presented.

**Methods:** A system model of the key drivers of community intervention will provide the basis of describing the critical aspects of successful intervention and their intersections. Examples are drawn to illustrate these relationships from across >20 community trials. The trials represent the cutting edge in obesity prevention including rigorous high quality outcome measures.

**Results:** The overarching systems model identified 9 stocks and 4 pairs of central balancing and reinforcing feedback loops. Illustrative key lessons include building commitment through relationships, mutual learning, strengthening collaboration, and embedding capacity. The examples show how critical defining roles and engaging leaders is and the importance of extending this work more broadly than traditional approaches to prevention. This broadening of perspectives creates roles for food retailers, government, and business and emphasises the importance of high-quality data and clear process to systematically address the complexity of obesity.

## **Conclusion:**

The use of systems thinking offers great potential to address the global syndemic of obesity. This presentation demonstrates several of these approaches and the status of current practice.

# How are guidelines for physical activity throughout pregnancy developed?

**Dr. Kristi Adamo**<sup>1</sup>, Dr. Margie Davenport<sup>2</sup>, Dr. Michelle Mottola<sup>3</sup>, Dr. Stephanie-May Ruchat<sup>4</sup>, Dr. Gregory Davies<sup>5</sup>

<sup>1</sup>University of Ottawa, Ottawa, Canada, <sup>2</sup>University of Alberta, Alberta, Canada, <sup>3</sup>University of Western Ontario, London, Canada, <sup>4</sup>Université du Québec à Trois-Rivières, Québec, Canada, <sup>5</sup>Queen's University, Ontario, Canada

**S.2.27 - 9 months and 24-hours: Innovations in 24-hour Movement Behaviors during Pregnancy, UKK - K3+4 (Level 3), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** N. Other

**Purpose:** In light of a wave of new research examining the role of physical activity/exercise in promoting health and wellness in pregnant individuals and their offspring, the absence of clear, evidence-based recommendations represented a gap to be filled. This presentation will describe the process followed by the Canadian team in developing the Clinical Practice Guideline for physical activity throughout pregnancy, including the application of the Appraisal of Guidelines for Research and Evaluation (AGREE) II instrument and the use of the Grading of Recommendations Assessment, Development and Evaluation (GRADE) methodology for rating the quality of recommendations.

**Methods:** A *Guidelines Consensus Panel*, consisting of researchers, methodology experts, exercise professionals and various stakeholder groups was convened, and with input from pregnant individuals, selected a set of key outcomes related to maternal, fetal and neonatal health. A comprehensive literature search strategy was created and performed by a research librarian targeting all relevant databases. The guidelines were informed by a set of twelve systematic reviews describing the impact of PA on outcomes of interest with the intent of illustrating the balance between benefits and potential harms of PA. The GRADE system was used to grade the strength of recommendations.

**Results:** As a result of the guideline development process, the *Guidelines Consensus Panel* arrived at a set of 6 recommendations of varying strength and evidence quality indicating who will benefit, from how much, how often, and what type.

**Conclusion:** Strong recommendations were made specifying that all pregnant individuals without contraindication should be physically active throughout pregnancy. They should engage in a minimum of 150 min of moderate- intensity PA weekly, accumulated over a minimum of 3 days, and greater benefits can be achieved by incorporating a variety of aerobic and resistance training modalities.

# Maternal 24-hour movement behaviors across pregnancy and 1 year postpartum: the LIFE-Moms consortium

**Dr. Chelsea Kracht<sup>1</sup>**, Dr. Kimberly Drews<sup>1</sup>, Dr. Emily Flanagan<sup>1</sup>, Dr. Sarah Keadle<sup>2</sup>, Dr. Leanne Redman<sup>1</sup>  
<sup>1</sup>Pennington Biomedical Research Center, Baton Rouge, USA, <sup>2</sup>Colifornia Polytechnic State University, San Luis Obispo, USA

**S.2.27 - 9 months and 24-hours: Innovations in 24-hour Movement Behaviors during Pregnancy, UKK - K3+4 (Level 3), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** N. Other

**Purpose:** Physical activity (PA) and sleep are critical during the perinatal period for maternal and child health. This analysis aimed to: 1) describe changes to 24-hour movement behaviors (PA, sleep, sedentary behavior [SB]) throughout pregnancy and 1-year postpartum, and 2) examine attainment of movement behavior guidelines in pregnancy and postpartum.

**Methods:** LIFE-Moms was a consortium of behavioral clinical trials for adequate gestational weight gain in women with overweight and obesity. Women assigned to the control group with complete data across all timepoints ( $n=161$ ) were included in the current analysis. Measurement of 24-hour movement behaviors (by Actigraph Gt3x) occurred in early (9-15 weeks) and late (35-36 weeks) pregnancy, and ~1-year postpartum. Sleep was defined by software algorithm identified episodes and remaining accelerometer wear time was used to quantify PA (light PA and moderate-to-vigorous [MVPA]), and SB. Sleep and PA were compared to adult and pregnancy-specific guidelines, respectively. SB was classified into quartiles. Generalized linear mixed models were used to examine changes in movement behaviors across time. Mixed models with appropriate adjustments were used to examine the association between baseline guideline attainment and the number of postpartum guidelines met.

**Results:** Participants were  $31.2 \pm 3.5$  years, 36.6% White, 44.1% overweight, 34.1% class-I obesity. In early pregnancy, approximately half (52.1%) attained one behavior guideline, while others met 2 (25.4%), all 3 (11.2%) or no guidelines (11.2%). There was a significant time effect for all movement behaviors ( $p$ 's < 0.001). Sleep (hours/day) decreased over time ( $7.9 \pm 1.1$ ,  $7.6 \pm 1.3$ ,  $7.2 \pm 1.2$ , respectively). SB (hours/day) increased during pregnancy (early:  $10.1 \pm 1.1$ ; late:  $10.4 \pm 1.1$ ) but then decreased postpartum ( $9.7 \pm 1.1$ ). Conversely, light PA and MVPA decreased during pregnancy and increased from late pregnancy to postpartum. Attainment of the PA guideline and being the lowest SB quartile in early pregnancy were independently related to meeting more guidelines postpartum.

**Conclusion:** In this sample, all three 24-hour movement behaviors changed between early pregnancy and postpartum. SB and PA had a reciprocal relationship across these time points, while sleep duration continually decreased. Supporting mothers to be physically active and spending less time in SB in early pregnancy may help restore a healthy balance of movement behaviors postpartum.

# Movement behaviors and maternal health outcomes: simulation using a compositional data approach

**Prof. Marie LÖf<sup>1</sup>**, Dr. Johanna Sandborg<sup>1</sup>, Ms. Emmie Söderström<sup>1</sup>, Dr. Jairo Migueles<sup>1</sup>

<sup>1</sup>Karolinska Institutet, Huddinge, Sweden

**S.2.27 - 9 months and 24-hours: Innovations in 24-hour Movement Behaviors during Pregnancy, UKK - K3+4 (Level 3), June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** N. Other

**Purpose:** Physical activity is beneficial for maternal and offspring health. However, thus far, focus has primarily been on moderate-to-vigorous physical activity (MVPA), and the co-dependency of the other movement behaviors on the 24hr continuum (sleep; light physical activity, LPA; sedentary behavior, SB) also needs to be considered. In this presentation we will 1) report the results for the proportion of women meeting current guidelines for movement behaviors in early and late pregnancy in a Swedish sample 2) demonstrate and simulate how compositional analyses as a method can be used to examine associations between co-dependent movement behaviors and health outcomes in early and late pregnancy.

**Methods:** These analyses utilize data from the HealthyMoms trial in 306 Swedish women that were repeatedly measured in gestational weeks 14 and week 37. We measured time spent in different movement behaviors by means of wrist-worn accelerometry using ActiGraph wGT3x-BT during seven 24-hr periods. Fat mass index (Bod Pod), and cardiometabolic health indicators (i.e., glucose levels, homeostatic model for insulin resistance [HOMA-IR], systolic and diastolic blood pressure, metabolic syndrome [MetS] score) were also assessed.

**Results:** Seventy-five percent of the women met the guidelines for MVPA in gestational week 14, while the corresponding figure in gestational week 37 was 50%. A high proportion of women (>90%) exceeded the guidelines for SB at both time points. In this sample, reallocating time to MVPA from LPA, SB, and sleep was associated with lower MetS score (adjusted  $\gamma=-0.34$ ,  $P=0.002$ ) in gestational week 14. Correspondingly, reallocating time to LPA from SB and sleep in gestational week 14 was associated with lower fat mass index, HOMA-IR and MetS score (adjusted  $\gamma=-0.47$  to  $-0.78$ ;  $P<0.05$ ) in gestational week 37. We will present different simulations on how changes in the different behaviors may impact the investigated health outcomes.

**Conclusions:** A large proportion of pregnant women in this Swedish sample did not meet current guidelines for MVPA, and had high levels of SB, which is a major public health concern. Our compositional analyses can provide a more comprehensive understanding on how changes in the individual behaviors during pregnancy may improve maternal health outcomes.

# Teachers' perception of integrating high-intensity physical activity breaks into senior school lessons: Findings from the Burn 2 Learn program

**Dr. Angus Leahy**<sup>1,2</sup>, Dr. Mark Babic<sup>1,2</sup>, Ms. Vibeke Hansen<sup>3</sup>, Associate Professor Narelle Eather<sup>1,2</sup>, Dr. Jordan Smith<sup>1,2</sup>, Dr. Sarah Costigan<sup>4</sup>, Prof. David Lubans<sup>1,2,5</sup>

<sup>1</sup>University of Newcastle, Callaghan, Australia, <sup>2</sup>Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>3</sup>Southern Cross University, Coffs Harbour, Australia, <sup>4</sup>Deakin University, Geelong, Australia,

<sup>5</sup>University of Jyväskylä, Jyväskylä, Finland

**S.2.28 - Can school-based high-intensity interval training (HIIT) interventions be scaled-up for population health?, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** In recent years, there has been an increase in the number of school-based high-intensity interval training (HIIT) interventions, however few have specifically targeted older adolescents. This presentation will explore teachers' perspectives of integrating HIIT into academic lessons for older adolescents, and address considerations for implementation at-scale.

**Methods:** Teachers were provided with training, resources, and support to deliver a 16-week HIIT program known as Burn 2 Learn (B2L). Teachers facilitated the delivery of 2-3 HIIT sessions per week during academic lessons. Following the intervention period, twelve teachers who delivered the program completed a semi-structured interview with a member of the research team (~30 minutes per interview). Audio recordings of the interviews were transcribed verbatim and analysed by an independent researcher using a template analysis approach.

**Results:** Four broad themes were identified: (i) appeal and motivation to deliver B2L, (ii) program barriers and facilitators, (iii) impact on students' health, well-being, and cognition, and (iv) sustainability of B2L in schools. The perceived benefit on students' wellbeing and classroom engagement was a primary driver for teachers to deliver the program. Unsurprisingly, academic pressure was reported as the main barrier to delivery, particularly as examinations drew closer. Another barrier was the school uniform that was not conducive to HIIT. Most teachers expressed witnessing a positive impact of the program on students' mental health and classroom focus, which was also noticed by the students themselves.

**Conclusion:** Teachers were supportive of the B2L program, citing benefits for students' wellbeing and classroom engagement as the main reason for implementation. Despite the relatively short time commitment, competing academic pressure was a common barrier to program delivery. As such, researchers may need to explore alternative times during the school day to implement the program (i.e., in the morning before classes). Our findings provide support for re-directing curriculum time towards physical activity in the senior school years. We recommend the scheduling of three mandatory classroom activity breaks (15-20 mins) per week.

# FFIT for girls? A qualitative evaluation of pupils' and teachers' experiences of a school-based high-intensity interval training (HIIT) programme for adolescent girls

**Dr. Kathryn Weston**<sup>1</sup>, Dr. Naomi Burn<sup>2</sup>, Dr. Shaun McLaren<sup>3</sup>, Dr. John Franklin<sup>4</sup>, Dr. Samantha Harrison<sup>4</sup>, Ms. Helene Elliot-Button<sup>5</sup>, Ms. Alice Lester<sup>6</sup>, Dr. Alan Barker<sup>6</sup>, Dr. Matthew Weston<sup>7</sup>

<sup>1</sup>Edinburgh Napier University, Edinburgh, United Kingdom, <sup>2</sup>University of South Australia, Adelaide, Australia, <sup>3</sup>Newcastle Falcons Rugby Club, Newcastle, United Kingdom, <sup>4</sup>Teesside University, Middlesbrough, United Kingdom, <sup>5</sup>University of Hull, Hull, United Kingdom, <sup>6</sup>University of Exeter, Exeter, United Kingdom, <sup>7</sup>University of Edinburgh, Edinburgh, United Kingdom

**S.2.28 - Can school-based high-intensity interval training (HIIT) interventions be scaled-up for population health?, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To explore participants' experiences of FFIT (Fun Fast Interval Tasks) for Girls; a school-based HIIT programme.

**Methods:** Pupils (66 females, aged  $12.4 \pm 0.3$  years [mean  $\pm$  SD]) were recruited from one school to participate in a 4-week HIIT programme called FFIT for Girls. The school neighbourhood was in the first decile (i.e., most deprived) of the English Index of Multiple Deprivation. FFIT for Girls took place during physical education (PE) lessons and comprised 10 maximal effort activities across two sessions weekly (one boxing-based, one running). Intensity was quantified via ratings of perceived exertion. Post-programme, 12 participants took part in focus groups to discuss their experiences. Semi-structured interviews were conducted with PE teachers (n=2). All data were transcribed, then analysed using directed content analysis using NVivo 12.

**Results:** Focus groups revealed some pupils were unsure about the intensity of HIIT but signed up because they wanted to try something new with their friends. Post-programme, pupils described HIIT as physically challenging, leading to sensations of breathlessness, tiredness, and sore muscles, which decreased across the four weeks. Some pupils thought HIIT could be adapted for everyone, whereas others thought some activities exposed they were not as fit as their peers. Generally, pupils viewed boxing more favourably than running. Pupils and teachers thought variety in activities was important for maintaining interest. Post-programme, pupils described feelings of togetherness and feeling fitter and stronger; others felt improved confidence. However, concerns were expressed about HIIT replacing PE lessons, and the potential impact on pedagogical outcomes. The teachers also highlighted that a flexible programme structure, which responded to pupils' needs and the school environment was a key facilitator for successful implementation.

**Conclusions:** FFIT for Girls could be modified to include various HIIT activities, with elements allowing direct peer comparisons minimised. Social support and group dynamics appear important to overall programme experience. To provide potential participants a better understanding of what HIIT can look and feel like, familiarisation sessions could be included in the recruitment of future programmes. To maximise implementation of school-based HIIT at scale, concerns over HIIT replacing, rather than complimenting, PE must be addressed.

# Teacher experiences delivering in-school HIIT incorporating indigenous narratives: the Pau te Hau programme

**Associate Professor Nigel Harris**<sup>1</sup>, Dr. Isaac Warbrick<sup>1</sup>, Dr. Denise Atkins<sup>1</sup>, Mrs. Jacqui Pratt<sup>1</sup>, Mrs. Nikki Penetito-Hemara<sup>1</sup>, Mr. Darrio Penetito-Hemara<sup>2</sup>, Prof. David Lubans<sup>3</sup>, Prof. Rachael Taylor<sup>4</sup>

<sup>1</sup>Auckland University of Technology, Auckland, New Zealand, <sup>2</sup>Toi Tangata, Auckland, New Zealand,

<sup>3</sup>University of Newcastle, Callaghan, Australia, <sup>4</sup>University of Otago, , New Zealand

**S.2.28 - Can school-based high-intensity interval training (HIIT) interventions be scaled-up for population health?, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To explore barriers and facilitators to teachers' delivery of in-school high-intensity interval training (HIIT) incorporating indigenous narratives.

**Methods:** Nine schools, including 834 student participants (11.6±1.0 years, 51.2% female), and 26 teachers participated. The programme known as 'Pau te Hau' consisted of twice weekly 10-15 minute HIIT sessions delivered in classrooms by generalist teachers using the customised Pau te Hau app, and Polar H10™ heart rate monitors for real-time effort feedback projected on screen. The app included exercise and 'pūrākau' videos on which sessions were based. Pūrākau are traditional Māori (indigenous population of Aotearoa New Zealand) stories. Teachers attended a 4-hour professional learning session prior to the start of a 16-week programme punctuated by a 2-week school break. Six of the schools were subsequently closed owing to government imposed COVID-19 restrictions from week nine onwards. At 16-weeks, semi-structured interviews were conducted with all teachers (including those in the COVID affected schools), using open ended interview questions then transcribed and analysed for key themes using NVivo™ software.

**Results:** Teachers identified the following as facilitators of implementation: (i) usability of the Pau te Hau app, (ii) provision of heart rate feedback as a motivator for students, (iii) the curriculum links (such as class analyses of heart rate data in mathematics and incorporation of Mātauranga Māori (Māori knowledge), and (iv) increased student focus and engagement immediately post-session. There was strong general intention expressed for continued implementation. The use of the heart-rate monitors was identified as a potential barrier to future use given their cost and management at school level. Some teachers felt they were not confident to expand on the pūrākau to use as part of teaching practice, or that the links between the pūrākau and the exercises were not clear enough to be meaningful to student engagement and learning.

**Conclusions:** Facilitators of the Pau te Hau programme were generally expressed as factors encouraging further use. The barriers noted might limit broader implementation, hence specific mitigating strategies would need to be pre-emptively offered to enhance sustainability and scalability, however HIIT delivered in the classroom incorporating indigenous narratives by non-specialist teachers appears scalable.

# Methodological foundation for evidence-based co-creation

Ms. Giuliana Longworth<sup>4</sup>, **Ms. Danielle Agnello<sup>1</sup>**, **Ms. Katrina Messiha<sup>3</sup>**, Ms. Rabab Chirou<sup>2</sup>

<sup>1</sup>Glasgow Caledonian University, Glasgow, United Kingdom, <sup>2</sup>Ghent University, Ghent, Belgium, <sup>3</sup>Amsterdam University Medical Centers, Amsterdam, Netherlands, <sup>4</sup>Fundacio Blanquerna, Barcelona, Spain, <sup>5</sup>National Center for Scientific Research Demokritos, Athene, Greece, <sup>6</sup>Umea University, Umea, Sweden, <sup>7</sup>Jacob University, Bremen, Germany

**S.2.29 - Advancing the science of co-creation of health promotion and behaviour change interventions: Health Cascade Network, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** To investigate the theoretical, ethical and methodological underpinning of co-creation to elevate co-creation into a rigorous and evidence-based methodology in collaboration with state-of-the-art digital technologies.

**Methods:** Through robust evidence synthesis, four Early Career Researchers are developing research to enable evidence-based co-creation. As a collective process, these fellows produce a methodology informed through continuous feedback from the multi-sectorial application.

**Methods:** An exhaustive database of scientific publications about co-creation in all field of research was compiled using a systematic search aided by artificial intelligence to consolidate existing knowledge on co-creation. Series of reviews were completed to establish the epistemological underpinning, ontological and ethical guiding principles and named theories currently in use in co-creation in various fields. We developed an exhaustive list of methods and evaluation frameworks that have been used in co-creation and organised them into taxonomy. Finally, using the differentiate principle we are developing key characteristics that have to be enacted by co-creation practice to be evidence-based and rigorous.

**Results:** The database contains over 13000 articles published until 2021. Reviews reveal multiple gaps between the aspiration of using co-creation and how it is delivered in practice. There is a lack of theoretical underpinning and methods used rarely go beyond simply consulting other stakeholders. We have established a working definition for evidence-based co-creation. Further to contemplate a guiding ontology for evidence-based co-creation in public health, such as the promise of critical realism. We have provisional ethical considerations such as 'acting in value' and the critical heuristics of co-creation using existing literature. We have developed a taxonomy of methods and critically appraised different evaluation frameworks.

**Conclusions:** For co-creation to be rigorous and an evidence-based methodology there a need to combine the rigour of Mode 1 research with the participatory and flexible approach of Mode 2 research Gibbons (2000). A Draft Evidence-based Co-Creation for Public Health Guideline is collective ongoing piece of work intended to provide co-creators with step-by-step guidance for executing a co-creation process in public health.

# Enabling Technology for Evidence-Based Co-creation

**Mr. George Balaskas<sup>2</sup>, Mr. Quentin Loisel<sup>1</sup>**

<sup>1</sup>Glasgow Caledonian University, Glasgow, United Kingdom, <sup>2</sup>National Center for Scientific Research Demokritos, Athenes, Greece

**S.2.29 - Advancing the science of co-creation of health promotion and behaviour change interventions: Health Cascade Network, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** How can supportive digital technologies, such as artificial intelligence tools, knowledge management, cloud-based platforms and other tools can assist and enhance the process of conducting, governing and evaluating co-creation? What characteristics these technology need to have in order to enable and enact a rigorous, evidence-based and ethical process?

**Methods:** Two Early Career Researchers are developing investigations to answer these questions. They have established a needs assessment based on qualitative expert interviews, scoping review of the literature (based on the database of co-creation research established by the network) and fieldwork working while developing co-creation protocols in Education, Health Care, Urbanism and Work-place settings. They have reviewed human limitations in the process of co-creation (e.g. bias, power play). They have done review of existing technology and identified gaps.

**Results:** Three class of needs were identified. First, the need for technology enabling the co-creation process including data management and knowledge synthesis, communications and organisation of the process. Second, the need for technology enabling the governance of the process and ensuring transparency, openness and ethics. Third, the need for technology to enable a conducive material and human environment. Existing and gaps in technologies were identified and prioritised. The need for tools to enable rapid evidence synthesis being the top priority. Two prototype technologies have been developed: A question and answer system enabling rapid synthesis of evidence that can be used by co-creators during the process to find evidence and a system capable of listening to co-creation workshops and outputting a summary of key themes and decision made.

**Conclusion:** Technology can enable to surmount some human limitation in the co-creation process but also speed up the process and render it more robust, fairer and more transparent. However, technology with the right characteristics need to be developed and tested.

# Multi-sectorial application of evidence-based co-creation

**Ms. Kunshan Goh<sup>3</sup>, Mr. Anand Kumar Vinayak<sup>6</sup>**, Ms. Janneke De Boer<sup>2</sup>, Ms. Lea Delfmann<sup>2</sup>, Ms. Mira Vogelsang<sup>1</sup>, Ms. Lauren McCaffrey<sup>1</sup>, Mr. Jorge Zapata<sup>4</sup>, Ms. Qingfan An<sup>5</sup>, Ms. Sara Rachdan<sup>3</sup>  
<sup>1</sup>Glasgow Caledonian University, Glasgow, United Kingdom, <sup>2</sup>Ghent University, Ghent, Belgium, <sup>3</sup>Amsterdam University Medical Centers, Amsterdam, Netherlands, <sup>4</sup>Fundacio Blanquerna, Barcelona, Spain, <sup>5</sup>Umea University, Umea, Sweden, <sup>6</sup>Jacob University, Bremen, Germany

**S.2.29 - Advancing the science of co-creation of health promotion and behaviour change interventions: Health Cascade Network, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Evidence-based co-creation methodology complemented by enabling technologies have a multi-sectorial application for health promotion and behaviour change in diverse group of people. The purpose of this talk is to present the range of settings and population in which evidence-based co-creation is being deployed, tested and adapted through action research.

**Methods:** Nine Early Career Researchers are co-creating health promotion interventions in diverse sector and populations including: a) promotion of sleep in school adolescent, b) promotion of physical activity in Small and Medium Enterprises, c) non-pharmaceutical digital health intervention for COPD patients, d) design of common indoor and outdoor spaces for healthy ageing in care home residents, e) place-making for youth-friendly urban spaces to promote health and wellbeing and f) digital health tools for mother and baby health in obstetrics.

**Results:** Collective co-creation protocol clinics, reflection practices and evaluation have been developed to extract lesson learned and improve the methodological foundation of evidence-based co-creation. A co-creation protocol library has been established. Recruitment and early development are underway.

**Conclusions:** Cross-learning from different applications can be extracted for understanding co-creation as applied to various contexts/ settings, demographics and public health concern. Use of the foundational methodology (namely underpinning theory, ethics, methods, implementation and evaluation) as well as supporting technologies to this end provides evidence for learning about what works well and what could be improved.

# Evaluating factors that influence the implementation of the Active Living After Cancer program using the Consolidated Framework for Implementation Research: A mixed-methods study

**Dr. Scherezade Mama<sup>1</sup>**

<sup>1</sup>The University of Texas MD Anderson Cancer Center, Houston, USA

**S.2.30 - Effectiveness and Implementation of Active Living After Cancer: A Community-Based Program to Increase Physical Activity, Physical Function, and Quality of Life in Cancer Survivors, Clarion Hotel Gillet - Room Swedenborg, June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** The Active Living After Cancer (ALAC) program was expanded to MD Anderson's Houston-area locations (HALs) to extend program reach to cancer survivors in the greater Houston area and to test a new delivery model, where HAL employees task-shift to facilitate implementation. This study aimed to understand more about organizational factors that impacted program implementation and reach.

**Methods:** Between July 2021 and April 2022, data were collected through questionnaires and key informant interviews with HAL employees. The Consolidated Framework for Implementation Research (CFIR) was used to guide collection and analysis of questionnaire and interview data. Questions covered key attributes that influence implementation, including inner and outer setting characteristics of HALs, characteristics of individuals involved with implementation of ALAC within HALs, and processes and priorities within HALs that impact implementation. A construct by case matrix was created with ratings for each CFIR construct by interviewee and grouped by HAL to identify which constructs most strongly influenced implementation at each HAL.

**Results:** Twenty individuals across the four HALs completed key informant interviews and a brief questionnaire. An additional four individuals, one at each HAL, completed an organizational questionnaire about the HAL. Individuals who completed questionnaires and interviews included those in leadership and managerial positions (30%), clinical providers (50%), and other clinical staff (20%) at the HALs, and most were involved with the ALAC program as a champion (45%) or facilitator (45%). Most felt physical activity was a high priority to cancer survivors served at their HAL (77.3%) and that implementing ALAC was essential in meeting their organizational goals and objectives (86.4%). When asked what factors helped make implementation successful, individuals mentioned a team-based approach with open and ongoing bidirectional communication, a positive and inclusive culture, regular meetings to aid in implementation planning, and ensuring referrals fit into workflow. Commonly cited barriers included time constraints and a lack of awareness of the program within the HAL.

**Conclusions:** We identified several influential CFIR constructs and their impact on ALAC implementation. Findings reinforce the need for organizational buy-in to facilitate implementation of ALAC into clinical workflow and to extend the reach of evidence-based programs to meet survivorship needs.

# Active Living After Cancer: Program adaptation and outcomes

**Dr. Karen Basen-Engquist<sup>1</sup>**

<sup>1</sup>The University of Texas MD Anderson Cancer Center, Houston, USA

**S.2.30 - Effectiveness and Implementation of Active Living After Cancer: A Community-Based Program to Increase Physical Activity, Physical Function, and Quality of Life in Cancer Survivors, Clarion Hotel Gillet - Room Swedenborg, June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Active Living After Cancer (ALAC) is a community-based program to improve the quality of life (QOL) and physical functioning of cancer survivors by promoting PA and providing navigation services for survivorship issues. In Phase 1 the program was provided to breast cancer survivors through partnerships with a single community organization. In Phase 2 we expanded to include survivors of other types of cancer, caregivers, and additional community partners. Here we report the impact of ALAC on PA, physical function, and QOL in underserved cancer survivors and their caregivers.

**Methods:** Participants in both phases were recruited through community organizations to participate in ALAC, which consists of 12 weekly sessions. They completed assessments of PA (Godin Leisure Time Exercise Questionnaire), physical functioning (6-min walk [phase 1 only], 30-sec sit-to-stand test), and QOL (PROMIS physical and mental health) at baseline and follow-up. Paired samples t-tests were used to assess changes in outcomes.

**Results:** In Phase 1, 188 participants enrolled and 127 provided data at both baseline and follow-up. The mean age of enrollees was 59.6 years (SD=10.7); 31% were white non-Hispanic, 31% were Black, and 27% were Hispanic. 15.5% spoke Spanish primarily. PA and QOL (mental and physical) improved from the baseline to follow-up (all  $P < .01$ ). Physical functioning improved, with increases in sit-to-stand repetitions (mean, 12.5 at the baseline vs 14.9 at the follow-up;  $P < .01$ ) and 6-minute walk distances (mean, 428m at the baseline vs 470m at the follow-up;  $P < .01$ ). Improvements were similar across the three racial/ethnic groups. In phase 2, 540 cancer survivors ( $M_{age}=61.1 \pm 11.3$ ) and 87 caregivers ( $M_{age}=62.3 \pm 13.1$  years) enrolled; participants were mostly women (91%), Hispanic (61%) or non-Hispanic Black (19%). Both survivors and caregivers experienced improvements in PA, physical functioning (30-sec sit-to-stand), and QOL.

**Conclusions:** Results indicate ALAC is effective for improving PA, physical functioning, and QOL among medically underserved cancer survivors and their caregivers. Furthermore, ALAC was successfully implemented by community partners within community settings and reached minority and medically underserved cancer survivors. Additional dissemination and implementation efforts are warranted to further extend reach, improve cancer survivorship, and reduce cancer health disparities among underserved cancer survivors.

# Program outcome comparisons between in-person vs. virtual group-based physical activity intervention for cancer survivors: Results from Active Living After Cancer

**Dr. Yue Liao<sup>1</sup>**

<sup>1</sup>University of Texas at Arlington, Arlington, USA

**S.2.30 - Effectiveness and Implementation of Active Living After Cancer: A Community-Based Program to Increase Physical Activity, Physical Function, and Quality of Life in Cancer Survivors, Clarion Hotel Gillet - Room Swedenborg, June 16, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** The Active Living After Cancer (ALAC) is an evidence-based program to help cancer survivors be more physically active through 12 weekly group sessions. In March 2020, ALAC stopped the in-person group meetings and converted to a virtual format via videoconferencing in response to the coronavirus pandemic. This study aims to examine the differences in program outcomes between ALAC participants who completed the program in-person vs. those who completed it virtually.

**Methods:** ALAC participants' attendance and program outcomes were compared between those who attended the program virtually vs. those who attended in-person. Participants completed questionnaires which included items to assess physical activity and quality of life, and a 30-second sit-to-stand test (observed via video call for virtual groups) to assess physical functioning at baseline and follow-up. Repeated measures ANOVA was used to test differences between group over time.

**Results:** A total of 578 cancer survivors who attended the in-person program and 191 who attended the virtual program were included in the analysis. Participants in the in-person program were older (61 vs. 58 yrs old), less educated (22% vs. 35% college degree or above) and had a higher portion using Spanish as the primary language (65% vs. 53%) compared to those attended the virtual program ( $p < .05$ ). Only 55% in-person participants attended at least nine sessions vs. 71% in the virtual participants did so ( $p < .05$ ). Both groups increased their physical activity from baseline to follow-up ( $p < .05$ ) at the similar level. Participants in the virtual program had a greater improvement in physical functioning than those in the in-person program ( $p < .05$ ). No changes in quality of life were observed for both programs.

**Conclusions:** Preliminary data suggested that the virtual ALAC program is feasible and produces similar outcomes when compared to the in-person program. However, those who are willing and able to participate in a virtual program might have different demographics than those who participate in an in-person program. Future community-based programs should consider offering both in-person and virtual options to increase the opportunity to engage individuals from diverse backgrounds.

# Get-up study: a cluster RCT on the effects of reduced sitting on toddlers' cognitive development

**Dr. Eduarda Sousa-Sá**<sup>1,2,3,6</sup>, Prof. Anthony D. Okely<sup>1,4</sup>, Associate Professor Dylan P Cliff<sup>1</sup>, Dr. Zhiguang Zhang<sup>5</sup>, Dr. Sanne L.C. Veldman<sup>1,7</sup>, Dr. João R. Pereira<sup>1,2</sup>, Dr. Sara S. Pereira<sup>2,3</sup>, Associate Professor Steven J. Howard<sup>1</sup>, Dr. Rute Santos<sup>3,6</sup>

<sup>1</sup>University of Wollongong, Wollongong, Australia, <sup>2</sup>Lusófona University, Lisbon, Portugal, <sup>3</sup>University of Porto, Porto, Portugal, <sup>4</sup>Western Norway University of Applied Sciences, Sogndal, Norway, <sup>5</sup>Beijing Normal University, Beijing, China, <sup>6</sup>Laboratory for Integrative and Translational Research in Population Health, Porto, Portugal, <sup>7</sup>Vrije Universiteit, Amsterdam, Australia

**S.2.31 - Understanding and improving physical activity and sedentary behaviour: From infancy to adolescence, UKK - Main Hall (Level 6), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Introduction:** Early childhood is a critical period to establish healthy patterns of physical activity and sedentary behaviours (SB), as well as positive trajectories for cognitive development. Cognitive development is paramount in the early years given its influence on future cognitive performance, academic achievement, health and wellbeing. The aim of this study was to describe the effects of reducing sitting time on cognitive development in Australian toddlers, from low to middle socio-economic strata, of the Get-Up! Study.

**Methods:** The Get-Up! Study was a 12-month, 2-arm parallel-group cluster RCT that included 27 Early Childhood Education and Care services and 333 healthy children (aged 12-26 months) at baseline. The intervention included four main strategies: (i) Educators' Professional development, (ii) Provision of resources/instrumental materials, (iii) Follow-up support and (iv) Performance monitoring and feedback. At baseline and at 12-month follow-up, we assessed cognitive development (Bayley Scales of Infant and Toddler Development Third edition) sitting time, sedentary time, and physical activity (accelerometers) as primary outcomes. Secondary outcomes included cardiovascular health, bone density and motor development. Randomization sequence was performed with a 1:1 allocation to intervention or control group (random block sizes of 2, 4 and 6, at the cluster level). The intervention was blinded to participants.

**Results:** Multilevel regression models showed that the 'Get-Up' study significantly increased the number of breaks in sitting time ( $\beta=29.51$ ,  $p=0.016$ ; 95% CI 5.49-53.54), light and total physical activity time, ( $\beta=17.86$ ,  $p=0.039$ ; 95% CI 0.87-34.84 and  $\beta=23.97$ ,  $p=0.033$ ; 95% CI 1.92-46.03, respectively), during childcare hours. The RCT showed significant effects on toddlers' cognitive development ( $\beta=11.34$ ,  $p=0.01$ ; 95% CI 4.61-18.07). as well as on toddler's motor development, specifically on object manipulation skills scores ( $\beta=0.76$ ,  $p=0.02$ ; 95% CI 0.12-1.40) after controlling for confounders. No adverse events or side effects were observed.

**Conclusions:** The results showed that a simple and affordable intervention, based on professional development targeting educators, to reduce sitting time in young children, during childcare hours, was able to increase breaks in sitting time and physical activity levels, as well as enhance cognitive and motor development.

# Gaining parent and child insights to design a screen time management program

**Dr. Lauren Arundell**<sup>1</sup>, Ms. Laura Gould<sup>1</sup>, Associate Professor Nicola D. Ridgers<sup>1,2</sup>, Dr. Ana Maria Contardo Ayala<sup>1</sup>, Dr. Katherine Downing<sup>1</sup>, Prof. Jo Salmon<sup>1</sup>, Prof. Anna Timperio<sup>1</sup>, Associate Professor Jenny Veitch<sup>1</sup>  
<sup>1</sup>Deakin University, Burwood, Australia, <sup>2</sup>University of South Australia, Adelaide, Australia

**S.2.31 - Understanding and improving physical activity and sedentary behaviour: From infancy to adolescence, UKK - Main Hall (Level 6), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Screen time is ubiquitous in the lives of children and families, and excessive use can impact physical, social, and mental health and wellbeing. To develop effective programs to help families manage screen time, it is crucial to understand their screen time management experiences and gain insight into their wants and needs for program delivery, strategy design and content, and how to maintain engagement in the program.

**Methods:** Thirty families in Victoria, Australia participated in semi-structures online interviews (parents mean age 40.8 years, 90% female; children mean age 11.4 years, 47% female). The interviews asked about developing a screen time management program for families, specifically who the program audience should be, their preferred delivery platform and delivery mode, what information, strategies and content they would want in the program, and how to maintain program engagement. Interviews were audio taped, transcribed, imported to NVivo, and analysed using inductive thematic analysis and a summative content analysis approach.

**Results:** The majority of families are experiencing challenges trying to manage screen time at home. Families are seeking a screen time management program with the preferred audience being both the parent and child. They want the program delivered online (website or app) with a combination of static and interactive content that could be accessed as needed. Seven categories of content/strategies for the program were sought by families including age-appropriate health information, accessing safe and appropriate online content including cyber-safety, goal setting and rewards, screen monitoring tools particularly for variable platforms and operating systems, examples of alternative activities to screen time, opportunities for parent social connections and sharing of experiences, and links to reputable information. To maintain engagement, it was suggested to include reminders sent via text message or through push notifications from the online platform.

**Conclusions:** Parents are urgently seeking help to manage screen time at home. Findings provide end-user insights into the preferred delivery, strategy design and content and engagement maintenance strategies, which should be considered in the development of a screen time management program for families.

# The mediating role of perceived motor competence and physical literacy on adolescent's physical activity participation

Dr. Nuria Ortega-Benavent<sup>1</sup>, Dr. Cristina Menescardi<sup>1</sup>, Dr. Jorge Romero-Martínez<sup>1</sup>, **Associate Prof. Isaac Estevan**

<sup>1</sup>University of Valencia, Valencia, Spain

**S.2.31 - Understanding and improving physical activity and sedentary behaviour: From infancy to adolescence, UKK - Main Hall (Level 6), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** An alarming trend of low physical activity (PA) participation in youth is evidenced globally. Actual and perceived motor competence (AMC and PMC, respectively) have been reported to be precursors to long-term PA participation. Specifically, a mediating role of PMC into the relationship between AMC and PA was proposed, and a recent systematic review suggested indeterminate evidence for this path. In addition, MC can also contribute to mental health decreasing anxiety and social stress. So, maybe it is not only PMC that mediates the association between AMC and PA but further aspects linked to self-perception in physical, affective and cognitive domains impacting PA participation. In this line, physical literacy involves the aforementioned domains and is defined as the motivation, confidence, physical competence, knowledge and understanding to value and take responsibility for engagement in PA throughout the lifespan. As a part of the ALPHYL project, the purpose of this study was twofold: (1) to analyse the influence of PMC on the relationship between AMC and PA and, (2) to analyse the mediating role of perceived physical literacy (PPL) in this relationship.

**Methods:** A sample of 222 students (112 girls, 50.5%) aged 12-14 years ( $12.31 \pm 0.57$ ) from four different high-schools participated voluntarily. The PAQ-A, the CAMSA test, the PMSC and the Perceived Physical Literacy scales were used to measure PA, AMC, PCM and PPL, respectively, in the respective schools. Structural equation models controlled by gender were conducted.

**Results:** Regarding the first aim, the results reveal a positive association between AMC and PA both in the direct and in the PMC-mediated relationship pathway. Regarding the second aim, the PPL mediated the relationship AMC-PA practice. Consequently, there are psychosocial factors related to adolescents' self-perception (PMC and PPL) that impact their PA practice. Secondary-school PE teachers and practitioners should maintain a holistic approach by fostering not only physical but psychological, social and cognitive aspects because this is associated with the multicomponent perspective of PA.

**Conclusion:** Finally, physical literacy promotion could be a main goal into the school setting so that adolescent's active lifestyles are fostered (e.g., peers support and effective feedback during PE classes).

# Research- vs. government-driven physical activity policy monitoring: a systematic review across different levels of government

**Dr. Sven Messing<sup>1</sup>**, Dr. Antonina Tcymbal<sup>1</sup>, Dr. Karim Abu-Omar<sup>1</sup>, Ms. Diana Richardson<sup>1</sup>, Dr. Peter Gelius<sup>1</sup>  
<sup>1</sup>Friedrich-Alexander-Universität Erlangen-Nürnberg, Erlangen, Germany

**S.2.32 - Monitoring and assessing physical activity policy from local to national level., UKK - Level 6**  
**Foyer, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Even though the importance of physical activity policy monitoring has increased in the last decade, there is a lack of understanding what different approaches exist and which methodology they employ. In order to address this research gap, this review attempts to map existing approaches of physical activity policy monitoring and to analyse methodological aspects, especially with regards to the roles of governments and researchers.

**Methods:** A systematic search was conducted in five scientific databases, using the terms “physical activity”, “policy” and “monitoring” and their variations. In total, 12.963 studies were identified and, after the elimination of duplicates, screened independently by two reviewers. During full text analysis, information on methodological aspects was extracted and studies were categorized based on the level of government involvement.

**Results:** The search yielded in a total of 112 studies. More than three quarters of these studies followed a research-driven approach (little or no government involvement) while only two studies were based on a government-driven approach (led by governments). The remaining studies were based on a co-production approach (strong collaboration between researchers and governments). All in all, 18 different tools for physical activity policy monitoring were identified; key examples are the Report Cards on Physical Activity for Children and Youth (research-driven approach), the HEPA Monitoring Framework (government-driven approach) and the HEPA Policy Audit Tool (co-production approach).

**Conclusions:** The level of government involvement in policy monitoring differs significantly, and research-driven, government-driven and co-production approaches can be distinguished. These approaches have different strengths and weaknesses, and can be linked to distinct theories of change and models on research-policy relations. Increasing awareness on the implications of these approaches is key to improve the understanding and further development of physical activity policy monitoring.

# Reviewing local Physical Activity Policy: The CAPLA-Sante tool and its application

Dr. Antoine Noel-Racine<sup>1</sup>, Dr. Aurelie Van Hoyer<sup>2</sup>, Mrs. Amandine Baron<sup>3</sup>, Prof. Anne Vuillemin<sup>1</sup>, **Prof. Catherine Woods<sup>2</sup>**

<sup>1</sup>Université Côte d'Azur, Nice, France, <sup>2</sup>University of Limerick, Limerick, Ireland, <sup>3</sup>French Society of Public Health, Laxou, France

**S.2.32 - Monitoring and assessing physical activity policy from local to national level., UKK - Level 6**  
**Foyer, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The promotion of health-enhancing physical activity (HEPA) has become a key objective in public health policy, but the lack of tools at local level is limiting its implementation. Based on the national HEPA Policy Audit Tool Version 2 (HEPA-PAT) of the World Health Organization, the CAPLA-Santé tool was designed to support local governments in assessing HEPA policies. The presentation will describe the adaptation process of the HEPA PAT, as well as results from data collection in France.

**Methods:** The adaptation work was conducted in three stages: (1) an intersectoral group of experts was constituted, and the group adapted each item of the HEPA PAT v2 tool to the local level; (2) a testing phase with seven local governments helped to collect data and feedback on the tool; and (3) a final workshop was organized to adjust and finalize the tool. Then, the CAPLA-Santé was used among 17 cities of the French Riviera.

**Results:** The final version of CAPLA-Santé contains 21 items divided into six major sections: overview of HEPA stakeholders in the local government area, policy documents, policy contents, funding and political engagement, studies and measures relating to physical activity in the local government area, and progress achieved and future challenges. Main findings using CAPLA included that written HEPA policy documents were formalized in only six cities. These documents (n = 14) were mainly from the sports (n = 8) and health services (n = 4) sectors. The key informants reported that support from national policy, the commitment of elected officials, and large local stakeholder networks facilitated HEPA promotion, whereas the lack of intersectoral collaboration and limited resources were the main barriers.

**Conclusions:** CAPLA-Santé allows the collection and in-depth analysis of local level policies to assess the progress in promoting HEPA and intersectoral collaboration as well as identifying successful policy levers and remaining challenges.

# Assessing the implementation of physical activity-promoting public policies in Ireland: A Study using the Physical Activity Environment Policy Index (PA-EPI)

**Mr. Kevin Volf<sup>1</sup>**, Dr. Liam Kelly<sup>1</sup>, Dr. Aurelie Van Hoyer<sup>1</sup>, Dr. Enrique García Bengoechea<sup>1,2</sup>, Prof. Catherine Woods<sup>1</sup>

<sup>1</sup>University of Limerick, Limerick, Ireland, <sup>2</sup>Sport Ireland, Dublin, Ireland

**S.2.32 - Monitoring and assessing physical activity policy from local to national level., UKK - Level 6 Foyer, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Government policy can promote physical activity (PA) as part of a multilevel systems-based approach. The impact of government policy is determined by its design and its implementation. The Physical Activity Environment Policy Index (PA-EPI) is a tool, consisting of 45 good practice statements (GPS) or indicators, and a monitoring framework to assess government policies and actions for creating a healthy PA environment. This study presents the results of the PA-EPI in Ireland.

**Methods:** An iterative 8-step process was undertaken. Steps 1 to 4 involved collecting concrete examples of evidence of action or inaction on policy implementation and its validation by government officials. A national PA coalition (N=32), a group of non-government public health and PA stakeholders, was established and rated the evidence of the extent of implementation of policy and infrastructure support against international best practice (steps 5-6). A 4-category scorecard was used to attribute high, medium, low or none/very little implementation to each indicator, generating a PA-EPI score. The final steps (7-8) identified future implementation priorities, actions and dissemination strategies.

**Results:** Of the 45 PA-EPI indicators, one GPS received a rating of none/very little, 25 low and 19 medium implementation. Critical implementation gaps were identified in the transport, urban design and healthcare policy domains, while sport and education fared better. In infrastructure support, evidence of gaps emerged for the Health in all Policies domain. While no GPS was rated as fully implemented by the panel, the GPSs that were implemented to the greatest extent related to government action to sustain mass media campaigns promoting PA and the monitoring of PA across the life course. Ten priority recommendations for public sector action on implementation were developed.

**Conclusions:** The PA-EPI tool can help policymakers determine where their country is now in relation to the implementation of policies to enhance PA, what is possible to change. It provides pathways on how to address implementation gaps and a mechanism for documenting progress. Country cross comparisons of PA-EPI results will, in time, help establish benchmarks for governments at the forefront of creating and implementing policies to address physical inactivity.

# The ‘necessity- versus choice-based physical activity models’ framework

**Dr. Deborah Salvo<sup>1</sup>**, Dr. Alejandra Jauregui<sup>2</sup>, Dr. Deepti Adlakha<sup>3</sup>, Dr. Olga Sarmiento<sup>4</sup>, Dr. Rodrigo Reis<sup>5</sup>  
<sup>1</sup>The University of Texas at Austin, Austin, USA, <sup>2</sup>Instituto Nacional de Salud Publica, Cuernavaca, Mexico, <sup>3</sup>North Carolina State University, Raleigh, USA, <sup>4</sup>Universidad de los Andes, Bogota, Colombia, <sup>5</sup>Washington University in St. Louis, St. Louis, USA

**S.2.33 - When moving is the only option: the role of necessity versus choice for understanding and promoting physical activity in Low- and Middle-Income Countries, UKK - Hall B (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** For many, physical activity is not a “healthy choice”, but an economic necessity. The aim of this paper is to describe a new conceptual tool for guiding contextually-relevant physical activity research and promotion efforts globally, with emphasis in low- and middle-income countries (LMICs): the “necessity- vs. choice-based physical activity models” framework.

**Methods:** A critical review of the physical activity literature was conducted to understand why to date most physical activity research and promotion efforts are framed through a “choice-based model. This included a summary of the: a) historical population patterns and drivers of physical activity, b) origins and evolution of the field of physical activity and health research, and c) key macro-level drivers of physical activity in LMICs. A new framework for conducting ethical and contextually-relevant physical activity research and promotion in different global settings, including those where physical activity is the result of economic necessity, was developed.

**Results:** We identified the “physical activity transition” and “physical activity paradox” theories as critical for understanding population patterns and drivers of physical activity in LMICs. Data from a selection of LMICs and high-income countries on the share of the population in physical labor jobs, car ownership prevalence, and income inequality measures, support the need for a necessity-based model of physical activity in these settings. The “necessity- vs. choice-based physical activity models” framework includes: 1) a classification of the domains that contribute to choice- (leisure and choice-based active transport), versus necessity- (occupational and necessity-based active transport) based physical activity; 2) the use of macro-contextual information to determine the predominant physical activity model in the population (economic context, epidemiological context, job market, family life, crime and violence, infrastructure and traffic safety, travel mode patterns, and discretionary time patterns); and 3) a 5-stage process for conducting contextually-responsive physical activity research and promotion with consideration of the underlying model in the given setting (necessity vs. choice based).

**Conclusion:** To promote equity, physical activity research, programs and policies in LMICs must focus on improving the conditions under which necessity-driven physical activity occurs for a vast majority of the population, whilst increasing opportunities for active leisure.

# Innovative strategies to improve the conditions in which necessity-based physical activity takes place in LMICs: case study of informal urban settlements in Bogotá, Colombia

**Dr. Olga Sarmiento**<sup>1</sup>, Dr. Alejandra Jauregui<sup>2</sup>, Dr. Deepti Adlakha<sup>3</sup>, Dr. Rodrigo Reis<sup>4</sup>, Dr. Deborah Salvo<sup>5</sup>

<sup>1</sup>Universidad de los Andes, Bogotá, Colombia, <sup>2</sup>Instituto Nacional de Salud Pública, Cuernavaca, Mexico,

<sup>3</sup>North Carolina State University, Raleigh, USA, <sup>4</sup>Washington University in St. Louis, St. Louis, USA, <sup>5</sup>The University of Texas at Austin, Austin, USA

**S.2.33 - When moving is the only option: the role of necessity versus choice for understanding and promoting physical activity in Low- and Middle-Income Countries, UKK - Hall B (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Cable cars are part of a novel sustainable transport model emerging in multiple Latin American cities for providing efficient public transport options to low-income populations living in informal urban settlements, for whom commuting times are otherwise extremely high, hindering their quality of life and reducing their free-time. We assessed the effects of TransMiCable on physical activity among dwellers of informal urban settlements in Bogotá, Colombia.

**Methods:** The natural experiment TrUST (Urban Transformations and Health) was conducted in 2018 and 2019 in intervention and control neighbourhoods. Physical activity was assessed before and after the implementation of the TransMiCable system using questionnaires (825 and 854 adults in the intervention and control groups) and accelerometers (357 and 334 adults in the intervention and control groups). Physical activity was also assessed using direct observation in parks in the studied areas. Multilevel regression models were used to assess changes in physical activity associated with the implementation of TransMiCable.

**Results:** 40.5% of adults in the intervention-group reported walking for transport more than 150 minutes per week before the TransMiCable and 51.6% afterwards (95% CI for the change: 6.4%, 15.9%), but this change did not differ from controls (OR 1.1; 95% CI 0.8, 1.5). Moderate-to-vigorous physical activity measured with accelerometry was 52.1 minutes per day before and 59.4 minutes per day after the TransMiCable in new users (95% CI for change: -22.5, 7.9). We observed an increase in physical activity in one of the intervention-neighborhood parks among males (OR 2.7; 95% CI 1.1, 6.8).

**Conclusion:** It is encouraging that physical activity remained high after implementing a new public transport system that significantly reduces overall commuting times (and hence enhances quality of life) for disadvantaged, low-income groups, for whom walking is the result of necessity and not “a healthy choice”. Urban transport interventions that improve the conditions in which necessity-driven physical activity takes should be accompanied by efforts to improve opportunities for active leisure, to avoid net-losses in overall physical activity, while improving equity and quality of life for urban commuters.

# Uncovering the necessity-based model of physical activity in middle-income country cities: exploring the role of motor-vehicle access on physical activity in Cuernavaca, Mexico, and Chennai, India.

**Dr. Deepti Adlakha**<sup>1</sup>, Dr. Alejandra Jauregui<sup>2</sup>, Dr. Olga Sarmiento<sup>3</sup>, Dr. Rodrigo Reis<sup>4</sup>, Dr. Deborah Salvo<sup>5</sup>

<sup>1</sup>North Carolina State University, Raleigh, USA, <sup>2</sup>Instituto Nacional de Salud Publica, Cuernavaca, Mexico,

<sup>3</sup>Universidad de los Andes, Bogota, Colombia, <sup>4</sup>Washington University in St. Louis, St. Louis, USA, <sup>5</sup>The University of Texas at Austin, Austin, USA

**S.2.33 - When moving is the only option: the role of necessity versus choice for understanding and promoting physical activity in Low- and Middle-Income Countries, UKK - Hall B (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Efforts to promote active transportation remain under-developed in low- and middle-income countries (LMICs). This study explored the applicability of a necessity-based model of active transportation in two LMIC cities with comparable levels of socioeconomic inequality, by examining the association of motor-vehicle ownership with domain-specific physical activity outcomes.

**Methods:** We conducted a cross-sectional analysis of 674 and 367 adults ( $\geq 18$  years) from Cuernavaca, Mexico (MEX) (2011), and Chennai, India (IND) (2015), respectively. Data were collected using standardized procedures of the International Physical Activity Environment Network adult study. Logistic regressions adjusting for age, sex, education, marital status, and neighborhood sampling cluster estimated the effect of motor vehicle ownership (yes/no) on: 1) any public transit use for commuting; 2) active travel (walking, bicycling) for commuting, 3)  $\geq 150$  minutes/week of leisure-time walking, 4)  $\geq 150$  minutes/week of leisure-time moderate-to-vigorous physical activity (MVPA), and 5)  $\geq 150$  minutes/week of transport-based physical activity. Analyses were stratified by site.

**Results:** In both sites, a higher proportion of participants met recommendations through transport-based physical activity (MEX=46.8%; IND=25.6%), versus leisure-time walking (MEX=14.2%; IND=22.5%) or leisure-MVPA (MEX=20.4%; IND=20.2%). In MEX and IND, after adjusting for covariates, owning a motor-vehicle was significantly associated with lower odds of any public transit use (MEX: OR=0.2, 95%CI=0.2-0.3; IND: OR=0.3, 95%CI=0.1-0.9), any use of active transportation (MEX: OR=0.2, 95%CI=0.2-0.3; IND: OR=0.1, 95%CI=0.0-0.6), and achieving  $\geq 150$  minutes/week of transport-based physical activity (MEX: OR=0.7, 95%CI=0.5-1.0; IND: OR=0.3, 95%CI=0.1-0.8). Motor vehicle ownership was not significantly associated with achieving  $\geq 150$  minutes/week of leisure-time walking or MVPA in either site ( $p>0.05$ ). Findings are consistent with studies from LMICs like Mexico, Colombia, and Nigeria, where car ownership is negatively associated with transport-based activity levels.

**Conclusions:** Most physical activity in both cities is transport-related, and occurs the most among people without access to cars. Participation in leisure-time physical activity in these settings is low. Physical activity research and promotion efforts in Chennai and Cuernavaca should take into consideration the operating necessity-based model for physical activity, by focusing on improving the conditions in which necessity-driven physical activity takes place, changing social norms around car ownership, and increasing opportunities for choice-based physical activity.

# Optimal movement behaviour patterns for adiposity and health-related quality of life outcomes in Australian children

**S.2.34 - Goldilocks and the Three Postdocs: Exploring the optimal day for health and wellbeing, UKK - Hall C (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** The optimal combination and accumulation of movement behaviours (the “Goldilocks Day”) for child health is unknown. This study aimed to: 1) examine associations of device-based movement behaviour compositions, including longer and shorter physical activity and sedentary bouts, with adiposity and health-related quality of life (HRQoL) outcomes; and, 2) determine the optimal time-use composition for these outcomes.

**Methods** Baseline ActiGraph GT3X+ accelerometry, adiposity (measured body mass index [BMI] and waist circumference) and self-reported EQ-5D-Y HRQoL data from the TransformUs effectiveness trial were used (2018; n=1252). Movement behaviours during waking wear time were divided into shorter and longer sedentary (<5 and ≥5 min), and light-, moderate- and vigorous-intensity physical activity (<1 and ≥1 min) bouts. The HRQoL composite score was a sum of five dimensions: mobility, looking after myself, doing usual activities, having pain/discomfort, and feeling worried/sad/unhappy. Compositional regression models examined associations between movement behaviour compositions and outcomes (BMI, waist circumference and HRQoL), adjusting for age, sex, area-level socio-economic status, logarithmic wear time and school. Model predictions were used to estimate the average “Goldilocks Day” time-use composition associated with top-5% health outcomes.

**Results** Valid (≥4 days, including ≥1 weekend day) accelerometry data from 891 children were obtained (mean age=9.0 years, SD=0.71; 51% female; 56% high socio-economic areas). Models showed evidence of associations between overall compositions and BMI ( $F=15.272$ ), waist circumference ( $F=13.009$ ), and quality of life ( $F=4.267$ ; all  $p<0.001$ ). The estimated “Goldilocks Day” for optimal health was similar across outcomes. Specifically, it consisted of 8-8.5 hours of sedentary time (18-22% spent in longer bouts), and 168-200 mins light- (2-2.5% in longer bouts), 36-45 mins moderate- (1-2% in longer bouts) and 38-48 mins (3-4% in longer bouts) of vigorous-intensity physical activity. The ‘Goldilocks Day’ included smaller proportions spent in longer bouts of all intensities compared to suboptimal compositions.

**Conclusions** The results suggest that combined movement behaviours were associated with adiposity and quality of life. Specifically, shorter bouts across the movement behaviour spectrum may be more beneficial for

health compared to longer bouts. Longitudinal studies should confirm whether children should engage in shorter physical activity and sedentary bouts to attain health benefit.

# The Goldilocks Day for optimal overall health among young adult participants within the Raine Study

<sup>1</sup>Norwegian University of Science and Technology, Trondheim, Norway, <sup>2</sup>Department of Physical Education and Sport Sciences, University of Limerick, Limerick, Ireland, <sup>3</sup>Alliance for Research in Exercise, Nutrition, and Activity (ARENA), Allied Health and Human Performance, University of South Australia, Adelaide, Australia,

<sup>4</sup>School of Allied Health and enAble Institute, Curtin University, Perth, Australia

**S.2.34 - Goldilocks and the Three Postdocs: Exploring the optimal day for health and wellbeing, UKK - Hall C (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** Daily time spent sedentary and active is well-acknowledged to influence health, with current physical behaviour guidelines recommending adults “sit less” and “move more”. However, how much time to spend in each behaviour for optimal overall health remains uncertain. The aim of this study was to investigate the optimal time-use composition for self-reported overall health among a group of young adults.

**Methods** This cross-sectional study was based on 658 men and 678 women who participated in the 22-year-old follow-up of the Raine Study pregnancy cohort. The average daily time-use composition of sedentary (SB), light physical activity (LPA) and moderate-to-vigorous physical activity (MVPA) was measured using hip-worn accelerometers. Self-reported overall health was assessed using the Short Form 12 Health Survey (SF-12) was regressed against the time-use composition and expressed as isometric log-ratios, adjusted for sex, age, BMI, and smoking status. The model was used to estimate the optimal time-use composition associated with best 5% of overall health, i.e., the “Goldilocks Day”.

**Results** Average age among the study participants was 22.1 years (SD=0.6), average BMI was 25.0 (SD=5.2) and average self-reported overall health was 2.7 (SD=0.9, range=1.0-5.0). The compositional mean in the total sample consisted of 9.3 h of SB, 5.2 h of LPA and 0.4 h of MVPA. The time-use composition was associated with overall health ( $F_{df1=2, df2=684} = 4.95, p = 0.001$ ). Compared to the overall sample mean, more time spent sedentary, and less time spent active was associated with best overall health. Specifically, the estimated Goldilocks Day consisted of 10.6 h of SB, 4.3 h of LPA and 0.1 h of MVPA.

**Conclusions** In contrast to current physical activity guidelines, our results suggest that reducing sedentary time and being more active does not necessarily associate with better overall health among young adults. This may reflect that time spend relaxing is essential for general well-being among this population group. If results are confirmed in future studies, this would imply that physical behaviour guidelines should be tailored to the audience and their current behaviours.

# The Goldilocks Day of 24-Hour Time-Use Behaviours for the Health and Well-Being of Youth within a National Time-Use Survey

**Dr. Nicholas Kuzik<sup>1</sup>**

<sup>1</sup>Healthy Active Living and Obesity Research Group, Children's Hospital of Eastern Ontario Research Institute, Ottawa, Canada

**S.2.34 - Goldilocks and the Three Postdocs: Exploring the optimal day for health and wellbeing, UKK - Hall C (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** Movement behaviour distribution research has improved our understanding of the ideal day of sleep, physical activity, and sedentary behaviours. Time-use surveys could complement previous research by adding a unique layer of context to the conceptualization of an ideal day of time-use behaviours. The purpose of this study was to identify the ideal distribution of self-reported contextual time-use behaviours for health and well-being in youth.

**Methods** Data from the 2015 General Social Survey (GSS) Time Use Survey (full sample,  $n = 17,390$ ) were used to create an analytical sample including only 15-24-year-old students ( $n=551$ ). Interviewed participants recalled their primary activities over a 24-hour period in 10-min intervals. Primary activities were categorized into the time-use behaviour variables: *Sleep*, Activities of Daily Living (*ADL*), *Active* (Active Leisure and Sports), *Television*, *Socializing*, and *Reading*. Examined outcomes included self-reported: well-being, health, and mental health. Robust regression models were built with the health/well-being outcomes and isometric log-ratio time-use behaviour compositions. For significant models, changes in health/well-being outcomes were predicted for all possible substitutions of time-use behaviours within a 2 SD range (e.g.,  $\pm 2SD$  *Sleep*). The top and bottom 2.5% of predicted health/well-being outcomes were retained to present the best and worst distributions of time-use behaviours.

**Results** The composition of time-use behaviours was significantly associated with subjective well-being, and the best day of time-use behaviors (minutes/day) were: *Sleep*=704.82 [95%CI:704.55, 705.07], *ADL*= 207.93 [95%CI:207.80, 208.05], *Active*= 265.97 [95%CI:265.68, 266.28], *Television*= 162.85 [95%CI:162.62, 163.09], *Socializing*= 74.63 [95%CI:74.43, 74.82], and *Reading*= 23.80 [95%CI:23.75, 23.85]. Compared to the average day, all time-use behaviours on the best day were higher except for *ADL*. Interestingly, the worst day of time-use behaviours for subjective well-being included more time spent *Socializing* and *Reading* compared to the best day.

**Conclusions** The best day of time-use behaviours for subjective well-being traded more leisure time for less *ADL*. An optimal zone was observed, where the time spent *Socializing* and *Reading* during the best day was more than the average day but less than the worst day. Future research should continue to explore categories of self-reported contextual time-use behaviours and their interrelationships.

# Showcasing the use of food purchase data in health research – the LoCard study

**Dr. Henna Vepsäläinen<sup>1</sup>**, Dr. Maijaliisa Erkkola<sup>1</sup>, Dr. Satu Kinnunen<sup>1</sup>, Dr. Jelena Meinilä<sup>1</sup>, Dr. Liisa Uusitalo<sup>1</sup>, Dr. Anna-Leena Vuorinen<sup>1</sup>, Dr. Hannu Saarijärvi<sup>2</sup>, Dr. Jaakko Nevalainen<sup>2</sup>, Dr. Mikael Fogelholm<sup>1</sup>

<sup>1</sup>University of Helsinki, Helsinki, Finland, <sup>2</sup>Tampere University, Tampere, Finland

**S.2.35 - A data driven approach to understand food purchasing behaviour and co-produce instore interventions to encourage healthier and more sustainable purchasing behaviour, UKK - Hall D (Level 2 - main floor), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Food retailers' customer loyalty-card data provide a unique tool for gaining insights into dietary patterns, health behaviors, and environmental sustainability. This presentation demonstrates the use of food purchase data with the most recent papers published from the LoCard study.

**Methods:** We obtained food purchase data from 47,066 loyalty-card holders of the largest grocery retailer in Finland. The consenting participants were randomized to fill in one of three online questionnaires concerning for example food consumption, attitudes, and nutrition literacy. The papers investigated 1) the relative validity of food purchases as a measure of food consumption, 2) transitions away from red meat as the main source of protein, 3) food purchase patterns and their carbon footprints, and 4) the effects of changes in alcohol legislation on alcohol purchases.

**Results:** Our study showed that the associations between food consumption and purchase data were mostly reasonable, suggesting that purchase data can be used as a proxy for food consumption in population-level studies. Food purchase profiles were dominated by red meat as a protein source, and red meat and plant-based food preferences showed the highest persistence with transitions from red meat most likely occurring towards other animal-based foods. An animal-based purchase pattern had the largest carbon footprint, whereas plant-based pattern had the smallest carbon footprint. The overall alcohol purchases did not increase as a result of a law reform allowing the sale of stronger alcoholic beverages in grocery stores.

**Conclusions:** Food purchase data can be used to examine nutritional quality, price, and carbon footprint of purchases in different socio-demographic groups. Objective, automatically accumulating food purchase data is also beneficial in monitoring the food system transformation as well as the potential short- and long-term effects of unexpected food system crisis, such as the COVID19 pandemic, inflation, or the war in Ukraine. Additionally, it can be used to give personalized, individual feedback on healthiness and carbon footprint of purchases.

# Does incentivisation increase purchases of fruit and vegetables in a supermarket setting? An analysis of loyalty card transaction data.

Ms. Ann Onuselogu<sup>1</sup>, Ms. Maddie Thomas<sup>1</sup>, **Dr. Francesca Pontin**<sup>1</sup>, Ms. Alexandra Dalton<sup>1</sup>, Prof. Willaim Young<sup>1</sup>, Dr. Alison Fields<sup>1</sup>, Associate Professor Michelle Morris<sup>1</sup>

<sup>1</sup>University of Leeds, Leeds, United Kingdom

**S.2.35 - A data driven approach to understand food purchasing behaviour and co-produce instore interventions to encourage healthier and more sustainable purchasing behaviour, UKK - Hall D (Level 2 - main floor), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** The supermarket setting is a prime location to test interventions that encourage purchase of healthier and more sustainable foods. We analysed two supermarket interventions using incentivisation as a behavioural lever to promote purchases of fruit and vegetables, and investigated the impact on the sales of these items, and the impact on the complete basket in comparison with the Eatwell Guide – the UK dietary recommendations.

**Methods:** In Trial 1, selected items were reduced in price to 60p in 101 UK supermarkets for the first 4 weeks of January in 2020 and 2021. We tested whether there was a difference in sales of the selected items compared to January 2019 and used interrupted time series analysis to test for sustained behaviour post intervention. In Trial 2 the supermarket issued a £2 top up voucher for use on fruit or vegetable purchases, to all shoppers using a government issued healthy start voucher between February and August 2021. We tested whether purchases of these items varied compared to baseline and whether behaviour was sustained post trial. For both trials, we matched all products to the Eatwell Guide categories and investigated differences compared to baseline and to baskets that did not engage with the trial.

**Results:** Reducing the price of fruit and vegetables led to a short-term uplift in the sales, increasing the diversity of the shoppers basket. The intervention was more effective in 2020 (78% uplift, 2.8 million more portions) than in 2021 (56% uplift, 2.1 million more portions) when the UK was living through a covid-19 national lockdown. Providing a £2 top-up voucher for fruit and vegetables for low-income families led to increased purchasing of fruit and vegetables, where the voucher was used. Both trials led to a positive shift towards the Eatwell guide recommendation for baskets that engaged with the trial promotion.

**Conclusions:** Incentivisation is an effective behavioural lever to encourage purchases of fruit and vegetables. In the general population, this lever is only effective for a short period. In low-income communities behaviour change is sustained for longer. More needs to be done to encourage Eatwell guide adherence.

# The role of product placement in encouraging healthier and more sustainable purchasing choices

Dr. Francesca Pontin<sup>1</sup>, Dr. Victoria Jenneson<sup>1</sup>, Associate Professor Michelle Morris<sup>1</sup>

<sup>1</sup>University of Leeds, Leeds, United Kingdom

**S.2.35 - A data driven approach to understand food purchasing behaviour and co-produce instore interventions to encourage healthier and more sustainable purchasing behaviour, UKK - Hall D (Level 2 - main floor), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Placement of products within the retail environment, including in-store location, shelving height and placement of complementary products side by side are all proven marketing techniques. We tested the theory that product placement can be utilised to encourage purchasing of healthier and/or more sustainable dietary choices. This presentation evaluates trials with two retailers looking at the placement of a) plant-based meat alternatives and b) salad products to encourage purchasing of these items and alignment of baskets towards the UK's Eatwell Guide recommendations.

**Methods:** Followed a non-randomised controlled before and after design, trial and control stores were matched based on customer demographic information by the retailer. Transaction data was obtained for the included stores for a yearlong pre-trial period, the 12-week intervention duration and a 12-week post-trial period. Interrupted time series modelling was used to evaluate trial success. A fuzzy matching algorithm was also developed to match products within the transaction data to the Eatwell guide to investigate any wider basket shifts towards a healthier and more sustainable diet.

**Results:** The placement of PBMA products alongside their meat counterparts was found to have a significant negative effect, with the sale of these products decreasing by 30% in trial stores. This unintended negative consequence was associated with lack of dual siting, suggesting regular PBMA customers were unable to find the PBMA products. Furthermore, we hypothesise that placement of PBMA products directly next to meat products highlighted the price differences of more expensive PBMA's, discouraging a swap to PBMA's. In contrast the salad placement trial had a positive impact on sales, but only for the first 3-weeks of the intervention. Seasonality appeared to impact the sale of salad products, mediating the trial's longer-term effectiveness.

**Conclusions:** Product placement interventions are product specific and risk unintended consequences, thus should be investigated in a real-world trial setting before long-term implementation. For success of interventions through product placement signposting may be needed to help customers find products which have been moved and prices should be comparable. Seasonality should also be considered to ensure promoted products align with customer preferences.

# Impact of financial incentives and default options on food choices in online retail settings

**Dr. Pasquale Rummo<sup>1</sup>**, Dr. Christina Roberto<sup>3</sup>, Dr. Lorna Thorpe<sup>1</sup>, Dr. Andrea Troxel<sup>1</sup>, Dr. Brian Elbel<sup>1,3</sup>

<sup>1</sup>Department of Population Health, New York University Grossman School of Medicine, New York City, USA,

<sup>2</sup>Wagner Graduate School of Public Service, New York University, New York City, USA, <sup>3</sup>Perelman School of Medicine, University of Pennsylvania, Philadelphia, USA

**S.2.36 - Online grocery stores as a novel tool for promoting healthy diets, UKK - K1 (+K2) (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The recent growth in online grocery shopping offers a promising opportunity to tailor healthy eating interventions to online settings, where it is easier to modify the design of shopping environments to influence consumer decision-making. We leveraged this opportunity by examining the extent to which financial incentives and default shopping cart options influence fruit and vegetable purchases.

**Methods:** We recruited 2,528 adults residing in the U.S. who currently or have ever received nutrition assistance benefits, and randomly assigned participants to one of four conditions: no intervention, 50% discount on eligible fruits and vegetables, pre-filled shopping carts with tailored fruit and vegetable items (i.e., default options), or a combination of a discount and default options. Participants were instructed to shop for a week's worth of groceries for their household in an experimental online grocery store, with a budget tailored to household size; no payment was taken.

**Results:** Approximately 54% of participants reported shopping online for groceries in the previous 12 months and 70% were classified as being food insecure. On average, participants spent 20.5% (SD=23.5) of total dollars on fruits and vegetables. Compared to no intervention, those in the discount, default, and combination conditions spent 4.7% (98.3% CI: 1.7, 7.7), 7.8% (98.3% CI: 4.8, 10.7), and 13.0% (98.3% CI: 10.0, 16.0) more of total dollars on fruits and vegetables, respectively. There was no difference between the discount and default conditions ( $p=0.06$ ) but the effect in the combination condition was significantly larger than both discount and default conditions ( $p's<0.001$ ). Default shopping cart items were purchased by 93% and 96% of participants in the default and combination conditions, respectively, compared to 46% and 53% of those in the control and discount conditions, respectively ( $p's<0.001$ ). We observed no significant variation by age, gender, or race/ethnicity, and results were similar when we excluded those who reported never shopping online for groceries.

**Conclusions:** Financial incentives for fruits and vegetables and default options, especially in combination, may lead to meaningful increases in fruit and vegetable purchases among adults with low income, which provides support for the implementation of multiple healthy eating strategies in an online retail setting.

# A Randomized Trial to Evaluate the Impact of Social Comparison-based Messages and Financial Incentives leveraging Loss-aversion on Diet Quality

**Dr. Soye Shin<sup>1</sup>**, Dr. Eric Finkelstein<sup>1</sup>, Dr. Mihir Gandhi<sup>2</sup>

<sup>1</sup>Program in Health Services and Systems Research, Duke-NUS Medical School, Singapore, Singapore,

<sup>2</sup>Centre for Quantitative Medicine, Duke-NUS Medical School,, Singapore, Singapore

**S.2.36 - Online grocery stores as a novel tool for promoting healthy diets, UKK - K1 (+K2) (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Non-communicable diseases are a growing concern worldwide. Poor diet quality is an important contributor to this trend, but consumers often fail to make healthier food choices at the point of purchase. This study aims to test two novel behavioral nudges for healthier diets that can only be done in an online store environment. The first intervention is norm-based messaging and peers comparison features based on the healthfulness of grocery baskets, and the other intervention is advance cash that will be forfeited if a shopper's grocery basket is less healthy than the peers' ones (loss-aversion).

**Methods:** We conducted a 3-arm crossover trial involving actual purchases in adult Singapore residents recruited online. Participants shopped once in each condition in an online grocery store in random order: 1) no Front-of-Pack (FOP) label store (Control); 2) store with products displaying Nutri-Score (NS) FOP labels and a vertical ruler with a happy or sad emoticon displaying the healthfulness of the shopper's basket, measured by the weighted average NS (ranging 1; least healthy to 5; healthiest), relative to that of the peers (Peer-comparison) ; 3) Condition 2 with conditional advance cash of 5 SGD provided before shopping (Peer-comparison+Cash). We used first-differenced regressions to assess the impact of the conditions on the overall diet quality of the baskets, measured by the weighted average NS, and changes in select nutrients (sugar, sodium, and saturated fat) and calories.

**Results:** The weighted average NS was 0.78 (26%) and 1.26 (42%) higher in the 'Peer-comparison' and 'Peer-comparison+Cash' conditions, respectively, relative to the Control (3.03). The 'Peer-comparison' feature decreased sugar per serving by 9 g (95% CI: [-16.5, -1.5]), sodium per serving by 446 mg (CI: [-983, 92]), and saturated fat per serving by 0.6 g (CI: [-0.9, -0.4]). The 'Peer-comparison+Cash' feature reduced sugar by 13.5 g (CI: [-22.5, -4.5]), sodium by 521 mg (CI: [-1026, -16]), and saturated fat by 0.9 g (CI: [-1.1, -0.6]). No effects on calorie reduction were found.

**Conclusions:** These results shed light on the considerable potential of the online shopping environment to improve diet quality through simple behavioral nudges.

# Developing an online grocery experimental platform for designing and testing food environment policy in Brazil

**Dr. Ana Clara Duran**<sup>1,2</sup>, Dr. Camila Borges<sup>1,2</sup>, Dr. Neha Khandpur<sup>1</sup>, Ms. Carmen Prestemon<sup>3</sup>, Ms. Fenanda Olivato<sup>3</sup>, Associate Professor Lindsey Taillie<sup>3,4</sup>

<sup>1</sup>Center for Epidemiological Studies in Nutrition and Health, University of Sao Paulo, Sao Paulo, Brazil,

<sup>2</sup>Center for Food Studies and Research, Campinas, Brazil, <sup>3</sup>Global Food Research Program, University of North Carolina at Chapel Hill, Chapel Hill, USA, <sup>4</sup>Department of Nutrition, Gillings School of Global Public Health, University of North Carolina at Chapel Hill, Chapel Hill, USA

**S.2.36 - Online grocery stores as a novel tool for promoting healthy diets, UKK - K1 (+K2) (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Experimental evidence is critical for informing evidence-based policies on food policy. Online grocery stores can provide a realistic experimental platform to assess the effects of food environment policies on consumer shopping behaviour, but their use in low- and middle-income settings is virtually non-existent. This study sought to use cognitive interviews to develop and refine the use of an online store for testing food environment policies on consumer behaviour.

**Methods:** We conducted cognitive interviews using the “think-aloud” protocol with a sample of 10 Brazilian adults from different regions in the country and socioeconomic backgrounds. Two Brazilian interviewers provided participants with instructions on how to navigate the online grocery store ‘Saruê’ that imitated a real and leading online grocery store in Brazil. After an introductory video, participants were instructed to shop for ten items across distinct categories. Interviewers intervened only after a period of silence. Half of the participants received a shopping budget. We present descriptive analyses of the cognitive interviews and discuss how they have helped us set up an experiment using an online grocery store.

**Results:** On average, participants took 25 minutes to complete the shopping task. Those who were given a shopping budget spent less money and shared their difficulties in staying within the given budget. Although most participants fulfilled the shopping requirements, three of them referred to easily forget the shopping task, followed their own shopping list, and had to be reminded of the target items. Participants browsed the food departments for the single items and only used the search bar when searching for meal items. Brands, price, and variety resembled participants real world experience, although they all noticed the scarcity of fresh fruits and promotions - something they mentioned to consider when doing their grocery shopping.

**Conclusions:** These findings shed light on the challenges of setting up an online grocery store that realistically mimic real-world shopping venues; and were key to improving the development of an online grocery store in Brazil. This platform is now more suitable to be used in the assessment of various context-specific food and nutrition policy options.

# The YoCo Project – A scientific approach to placemaking for youth-friendly urban spaces promoting adolescent health and well-being in Amsterdam – A Health CASCADE project.

**Ms. Sara Rachdan<sup>1</sup>**, Ms. Kunshan Goh<sup>1</sup>, Prof. Mai Chin A Paw<sup>1</sup>, Dr. Teatske Altenburg<sup>1</sup>, Prof. Greet Cardon<sup>2</sup>, Dr. Artur Steiner<sup>3</sup>

<sup>1</sup>Amsterdam UMC, Amsterdam, Netherlands, <sup>2</sup>Ghent University, Ghent, Belgium, <sup>3</sup>Glasgow Caledonian University, Glasgow, United Kingdom

**S.2.38 - Engaging different generations in research to co-create healthy urban spaces in Europe and Africa, UKK - K1 (+K2) (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** The built environment can negatively and positively affect multiple dimensions of adolescent health and well-being. By directly involving adolescents in community- and context-based urban planning processes, YoCo (Youth Co-creation) enables the creation of youth-centred design solutions that meet their needs. Together with youth, YoCo aims to: i) co-create physically- and socially-activating urban spaces that promote their health and well-being; ii) evaluate the co-creation process and outcomes.

**Methods** YoCo follows an interdisciplinary approach with key intersections between 'urban design for health', spatial planning, inclusive research and systems thinking in 4 phases: Phase 1 Needs assessment; Phase 2 Co-designing solutions; Phase 3 Prototyping and testing; and Phase 4 Implementation. Implementation of the co-created spatial interventions will be aligned with local development plans and in collaboration with the local municipality. Academic researchers facilitate co-creation workshops, bringing together key stakeholders including adolescents, community, urban planners and local government. Co-creation workshops use principles and methods to promote adolescents' action and decision-making. Process and outcome evaluation frameworks are incorporated, with iterative evaluations of the co-creative process and effects of the co-created spatial interventions on adolescents' physical activity and well-being.

**Results** Phase 1: Needs assessment was conducted over a combined total of 17 sessions with 33 students aged 11-15, from a local secondary school in the Amsterdam neighbourhood of Reigersbos who participated as young co-researchers. Key activities in this phase included: creating project ownership among stakeholders; understanding adolescents' perspectives of the environment on their health, selecting and adapting measurement instruments; and defining critical decision factors to evaluate the effectiveness of the planned design interventions. More results pertaining to Phase 1: Needs assessment and Phase 2: Co-designing solutions will be presented.

**Conclusion** Lessons learnt from Phases 1 and 2, along with key recommendations for co-creating healthy urban spaces for and with adolescents will be discussed

# Engage4Change – Engaging community-dwelling and institutionalized older adults in Barcelona in the co-creation of healthy urban spaces to promote physical activity and reduce loneliness – A Health CASCADE project.

**Mr. Jorge Raúl Zapata-Restrepo<sup>1</sup>**, Dr. Philippa Dall<sup>3</sup>, Prof. Dawn Skelton<sup>3</sup>, Prof. Mai Chin A Paw<sup>2</sup>, Ms. Giuliana R Longworth<sup>1</sup>, Dr. Sacra Morejón Torné<sup>1</sup>, Prof. Maria Giné-Garriga<sup>1</sup>

<sup>1</sup>Fundació Blanquerna - Universitat Ramon Llull, Barcelona, Spain, <sup>2</sup>Amsterdam UMC, VU University Medical Center, Amsterdam, Netherlands, <sup>3</sup>Glasgow Caledonian University, Glasgow, United Kingdom

**S.2.38 - Engaging different generations in research to co-create healthy urban spaces in Europe and Africa, UKK - K1 (+K2) (Level 3), June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose** Older adults, especially care home residents, are the least active and most sedentary segment of the population, and are more likely to be isolated and experience loneliness. They also present difficulties accessing spaces to engage in physical activity and social interaction. Engage4Change proposes the use of co-creation as an overarching approach to position end-users and key stakeholders as decision-making agents in urban design and spatial planning.

**Methods** Engage4Change focuses on the older adult population (65+) of the Dreta de l'Eixample neighborhood in the city of Barcelona. The participants of this study, known as “co-creators” consist of three groups of 10 older adults ( $n \cong 30$ ) (residents from 2 selected care homes and community dwellers), 3 relatives, 2 health professionals, 2 care-home staff members, 1 researcher, and 2 urban design and planning professionals. This project spans 2 years with 3 phases: Phase 1 Exploratory Stage; Phase 2 Needs assessment; Phase 3 Co-creation Core and Prototyping with an iterative process and outcome evaluation distributed in all phases.

**Ph1:** Care home distribution analysis and public space accessibility, exploratory interviews, and recruitment.

**Ph2:** GPS, photovoice, community walk audits; EQ-5D, Lubben Social Scale, De Jong Loneliness Scale, IPAQ, and SBQ.

**Ph3:** Participatory mapping, world cafes, focus groups, spatial prototyping, and VR/AR testing.

**Results** Phase 1 concluded with the selection of 2 neighboring care homes and 1 community center, conforming 3 groups of co-creators. In phase 2 we identified that these three groups showed different levels of perceived quality of life, loneliness, and PA and SB levels. The three centers shared the use of common outdoor spaces, as shown in the GPS data. The sample documented spatial obstacles present in public spaces. Phase 3 will be geared towards designing an urban community space near the care homes. The group of co-creators will lead the concept ideation, refinement, and project delivery. The project will test the incorporation of VR/AR technologies to deliver a spatial prototype as a result of the co-creation process.

**Conclusions** Lessons learned from Phases 1 and 2, along with key recommendations for co-creating healthy urban spaces for and with older adults will be discussed.

# The development of BRIGHT – an app-based intervention to support healthy growth and responsive feeding amongst formula fed infants

**Ms. Kristiane Tommerup**<sup>1</sup>, Dr. Andrea Smith<sup>2</sup>, Prof. Ken Ong<sup>2</sup>, Dr. Raj Lakshman<sup>2</sup>, Dr. Amy Ahern<sup>2</sup>, Miss Marcella Rosa Cimino Avery<sup>1</sup>, Miss Sara Esser<sup>1</sup>, Mrs. Nilushka Perera<sup>3</sup>, Mr. Matthew Black<sup>3</sup>, Associate Professor Clare Llewellyn<sup>1</sup>

<sup>1</sup>Research Department of Behavioural Science and Health, University College London, London, United Kingdom, <sup>2</sup>MRC Epidemiology Unit, University of Cambridge, Cambridge, United Kingdom, <sup>3</sup>Best Beginnings, London, United Kingdom

**S.2.39 - Opportunities, challenges and strategies for developing digital health interventions for the first 1000 days, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Rapid infant weight gain (RIWG) is a risk factor for future childhood obesity. Whilst evidence-based strategies which could encourage responsive feeding behaviours and reduce risk of RIWG exist, they have yet to be delivered through digital intervention. The following talk will present the development of BRIGHT – the first app-based intervention to support healthy growth amongst formula-fed infants through appropriate bottle feeding and complementary feeding behaviours, in collaboration with the Baby Buddy App developed by Best Beginnings. Previous qualitative insights indicate the presence of sensitivity and stigma in relation to formula feeding. Therefore, support and guidance must be produced in collaboration with caregivers. The presentation will present findings from Patient and Public Involvement and Engagement (PPIE) panels with parents, and how these insights were integrated into the BRIGHT prototype.

**Methods:** The person-based approach – inclusive of a PPIE panel (n=10) interviews were applied iteratively to enable co-creation with caregivers of infants. These participatory methods were used to develop the key intervention messages and novel intervention functionalities tailored to infant appetite and growth.

**Results:** The first theme arising from PPIE interviews was the common feelings of stigma and confusion felt by parents of formula-fed infants, given the limited resources available for formula feeding. The second key theme that emerged was the conflict parents feel between the individuality of infant appetite and 'one size fits all' feeding guidance. Hence, we sought to develop and test a 'baby appetite quiz' offering parents information regarding their infant's appetite and how to best manage their child's unique appetite. Additionally, challenges, learnings, and opportunities in developing *tailored* digital interventions for the first 1,000 days were collated.

**Conclusions:** mHealth interventions provide opportunities to scale-up the reach of public health promotion. In co-creation with parents, it was found that digital resources targeting infant feeding and growth must be delivered *sensitively* and with consideration of individual differences in infant appetite and growth. These key learnings may inform future co-creation and development of *tailored* digital interventions, both within and outside the first 1,000 days period.

# Application of the person-based approach to the development of an exclusively app-based intervention targeting diet, physical activity and weight management during pregnancy

**Mrs. Alexandra Rhodes<sup>1</sup>**, Miss Arya Primprikar<sup>1</sup>, Mrs. Alison Baum<sup>2</sup>, Dr. Helen Croker<sup>4</sup>, Dr. Andrea Smith<sup>3</sup>, Associate Professor Clare Llewellyn<sup>1</sup>

<sup>1</sup>Research Department of Behavioural Science and Health, University College London, London, United Kingdom, <sup>2</sup>Best Beginnings, London, United Kingdom, <sup>3</sup>MRC Epidemiology Unit, University of Cambridge, Cambridge, United Kingdom, <sup>4</sup>World Cancer Research Fund International, London, United Kingdom

**S.2.39 - Opportunities, challenges and strategies for developing digital health interventions for the first 1000 days, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose** Maternal obesity and excessive gestational weight gain (GWG) are independently associated with adverse maternal and foetal health outcomes. Dietary and physical activity (PA) interventions can be effective in reducing rates of excessive GWG and postpartum weight retention. As an established and free parenting app used widely in the UK's National Health Service, 'Baby Buddy' is an ideal platform for delivering a new innovative digital dietary and PA intervention. A four-phased study was undertaken to create a theory-based intervention to empower and support expectant parents to improve dietary and PA behaviours to assist in managing GWG.

**Methods** The intervention development process adhered to a person-based approach. A systematic review and meta-analysis of digital interventions targeting diet and/or PA in pregnancy (n=11) informed the rudimentary intervention concept by identifying potentially effective behaviour change techniques. Three stages of qualitative research with pregnant and recently pregnant parents followed. Study 1, comprising 4 online focus groups (n=18) and 12 telephone interviews, investigated target users' views of the rudimentary concept and generated ideas for its development. Study 2, comprising online individual and couple interviews (n=29), used wireframes and scripts to explore intervention design, content, branding and tone. Study 3 tested an app prototype using 'think aloud' interviews with current Baby Buddy users (n=21). A Public Patient Involvement (PPI) group (n= 18) and other expert contributors (n=14) provided input and weekly meetings with the Baby Buddy team ensured the intervention remained feasible and aligned with the app's principles.

**Results** Study 1 confirmed the appeal of including partners and identified themes that underpinned the development of the intervention design. Iterative feedback from Study 2 refined the intervention design in line with the views of a culturally-diverse range of target users. Key learnings with regards to weight and health messaging shifted the emphasis away from GWG towards healthier dietary and PA habits for pregnancy and parenthood. Study 3 highlighted functionality, content and design issues and identified ways of improving the user-experience.

**Conclusions** Listening to target users at each stage of the design process yielded actionable insights to optimise the intervention's relevance and appeal to its target audience.

# The development and testing of the INTER-ACT program, an app-supported lifestyle intervention during and between pregnancies to prevent excessive weight gain in pregnancy and enhance optimal weight and a healthy lifestyle in the interpregnancy period.

**Prof. Annick Bogaerts<sup>1,2</sup>**, Prof. Roland Devlieger<sup>1,3</sup>, Dr. Lieveke Ameye<sup>1</sup>, Dr. Margriet Bijlholt<sup>1,2</sup>, Ms. Hanne Van Uytsel<sup>1</sup>

<sup>1</sup>Department of Development and Regeneration, University of Leuven, Leuven, Belgium, <sup>2</sup>Faculty of Medicine and Health Sciences, Centre for Research and Innovation in Care, University of Antwerp, Antwerp, Belgium,

<sup>3</sup>Department of Obstetrics and Gynecology, University Hospitals Leuven, Leuven, Belgium

**S.2.39 - Opportunities, challenges and strategies for developing digital health interventions for the first 1000 days, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** This presentation will (1) discuss the development of the INTER-ACT app, which is part of an interpregnancy and pregnancy lifestyle coaching module; and (2) summarize the effect of the INTER-ACT program on eating behaviour, energy intake, physical activity, mental health and maternal anthropometrics. The INTER-ACT program aims to enhance optimal weight gain, a healthy lifestyle in the interpregnancy and pregnancy period and reduce the prevalence of large-for-gestational-age babies, gestational diabetes, pregnancy-induced hypertension, and caesarean deliveries.

**Methods:** Firstly, a mixed methods design involved 15 semi-structured interviews, 2 focus groups, and 2 surveys. The user-interface was evaluated in a pilot study (N=9). Secondly, the INTER-ACT program was tested in a multi-centre randomised controlled trial, targeting women at high risk of pregnancy and birth related complications. At week 6 postpartum, participants were randomised into an intervention or control arm. The intervention focused on weight, diet, physical activity and mental well-being, and comprised face-to-face coaching and the use of an app, which was Bluetooth-connected to weighing scales and an activity tracker. The intervention was rolled out between 6 weeks and 6 months postpartum and during each trimester of the subsequent pregnancy. In this presentation, we report on results from the postpartum period only.

**Results:** Firstly, the INTER-ACT app was valued by its end users because it was offered in combination with face-to-face contact with a caregiver. Secondly, the INTER-ACT program was shown to improve postpartum food intake quality and eating behaviours, but not physical activity and sedentary behaviour. Women in the intervention group who reduced their energy intake and had improved eating behaviours reported a larger decrease in weight and fat percentage.

**Conclusions:** In conclusion, the postpartum phase of the INTER-ACT RCT was effective in improving nutrition-related outcomes, but not directly effective in the reduction of post-partum weight retention and body composition measures. However, improved energy intake and enhanced eating behaviour were associated with higher postpartum weight loss and larger decrease of fat percentage and waist circumference. This emphasizes the need to incorporate not only nutritional intake guidance but also eating behaviour-related aspects in lifestyle interventions.

# Changes in the Daily Activity Profile of Middle-Aged versus Older Adults Following A 6-Month Exercise Intervention

**Dr. Neha Gothe<sup>1,2</sup>**, Dr. Emily Erlenbach<sup>1</sup>, Ms. Revati Malani<sup>1</sup>, Dr. Edward McAuley<sup>1</sup>

<sup>1</sup>University of Illinois Urbana Champaign, Urbana, USA, <sup>2</sup>Northeastern University, Boston, USA

**S.2.40 - Physical Activity and Sedentary Behavior Interventions in Older Adults to Address Cognitive Aging, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** A. Ageing

**Background:** Adults' waking hours are spent engaged in a combination of sedentary time (ST), light-intensity physical activity (LPA) and moderate-vigorous intensity physical activity (MVPA), collectively referred to as a daily activity profile. These profiles often vary between middle-aged (MA) and older-adults (OA)- two groups which differ in their leisure and lifestyle activity levels. As part of a larger RCT, adults were randomized into a 6-month exercise intervention composed of either aerobic, stretch-tone or yoga exercise. We investigated how six months of participation in these three distinct exercise modes may have impacted the composition of participants' daily activity profiles.

**Methods:** Inactive adults were recruited and randomized into one of the three abovementioned exercise groups. All groups met for 3, 60-minute sessions/week for six months. At baseline and 6-months, participants were issued an Actigraph wGT3x+ accelerometer to wear for 7 days to obtain pre-post measures of minutes/day spent in ST, LPA and MVPA. Group\*Time analyses were carried out separately for MAs (<65 years) and OAs (≥ 65) and included sex and program attendance rates as covariates.

**Results:** Our sample consisted of 39 MAs and 50 OAs ( $M_{age} = 58.77$  and  $68.90$ , respectively). Regarding changes in ST, OAs in the stretch-tone group significantly increased their ST by  $63.23$  min/day ( $F(1.00,45)=6.945$ ,  $p=0.011$ ,  $\eta^2_p=0.134$ ). For LPA, MAs in the stretch-tone group significantly decreased their LPA by  $33.92$  minutes/day ( $F(1.00,34) = 5.294$ ,  $p=0.028$ ,  $\eta^2_p=0.135$ ). Changes in LPA min/day among both MA and OAs in aerobics approached significance, with a positive increase in LPA of  $32.25$  minutes/day for MAs and decrease of  $26.87$  min/day of OAs. There were no significant group\*time effects for MVPA among either age or intervention groups.

**Conclusions:** Our findings reveal the subtle ways in which the daily activity profiles of MAs and OAs can be impacted by differing modes of exercise. Future work should investigate the psychological processes MAs and OAs experience when starting an exercise program and sedentary behaviors they may engage in as possible "compensation" for exercising periodically throughout the week.

# Protocol for a sedentary behavior and physical activity intervention for older Latino/Hispanic adults to prevent cognitive decline

**S.2.40 - Physical Activity and Sedentary Behavior Interventions in Older Adults to Address Cognitive Aging, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Background:** Rates of Alzheimer's Disease and related dementias (ADRD) are higher for older Hispanic/Latino(as) compared to non-Hispanic White adults. Very few physical activity (PA) interventions have been culturally adapted for the older Hispanic/Latino(a) community. Here, we plan to culturally adapt a sedentary behavior (SB) and PA intervention.

**Methods:** To support design and cultural adaptation, we will convene a community advisory board (CAB) including community members and relevant organizational representatives. Further, we will conduct a pilot intervention for 10 participants to test feasibility and acceptability of initial intervention adaptations. The pilot will be offered in Spanish and English and consist of brief health coaching contacts by phone following a two-step "staircase approach" to gradually increase activity. In Step 1, participants will work to reduce their SB, and then, as ready and able, they progress to Step 2, which focuses on increasing PA and PA intensity. Psychosocial mediators of the intervention will include social support, self-efficacy, enjoyment, and habit strength. Fitbit Inspire bands will be provided to participants to track steps, PA, and receive movement reminders. Data from participants' Fitbit will also be shared with health coaches via Fitabase to inform coaching. Outcomes of interest will include activPAL-measured PA/SB, psychosocial and quality of life measures, and neuropsychological assessments (e.g., digit span, verbal fluency, verbal memory). All measurements will be conducted remotely and, where applicable, leverage measures validated in both Spanish and English. A focus group with all pilot participants will be conducted after pilot completion to aid in further adapting the intervention to prepare for a future efficacy trial.

**Results:** We have recruited 7 community members and organizational stakeholders to serve on the CAB. The first CAB meeting (November 2022) will focus on adapting initial recruitment, intervention, and measurement materials. Pilot participants will be recruited in early 2023 and feasibility and cultural adaptation ideas will be presented.

**Discussion:** There is an urgent need for ADRD prevention interventions that are culturally adapted to support the health of underserved communities. This is one of the first such interventions that will be specifically adapted and tested in a larger RCT for the older Hispanic/Latino(a) community.

# The effect of a 2-year dementia risk reduction intervention on accelerometer-measured physical activity

**Dr. Dori E. Rosenberg<sup>1</sup>**, Dr. Eric Vittinghoff<sup>2</sup>, Dr. Carrie Peltz<sup>2</sup>, Dr. Deborah E. Barnes<sup>2</sup>, Dr. Sascha Dublin<sup>1</sup>, Dr. Benjamin H. Balderson<sup>1</sup>, Ms. Lynn Fleckenstein<sup>1</sup>, Dr. Kristine Yaffe<sup>2</sup>

<sup>1</sup>Kaiser Permanente Washington Health Research Institute, Seattle, USA, <sup>2</sup>University of California, San Francisco, San Francisco, USA

**S.2.40 - Physical Activity and Sedentary Behavior Interventions in Older Adults to Address Cognitive Aging, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** A. Ageing

**Background:** Researchers estimate that ~30-40% of Alzheimer's disease and related dementias (ADRD) may be due to modifiable risk factors. We developed the Systematic Multi-domain Alzheimer's Risk Reduction Trial (SMARRT) to pilot-test a patient-centered intervention targeting medical and behavioral risk factors for ADRD including physical inactivity. Here we describe the accelerometer outcomes of SMARRT.

**Methods:** Participants (N=172) with at least 2 of 8 ADRD risk factors (e.g. less than 150 minutes of physical activity [PA]/week) were randomized to the SMARRT intervention or health education control group for 2-years. The intervention included health coaching sessions every 4-6 weeks to set goals related to risk factors chosen by participants, such as increasing PA and reducing sedentary time (ST). Waist ActiGraph wGT3X+ accelerometers were worn for 7 days at baseline and 24 months in a subset of participants. Outcomes included steps/day and minutes/day in ST, light-intensity PA (LPA), and moderate-to-vigorous PA (MVPA). We used linear regression to calculate between-group treatments effects for accelerometer outcomes adjusting for baseline level of each outcome, wear time (except for step count models), demographics, and comorbidities.

**Results:** There were 45 control and 32 intervention participants in the accelerometer subset (Mean age = ~75 +/- 5 years; 56% women, 67% Non-Hispanic White). At baseline, participants had similarly high ST (median ST ~10.7 hours/day) and low steps (median steps/day = 3965.6, control, and 3058.5, intervention). There were no significant differences in the accelerometer outcomes at 2 years. Patterns showed that both groups decreased PA, but declines were steeper in the control group with median steps/day decreasing by 2042 and 775 (p = 0.36) and median MVPA decreasing by 19.9 and 3.3 mins/day (p = 0.85) in the control and intervention arms respectively. ST and LPA declined in both groups (p-values = 0.70 and 0.69 respectively).

**Conclusions:** Both intervention and control groups showed large decreases in step counts over 2-years, but the control group's decline was 2.5 times larger than the intervention. Although this difference was not statistically significant given the small sample size, the magnitude suggests that this intervention holds promise and warrants testing in an adequately powered full-scale study.

# The Impact of Charitable Food Assistance on Food Insecurity in the United States

**Dr. Craig Gundersen<sup>1</sup>**, Ms. Emily Engelhard<sup>2</sup>, Dr. Tom Summerfelt<sup>2</sup>, Dr. Bill Byrnes<sup>2</sup>

<sup>1</sup>Baylor University, Waco, Texas, USA, <sup>2</sup>Feeding America, Chicago, IL, USA

**S.2.53 - Addressing Food Insecurity: Formal and Charitable Food Assistance and Implications for Nutrition Policy and Practice in Community and Clinical Settings, Clarion Hotel Gillet - Room Swedenborg, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Charitable food assistance (CFA) constitutes the second largest source of free meals to vulnerable Americans; only the Supplemental Nutrition Assistance Program (SNAP) distributes more free meals than CFA programs. Despite its prominence in efforts to reduce food insecurity in the U.S. and other high-income countries, research is limited on CFA programs. In particular, one question not addressed: What is the impact of CFA on food insecurity? Answering this is difficult for several reasons including the lack of a well-defined comparison group of those not using CFA; underreporting of CFA use in nationally representative surveys; and an unclear set of approaches to addressing non-random selection into CFAs.

**Methods:** We use data from the 2009 to 2021 Current Population Survey (CPS) supplemented with administrative data from Feeding America (the largest food bank network food banks in the U.S.) for the analyses. Of particular note is a question on the CPS about the amount of resources a household reports needing to be food secure (FS); a question used in other studies. A household is said to be made FS by CFA if the number of meals they report needing to be FS is less than the amount they would receive via CFA. These analyses rely on various assumptions about the distribution of charitable food and self-reports of resources needed to be FS.

**Results:** In 2021, the average food insecure household reported needing \$40.38 more per week to be FS with this value rising sharply from 2019. In the same year, 6.7 billion pounds of free food were distributed in CFA to 53 million Americans. Based on the distribution of responses to dollars needed to be FS, we find that, in the absence of CFA, food insecurity rates would be 11.8% (about 1 percentage point) higher in the U.S. This is our preferred specification; when we consider alternative specifications, the range is from 3.5% to 20.1%.

**Conclusions:** A wide array of tools, including CFA, are used in high-income countries to alleviate food insecurity. The results from this study demonstrate that CFA programs serve a critical role in alleviating food insecurity in the U.S.

# Learning from National and Local Policy Responses to Food Insecurity in the UK During the COVID-19 Pandemic

**Dr. Rachel Loopstra<sup>1</sup>**, Ms. Katy Gordon<sup>2</sup>, Dr. Hannah Lambie-Mumford<sup>2</sup>

<sup>1</sup>University of Liverpool, Liverpool, United Kingdom, <sup>2</sup>University of Sheffield, Sheffield, United Kingdom

**S.2.53 - Addressing Food Insecurity: Formal and Charitable Food Assistance and Implications for Nutrition Policy and Practice in Community and Clinical Settings, Clarion Hotel Gillet - Room Swedenborg, June 16, 2023, 4:15 PM - 5:30 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** The proportion of households experiencing food insecurity in the UK in September 2022 returned to levels observed at the height of the first wave of the COVID-19 pandemic. Local and national governments are implementing various interventions in response. This paper presents findings from a two-year project monitoring responses to food insecurity over the COVID-19 pandemic, highlighting how and where learnings from the pandemic period can be applied today.

**Methods:** A mixed methods study, involving systematic document searches for policy and programmes implemented across each of the four UK nations, interviews and focus groups with over 100 national, devolved nation and local authority civil servants and charities, and secondary analyses of nationally representative survey data to evaluate the impacts of specific policy interventions on food insecurity.

**Results:** At all levels of government, the scale of responses to concerns about food insecurity over the pandemic was unprecedented. National and devolved governments supported food charities with funding and enacted income-support interventions, namely the furlough scheme and uprating some income-replacement benefits. At the local level, there was heavy reliance on food banks and other third-sector organisations to distribute in-kind food provision. National and devolved governments also provided food boxes to support people who were “shielding”, that is, who were severely vulnerable to COVID-19, to enable them to isolate at home. Quantitative analyses suggested that levels of food insecurity were lower among groups targeted for financial interventions (namely, those furloughed or receiving an uplift in benefits) compared to matched groups not receiving these interventions. The provision of food boxes to people shielding did not have a discernible impact on food insecurity for this group. Qualitative evidence from stakeholders raised concerns about the delivery, reach and appropriateness of in-kind food provision over this period.

**Conclusions:** As policymakers enact responses to growing food insecurity in the UK today, these findings from the pandemic period support the implementation of targeted income interventions to enable secure financial access to food, rather than investment in direct food provision initiatives.

# Understanding the Nutritional Challenges of Food Insecure Adults with a History of Cancer

**Dr. Anna E. Arthur<sup>1</sup>**, Ms. Amirah Burton-Obanla<sup>2</sup>, Ms. Kate Young<sup>1</sup>, Dr. Leonidis Bantis<sup>1</sup>, Ms. Brenda Koester<sup>2</sup>, Dr. Craig Gundersen<sup>3</sup>

<sup>1</sup>University of Kansas Medical Center, Kansas City, MO, USA, <sup>2</sup>University of Illinois, Urbana-Champaign, USA,

<sup>3</sup>Baylor University, Waco, TX, USA

**S.2.53 - Addressing Food Insecurity: Formal and Charitable Food Assistance and Implications for Nutrition Policy and Practice in Community and Clinical Settings, Clarion Hotel Gillet - Room Swedenborg, June 16, 2023, 4:15 PM - 5:30 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** The economic burden associated with cancer care in the USA may intensify the risk of food insecurity among adults with a history of cancer. Diet quality and nutritional status play a critical role in determining cancer outcomes, but adults diagnosed with cancer are at risk of suboptimal nutrition due to the intensity and burden of the disease and associated treatments. Being food insecure may further exacerbate the nutritional risk of individuals with cancer. Therefore, the purpose of this study was to examine the associations of food insecurity with diet quality, malnutrition risk, and participation in food assistance programs in adults with a recent cancer diagnosis.

**Methods:** This was a cross-sectional pilot study of a hospital-based sample of 220 adults diagnosed with cancer between 2018-2021 in the US. Food insecurity was assessed using the United States Department of Agriculture Six-item Short Form Food Security Survey Model. Usual intake of total fruits and vegetables, percent kilocalories from fat, and dietary fiber were estimated using the National Cancer Institute Multifactor Screener. Malnutrition risk was measured using the Malnutrition Screening Tool. Two additional survey questions asked participants about their use of Supplemental Nutrition Assistance Program (SNAP) benefits and food banks or pantries. Associations between food security status and variables of interest were examined using chi-square or fisher exact tests.

**Results:** The prevalence of food insecurity in the study sample was 10%. Food insecure participants were more likely to consume <5 servings of fruits and vegetables, ≥30% of their total kilocalories from fat, ≤15 grams of fiber per day, and be at risk for malnutrition compared to food secure participants. Food insecure participants also reported utilizing formal food assistance, SNAP benefits, and charitable food assistance, food bank/pantry, at a higher rate compared to food secure participants.

**Conclusions:** Food insecure adults with a recent history of cancer may be more likely to experience nutritional deficits which may, in turn, lead to worse cancer outcomes and use food assistance programs than those who are food secure. Future work should focus on building connections between cancer patients and charitable food assistance programs.

# Co-creation of a school- and home based intervention to promote compliance with 24-hour movement behavior guidelines in low SES preschoolers

Miss Sofie Naeyaert<sup>1</sup>, **Dr. Vera Verbestel<sup>1</sup>**, Prof. Greet Cardon<sup>1</sup>, Assistant Prof. Marieke De Craemer<sup>1</sup>  
<sup>1</sup>Ghent University, Ghent, Belgium

**S.3.41 - Interventions to optimize 24-hour movement behaviors in preschoolers and children, UKK - Main Hall (Level 6), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose** In 2019, the World Health Organization published 24-hour movement behavior guidelines for sleep, physical activity and sedentary behavior. Research on compliance with these guidelines in socially disadvantaged preschoolers is very limited. Nevertheless, when examining the isolated behaviors, preschoolers with a low socioeconomic status (SES) sleep less, are less physically active and more sedentary, and therefore have a higher risk for health problems later in life. Parents and teachers have a major influence on preschoolers' health behavior. Involving them in the development of an intervention through the intervention mapping protocol (IMP) can increase the effectiveness of interventions. This study aims to describe the co-creation process to develop a school- and family-based intervention to optimize low SES preschoolers' 24-hour movement behaviors.

**Methods** Six weekly or two-weekly co-creation sessions took place with teachers (n=8) and low SES parents (n=4) within the same school. The IMP was used as a theoretical framework. An extra group of low SES parents (n=6) within a community center was consulted after completing the co-creation sessions to discuss the final intervention. The co-creation process was evaluated through reflection questions at the end of each session, and through teacher questionnaires. All sessions were transcribed and thematically analyzed in Nvivo.

**Results** Both co-creation groups went through four steps of the IMP: 1) needs assessment, 2) goal setting 3) methods and applications, and 4) program development. Only a limited number of parents participated, but they all considered the co-creation as very beneficial, and especially enjoyed the social contact and the exchange of experiences with other parents. They felt more understood and supported afterwards. In teachers, there was a lot of resistance at first to develop the intervention. They felt like they were already doing enough to promote preschoolers' movement behaviors. Eventually, their perspectives changed and they did see the need for an intervention which improved cooperation.

**Conclusion** Co-creation through the IMP was an intensive process in both groups and had its strengths (empowerment) and limitations (translating IMP to the target group). A randomized controlled trial is needed to examine whether the developed intervention optimizes 24-hour movement behaviors in low SES preschoolers.

# Implementation degree of the DAGIS intervention, changes in parents' norm for children's screen time and changes in children's screen time

**Prof. Carola Ray**<sup>1,2</sup>, Dr. Reetta Lehto<sup>1,2</sup>, Mr. Aku-Ville Lehtimäki<sup>1</sup>, Prof. Majjaliisa Erkkola<sup>2</sup>, Prof. Eva Roos<sup>1,2,3</sup>  
<sup>1</sup>Folkhälsan Research Center, Helsinki, Finland, <sup>2</sup>University of Helsinki, Helsinki, Finland, <sup>3</sup>Uppsala University, Uppsala, Sweden

**S.3.41 - Interventions to optimize 24-hour movement behaviors in preschoolers and children, UKK - Main Hall (Level 6), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose** The DAGIS intervention study targeting children's energy balance-related behaviors was based on the intervention mapping (IM) protocol in which the sixth step of IM is evaluation of the program effectiveness and processes. The purpose of this study is to examine whether the intervention had effects on parent's norm about suitable screen time for children and children's screen time according to the degree of implementation of the program in the families.

**Methods** The developed intervention was a 22-week program, which was run in preschools and families targeting children aged 3-6 years (mean age 5.2 years). At the end of the intervention, parents reported the program implementation in their family. Questions about implementation were based on the Saunders process evaluation framework. A variable called degree of implementation (DOI) was formed. At baseline and at the end of the intervention parents reported their view on suitable screen time for children (ST norm), and kept screen time (ST) diary for seven consecutive days for their child. Hayes Process Macro for SPSS was used to test whether changes in ST norm predicted the changes in children's ST behavior when comparing control, low DOI, and high DOI groups.

**Results** Preliminary results show that the ST norm decreased significantly in both DOI groups when comparing them separately to the control group ( $p < 0.05$ ). There was a significant association between change in ST norm and change in children's ST. The indirect effect of DOI to ST via the ST norm was significant for the low DOI group  $B = -2.1721$  ( $-4.4214, -0.0887$ ), and the high DOI group  $B = -2.0622$  ( $-4.3201, -0.1826$ ) compared to the control group. The total effect of DOI on children's ST was not significant.

**Conclusion** In both DOI groups, the intervention had an effect on parent's ST norm, and further a decrease in ST norm decreased children's ST. The DAGIS intervention targeted also other parental determinants for children's ST. Further analyses of the DAGIS study in which DOI is included, are needed to get a broader understanding of the change mechanisms in parent's and children's behaviors.

# Effects of a multicomponent intervention to improve movement behaviours as well as the compliance of the 24-Hour Movement Guidelines among 3- to 9-Year-Old Spanish Children

**Prof. Javier Rodrigo-Sanjoaquin<sup>1,2</sup>**, Prof. Julien Bois<sup>1</sup>, Dr. Alberto Aibar Solana<sup>2</sup>, Dr. Léna Lhuisset<sup>1</sup>, Prof. Javier Zaragoza Casterad<sup>2</sup>

<sup>1</sup>Université de Pau & Pays de l'Adour, Tarbes, France, <sup>2</sup>University of Zaragoza, Zaragoza, Spain

**S.3.41 - Interventions to optimize 24-hour movement behaviors in preschoolers and children, UKK - Main Hall (Level 6), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose** Although the 24-hour movement guidelines are well extended worldwide, there is a lack of school-based interventions about 24-hour movement behaviours conducted with children and pre-schoolers. Therefore, this study aimed to examine the effects of a school-based intervention built on the Creating Active Schools (CAS) framework, and to describe the proportion of 3 to 9-year-old children meeting the 24-hour movement guidelines at the end of the intervention.

**Methods** A quasi-experimental design without a control group was conducted. Data about 24-hour movement behaviours was collected at baseline and at the end of the 2-year intervention. A total of 139 students (M=5.9; SD=2.2; 53% girls; 55% primary school) from a Spanish school were recruited to participate in a multicomponent intervention. The study was approved by the scientific ethics committee of Aragon, Spain (CEICA PI20/009).

**Results** There was a significant improvement in LPA (21.86;  $t=2.01$ ;  $p=.049$ ), while MVPA decreased significantly on weekends (-9.97;  $t=-2.35$ ;  $p=.022$ ). No significant effect was found for screen-time and sleep. Most children met MVPA (80.2%) and sleep duration (96.3%) guidelines. Lowest compliance was found for recreational screen-time (59%). More than half of the sample met all 24-hour movement guidelines (42.1%). All children complied with at least one individual guideline. Finally, the percentage of boys meeting the MVPA guideline was higher than girls in both primary school children ( $\chi^2=5.33$ ;  $p=0.019$ ) and pre-schoolers ( $\chi^2=11.72$ ;  $p<0.001$ ).

**Conclusion** Grounded in the CAS framework, a multi-component school-based intervention implemented through two years seems to be effective to improve LPA, but not MVPA among pre-schoolers and children. Screen time, recreational screen-time and sleep remained stable across the intervention. Compliance with the three combined 24-hour movement behaviour guidelines improved. Furthermore, this school-based intervention had a limited effect on MVPA, and that issue should be further examined in future studies.

# Park features that encourage park visitation among older adults: a qualitative study

**Ms. Amber Van Puyvelde**<sup>1,2</sup>, Prof. Benedicte Deforche<sup>1,3</sup>, Dr. Lieze Mertens<sup>1,2</sup>, Ms. Elise Rivera<sup>4</sup>, Prof. Delfien Van Dyck<sup>2</sup>, Associate Professor Jenny Veitch<sup>4</sup>, Dr. Louise Poppe<sup>1</sup>

<sup>1</sup>Department of Public Health and Primary Care, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>2</sup>Department of Movement and Sports Sciences, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>3</sup>Department of Movement and Sport Sciences, Faculty of Physical Education and Physiotherapy, Vrije Universiteit Brussel, Brussel, Belgium, <sup>4</sup>Deakin University, Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Sciences, Geelong, Australia

**S.3.42 - Park features and their micro scale designs important for park use among adults and older adults., UKK - Level 6 Foyer, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Parks provide many opportunities for promoting physical activity and consequently also the physical, social and mental wellbeing among older adults. However, older adults are the age group least frequently observed visiting parks. To attract more older adults to parks, it is important to understand their needs and preferences for park design. The aim of this qualitative study was to gain in-depth information about the preferred park features for park visitation among older adults (60+ years).

**Methods:** Twenty-five semi-structured interviews were conducted with older adults who visited a recently renewed urban park in Ghent, Belgium at least once since its renewal. The interview questions related to which elements the older adults liked, disliked or found lacking in the park. The interviews were conducted in-park or in the nursing home adjacent to the park until saturation of information was obtained. All interviews were transcribed verbatim, pseudonymized and analyzed by inductive content analysis using NVivo 12 software.

**Results:** The most preferred park activities were walking, sitting, and watching the environment. Participants mostly talked about walking paths and liked that there were many different paths and that the paths were clean, even, broad and accessible for wheelchairs and bikes. Other park features liked by older adults were nature and vegetation, openness and structural layout of the park and the presence of sufficient and good quality sitting areas. Park features the older adults did not like mostly related to poor park maintenance which included litter, illegal dumping of domestic waste and furniture, too much green waste and wild growth, and insufficient or too small rubbish bins, or not sufficiently emptied rubbish bins. Participants missed a café, toilet, organized events, a plan of the park, nameplates for trees and plants, and would like some more vegetation, such as flowers and (berry) bushes.

**Conclusion:** This study provides an overview of park features that older adults in Belgium perceive as important for park visitation. The evidence can help urban planners, landscape architects and policymakers to (re)design attractive local parks that promote physical activity and the physical, social and mental wellbeing of older adults.

# Designing walking paths and outdoor fitness areas for older adults

**Ms. Chahana Paudel<sup>1</sup>**, Prof. Anna Timperio<sup>1</sup>, Prof. Jo Salmon<sup>1</sup>, Prof. Benedicte Deforche<sup>2,3</sup>, Dr. Venurs Lo<sup>1</sup>, Associate Professor Jenny Veitch<sup>1</sup>

<sup>1</sup>Deakin University, Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Sciences, Geelong, Australia, <sup>2</sup>Department of Public Health and Primary Care, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>3</sup>Department of Movement and Sport Sciences, Faculty of Physical Education and Physiotherapy, Vrije Universiteit Brussel, Brussel, Belgium

**S.3.42 - Park features and their micro scale designs important for park use among adults and older adults., UKK - Level 6 Foyer, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Park features such as walking paths, and outdoor fitness areas are important for active and social park visits among older adults. However, little is known about the micro-level design aspects of these park features to ensure they are appealing to older adults and encourage them to be active during their park visits. This study used Adaptive Choice-Based Conjoint (ACBC) analysis to examine the relative importance of selected micro-level design features of walking paths and outdoor fitness areas preferred by older adults and examined if preferences varied by sex, park accompaniment, and mobility status.

**Method:** Cross-sectional data were collected from older adults (≥65 years) who are living independently in Australia. Participants completed an online survey that included a series of ACBC tasks related to features of walking paths (n=383, 65-93 years; 56% female) and outdoor fitness areas (n=372; 65-93 years; 57% female) in random order. Hierarchical Bayes analysis within Sawtooth Software was used to identify the relative importance and part-worth utility scores for each micro-level design feature.

**Result:** The three most important micro-level design features of walking paths were the “gradient of path” (21.3%, 95% CI=19.6, 22.9), “shady trees along the path” (21.2%, 95% CI= 20.1, 22.4), and “surface type” (13.3%, 95% CI= 12.2, 14.4). For these features, the part-worth utility scores showed that a path with gentle slopes; lots of shady trees; and rubber surfaces were preferred, respectively. The three most important micro-level design features of outdoor fitness areas were: “surface type” (21.5%, 95% CI 20, 22.9), especially rubber surface; “equipment specially designed for older adults” (18.7%, 95% CI 17.3, 20.2); and “shady trees around the fitness area” (14.0%, 95% CI 12.9, 15.0).

**Conclusion:** This study will help stakeholders in understanding which micro-level design feature to prioritise when (re)designing walking paths and outdoor fitness areas targeting older adults. The findings from this study show that paths with gentle slopes, lots of shady trees, and rubber surfaces and fitness areas with rubber under surfacing, lots of shady trees, and equipment specially designed for older adults should be prioritised when designing walking paths and fitness areas in parks.

# Understanding preferences for park features that encourage park visitation, park-based physical activity, and social interaction among adults: An adaptive choice-based conjoint analysis

**Associate Professor Jenny Veitch**<sup>1</sup>, Prof. Anna Timperio<sup>1</sup>, Ms. Elise Rivera<sup>2</sup>, Prof. Benedicte Deforche<sup>3,4</sup>, Dr. Venurs Loh<sup>1</sup>, Ms. Chahana Paudel<sup>1</sup>

<sup>1</sup>Deakin University, Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Sciences, Geelong, Australia, <sup>2</sup>Deakin University, School of Exercise and Nutrition Sciences, Geelong, Australia, <sup>3</sup>Department of Public Health and Primary Care, Faculty of Medicine and Health Sciences, Ghent University, Ghent, Belgium, <sup>4</sup>Department of Movement and Sport Sciences, Faculty of Physical Education and Physiotherapy, Vrije Universiteit Brussel, Brussel, Belgium

**S.3.42 - Park features and their micro scale designs important for park use among adults and older adults., UKK - Level 6 Foyer, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Parks are a key setting that can support the health and well-being of adults through facilitating physical activity and social interaction. This cross-sectional study examined the relative importance of park features for encouraging park visitation, park-based physical activity, and social interaction among adults (19-64 years) living in Melbourne and Sydney, Australia, and explored if preferences varied by sex and frequency of park visitation.

**Methods:** In August 2021, participants (n=260, mean age 55.8 years (12.8), 50% female) completed an online survey to derive a relative ranking of important park features for influencing choice of park for visitation, physical activity, and social interaction. They completed a series of Adaptive Choice-Based Conjoint (ACBC) analysis tasks, with responses used to identify the part-worth utilities and relative importance scores of selected park features using Hierarchical Bayes analyses within Sawtooth Software.

**Results:** Overall, a sense of safety from strangers and undesirable people was the most important feature influencing all three outcomes including choice of park to visit (20.7%; 95%CI: 18.7, 22.7), to be physically active (21.5%; 95%CI=18.9, 24.1) and be social (21.0%; 95%CI=17.9, 24.0). For visiting, good park maintenance and cleanliness (16.0%; 95%CI: 14.5, 17.4), and a peaceful and relaxed setting (14.8%; 95%CI: 13.6, 15.9) were the second and third most important park features. For physical activity, walking/cycling paths (15.5%; 95%CI=13.8, 17.3), and clean toilets (13.7%, 11.6, 15.9) were the second and third most important park features. For social interaction, the second, and third most important park features were good park maintenance and cleanliness (14.5%; 95%CI= 12.4, 16.6), and a BBQ or picnic area (13.6%; 95%CI= 11.7, 15.6). There were no noteworthy differences in results between males and females and between frequent and infrequent park visitors.

**Conclusion:** To ensure parks appeal as a setting that encourages adults to visit, engage in physical activity and interact socially, policymakers should prioritise safety, good park maintenance and cleanliness, a peaceful and relaxed setting, walking paths, clean toilets and a BBQ or picnic area.

# How theory can help to understand the potential impact of food environment policies on socioeconomic inequalities in diet: an application of Bourdieu's Capital Theory and the Scarcity Theory

**S.3.43 - The underlying mechanisms via which food environments and related policies impact on socioeconomic inequalities in diets, UKK - Hall B (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Government policies that promote healthy food environments are considered promising to reduce socioeconomic inequalities in diet. Empirical evidence of effects on these inequalities, however, is relatively scarce and, with a few exceptions, tends to be inconclusive.

**Methods:** We use two contemporary theories that help to understand socioeconomic inequalities in health and health-related behaviours (Bourdieu's Capital Theory and Mullainathan and Shafir's Scarcity Theory) to reason how policies influencing food environments may differentially impact lower and higher socioeconomic groups.

**Results:** In essence, these theories enable us to understand how specific elements of broader daily living conditions (e.g. social practices that lead to habitus formation, material conditions that shape experiences of scarcity) may lead to a greater benefit of certain food environment policies for the healthfulness of diets of lower or higher socioeconomic groups.

**Conclusions:** We conclude that the application of theories on the mechanisms underlying socioeconomic inequalities in health can help to guide future empirical studies in testing theory-based hypotheses on differential effects of policies, and thereby enhance the development of effective policies tackling socioeconomic inequalities in dietary intakes.

# Do financial constraint and perceived stress modify the effects of food tax schemes on food purchases: moderation analyses in a virtual supermarket

Mrs. Sanne Djojosoeparto<sup>1</sup>, Associate Professor Maartje Poelman<sup>2</sup>, Dr. Michelle Eykelenboom<sup>3</sup>, Assistant Professor Marielle Beenackers<sup>4</sup>, Prof. Ingrid Steenhuis<sup>3</sup>, Associate Professor Maartje Van Stralen<sup>3</sup>, Associate Professor Margreet Olthof<sup>3</sup>, Associate Professor Carry Renders<sup>3</sup>, Prof. Frank Van Lenthe<sup>4,1</sup>, **Associate Professor Carlijn Kamphuis<sup>5</sup>**

<sup>1</sup>Department of Human Geography and Spatial Planning, Utrecht University, Utrecht, Netherlands, <sup>2</sup>Chairgroup Consumption and Healthy Lifestyles, Department of Social Sciences, Wageningen University & Research, Wageningen, Netherlands, <sup>3</sup>Department of Health Sciences, Faculty of Science, Vrije Universiteit Amsterdam, and Amsterdam Public Health Research Institute, Amsterdam, Netherlands, <sup>4</sup>Department of Public Health, Erasmus University Medical Center Rotterdam, Rotterdam, Netherlands, <sup>5</sup>Department of Interdisciplinary Social Science, Utrecht University, Utrecht, Netherlands

**S.3.43 - The underlying mechanisms via which food environments and related policies impact on socioeconomic inequalities in diets, UKK - Hall B (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Objective** This study aimed to investigate whether financial constraint and perceived stress modify the effects of food-related taxes on the healthfulness of food purchases.

**Methods** A moderation analysis was conducted with data from a randomised controlled trial in a virtual supermarket where participants (n=394) were exposed to: (i) control condition, (ii) SSBs tax condition, or (iii) nutrient profiling tax condition. Outcome measures were: (i) overall healthiness of food purchases (proportion healthy %), (ii) energy content (kcal) and (iii) SSB purchases (liters). Effect modification was analyzed by adding interaction terms between the conditions and financial constraint or perceived stress in linear and ordinal regression models. Outcomes for each combination of condition and effect modifier were visualized.

**Results** Experiencing financial constraint or perceived stress did not significantly modify the effects of an SSBs tax or nutrient profiling tax on the outcome measures. In the control condition, the percentage of healthy food purchases and likelihood of being in a lower-level category of SSB purchases were lowest among those with moderate or high levels of financial constraint. Among those with moderate or high levels of constraint, a nutrient profiling tax increased the percentage of healthy food purchases and reduced SSB purchases.

**Conclusion** Financial constraint and perceived stress did not significantly modify the effects of food-related taxes on the healthfulness of food purchases. Patterns observed however, warrant further studies with larger samples to assess whether food-related taxes differentially affect the healthfulness of dietary intakes of subgroups

# Dynamics of the complex food environment underlying dietary intake in low-income groups: a systems map of associations extracted from a systematic umbrella literature review

**Dr. Alexia Sawyer<sup>1</sup>**, Prof. Frank Van Lenthe<sup>2, 7</sup>, Associate Professor Carlijn Kamphuis<sup>3</sup>, Prof. Laura Terragni<sup>4</sup>, Prof. Gun Roos<sup>5</sup>, Associate Professor Maartje Poelman<sup>6</sup>, Assistant Professor Mary Nicolaou<sup>1</sup>, Assistant Professor Wilma Waterlander<sup>1</sup>, Mrs. Sanne Djojosoeparto<sup>7</sup>, Dr. Mary Scheidmeir<sup>8</sup>, Associate Professor Agnieszka Neumann-Podczaska<sup>9</sup>, Prof. Karien Stronks<sup>1</sup>

**S.3.43 - The underlying mechanisms via which food environments and related policies impact on socioeconomic inequalities in diets, UKK - Hall B (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Examining the economic, social, physical and political food environment of low-income groups as a complex adaptive system – i.e. a system of multiple, interconnected factors exerting non-linear influence on an outcome, can enhance the development and assessment of effective policies and interventions by honouring the complexity of lived reality. We aimed to develop and apply novel causal loop diagramming methods in order to construct an evidence-based map of the underlying system of environmental factors that drives dietary intake in low-income groups.

**Methods:** A systematic umbrella review was conducted on literature examining determinants of dietary intake and food environments in low-income youths and adults in high/upper-middle income countries. Information on the determinants and associations between determinants was extracted from reviews of quantitative and qualitative studies. Determinants were organised using the Determinants of Nutrition and Eating (DONE) framework. Associations were synthesised into causal loop diagrams that were subsequently used to interpret the dynamics underlying the food environment and dietary intake. The map was reviewed by an expert panel and systems-based analysis identified the system paradigm, structure, feedback loops and goals.

**Results:** Findings from forty-three reviews and expert consensus were synthesised in an evidence-based map of the complex adaptive system underlying the food environment influencing dietary intake in low-income groups. The system was interpreted as operating within a supply-and-demand, economic paradigm. Five sub-systems ('geographical accessibility', 'household finances', 'household resources', 'individual influences', 'social and cultural influences') were presented as causal loop diagrams comprising 60 variables, conveying goals which undermine healthy dietary intake.

**Conclusions:** Our findings reveal how poor dietary intake in low-income groups can be presented as an emergent property of a complex adaptive system that sustains a food environment that increases the accessibility, availability, affordability and acceptability of unhealthy foods. In order to reshape system dynamics driving unhealthy food environments, simultaneous, diverse and innovative strategies are needed to facilitate longer-term management of household finances and socially-oriented practices around healthy food production, supply and intake. Ultimately, such strategies must be supported by a system paradigm which prioritises health.

# Trial designs for sleep interventions in childhood: What works?

**Dr. Jillian Haszard<sup>1</sup>**, Dr. Justine Camp<sup>2</sup>, Prof. Barbara Galland<sup>3</sup>, Prof. Rachael Taylor<sup>2</sup>

<sup>1</sup>Biostatistics Centre, University of Otago, Dunedin, New Zealand, <sup>2</sup>Department of Medicine, University of Otago, Dunedin, New Zealand, <sup>3</sup>Department of Women's and Children's Health, University of Otago, Dunedin, New Zealand

**S.3.44 - Enhancing the design of interventions to change health behaviours, UKK - Hall C (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Improving sleep health in children may benefit multiple aspects of their lives, including diet, body weight, wellbeing, and quality of life. To investigate how to improve sleep health, it is important to choose the best study design for the identified need.

**Methods:** We have carried out several trials on sleep health, including a crossover trial (DREAM) that aimed to understand how mild sleep deprivation in children could influence eating; a parallel RCT (POI) that showed a brief sleep intervention in infancy improved obesity at five years; and a MOST trial (Moemoeā) that looked to determine an optimised intervention for improving sleep and wellbeing in infants and their families from an indigenous-led perspective. Lessons from these trials were used to design a suite of new sleep intervention studies that we are currently planning, which include a cluster RCT and a stepped-wedge trial.

**Results:** Our DREAM study showed that mild sleep deprivation in children causes higher energy intake and lower quality of life – identifying possible benefits of sleep health interventions. The POI study showed that a brief sleep intervention in infancy improved obesity outcomes in young children, but not for all, in particular not for Māori (New Zealand indigenous population). The Moemoeā study taught us that the MOST design did not fit with the Māori world-view and that our implementation was not strong. In response to these results we have designed a Māori-led cluster RCT with implementation feasibility (hybrid 1 trial) to assess the effectiveness of a sleep intervention in infancy on family wellbeing. The cluster design allows our intervention to align with the Māori world-view as well as the structure of health providers in New Zealand. We have also planned a stepped-wedge trial to assess the influence of making school start times later for senior high school students – a design suitable for interventions that will be implemented in pre-schools or similar.

**Conclusions:** Appropriate study design is critical to be able to meet the research objectives and provide the desired outcomes for the population. However, if the design fails in some way, these lessons should be shared and built upon.

# The power of collaboration: deconstructing and learning from existing early obesity prevention interventions in the TOPCHILD Collaboration

**Dr. Brittany Johnson**<sup>1</sup>, Associate Professor Paul Chadwick<sup>2</sup>, Ms. Samantha Pryde<sup>1</sup>, Dr. Anna Lene Seidler<sup>3</sup>, Ms. Kylie Hunter<sup>3</sup>, Mr. Hei In Lau<sup>1</sup>, Prof. Rebecca Golley<sup>1</sup>, Other on behalf of the Transforming Obesity Prevention for CHILDren (TOPCHILD) Collaboration

<sup>1</sup>Caring Futures Institute, Flinders University, Adelaide, Australia, <sup>2</sup>Centre for Behaviour Change, University College London, London, United Kingdom, <sup>3</sup>NHMRC Clinical Trials Centre, The University of Sydney, Sydney, Australia

**S.3.44 - Enhancing the design of interventions to change health behaviours, UKK - Hall C (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Over the past two decades numerous complex early obesity prevention interventions have been designed and tested. Little is known about how such interventions seek to change behaviour and which components are or are not effective. Understanding the discrete intervention components provides a first step towards examining intervention effectiveness by components, to inform design of future interventions. This study aimed to characterise early obesity prevention interventions in terms of target behaviours, delivery features and behaviour change techniques (BCTs).

**Methods:** Annual systematic searches were performed in Epub Ahead of Print/MEDLINE, Embase, Cochrane (CENTRAL), CINAHL, PsycINFO, as well as clinical trial registries from 2020-2022. Eligible randomised controlled trials of behavioural child obesity prevention interventions commencing antenatally or in the first year after birth were invited to join the Transforming Obesity in CHILDren (TOPCHILD) Collaboration. Standard frameworks and taxonomies were used to systematically code target behaviour clusters, delivery features (i.e. how an intervention is delivered) and BCTs. Narrative syntheses were performed to summarise intervention components.

**Results:** Twenty-six studies involving 31 active interventions had joined the TOPCHILD Collaboration and shared materials as of Oct 2022. Preliminary findings revealed the most frequently targeted behavioural clusters were food provision and parent feeding practices (N=28), followed by infant feeding practices (N=24). Commonly used feature categories were didactic sessions (n=31), face-to-face delivery (n=25), written materials (n=24), home setting (n=21), and monthly or greater frequency of contact (n=20). The most frequently coded BCTs from published descriptions, regardless of behavioural cluster were BCT 1.2, BCT 3.1, BCT 4.1, BCT 8.1, BCT 9.1.

**Conclusion:** This project provides the first comprehensive, systematic examination of the components of complex early child obesity prevention interventions. While there were some common components across majority of interventions, such as the delivery feature materials or procedures used, there was in general large variation in other delivery features and range of BCTs, with few interventions targeting sleep practices. We have also identified untapped intervention components to be investigated in future research. Combining the coded intervention components with individual participant outcome data will allow us to examine which components are associated with intervention effectiveness to design next generation interventions.

# Design of a micro-randomized trial to optimize just-in-time-adaptive intervention messaging to improve adherence to weight-related behaviors in young adults

**Assistant Professor Carmina Valle**<sup>1,2</sup>, Assistant Professor Brooke Nezami<sup>1</sup>, Assistant Professor Heather Wasser<sup>1</sup>, Ms. Karen Hatley<sup>2</sup>, Ms. Molly Diamond<sup>2</sup>, Dr. Kristen Polzien<sup>2</sup>, Associate Professor Nisha Gottfredson<sup>1</sup>, Prof. Deborah Tate<sup>1,2</sup>

<sup>1</sup>Gillings School of Global Public Health, University of North Carolina at Chapel Hill, Chapel Hill, USA,

<sup>2</sup>Lineberger Comprehensive Cancer Center, University of North Carolina at Chapel Hill, Chapel Hill, USA

**S.3.44 - Enhancing the design of interventions to change health behaviours, UKK - Hall C (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Just-in-time adaptive interventions (JITAI) have the potential to improve multiple weight-related behaviors by integrating data from digital devices and providing adaptive, tailored messages that offer the “right type of support” at “the right time.” However, little empirical evidence exists regarding what types of JITAI messages are most effective and under what conditions. The purpose of this study is to systematically test the effects of 7 different types of intervention messages that target distinct behavior change techniques (i.e., BCT messages) on daily adherence to weighing, dietary, and physical activity goals among young adults of reproductive age.

**Methods:** Building on our pilot micro-randomized trial, 201 young adults with overweight and obesity will receive a 6-month behavioral weight loss intervention using our Nudge mobile app, which includes evidence-based weekly lessons, tailored feedback, self-monitoring, and daily BCT messages. Participants will have 3 daily weight-related behavioral goals: weigh daily, stay at or under a “red” food limit (energy dense foods), and meet an active minutes goal. At 3 decision points per day, participants will be micro-randomized to receive, or not receive, 1 of 7 types of BCT messages. All BCT messages have unique decision rules that evaluate an individual’s availability to receive an intervention. Candidate BCT messages have been carefully selected from empirical evidence or tested in our prior studies, or are from our pilot micro-randomized trial. Each BCT message is aimed at improving one of 3 weight-related proximal outcomes on the same day the message is delivered, or not delivered: *daily weighing* (assessed by wireless scale), *staying at or under a daily red food limit* (assessed by self-report in the app), or *meeting a daily active minutes goal* (assessed by activity tracker). Assessments will occur daily, and at 0, 3 and 6 months.

**Results:** Recruitment for the micro-randomized trial will be begin in early 2023.

**Conclusions:** Findings will expand our understanding of what BCT messages are effective, when they are effective, and for whom. Given the focus on young adults, findings may inform interventions aiming to prevent early childhood obesity through the improvement of nutrition and activity behaviors of parents of young children.

# What factors shape food environments in health care institutions? A systems dynamics approach

**Ms. Joline Wierda**<sup>1</sup>, Assistant Professor Coosje, S Dijkstra<sup>2</sup>, Ms. Tamika, M Wopereis<sup>1</sup>, Prof. Emely de Vet<sup>1</sup>, Associate Professor Maartje, P Poelman<sup>1</sup>

<sup>1</sup>Chair Group Consumption and Healthy Lifestyles, Wageningen University & Research, Wageningen, Netherlands, <sup>2</sup>Department of Health Sciences, Amsterdam Public Health Research Institute, Vrije Universiteit Amsterdam, Amsterdam, Netherlands

**S.3.45 - Towards healthy and sustainable food environments in hospitals and other health care settings: international lessons learned, UKK - Hall D (Level 2 - main floor), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The food environment of health care institutions is complex and has to serve patients/clients, visitors and staff. Creating a healthy and sustainable food environment asks for a broad and systemic approach. The aims of this study were to 1) identify systemic factors that shape the food environment in health care organizations for patients/clients, visitors and staff and 2) formulate actions that are needed for a systemic transition towards a healthy and sustainable food environment in health care settings.

**Methods:** A group model building (GMB) approach was used during two live workshops in the spring of 2022 with different stakeholders (n=9-10) of five different health care settings in the Netherlands: a nursing home, two revalidation centres, mental health care institution and care setting for people with intellectual disabilities. During the first workshop, GMB scripts were used to facilitate stakeholders in identifying factors and positive and negative associations between those factors in a causal loop diagram (CLD). Subsequently, stakeholders were required to identify leverage points for change. In the second workshop, stakeholders were encouraged to formulate actions for change. The CLD was used to interpret the system dynamics underlying the food environment in health care settings.

**Results:** The developed CLD consisted of 35 associating factors that stimulate a healthy and sustainable diet in health care organizations and were categorised into six interrelated subsystems: the health care organization, social context, budget and procurement, media influence, the individual (patient/client) and the national government. Eleven leverage points were identified (e.g. 'vision and policy on food') and thirteen corresponding actions were formulated by the stakeholders (e.g. 'a committed management').

**Conclusions:** The developed systems map illustrates the complexity of the food environment in health care settings and the interrelatedness of the factors within different subsystems. It demonstrates that actions on different levels of different subsystems are needed to long lastingly improve food environments in health care institutions. This map can support health care institutions and policy makers to better understand the components of the food environment and to recognize where change is needed in the system to create health promoting environments in health care settings.

# Creating healthy hospital retail food environments at-scale: examining the acceptability, feasibility and effectiveness of a policy solution.

Dr. Leonie Cranney<sup>1,2</sup>, **Dr. Margaret Thomas<sup>1,2</sup>**

<sup>1</sup>School of Public Health, Faculty of Health, University of Technology Sydney, Sydney, Australia, <sup>2</sup>Charles Perkins Centre, The University of Sydney, New South Wales, Australia

**S.3.45 - Towards healthy and sustainable food environments in hospitals and other health care settings: international lessons learned, UKK - Hall D (Level 2 - main floor), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** This research determined the acceptability, feasibility and effectiveness of a hospital healthy food retail policy within a large and complex health system. The presentation will highlight the value of a pragmatic, mixed methods approach to evaluating complex, real-world food environment policy interventions.

**Methods:** A pragmatic perspective underpinned the research, which used a convergent parallel mixed methods pre-post evaluation design. The design focussed equally on effectiveness and process outcomes and used multiple data sources to examine them. Quantitative studies included census audits of food retail outlets and repeat consumer intercept surveys with 4,808 staff and visitors in 10 randomly selected hospitals. Qualitative studies using semi-structured interviews adopted a grounded theory approach to explore stakeholder implementation experiences (n=99 stakeholders). The underlying mechanisms that generated outcomes were examined, as well as the intervention and contextual factors that triggered them. Interviews were audio-recorded, transcribed, coded and thematically analysed in NVivo 11.

**Results:** Several important factors enhancing feasibility of policy implementation were identified: executive commitment to implementation and monitoring; a flexible approach to locally tailored implementation; and historical precedents. Clear practice targets within a long-term incremental approach, system-wide support, and monitoring requirements were key intervention features. These triggered sufficient accountability and autonomy to drive organisational and environmental change. Other key mechanisms that drove systemic change included stakeholder's broad acceptance of the policy premise, their desire to succeed, perceived benefits and effectiveness. Most retail outlets removed sugar-sweetened beverages from sale (58% to 96%;  $p < 0.001$ ), which was well supported by consumers (80%). Local implementers and retailers worked towards achieving further food-related benchmark criteria with intercept surveys showing strong and increasing levels of consumer support (89% to 92%;  $p = 0.01$ ), but only a slight percentage increase in healthier food purchases was observed (56 to 59 %;  $p = 0.22$ ).

**Conclusions:** Healthy food retail policy can be successfully implemented in the hospital setting, and at-scale across a large and complex health system. The pragmatic and comprehensive evaluation design was feasible and appropriate for real-world policy evaluation in this context and generated meaningful evidence for ongoing policy implementation and the broader evidence base.

# Healthy and climate-friendly menus in nursing homes in the City of Copenhagen – Development of guidelines and follow-up of implementation

**Ms. Matilda Nordman<sup>1</sup>**, Dr. Anne, D Lassen<sup>1</sup>, Dr. Ellen Trolle<sup>1</sup>

<sup>1</sup>National Food Institute, Technical University of Denmark , Kongens Lyngby, Denmark

**S.3.45 - Towards healthy and sustainable food environments in hospitals and other health care settings: international lessons learned, UKK - Hall D (Level 2 - main floor), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Shifting public food procurement is an important step for climate action but nursing homes face many nutritional challenges. Here we demonstrate by scenario analysis how diet-related greenhouse gas emissions (GHGE) can be reduced by at least 25% in nursing homes in the City of Copenhagen while at the same time providing nutritionally adequate and recognizable menus. In addition, we showcase how the City of Copenhagen is working towards these goals as part of their food strategy and present preliminary results of a mid-way evaluation of the effects on the food purchased by nursing homes.

**Methods:** We carried out a scenario analysis based on the municipality's food procurement data from 2018 to create target group-specific guidance for improved nutritional quality and lower GHGE of the food served in nursing homes. We describe how the municipality is currently implementing the guidelines in practice as part of a larger new food strategy implementation. Finally, based on 2022 food procurement data we carry out a mid-way evaluation of the effects of implementation.

**Results:** Diet models and guidelines were created to take into account both nutritional quality and sustainability (GHGE reduction 22-26%) of the food purchased by nursing homes. Compared with baseline practices, the guidelines outline changes in serving amounts of meat (decreased to no more than 500 g/person/week of cooked red meat and poultry) and a substantial increase in plant-based protein-rich foods such as pulses, nuts, and seeds. Activities of the implementation in the municipality include the provision of guidelines, the creation of a recipe database, and training and supervision of food providers by food consultants. Mid-way evaluation includes analysis of the potential changes in the composition of the food purchased, e.g., use of legumes and meat (especially ruminant meat).

**Conclusions:** This study presents how guidelines for healthy and more climate-friendly menus can be formulated and used as instrument to guide dietary transition in nursing homes. Mid-way evaluation provides status on the implementation and perspectives for further involvement of stakeholders needed to achieve the transition to a healthy and sustainable food system, all while ensuring the nutritional quality of meals in nursing homes.

# Recall, understanding, use, and perceived utility of the front-of-package warnings labels in Peru: A qualitative study with mothers of preschool children in 4 cities

**Mr. Francisco Diez-Canseco**

<sup>1</sup>Cronicas Center of Excellence in Chronic Diseases, Cayetano Heredia University, Lima, Peru

**S.3.46 - Evaluating innovative food policies to reduce consumption of unhealthy foods and drinks in Chile and Peru, UKK - K1 (+K2) (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** In June 2019, as part of an effort to reduce the risk of overweight and NCDs among children and adolescents, Peru implemented four octagon-shaped front-of-package (FoP) warning labels to inform consumers about high levels of sugar, saturated fats, sodium, and trans fats on processed foods and beverages. A qualitative study was designed to explore the recall, understanding, use and perceived utility of the FoP among mothers of preschool children in four Peruvian cities.

**Methods:** In mid-2021, 18 virtual focus groups with mothers from different socioeconomic statuses (SES) and living in four cities of different size, geography and culture were conducted. A content analysis of the transcriptions was performed.

**Results:** Ninety-eight women (average age: 32 years old, average children: 2) participated. The warning labels were easily identified and remembered by mothers of all cities and SES and their general purpose clearly understood, although some octagons and claims were better recalled and more clearly understood than others. The warning labels were commonly used by many mothers when deciding what packaged products to buy, although the use seemed to be heterogenous, that is more valued to purchase some products than others. Most mothers reported changes in their purchasing habits due to the warning labels, mainly reducing the frequency and quantity of processed foods and beverages intake, replacing them with home-made preparations or buying other packaged products without octagons. There was a strong support to the warning labels policy in all cities and SES. Mothers perceived the warning labels informative and useful to take better decisions and protect their family health. There was also high support to ban labelled foods school cafeterias, although mothers expressed their concern about the lack of a healthier offer to replace the prohibited products.

**Conclusion:** The use of qualitative tools allowed us to understand that, among women from very different regions and SES, the FoP warning labels were well remembered, commonly used when buying packaged foods and beverages, and highly valued. The implementation of this policy seemed to have helped women to reduce the purchase and intake of products high-in sugar, sodium and fats.

# Sugary beverage purchases after the Chilean and Peruvian sugar reduction policies

**Dr. Lindsey Smith Taillie**<sup>1</sup>, Mr. Maxime Bercholz<sup>1</sup>, Dr. J. Jaime Miranda<sup>2</sup>, Mr. Francisco Diez-Canseco<sup>2</sup>, Dr. Camila Corvalan<sup>3</sup>

<sup>1</sup>University of North Carolina, Chapel Hill, Chapel Hill, USA, <sup>2</sup>CRONICAS, University of Cayetano Heredia, Lima, Peru, <sup>3</sup>INTA, University of Chile, Santiago, Chile

**S.3.46 - Evaluating innovative food policies to reduce consumption of unhealthy foods and drinks in Chile and Peru, UKK - K1 (+K2) (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Sugary drinks are a pressing public health concern in Latin America due to their increasing sales and association with non-communicable disease (NCDs) risk. Sugary drink taxes and front-of-package labels, including “high-in sugar” warnings, are increasingly popular strategies to reduce consumption of sugary drinks, yet empirical evaluations of these policies in Latin America are sparse. This study evaluates two sets of sugar reduction policies and their association with sugary drink purchases: Peru’s sugary drink tax modifications (the first implemented in May 2018 and the second in June 2019) and ‘high-in’ warning labels (June 2019), and Chile’s ‘high in’ warning labels and advertising policy (the first phase was implemented in June 2016; the second in June 2018).

**Methods:** In each country, we used panel data on household beverage purchases aggregated to the monthly level (n=44,909 and n=92,189 household-month observations in Chile and Peru, respectively) to describe changes in the shares of calories and sugar purchased from “high-in” products between the 12-month period before the first policy implementation (“pre-policy period”) and the 12-month period after the second policy implementation (“post-policy period”). Means and household-level-cluster-robust 95% CIs were calculated for each period. Final methods will include fixed effects models controlling for seasonality, trends, and household-level covariates.

**Results:** After one year in the post-policy period, we observed reductions of 20-30 percentage points (pp) relative to the pre-policy period. In Chile, the share of calories coming from high-in beverages fell 23 pp (from 55% [95% CI 54%, 55%] to 32% [31%, 33%]), while the share of sugar coming from high-in beverages fell 25 pp (from 66% [65%, 67%] to 41% [40%, 42%]). In Peru, the share of beverage calories and sugar from high-in beverages fell by 21 pp (from 33% [33%, 34%] to 12% [11%, 12%]) and 30 pp (from 48% [48%, 49%] to 18% [17%, 18%]), respectively.

**Conclusion:** After one year, the Chilean and Peruvian sugar reduction policies were associated with reductions in calories and sugar from high-sugar beverages relative to overall calories and sugar, suggesting suggest that these policies may contribute to healthier beverage consumption.

# Chile's Food Labeling and Marketing Law: effect on children's exposure to food advertising and parents' perceptions and nutritional knowledge

Dr. Camila Corvalán<sup>1</sup>, Dr. Marcela Reyes<sup>1</sup>, Dr. Teresa Correa<sup>2</sup>, Dr. Francesca Dillman-Carpentier<sup>3</sup>, **Dr. Fernanda Mediano**<sup>5,6</sup>, Dr. Lindsey Smith Taillie<sup>4</sup>

<sup>1</sup>INTA, University of Chile, Santiago, Chile, <sup>2</sup>School of Communication, Universidad Diego Portales, Santiago, Chile, <sup>3</sup>Hussman School of Journalism and Media, University of North Carolina, Chapel Hill, Chapel Hill, USA, <sup>4</sup>Gillings School of Global Public Health, University of North Carolina, Chapel Hill, Chapel Hill, USA, <sup>5</sup>School of Psychology, Pontificia Universidad Católica de Chile, , Chile, <sup>6</sup>Carolina Population Center, University of North Carolina, North Carolina, USA

**S.3.46 - Evaluating innovative food policies to reduce consumption of unhealthy foods and drinks in Chile and Peru, UKK - K1 (+K2) (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** In June 2019, Chile completed the implementation of the Chilean Food Labelling and Marketing Law, one of the most comprehensive policies to date to improve children's food environment. The regulation includes the use of warning label on unhealthy "high-in" food products and comprehensive marketing regulations, among other aspects. We have reported decreases on "high-in" foods TV marketing and positive changes on consumer's behaviors after initial implementation; however, we are interested in assessing long-term effects remained long-term, especially after the daytime ban on all "high-in" food advertisement that occurred in Phase 2.

**Methods:** We analyzed a random stratified sample of ads from two constructed weeks of television from pre-regulation (2016), Phase 1 child-directed restrictions (2017, 2018), and the Phase 2 high-in daytime ban (2019). Children's exposure was assessed using daily gross rating points from audience ratings data. We also conducted nine focus groups of mothers (7–10 people each) of children (2–14 yo) in Santiago, Chile in 2019 and macrocodes were developed, combining an iterative process of deductive and inductive thematic analyses.

**Results:** For TV advertisements, we observed that compared to pre-regulation, unhealthy foods ads decreased after full implementation by 64% in total, 66% between 6am-10pm, 56% after 10pm, 67% for ads with child-directed content, and 77% in programs attracting children ( $P < 0.01$ ). Children's exposure to TV unhealthy foods advertisement decreased by 73% compared to pre-regulation ( $P < 0.001$ ). In the focus groups, we found that parents' attention to warning labels decreased over time, particularly among those with lower-socioeconomic status (SES). However, mother of all SES mentioned that because of the law they have developed greater knowledge about nutrition and appreciation for natural foods. Low-SES mother complained that acquiring this knowledge was not useful if healthy foods remained financially and physically inaccessible. All mothers emphasize that schools are a key healthy promoting environment.

**Conclusions:** The Chilean Labelling and Marketing Law improved food literacy in all SES groups as well as reduce children's exposure to unhealthy food advertising. The results suggest that food environment policies can promote nutrition equity, though more attention needs to be paid to healthy food affordability.

# Adventurous play and mental health: Findings from the British Children's Play Survey.

**Dr. Rachel Nesbit<sup>1</sup>**, Dr. Lily Fitzgibbon<sup>2</sup>, Ms. Brooke Oliver<sup>3</sup>, Prof. Helen Dodd<sup>1</sup>

<sup>1</sup>Department of Public Health and Sports Sciences, University of Exeter, Exeter, United Kingdom, <sup>2</sup>University of Stirling, Stirling, United Kingdom, <sup>3</sup> University of Reading, Reading, United Kingdom

**S.3.47 - Risky play in childhood: innovative insights and future research directions, UKK - K3+4 (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Adventurous play has been proposed to provide a positive context where children experience and learn about fear, uncertainty, decision-making, risk-judgement and coping and in turn affords children with the skills to manage future situations that may be scary or uncertain. As such, adventurous play has been theorised as a mechanism to reduce children's risk for problematic anxiety. The aims of this presentation are twofold. Using data from The British Children's Play Survey, the first aim is to examine how adventurously children in Britain play, where this play takes place and how much time children in Britain spend playing adventurously across the year. The second aim is to examine factors related to the amount of time children spend playing adventurously, including socio-demographic factors, parent attitudes towards risk and engagement and children's mental health.

**Methods:** The British Children's Play survey was conducted to provide nationally representative data on the play of primary-school aged children in Britain (N =1919). Parents and caregivers completed a range of measures reporting on their child's play and adventurous play (location, frequency, time), their attitudes towards risk in play, socio-demographics and measures of their child's mental health.

**Results:** Children in Britain were reported to have the highest levels of adventurous play in green spaces such as forests and fields and the lowest levels of adventurous play at home. Children who spent the most amount of time playing adventurously were boys, younger children, children who did not have a disability and children whose responding parent/caregiver was white and working part-time. Parents who were more tolerant of risk and who had more positive attitudes about their child engaging with risk had children who spent more time playing adventurously. Children who spent more time playing adventurously had fewer internalising symptoms and more positive affect.

**Conclusions:** Our findings provide the first empirical evidence linking adventurous play to children's mental health. Our findings highlight that providing children with opportunities to play in an adventurous way may offer benefits for children's mood and long-term mental health.

**Funding:** This research was funded by a UKRI Future Leaders Fellowship, grant number MR/S017909/1.

# ViRMa: Virtual Risk Management - exploring effects of childhood risk experiences through innovative methods

**Prof. Ellen Sandseter<sup>1</sup>**

<sup>1</sup>Queen Maud University College of Early Childhood Education, Trondheim, Norway

**S.3.47 - Risky play in childhood: innovative insights and future research directions, UKK - K3+4 (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose** Studies suggest that through risky play, children learn to manage risks (Sandseter & Kennair, 2011; Lavrysen et al., 2015; Brussoni et al., 2015). However, most studies consist of small samples and lack the robustness of larger quantitative designs. There are also ethical issues with studies where children take real risk, while restricting children from playing freely to assess negative effects would be equally problematic. Virtual Reality (VR) (Morrongiello et al., 2015; Wang et al., 2020) is a promising method for studying aspects of risk, still meeting requirements for research ethics. The aim of this project is twofold; to develop new technological methods to measure children's willingness to take risks, their risk assessment and management skills, and to explore associations between risky play experiences and risk assessment/management skills.

**Methods** Based on common injury causes among children, three categories of risk situations were chosen: 1) Street crossing, 2) River crossing, 3) Balancing high playground equipment. VR scenarios of these risk situations, including different levels of risk, were developed as virtual spaces for children to assess and manage risk. In addition, while performing tasks in VR (VIVE Pro Eye), eye-tracking technology measure children's use of their gaze, and bodily movements are measured with motion-capturing technology (Xsens MTw Awinda). Background data from children and parents around sensation-seeking personality, perceived motor skills, parenting style and earlier risk experiences are collected through questionnaires. The methods were piloted and modified during 2022. The main data collection will be conducted during January–April 2023, including approximately 500 children and their parents.

**Results** This presentation will focus on the development of innovative methods, as well as preliminary analysis of the data from the main data collection. Data from the VR, eye-tracking technology and motion capturing will be processed in MATLAB and STATA for statistical analysis. Similarly, data from questionnaires will be imported to STATA.

**Conclusions** New technology gives opportunities to measure children's risk-taking, risk assessment and risk management in an ethical appropriate way, and insight into the relationship between children's risky play experiences and their risk assessment/management skills will be presented.

**Funding:** The Research Council of Norway (project #324155)

# PROMoting Early Childhood Outside (PRO-ECO): measuring children's outdoor and risky play at child care centres in Vancouver, BC

**Ms. Rachel Ramsden<sup>1</sup>**, Prof. Ian Pike<sup>1,2</sup>, Prof. Sally Thorne<sup>3</sup>, Prof. Mariana Brussoni<sup>1,2,4</sup>

<sup>1</sup>Department of Pediatrics, The University of British Columbia, Vancouver, Canada, <sup>2</sup>British Columbia

Children's Hospital Research Institute, Vancouver, Canada, <sup>3</sup>UBC School of Nursing, Vancouver, Canada,

<sup>4</sup>Human Early Learning Partnership, School of Population and Public Health, University of British Columbia, Vancouver, Canada

**S.3.47 - Risky play in childhood: innovative insights and future research directions, UKK - K3+4 (Level 3), June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** F. Early care and education

**Purpose:** Participation in outdoor and risky play can benefit children's development, health and overall well-being. This study aims to measure outdoor and risky play affordances at childcare centres in Vancouver, Canada. Using innovative methodological approaches, the objective of this study is to understand environmental components that support children's outdoor and risky play and produce child-centred recommendations for the planning, design and modification of childcare spaces.

**Methods:** Baseline data from 8 participating childcare centres in the PROMoting Early Childhood Outside (PRO-ECO) study were used. Children aged 2.5 – 6 years attending participating childcare centres were recruited to participate in this study. The expanded *Tool for Observing Play Outdoors (TOPO)* and the *Categories of Risk-taking Behaviour* were used to measure children's observed outdoor and risky play in relation to physical location during designated outdoor play times at childcare. Descriptive maps outlining the frequency of play behaviour, activity level and risk-taking behaviour for each child care centre were produced. Using the *Mosaic Approach*, qualitative interviews, walk-along tours and map-making were also conducted with children. Thematic analysis was used to analyze children's perspectives of their outdoor and risky play in relation to outdoor affordances.

**Results:** The sample for this study consisted of 130 children. Of these participants, 23 children from two participating childcare centres were included in the qualitative component of this study. Results from quantitative and qualitative analyses demonstrate the areas of outdoor childcare spaces where children are most likely to participate in outdoor and risky play, including the sandbox, climbing structures and tricycle paths. This presentation will focus on the methodology used to measure children's outdoor and risky play behaviour and showcase the preliminary results of this study.

**Conclusions:** This research provides new methodological considerations for including children's perspectives in the measurement of outdoor and risky play as well as unique findings on outdoor and risky play affordances. The results of this study will have implications for the advancement of enhanced planning and design of outdoor childcare spaces to support outdoor and risky play.

**Funding:** The PRO-ECO study is funded by the Lawson Foundation

# Implementation of SuperFIT in preschools: facilitators and barriers according to the main stakeholders

**Dr. Sanne Gerards<sup>1</sup>**, Dr. Kelly Stewart<sup>1</sup>, Mr. Daan Pluim<sup>2</sup>, Ms. Angela Erkens<sup>3</sup>, Dr. Jessica Gubbels<sup>1</sup>

<sup>1</sup>Maastricht University, Maastricht, Netherlands, <sup>2</sup>Ecsplora, Sittard, Netherlands, <sup>3</sup>MIK-PIW groep, Beek, Netherlands

**S.3.48 - Narrowing the science-practice implementation gap in the field of physical activity and nutrition, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** SuperFIT is a comprehensive, integrated, preschool intervention approach aiming to improve children's energy balance-related behaviors (2-4 years). SuperFIT aims to change the physical, socio-cultural and political environment in both the preschool and home setting. An effect evaluation and a process evaluation study of SuperFIT have previously shown some promising results. Currently, the intervention is being implemented on a large scale in the southern part of the Netherlands. In the current study, we investigated the barriers and facilitators of the large-scale implementation of SuperFIT. Based on these findings, adequate implementation strategies will be developed.

**Methods:** 21 individual interviews were done with a broad range of stakeholders (i.e. preschool teachers and management, SuperFIT implementers, parents). The interviews were based on the Consolidated Framework of Implementation Research by Damschroder. The interviews were analysed using Nvivo.

**Results:** All categories of Damschroder were mentioned in the interviews as affecting the implementation of SuperFIT: the intervention, the implementer, the organisation and the socio-political context. SuperFIT was perceived as an adaptable intervention approach, which eventually felt as fitting within the working procedures. However, there is a need for additional tools to facilitate the conversation with preschool teachers and parents on SuperFIT and to exchange experiences. Implementers indicated that they needed some extra training to be able to work context-dependent. The enthusiasm of relevant stakeholders seem to be most predictive of how well SuperFIT was implemented. Regarding the organisation, although the management prioritized the implementation of SuperFIT, some challenging circumstances hindered the implementation: i.e. personnel shortages and sick leave, as well as the concurrent implementation of other programs. At the socio-political context level, regulations and national developments were stimulating, but COVID-19 had a negative impact.

**Conclusion:** The current study provided insight in perceived barriers and facilitators, which led to the development of the following implementation strategies: deploying SuperFIT ambassadors, training of SuperFIT implementers, and development of extra tools supporting the implementation of SuperFIT (e.g. an inspirational platform and a conversation tool).

# Implementing interventions in the real world - A balancing act between practice and science. Key challenges of the Familie+ project.

**Dr. Christina Niermann<sup>1</sup>, Ms. Friederike Butscher<sup>2</sup>**, Mr. Felix Arway<sup>3</sup>, Ms. Alexandra Ziegeldorf<sup>4</sup>, Prof. Martina Kanning<sup>3</sup>

<sup>1</sup>Medical School Hamburg, Hamburg, Germany, <sup>2</sup>Technical University of Munich, Munich, Germany, <sup>3</sup>University of Konstanz, Konstanz, Germany, <sup>4</sup>University of Leipzig, Leipzig, Germany

**S.3.48 - Narrowing the science-practice implementation gap in the field of physical activity and nutrition, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose** The aim of the Familie+ project was to evaluate the real-life implementation of a school-based intervention. Familie+ aims to promote physical activity, nutrition, sedentary behaviour and sleep behaviour simultaneously in school and family life using a collection of equivalent actions for both settings. The inclusion of community and school stakeholders and families in the development and real-life implementation processes required a collaboration between practice and science throughout all project phases. The purpose of this study was to integrate perspectives of stakeholders (community, school), implementers and users of the intervention (teachers, families) and researchers aiming to identify aspects reflecting the main challenges of the science-practice collaboration.

**Methods** Familie+ comprises three phases: 1) development, 2) implementation and evaluation, 3) translation and dissemination. The intervention was implemented in 47 classes in nine primary schools in three communities in an uncontrolled effectiveness-implementation hybrid trial. We applied a multistage mixed methods approach (questionnaires, one-to-one interviews, focus groups). Regarding qualitative data, content analyses were used to categorize manifestations of the research-practice gap. Those categories were contrasted with according aspects of the academic system. First results of manifestations of the research-practice gap are presented.

**Results** We found manifestations of the research-practice gap in the statements of teachers, school principals, families and community stakeholders. For instance, aiming to produce 'high quality' data, researchers tend to standardize and control implementation processes. This was in contrast with needs and expectations of community and school stakeholders, who both needed a highly individualized proceeding and adaption to community, school and class specific conditions. Overall the statements reflect a non-fit between the scientific Familie+ project, including e.g. applied processes such data assessments and standardized implementation on the one side and real-life conditions of teachers, families and community stakeholders on the other side.

**Conclusions** Collaboration between two inherently different 'systems' - science/academia and practice - is a huge challenge. Neither abandon science principles nor ignoring practice issues is a solution. There is a need to focus on antecedents of appropriate collaboration and uncovering the consequences of more or less adherence to science principles and more or less orientation on practice conditions, respectively.

# Practice and research-driven Dutch implementation research agenda

**Dr. Femke Van Nassau**<sup>1</sup>, Miss Anouk Driessen<sup>1</sup>, Dr. Leti van Bodegom-Vos<sup>2</sup>, Dr. Bethany Hipple Walters<sup>3</sup>, Dr. Erwin Ista<sup>4</sup>, Dr. Wouter Keijser<sup>5</sup>, Dr. Rianne van der Kleij – van der Sluis<sup>2</sup>, Dr. Christiaan Vis<sup>6</sup>, Dr. Gera Welker<sup>7</sup>, Prof. Michel Wensing<sup>8,9</sup>

<sup>1</sup>Amsterdam UMC, Amsterdam, Netherlands, <sup>2</sup>Leiden UMC, Leiden, Netherlands, <sup>3</sup>Trimbos-instituut, Utrecht, Netherlands, <sup>4</sup>Erasmus MC, Rotterdam, Netherlands, <sup>5</sup>Universiteit Twente / DIRMI Instituut, Enschede, Netherlands, <sup>6</sup>Vrije Universiteit, Amsterdam, Netherlands, <sup>7</sup>UMC Groningen, Groningen, Netherlands, <sup>8</sup>Heidelberg Universiteit, Heidelberg, Germany, <sup>9</sup>Radboudumc, Nijmegen, Netherlands

**S.3.48 - Narrowing the science-practice implementation gap in the field of physical activity and nutrition, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** In recent years, implementation research has gained more attention in the Netherlands. Yet, scarce funding of implementation research has resulted in mainly context specific knowledge and lacks generalizability to other contexts. Therefore, the Netherlands Implementation Collective (NIC) (*Nederlands Implementatie Collectief*, 2022) was asked by the national funding agency ZonMw to develop a Dutch implementation research agenda.

**Methods:** To do so, we 1) held interviews with Dutch implementation researchers; 2) conducted a 2-round e-Delphi study (Keeney et al., 2006); and 3) reached out to implementation professionals to share their implementation barriers in an online survey. In the e-Delphi study, panelists were asked to provide research questions in round 1, which were then merged into 31 proposed research topics. Delphi panelist scored these topics (on a 5-point Likert scale). Consensus was reached if 67% agreed with inclusion of the topic (Mokkink et al., 2010). These topics guided the thematic analyses of the input of the survey among practice professionals.

**Results:** Of the 47 invited researchers, 26 (55%) participated in round 1 (222 research questions). Twenty participants (77% of 26) completed round 2, in which consensus was reached on 14 topics. The survey among 74 practice professionals provided 230 barriers. Topics were categorised into 7 themes linked to implementation, sustainability, scale-up and de-implementation, such as knowledge on how to link determinants to strategies, tailoring of strategies, using innovative research designs. But also need for capacity for implementation and implementation research was expressed, and the need for practical tools to apply evidence-based implementation in practice.

**Conclusions:** By combining both input from implementation researchers (*how does it work*) as well as professionals (*how to apply*), the research agenda addresses topics relevant for both fields. The research agenda is widely disseminated among funding organisations, policy makers, researchers and practice to guide future implementation research

# Machine learning approaches for food categorization and nutrient profiling

**Dr. Guanlan Hu<sup>1</sup>**, Dr. Mavra Ahmed<sup>1</sup>, Dr. Mary L'Abbe<sup>1</sup>

<sup>1</sup>University of Toronto, Toronto, Canada

**S.3.49 - Artificial Intelligence as Applied Predictive Models for Food Composition Databases, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** D. e- & mHealth

**Background:** National food composition databases are expensive to develop, construct and maintain. Previous versions of food composition databases have relied on manual categorization and/or nutrient profiling, which considering the number of products in food composition databases, the number of food labels and complex calculation steps for nutrition profiling, is labour-intensive, time-consuming, and costly. Effective and generalizable automated process using machine learning is required.

**Objectives:** This study used the pre-trained language model and supervised machine learning for food label text to automate food categorization and nutrient profiling.

**Methods:** Food product information from FLIP2017 (n=17,448) and FLIP2020 (n=74,445) databases were used. Health Canada's TRA system (24 categories and 172 sub-categories) and FSANZ nutrient profiling system and nutrition quality score evaluation. A modified pre-trained language model was used to encode unstructured text from food labels into lower-dimensional vector representations, followed by an ensemble of supervised learning algorithms (i.e., elastic net, KNN, and XGBoost) for multi-class classification and regression.

**Results:** Pre-trained language model representations followed by XGBoost multi-class classification algorithm reached an overall accuracy score of > 0.95 in predicting food TRA major and sub-categories. For nutrition quality score estimation, the pre-trained language model reached a high prediction accuracy ( $R^2$  0.87 and MSE 14.4), while the performance of the structured nutrition facts machine learning model is better ( $R^2$  0.98 and MSE 2.5). The pre-trained language model also reached a high generalizable ability on the external test datasets.

**Conclusions:** Our result showed that pre-trained language model, together with ensemble learning approaches, achieved high accuracy in classifying food categories and predicting food healthfulness scores using text information found on food labels. This approach is effective and generalizable for further application in a dynamic food environment, where large sets of labelled data can be obtained from websites.

# An innovative machine learning approach to predict the dietary fiber content of packaged foods

**Mr. Tazman Davies<sup>1</sup>**, Dr. Jimmy Chun Yu Louie<sup>2</sup>, Dr. Tailane Scapin<sup>3</sup>, Dr. Simone Pettigrew<sup>1</sup>, Dr. Jason Hy Wu<sup>1</sup>, Dr. Matti Marklund<sup>4</sup>, Ms. Daisy Coyle<sup>1</sup>

<sup>1</sup>The George Institute for Global Health, Faculty of Medicine, University of New South Wales, Sydney, Australia, <sup>2</sup>The University of Hong Kong, Hong Kong, Hong Kong, <sup>3</sup>Deakin University, Melbourne, Australia, <sup>4</sup>Tufts University, Boston, USA

**S.3.49 - Artificial Intelligence as Applied Predictive Models for Food Composition Databases, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** We developed a machine learning approach for automated and systematic prediction of fiber content using nutrient information commonly available on packaged products.

**Method:** An Australian packaged food dataset with known fiber content information (FoodSwitch) was divided into training ( $n = 8986$ ) and test datasets ( $n = 2455$ ). The model was built using k-nearest neighbors (KNN). The KNN model's performance was assessed using the coefficient of determination ( $R^2$ ) and compared with the performance of an existing manual fibre prediction approach.

**Results:** Compared with the manual fibre prediction approach, the KNN approach explained a greater degree of variation in fibre content ( $R^2 = 0.68$  and  $R^2 = 0.84$ , respectively). The KNN algorithm was most at predicting fibre content for 'other cereal and grain products' ( $R^2 = 0.95$ ) and 'soup' ( $R^2 = 0.89$ ).

**Conclusions:** Our findings highlight the opportunity to use machine learning to efficiently predict the dietary fiber content of packaged products on a large scale. These predictions can be used to monitor fiber levels in the packaged food supply and can also be integrated into novel barcode-scanning phone applications to allow consumers to track fiber intake. The algorithm can also be adapted to predict other nutrients of public health interest that are often omitted on packaged products.

# Predictive Modeling for Nutrient Prediction combining data and domain-driven knowledge

**Ms. Gordana Ispirova**<sup>1</sup>, Assistant Professor Tome Eftimov<sup>1</sup>, Prof. Barbara Koroušić Seljak<sup>1</sup>

<sup>1</sup>Jozef Stefan Institute, Ljubljana, Slovenia

**S.3.49 - Artificial Intelligence as Applied Predictive Models for Food Composition Databases, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** One of the most persistent problems adding uncertainty to data analysis are missing values. The Food and Nutrition domain is no exception. Common solutions to this problem across domains include omitting the missing data, or filling in with means or medians. For Food Composition Databases (FCDBs) the solution most resort to is borrowing data from other countries. We have previously introduced a statistical method for generating rules for borrowing missing nutrient values, and we have compared all statistical methods for missing data imputation. The problem of missing data can be treated as a predictive modeling task in Machine Learning (ML). Until now, in ML the solutions include simple applications of ML algorithms. We introduce a novel method for dealing with missing data, a ML pipeline combining data and domain-driven knowledge to predict nutrient values.

**Methods:** The ML pipeline consists of three parts: representation learning (RL), unsupervised ML, and supervised ML. In the RL part, word and paragraph embeddings are learned for text descriptions (names of foods), in the unsupervised ML part the foods are separated in clusters based on two criteria (FoodEx2 classification and food category), and in the supervised ML part separate predictive models are trained for each cluster for separate nutrients. The pipeline is evaluated using domain knowledge (nutrient tolerance levels) and compared to baselines (mean and median).

**Results:** The data used in the experiments is from the FoodData Central USDA. Using four RL algorithms, and sets of different parameters we learn embeddings. The first clustering approach uses graph embeddings of the FoodEx2 hierarchy, and the second the food category labels of the foods. Predictive models are trained using six different regression algorithms, hyper-parameter tuning and cross fold validation. The results show a significant improvement from the baseline (up to 93% accuracy vs. up to 45% accuracy).

**Conclusions:** This methodology opens up many possibilities for facilitating and easing the process of calculating macronutrient content, which is crucial for dietary assessment, dietary recommendations, dietary guidelines, macronutrient tracking, and other such tasks which are key tools for doctors, health professionals, dietitians, nutritional experts, policy makers, professional sport coaches, athletes.

# Conducting exercise interventions for patients with metastatic prostate cancer: strategies and lessons learned in the CHAMP and INTERVAL-GAP4 trials

**Dr. Nicolas H. Hart<sup>1</sup>**, Dr. Stacey A. Kenfield<sup>2</sup>, Dr. Erin L. Van Blarigan<sup>2</sup>, Mr. Neil Panchal<sup>2</sup>, Dr. Anthony Luke<sup>2</sup>, Ms. Jennette Sison<sup>2</sup>, Mr. Kyle Smith<sup>3</sup>, Dr. Fred Saad<sup>4</sup>, Dr. Robert U. Newton<sup>3</sup>, Dr. June M. Chan<sup>2</sup>

<sup>1</sup>University of Technology Sydney, Sydney, Australia, <sup>2</sup>University of California, San Francisco, San Francisco, USA, <sup>3</sup>Edith Cowan University, Joondalup, Australia, <sup>4</sup>University of Montreal Hospital Center, Montreal, Canada

**S.3.50 - Randomized controlled trials of remotely delivered exercise interventions for men with prostate cancer: rationale, design, and adherence in men across the cancer spectrum from active surveillance to metastatic disease, Clarion Hotel Gillet - Room Swedenborg, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Background:** Physical activity may improve clinical and quality of life outcomes for men with prostate cancer. Few studies have examined the feasibility, safety, acceptability, and clinical efficacy of exercise training in men with metastatic prostate cancer.

**Methods:** The completed 3-arm 3-month pilot randomized controlled trial (RCT) called CHAMP (A Clinical Trial of High-Intensity Aerobic and Resistance Exercise for Metastatic Prostate Cancer) was conducted in 25 men with metastatic prostate cancer to assess feasibility, safety, and acceptability. It started as a supervised onsite exercise trial (1:1:1 aerobic or resistance exercise 3x/week or usual care) and transitioned to remotely monitored exercise to increase enrollment. The ongoing phase III global RCT called INTERVAL-GAP4 (Intense Exercise for Survival among Men with Metastatic Prostate Cancer) also began as a supervised exercise trial but transitioned to home-based exercise during the COVID-19 pandemic and has since expanded to offer participants a remotely monitored exercise option. Following consent, men are randomized to a 2-yr supervised or monitored exercise intervention vs. self-directed exercise (1:1). The primary endpoint is overall survival assessed every 6 months, with patient-reported outcomes assessed quarterly. We will discuss eligibility criteria, safety measures, the exercise prescription, and challenges and opportunities when implementing these studies in different countries (INTERVAL offered in 7 countries and 3 languages).

**Results:** Both trials have extensive eligibility criteria to ensure appropriate patient enrollment. No safety concerns have been identified related to exercise testing or training in either trial. Common adverse events include joint or bone pain consistent with disease status; some may be possibly related to the study. Providing exercises that are accessible to those with progressive prostate cancer symptoms (e.g., bone pain, stiffness, nausea, fatigue) is necessary, as well as continuous tailoring to participants' capabilities. Finally, when implementing the program, different team setups - for example, academic/university-led vs. clinician/hospital-led teams - must leverage the expertise and operational advantages and address the limitations and challenges of each structure.

**Conclusion:** Remotely monitored exercise interventions can be safe, feasible, and acceptable for patients with metastatic cancer. This is an attractive intervention model that will grow as survivorship support expands beyond the clinic/center.

# Effect of Remotely Monitored Aerobic Training on Cardiopulmonary Fitness among Men with Prostate Cancer on Active Surveillance

Dr. Erin L. Van Blarigan<sup>1</sup>, Dr. Stacey A. Kenfield<sup>1</sup>, Dr. Adam Olshen<sup>1</sup>, Mr. Neil Panchal<sup>1</sup>, Ms. Katriel Encabo<sup>1</sup>, Ms. Imelda Tenggara<sup>1</sup>, Dr. Rebecca E. Graff<sup>1</sup>, Dr. Katsuto Shinohara<sup>1</sup>, Dr. Matthew R. Cooperberg<sup>1</sup>, Dr. Peter R. Carroll<sup>1</sup>, Dr. Lee W. Jones<sup>2</sup>, Dr. Kerri M. Winters-Stone<sup>3</sup>, Dr. Anthony Luke<sup>1</sup>, **Dr. June M. Chan<sup>1</sup>**

<sup>1</sup>University of California, San Francisco, San Francisco, USA, <sup>2</sup>Memorial Sloan Kettering Cancer Center, New York, USA, <sup>3</sup>Oregon Health & Science University Knight Cancer Institute, Portland, USA

**S.3.50 - Randomized controlled trials of remotely delivered exercise interventions for men with prostate cancer: rationale, design, and adherence in men across the cancer spectrum from active surveillance to metastatic disease, Clarion Hotel Gillet - Room Swedenborg, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Vigorous exercise is associated with lower risk of prostate cancer-specific mortality. Scalable interventions to increase exercise among people with prostate cancer are needed. The purpose of this study was to demonstrate the feasibility and effects of remotely monitored aerobic training compared to usual care among men with prostate cancer on active surveillance.

**Methods:** We conducted a randomized controlled trial to estimate the effect of 16-weeks of remotely monitored, structured, nonlinear, aerobic training versus usual care among men with prostate cancer on active surveillance. The intervention included a heart rate monitor and aerobic training program tailored to baseline fitness (up to five 20-60-minute sessions per week with target heart rates corresponding to 45-85% of VO<sub>2</sub>max). An exercise physiologist assessed adherence weekly in the intervention arm. Adverse events (AE) were also collected from all participants at weeks 8 and 16. Our primary outcome was change in VO<sub>2</sub>max assessed using a cardiopulmonary exercise test at 0 and 16 weeks. Secondary outcomes reported here include change in weight, waist circumference, and body mass index (BMI). We used multivariable linear mixed-effects models; analyses were intent-to-treat.

**Results:** Between 2016 and 2021, 51 men (mean age: 62.9 ± 6.8 years) were randomized to intervention (n=26) or usual care (n=25). Follow-up at 16-weeks was 88% (45/51) complete, 85% (22/26) in the intervention and 92% (23/25) in the control. Four participants discontinued the intervention; one due to an AE related to the study, one due to an AE unrelated to the study, and two for personal reasons. Improvements in VO<sub>2</sub>max were greater in the intervention than usual care arm (+3.7 vs -1 mL/kg/min;  $p < 0.001$ ). The intervention arm also lost more weight (-1.7 vs. +0.23 kg;  $p = 0.05$ ) and reduced their BMI (-0.58 vs. 0.07 kg/m<sup>2</sup>;  $p = 0.05$ ) compared to usual care. There was no difference in waist circumference.

**Conclusions:** Remotely monitored aerobic training improved VO<sub>2</sub>max and lowered body weight among men with prostate cancer on active surveillance. Future analyses from this trial will examine the effect of the intervention on anxiety, adherence to active surveillance, and biomarkers of prostate cancer aggressiveness.

# A 4-arm randomized controlled trial testing remotely delivered exercise & diet, diet-only, and exercise-only interventions vs. usual care on risk of PSA recurrence, biomarkers, and patient-reported outcomes among men with prostate cancer treated via radical prostatectomy: trial in-progress

**Dr. Stacey A. Kenfield<sup>1</sup>**, Dr. Erin L. Van Blarigan<sup>1</sup>, Ms. Ada Sanchez<sup>1</sup>, Dr. Li Zhang<sup>1</sup>, Ms. Vivian Liu<sup>1</sup>, Dr. Rebecca E. Graff<sup>1</sup>, Ms. Imelda Tenggara<sup>1</sup>, Dr. Kerri M. Winters-Stone<sup>2</sup>, Dr. Matthew R. Cooperberg<sup>1</sup>, Dr. Peter R. Carroll<sup>1</sup>, Dr. June M. Chan<sup>1</sup>

<sup>1</sup>University of California, San Francisco, San Francisco, USA, <sup>2</sup>Oregon Health & Science University Knight Cancer Institute, Portland, USA

**S.3.50 - Randomized controlled trials of remotely delivered exercise interventions for men with prostate cancer: rationale, design, and adherence in men across the cancer spectrum from active surveillance to metastatic disease, Clarion Hotel Gillet - Room Swedenborg, June 17, 2023, 8:15 AM - 9:30 AM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Background:** Diet and physical activity are associated with prostate cancer mortality. No randomized controlled trial (RCT) has examined the effects of long-term diet and exercise change on prostate cancer clinical, biological, or patient-reported outcomes (PRO's).

**Methods:** We are conducting a 4-arm RCT among 200 men with prostate cancer who have chosen radical prostatectomy (RP) as primary treatment. Men are enrolled prior to RP and randomized to diet + exercise, diet-only, exercise-only interventions or usual care (50/arm). The study included onsite visits; during COVID-19, the study was modified to be fully remote. The intervention arms receive a 2-year intervention delivered via website and text messages, personalized lifestyle report, quarterly coaching calls, and study materials (recipe booklet for diet; heart rate monitor and resistance bands for exercise). Exercise goals are 150 min/wk moderate or 75 min/wk vigorous aerobic, 2 strength sessions/wk, and 2 flexibility sessions/wk. Prostate-specific diet recommendations emphasize cruciferous vegetables, cooked tomatoes, healthy fats, and fish, while avoiding processed meats and whole milk. The primary endpoint is PSA recurrence. Secondary endpoints include change in a prognostic risk score and tumor mRNA expression from biopsy to RP and PROs at 0, 6, 12, and 24 months; blood and anthropometry are obtained at 0, 12, and 24 months.

**Results:** Since 2017, we have screened 693 men; 377 (54%) were not interested or did not respond and 146 (21%) were ineligible. Main reasons for ineligibility include not meeting study treatment requirements (n=80) (e.g., receiving hormones), non-English speaking (n=30), had contraindications to exercise (n=19), no local laboratory facilities (n=6), and already meeting study recommendations (n=5). 170 men have been randomized. The median (IQR) age at enrollment is 65 (60, 70) years. Follow-up is 83% (109/132) at 12 months and 78% (76/98) at 24 months.

**Conclusions:** Remotely delivered digital programs can increase access for cancer survivors. Long-term interventions must carefully balance the need for self-monitoring, particularly for diet and resistance exercise, to guide continued improvements and tailoring, while minimizing participant burden. This 4-arm remote-based randomized controlled trial will provide evidence of the impact of lifestyle change on prostate cancer recurrence, biology and quality-of-life.

# Background and rationale for the Ending Childhood Obesity (ECHO) zone programme

**Associate Professor Rønnaug Astri Ødegård<sup>1</sup>, Dr. Suzanne Ring-Dimitrio<sup>2</sup>**

<sup>1</sup>Norges teknisk-naturvitenskapelige universitet - NTNU, Trondheim , Norway, <sup>2</sup>Paris-Lodron Universitat Salzburg (University of Salzburg), Salzburg, Austria

**S.3.51 - How to unlock the power of data, cities and systems in a new way to prevent childhood obesity: The Ending Childhood Obesity (ECHO) programme, UKK - Main Hall (Level 6), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Recently a whole-of-community level approach addressing complex causes of obesity have shown promising short term results. However, effects over time often diminish due to a lack of monitoring and low stakeholder integration. To engage core community stakeholders to an evidence-based practice and practice-based evidence strategy, we hypothesize that data-assisted and real-time feedback on maintaining the stakeholder engagement is a solution. The purpose of the present project is to develop and evaluate the impact of the ECHO zone model on the prevalence of childhood obesity (sustainable) and on the feasibility regarding the implementation of ECHO zone actions to any geographical area worldwide (scalable).

**Methods:** An ECHO zone operative network, consisting of two communicating pillars, the pilot ECHO zones (EZ) addressing children and their families, and the advocates for change including members of the civil society and other stakeholders, will be established.

Based on existing pre-obesity clinical data repositories and by utilizing the systems thinking community knowledge tool (STICKE), data about the wider determinants of health (WDoH) to impact the prevalence of childhood obesity will be sampled to initiate a co-creation process at ECHO zone level and to tailor interventions. The sampled data will feed the “Digital City Twin” repository to identify zone-specific intervention strategies by employing machine learning and artificial intelligence.

**Results:** The study design will be demonstrated by illustrating the platform and a first set of core data for Digital City Twins. Further, a first outline on how to integrate stakeholders at relevant WDoH-levels into the ECHO zone and the rationale for the process of scaling up will be described.

**Conclusions:** The ECHO zone network, supported by the Digital City Twin and following a stakeholder approach, seeks to identify effective and scalable interventions tailored to the living world of children aged 0-6, their families and civil society.

# Introducing the ECHO zone program and its local implementation

**Mrs. Betty Pettersen**<sup>1</sup>, Ms. Maja Engsner<sup>2</sup>

<sup>1</sup>Trondheim Municipality, Trondheim, Norway, <sup>2</sup>Uppsala University, Uppsala, Sweden

**S.3.51 - How to unlock the power of data, cities and systems in a new way to prevent childhood obesity: The Ending Childhood Obesity (ECHO) programme, UKK - Main Hall (Level 6), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Conclusions:** The ECHO zone model developed with and driven by stakeholders will advance the understanding of co-creation processes and implementation research

**Purpose:** Child obesity prevention strategies have attempted to actively address the complex causes of obesity. Interventions on a whole-of-community level have shown promise but are challenging regarding implementation. The ECHO zone model will function as the roadmap that bridges the above defined challenge by developing and implementing childhood obesity prevention strategies with a new, wider and holistic approach driven by local stakeholders supported by the flow of digital information. The purpose of this talk is to present the model and its implementation from the local stakeholder perspective.

**Methods:** The ECHO zone model has three components: the ECHO zone with its local stakeholders, co-creation of local actions, and the DCT including data collected at all levels of the WDoH. The role of committed stakeholders is to drive and facilitate change in the local context of the ECHO zone. The model has a number of co-creation processes for the ECHO zones to implement. The processes are not aligned in a linear manner, but include: building local capacity in relation to key features of the project through capacity building workshops, mapping of the local environment, co-creating an action plan, implementing the action plan and following up the effects of the actions. These processes feed into each other so that the ECHO zone continuously adapts and evolves over time within the host city.

**Results:** The setup of the ECHO zone-structure is fundamental for reaching children, to ensure feasibility of preventative actions, and to facilitate a scaling-up of creative and engaging programs. Via the stakeholder-driven community diffusion theory, improvements in stakeholder engagement and knowledge will increase readiness for change and the model will ensure locally tailored actions in various living environments of the child and families associated with different WDoH-levels.

# A mixed-methods, comprehensive evaluation framework for the ECHO zone programme

**Miss Maja Engsner**<sup>1</sup>, Associate Professor Rønnaug Astri Ødegård<sup>2</sup>

<sup>1</sup>Uppsala University, Uppsala, Sweden, <sup>2</sup>Norwegian University of Science and Technology, Trondheim, Norway

**S.3.51 - How to unlock the power of data, cities and systems in a new way to prevent childhood obesity: The Ending Childhood Obesity (ECHO) programme, UKK - Main Hall (Level 6), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The ECHO zone programme represents a complex set of interventions, driven and informed by their Digital City Twin (DCT), that are delivered within a complex system, and across nine different cities. The methods available to evaluate such complexity are limited and we need to find novel and innovative approaches to truly capture the richness of what happened, in what context, and why. The purpose of this talk is to present the evaluation framework for the ECHO zone programme.

**Methods:** A case study approach will be taken to understand how the ECHO zone model has been implemented within each of the nine cities. The ENCOMPASS framework will guide the intentions of the evaluation, whereby we will focus on: (a) adopt a systems lens to the evaluation, (b) define the boundaries of the ECHO zone programme in each city, (c) understand the systems that the ECHO zone programme is implemented within, and (d) explore the intended, and unintended, outcomes and impacts associated with its implementation. Novel methods such as ripple effects mapping, social network analyses, and group model building will be implemented. To further understand where the ECHO zones implement action, these actions will be audited and analysed against the Wider Determinants of Health Model and the locally developed systems maps. Other data such as anthropometrics and biomarker data will also be routinely gathered in each ECHO zone. Data and findings will be triangulated to comprehensively understand what occurred within each city and why.

**Results:** The evaluation framework will enable the nuances within each ECHO zone to be fully examined, helping to understand why the model may work differently within certain contexts. Moreover, given that it adopts highly innovative methods which are underpinned by the recently published ENCOMPASS framework, the planned evaluation will be one of the first to comprehensively evaluate the design, implementation, and iterative development of a systems approach to childhood obesity prevention.

**Conclusions:** The proposed evaluation framework will ensure that the ECHO zone programme not only contributes towards significant advances in the obesity prevention field, but that it also develops the fields of complex systems evaluation and research.

# Interventions to reduce meat consumption: Evaluations of eco-labelling and meat-free availability in worksite cafeterias

**Dr. Rachel Pechey**<sup>1</sup>

<sup>1</sup>The University of Oxford, Oxford, United Kingdom

**S.3.52 - Reducing red and processed meat consumption: what works?, UKK - Level 6 Foyer, June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose.** Substantial reductions in meat consumption are required by 2030, if the UK is to deliver on its target of net zero carbon emissions. Labelling is one of the most acceptable policy options, but may not be the most effective. In a series of randomised controlled trials (RCTs) and evaluations of natural experiments, we investigated the impact of ecolabelling and increasing meat-free meal availability in worksite cafeterias on the environmental impact of food purchases and selection of meat-based options.

**Methods.** Two field trials and two natural experiments were evaluated in UK worksite cafeterias between 2020-2022, examining the impact of environmental impact labelling (in the form of coloured stickers indicating an A-E grade) on hot meal options (two RCTs) and increased meat-free meal availability (two natural experiments).

**Results.** In both studies within worksite cafeterias, we found no evidence that ecolabels influenced the sustainability of food purchases. In contrast, increasing the availability of meat-free options was shown to be effective at reducing meat selection and purchasing, with smaller changes in availability accompanying effects of smaller magnitude.

**Discussion.** Altering meat-free meal availability may be a more effective intervention – at least in the context of worksite cafeterias – than ecolabelling, but is less acceptable to the public, and perhaps also to catering providers. There is also a need to evaluate the wider impact of ecolabels on food provision, as well as consumer demand, given that their introduction may increase the availability of lower environmental impact options in the longer-term.

# Meat sectors and carbon footprint taxes: what is the role of firms in climate mitigation?

**Dr. Céline Bonnet<sup>1</sup>**, Dr. Zohra Bouamra-Mechemache<sup>1</sup>

<sup>1</sup>Toulouse School of Economics, Toulouse, France

**S.3.52 - Reducing red and processed meat consumption: what works?, UKK - Level 6 Foyer, June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose.** We want to assess the price transmission of a carbon tax on the meat sector to evaluate the role of firms in climate mitigation. The literature already tackled this question through the analysis of consumers' price response without considering the role of firms in price transmission. If prices are not perfectly transmitted along the supply chain, the effect of taxes can be partially transmitted or amplified depending on the strategic price reaction of processing and retailing firms. While the literature found a significant but limited effect of a carbon tax on meat consumption, we investigate whether this result still holds when taking into account firms' reaction to a carbon tax.

**Methods.** We use household scanner data provided by the society Kantar that provides information on animal-based product purchases of more than 12,000 French households in 2012. We consider 13 food categories of animal-based products distinguished by brand and retail stores such that our data contains more than 4 million purchases for 420 animal food products. We develop a structural econometric approach to model the demand for animal-based products and manufacturers - retailers relationships. Using the estimated behavior of consumers and firms, we implement simulations to analyze the effect of a carbon tax of €100 per ton of CO<sub>2</sub> eq. Given our empirical framework, we analyze how manufacturers and retailers adapt their pricing strategy to the carbon tax and then how consumers react to price changes.

**Results.** We show that manufacturers and retailers over transmit the carbon tax by more than 30% on average above the increase in costs implied by the tax and then amplify the expected effect on demand. Considering the role of firms, we expect a 40% decrease in carbon footprint when all animal-based products are taxed, a 30% decrease when only red meat is taxed, and a 15% decrease when only beef is taxed.

**Conclusions.** In France, our results suggest that given the over transmission of price by firms, climate change could be mitigated through price policies.

# Health effects of reductions in red and processed meat consumption in the United States: A microsimulation study

**Dr. Joe Kennedy<sup>1</sup>**, Dr. Peter Alexander<sup>1</sup>, Dr. Lindsey Taillie<sup>2</sup>, Prof. Lindsay Jaacks<sup>1</sup>

<sup>1</sup>The University of Edinburgh, Midlothian, United Kingdom, <sup>2</sup>The University of North Carolina, Chapel Hill, Chapel Hill, USA

**S.3.52 - Reducing red and processed meat consumption: what works?, UKK - Level 6 Foyer, June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The US population simultaneously has among the highest rates of chronic disease and highest levels of red and processed meat consumption globally. Given that red and processed meat consumption has been associated with an increased risk of developing multiple chronic diseases, quantifying the health benefits from reducing consumption of these foods may guide policy aimed at alleviating the burden of chronic disease in the United States.

**Methods:** Microsimulations have become an increasingly popular method to study population-level health outcomes following dietary change. Rather than using population-wide indicators, microsimulations assess the impact of an intervention on a population of simulated individuals who collectively form a representative sample of the whole population. In this study, we developed a microsimulation model, mSHIFT: micro-Simulation of the Health Impact of Food Transformations, to quantify the prevented cases of diabetes, cardiovascular disease and colorectal cancer in the United States following fixed percentage reductions in red meat intake, processed meat intake, or both, annually over a 10-year period.

**Results:** A 30% reduction in red and processed meat consumption was found to prevent 189,000 diabetes cases, 34,000 cardiovascular disease cases and 7,000 colorectal cancer cases in the first year. Even modest (e.g. 10%) reductions in red and processed meat consumption were found to lead to statistically significant reductions in chronic disease incidence. In addition, nonlinear relationships between the percentage reduction and prevented disease cases demonstrated how, in some instances, health gains are amplified with large reductions in meat consumption.

**Conclusions:** This is the first study to examine the impact of reducing red and processed meat consumption on multiple health outcomes in the United States. Our results demonstrate the potential for significant health benefits and provide additional motivation beyond the environmental consequences to reduce red and processed meat consumption in countries where consumption levels are high.

# Characterising the Healthiness of Out-of-Home Food Outlets in Great Britain using Online Menus

**Ms. Yuru Huang<sup>1</sup>**, Dr. Thomas Burgoine<sup>1</sup>, Mr. Tom Bishop<sup>1</sup>, Prof. Jean Adams<sup>1</sup>

<sup>1</sup>University of Cambridge, Cambridge, United Kingdom

**S.3.54 - Characterising the out-of-home food environment using big data sources, UKK - Hall C (Level 3), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Background:** Food environment research predominantly focuses on the spatial distribution of food outlets, while the healthiness of food choices available within outlets has been understudied. Traditional methods of assessing the healthiness of out-of-home food outlets are time and resource consuming, resulting in a dearth of data on consumer nutrition environment across large geographical areas. In this study, we proposed an innovative approach to characterise the healthiness of out-of-home food outlets at scale. We also aimed to investigate if the healthiness of out-of-home food outlets is socioeconomically patterned across neighbourhoods.

**Methods:** We calculated menu healthiness scores (0-12, 12 being the healthiest) for food outlets on *JustEat* in Great Britain (GB) based on menu attributes (e.g., diversity of vegetables). Using this data, we trained a deep learning model to predict healthiness scores of all physical food outlets in GB based on food outlet names. We used linear mixed models with random intercepts to examine the relationship between area-level deprivation and food outlet healthiness, accounting for clustering on the lower-layer super output area (LSOA) level.

**Results:** In August 2021, we identified 54,575 food outlets available on *JustEat* in GB and calculated their healthiness scores. Our best performing deep learning model — trained with the Universal Language Model Fine-Tuning Approach - achieved a mean absolute error of 0.82. Using this model, we extrapolated the healthiness of all out-of-home food outlets available ( $N = 177,926$ ) in GB in 2021. We found that in more deprived areas, individuals had greater access to out-of-home food outlets ( $p < 0.001$ ), and these out-of-home food outlets were less healthy ( $p < 0.001$ ). The pattern was consistent across all types of out-of-home food outlets.

**Conclusions:** The development of menu healthiness scores added more granularity to the existing classification of out-of-home food outlets in food environment research, differentiating healthier and less healthy outlets of the same type. The proposed method can be automated to understand the healthiness landscape of out-of-home food outlets in large geographical areas. Our findings also highlight the “double burden” of the unhealthy food environment in deprived areas where there tend to be both more outlets and less healthy outlets.

# Nutrition assessment of restaurants using consumer-posted food images

**Dr. Xiang Chen<sup>1</sup>**, Dr. Caiwen Ding<sup>1</sup>, Dr. Ran Xu<sup>1</sup>

<sup>1</sup>University of Connecticut, Storrs, USA

**S.3.54 - Characterising the out-of-home food environment using big data sources, UKK - Hall C (Level 3), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Existing methods to evaluate the nutrition level of a restaurant employ store audit tools, such as the Nutrition Environment Measures Survey. However, these store audit tools cannot be easily implemented on a large scale because of their cost-and-labor-intensive nature in data collection and surveyor training. Recently, advances in image recognition technologies provide a new opportunity for nutrition assessment. Through computer-aided deep learning models, the nutrition information can be estimated using a food image.

**Methods:** This study employs an image recognition model to perform the nutrition assessment of restaurants using food images posted on restaurant review websites in two US cities. Manual coding is used to validate the model accuracy based on the Food and Nutrient Database for Dietary Studies. The estimated restaurant nutrition information is visualized at both the restaurant level and the census tract level using a geographic information system.

**Results:** The model-assisted nutrition assessment achieves 75.1% accuracy compared with that of manual coding. The model generates more accurate labels for ethnic foods but cannot identify portion sizes, certain food items (e.g., specialty burgers and salads), and multiple food items in an image. The spatial inequities of restaurant nutrition are revealed in GIS maps. Further correlation analysis shows moderate positive correlations between the tract-level restaurant nutrition and neighborhood deprivation variables.

**Conclusions:** The study proposes a new method for large-scale nutrition assessment of restaurants across a city. It shows that the computer-aided nutrition assessment can be empowered by consumer-posted food images through gathering dietary data at a minimum cost and acceptable data quality. The pilot nutrition assessment model can help identify issues of health inequity by exploring the different levels of nutritional provisioning across communities. Eventually, it is expected that the model-derived restaurant nutrition information can serve as evidence for developing an information system for nutrition education and health promotion.

# Monitoring the healthiness and accessibility of food outlets across Australia on the leading meal delivery application: Initial results from the DIGIFOOD Dashboard Study

**Miss Sisi Jia**<sup>1</sup>, Dr. Stephanie Partridge<sup>1</sup>, Dr. Alice Gibson<sup>1</sup>

<sup>1</sup>University of Sydney, Sydney, Australia

**S.3.54 - Characterising the out-of-home food environment using big data sources, UKK - Hall C (Level 3), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Background:** The rising use of online food delivery services (OFDS) enable individuals to conveniently access foods from over 3km away, which is beyond traditional neighbourhood food environments. This increased accessibility may have implications on the consumption of healthful or unhealthful foods. Using a purpose-built dashboard with data extracted via web-scraping, we aimed to map and evaluate the differences in the healthiness of food outlets accessible online, across varying socioeconomic areas in Australia.

**Methods:** The data-driven DIGIFOOD dashboard mapped 816 food outlets across 2725 postcodes in Australia serviced by the leading meal delivery application. Data for the dashboard was collected via web scraping in January 2021 and the healthiness of food outlets at a category level was determined using the validated Food Environment Score. A paired t-test was applied to compare the healthiness of food outlets that are *locally available within a specified postcode* (physical food environment) versus food outlets that *could deliver to any specified postcode* via OFDS (online food environment). A linear regression model was used to test the trend of healthiness scores of food outlets (physical and online) across quintiles of Index of Relative Socio-economic Advantage and Disadvantage (IRSAD; 1-most disadvantaged and 5 - most advantaged), adjusting for the density of physical outlets.

**Results:** Food outlets accessed online via OFDS have a healthier score than outlets that can be physically accessed in Australia (Mean difference  $0.11 \pm 0.88$ ,  $p=0.0003$ ). Mean healthiness scores of physical food outlets ( $p < .0001$ ) and online food outlets ( $p < .0001$ ) improved from the most advantaged (IRSAD 1) to the least advantaged (IRSAD 5). When IRSAD 1 was compared to IRSAD 5, this difference in mean healthiness scores between physical and online was significant ( $p=0.0049$ ).

**Conclusions:** OFDS may be increasing accessibility to healthier food outlets by providing more options than what can be physically accessed within an individual's residential postcode in Australia. It is critical to consider the impact of OFDS on the food environment and improving accessibility to healthy food should be a high priority for policy makers. The DIGIFOOD Dashboard can be a useful monitoring tool for the evolving digital food environment.

# Combining physical activity data with contextual information: PALMSplusR

**Dr. Tom Stewart<sup>1</sup>**, Dr. Michal Vorlicek<sup>2</sup>, Prof. Jasper Schipperijn<sup>3</sup>

<sup>1</sup>AUT University, Auckland, New Zealand, <sup>2</sup>Palacký University, Olomouc, Czech Republic, <sup>3</sup>University of Southern Denmark, Odense, Denmark

**S.3.55 - “Where, when, and how much? How to measure physical activity behaviors in the urban environment, UKK - Hall D (Level 2 - main floor), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** Combining accelerometers and GPS to measure physical activity context is important. However, converting these data into usable metrics can be complex and time-consuming. The purpose of this presentation is to demonstrate an automated data processing pipeline for both merging GPS/accelerometer data and summarizing these data into meaningful metrics across different contexts. Data from several countries will be used as examples.

**Methods** Data were collected from 315 adolescents (aged 12–18 years) in New Zealand and the Czech Republic. Each of these participants wore an accelerometer (Actigraph) and a GPS (Qstarz BT-Q1000X or Holux RCV-3000) for 7 days. Data were merged using HABITUS, before being summarized using the PALMSplusR package. This package allows researchers to summarize these data within different spatial (within a particular area) and temporal (during a particular time of day) domains, and isolate specific transportation behaviors (such as commuting to and from school or work).

**Results** Data were summarized across six different domains: home, school, transportation, playgrounds, greenspace, and other. The time spent within each domain, and the intensity of physical activity within each domain varied, and was different between countries. Most higher-intensity physical was achieved in the transportation domain. This domain encompasses a combination of walking, cycling, and vehicle trips, the patterns of which varied substantially across different neighborhoods.

**Conclusions** Processing accelerometer and GPS data is traditionally complex and time-consuming, but new automated tools like HABITUS and PALMSplusR make this work much more straightforward and feasible. Summarizing these data across different contextual domains can provide greater insight into the nuances of human behavior and increase the precision and sensitivity of physical activity measures in future research.

# Variation in physical activity by commuting mode to and from school in Spanish adolescents: using accelerometer and GPS data

**Mr. Pablo Campos-Garzón<sup>1</sup>**, Dr. Thea Toft Amholt<sup>2</sup>, Dr. Daniel Molina-Soberanes<sup>1</sup>, Ms. Ximena Palma-Leal<sup>1,3</sup>, Dr. Ana Queral<sup>4</sup>, Dr. Amador Lara-Sánchez<sup>5</sup>, Dr. Tom Stewart<sup>6</sup>, Dr. Jasper Schipperijn<sup>2</sup>, Dr. Yaira Barranco-Ruiz<sup>1,7</sup>, Dr. Palma Chillón<sup>1</sup>

<sup>1</sup>PROFITH "PROmoting FITness and Health through physical activity" Research Group, Sport and Health University Research Institute (iMUDS), Department of Physical Education and Sports, Faculty of Sport Sciences, University of Granada. , Granada, Spain, <sup>2</sup>Active Living, Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Campusvej 55, 5230. , Odense, Denmark, <sup>3</sup>IRyS Group, School of Physical Education, Pontificia Universidad Católica de Valparaíso. , Viña del Mar, Chile, <sup>4</sup>AFIPS Research Group, Department of Nursing, University of Valencia, Valencia, Spain, <sup>5</sup>Department of Didactics of Musical, Plastic and Corporal Expression. University of Jaen , Jaén, Spain, <sup>6</sup>Human Potential Centre, Auckland University of Technology., Auckland, New Zealand, <sup>7</sup>Department of Physical and Sports Education, Faculty of Education and Sport Sciences, University of Granada. , Melilla, Spain

**S.3.55 - "Where, when, and how much? How to measure physical activity behaviors in the urban environment, UKK - Hall D (Level 2 - main floor), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** The first aim was to examine the characteristics of home-school and school-home trips. The second aim was to analyse the physical activity (PA) and physical activity energy expenditure (PAEE) related to commuting to/from school, as well as the contribution to the achievement of PA guidelines.

**Methods** A total of 185 adolescents (50.8% girls) aged 14.4±0.6 wore a belt attached on their hip with an accelerometer and a Global Positioning System (GPS). The software HABITUS was used to clean GPS data, combine them with accelerometer data, and predict the mode of commuting (i.e., walking or motorized-vehicle). Then, the PALMSplus R package was used to identify trip characteristics (i.e., speed, duration, and distance), PA levels (i.e., light and moderate to vigorous [MVPA]) and PAEE during home-school and school-home trips. Mixed model analysis was used to examine the differences in trip characteristics, PA levels, and PAEE between the trip directions and the modes of commuting.

**Results** A total of 507 trips were identified, 318 walking trips and 189 vehicle trips. Motorized-vehicle trips showed higher distance and speed and shorter duration than walking trips to/from school (all, p<0.001). Regarding PA and PAEE, walking trips showed higher MVPA (home-school trips: 7.4 min vs 2.2 min; school-home trips: 7.0 min vs 2.8 min) and PAEE (home-school trips: 2.4 METs vs 1.8 METs; school-home trips: 2.3 METs vs 1.9 METs) than motorized-vehicle trips to/from school (all, p<0.001). There were no significant differences between walking and motorized-vehicle trips to/from school for light PA. Moreover, walking to/from school contributed almost 25% of the PA guidelines (i.e., 60 daily minutes of MVPA), whereas motorized-vehicle trips only contributed 8.4%.

**Conclusion** The characteristics of the trips differed between walking and motorized-vehicle trips to/from school. In addition, walking trips to/from school seem to have a positive impact on MVPA, PAEE, and contributing to the PA recommendations compared to motorized-vehicle trips. Future strategies to increase daily MVPA may focus on promoting the use of active modes of commuting to/from school.

# Using accelerometer and GPS to measure physical activity in its context

**Prof. Jasper Schipperijn<sup>1</sup>**, Miss Line Matthiesen<sup>1</sup>, Dr. Thea Toft Amholt<sup>1</sup>

<sup>1</sup>University of Southern Denmark, Odense, Denmark

**S.3.55 - “Where, when, and how much? How to measure physical activity behaviors in the urban environment, UKK - Hall D (Level 2 - main floor), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** Daily physical activity is not one behavior that takes place in one location; it consists of many different behaviors occurring in different locations. It is essential to know where the physical activity occurs, and what the specific determinants of the behavior are. The purpose is to explain how accelerometer and GPS data can be used to measure key aspects of physical activity: where (space), when (time) and how much (type and intensity). A series of projects in Denmark will be used as examples.

**Methods** Data were collected among schoolchildren (9–12 yrs old) and adults (18–80) in Denmark using an accelerometer (Axivity) and a GPS (Qstarz BT-Q1000X) for 7 days (5 week days, 2 weekend days) to determine where and when which activity took place. The GPS position was recorded every 15 seconds and their activity level was recorded at 100 Hz and compiled into 15 second epochs. Data were merged and processed using HABITUS, an online tool available via the University of Southern Denmark ([www.habitus.eu](http://www.habitus.eu)). The worst locational GPS errors were removed using filters for excessive speed and changes in altitude. Walking, cycling and vehicle trips were classified based on the 90<sup>th</sup> percentile average speed during a trip. Activity intensity levels were classified using classic accelerometer count cut-points.

**Results** For children, physical activity occurred in schoolyards, neighborhoods, sports facilities and shared backyards between multistory social housing complexes. Furthermore, for many children, a large share of their daily activity occurred during transportation. There were large individual differences in where and when children were active.

For adults, the differences in activity profiles were even more pronounced with some adults almost entirely sedentary during weekdays, while very active at sports facilities during the weekend. Others gained most of their activity during weekday transportation, with little leisure time activity at sport facilities.

**Conclusions** Collecting and processing accelerometer and GPS data is time-consuming, but the data provides unique possibilities to identify physical activity patterns in time and space. Having this type of data easy to determine, at an individual as well as population level, in which contexts interventions may have most potential.

# Perspectives of staff and pupils in English secondary schools on national school food policy relating to food provision and support for healthy eating

**Dr. Marie Murphy<sup>1</sup>**, Dr. Clare Rawdin<sup>1</sup>, Dr. Rachel Adams<sup>1</sup>, Prof. Peymane Adab<sup>1</sup>, Dr. Miranda Pallan<sup>1</sup>

<sup>1</sup>University of Birmingham, Birmingham, United Kingdom

**S.3.56 - Improving the school food environment: challenges and solutions for children aged 5 to 18 years, UKK - K1 (+K2) (Level 3), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** This qualitative study was nested within a larger observational study evaluating the implementation and impact of the national school food standards (SFS) and related school food plan (SFP), a resource outlining a whole school approach to healthy eating, in secondary schools in England. We explored how the SFS, SFP and local school policy/initiatives were implemented in schools.

**Methods** We used a qualitative case study approach, selecting four secondary school sites from the main study sample (n=36), aiming for representation of schools with a high proportion of pupils eligible for free school meals (FSM) and varying catering models (external/in-house). We aimed to recruit 4-6 relevant school staff (catering managers, senior leadership, teachers and governors) to interviews and 18-24 pupils (aged 11-16) to focus groups per site. Data from interviews and focus groups were coded inductively using framework analysis. We also deductively coded data relating to an *a priori* code for implementation of the SFS and SFP.

**Results** 21 staff/governors and 137 pupils participated across four sites, with variation across the school sample in FSM eligibility (9-53%) and catering model (50% external). In relation to the SFS, school staff described patchy implementation, acknowledging some standards were difficult to adhere to, especially at breakfast/breaktime. Staff described balancing priorities around maintaining viable levels of school food uptake, cost/profit, pupil preferences, and competition from outside. Challenges to school food uptake included negative pupil perceptions of the lunchtime experience. Key drivers behind pupils' school food choices included convenience, speed and taste. Some school staff felt limited in their influence upon pupils' food choices as a result of social and environmental contexts e.g. ease of access to unhealthy food; levels of food poverty. School staff/governors had a low awareness of the SFP and were generally not taking steps to implement it. Healthy eating education had a relatively low status within timetables, despite staff acknowledging its importance.

**Conclusions** These findings provide insights into the challenges in implementing the SFS and SFP in secondary schools, providing greater direction for policymakers in considering how to best support secondary schools in delivering national school food policy.

# Outcomes of a sensory food education intervention in 4-7 year old children: a cluster-randomised controlled trial

**Dr. Nicholas Wilkinson**<sup>1</sup>, Dr. Srimathi Kannan<sup>2,3</sup>, Dr. Harish Ganguri<sup>4,5</sup>, Prof. Marion Hetherington<sup>1</sup>, Dr. Charlotte Evans<sup>1</sup>

<sup>1</sup>University of Leeds, Leeds, United Kingdom, <sup>2</sup>University of Michigan, Michigan, USA, <sup>3</sup>University of Texas, Austin, USA, <sup>4</sup>Icahn School of Medicine, New York, USA, <sup>5</sup>University of Cumberland, Kentucky, USA

**S.3.56 - Improving the school food environment: challenges and solutions for children aged 5 to 18 years, UKK - K1 (+K2) (Level 3), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose** We will present a cluster-randomised controlled trial examining outcomes of a sensory food education intervention in primary school children aged 4-7 years.

**Methods** We evaluated a sensory food education programme (6 weekly sessions), delivered by classroom teachers, who attended a training session and were given 6 lesson plans. The control group went on a waiting list for the programme. We conducted a repeated measures cluster-RCT (n=195, 12 clusters) to assess (a) willingness-to-taste (WTT) (reported here) and (b) facially expressed enjoyment and engagement, in a fun 'sensory' vegetable and fruit tasting activity to evaluate the intervention. We video recorded children taking part in the tasting activity at baseline and follow up, and analysed children's tasting behaviour and the facial expressions which accompanied tasting. For a subset of children (n=68), we obtained parental ratings of children's eating behaviour.

**Results** Baseline results from 181 children indicated high WTT in the tasting activity before the intervention. In total, 113 children (62.4) tasted all 9 samples, 59 (32.6%) tasted some (1-8) and 9 (5.0%) did not taste any of the foods (mean 7.6, SD 2.4). Fourteen children were absent. Baseline WTT was similar for the seven children rated fussy/neophobic by caregivers on all relevant survey questions, with 4 out of 7 tasting all 9 samples. Facial expression measures were variable across subjects, but were stable within-subjects across the repeated measures. Mean WTT at follow up increased in both groups and the difference between groups was small and not significant when adjusted for baseline (mean difference 0.01, 95% CI -0.4 to 0.4). One child tasted zero samples at follow-up. Most children were willing to taste vegetables and fruit at baseline, and even more so at follow-up, regardless of intervention.

**Conclusions** WTT may be highly dependent on context. 'Sensory' tasting activities at school offer a powerful way to engage 4-7 year old children in tasting vegetables. The intervention did not increase WTT more than the control. The primary benefits of sensory food education may be providing context which is conducive to tasting, rather than in changing children's tasting behaviour, which needed little changing in our context.

# Systematic reviews investigating the impact of free school meals and cooking programmes on a range of outcomes in children

**Ms. Karen Vaughan<sup>1</sup>, Prof. Elling Bere<sup>2</sup>, Prof. Janet Cade<sup>1</sup>, Dr. Arnfinn Helleve<sup>2</sup>, Prof. Marion Hetherington<sup>1</sup>, Dr. Ingrid Hovdenak<sup>2</sup>, Dr. Annlaug Selsto<sup>2</sup>, Dr. Charlotte Evans<sup>1</sup>**

<sup>1</sup>University of Leeds, Leeds, United Kingdom, <sup>2</sup>Norwegian Institute of Public Health, Oslo, Norway

**S.3.56 - Improving the school food environment: challenges and solutions for children aged 5 to 18 years, UKK - K1 (+K2) (Level 3), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose** We will present our findings from two systematic reviews related to improving diet in childhood. The first looks at the benefits of offering free school meals on health and wellbeing. A recent international review concluded that universal free school meals may have multiple benefits for students including diet quality, reducing social inequality and higher academic performance, and this review will focus on the benefits in Nordic countries. The second review looks at the impact of school-based cooking and food preparation education on dietary habits, cooking skills and food literacy of children.

**Methods** Review 1 searched Medline, Embase, Web of Science and Education Information Centre (ERIC) through September 2022. Review 2 searched Medline, CINAHL, Embase and ERIC through January 2022. Both used a range of relevant search terms matched to subject headings. For example review 2 used 'cooking' or 'food preparation' or 'food literacy' or 'food technology'. Eligible study designs included were randomised controlled trials (RCT), cluster RCTs, and quasi-experimental designs.

**Results** After duplicates were removed and articles screened against eligible criteria, 17 studies were included in review 1 and 24 studies were included in review 2. In review 1, compared to the international review, the results from the Nordic studies were more mixed; and a large number of studies had low quality. Most Nordic studies reported that a free school meal (breakfast or lunch) had a positive effect on diet quality and could contribute to reduce social dietary inequalities. No probable effect was found for academic performance or absenteeism. In review 2, six studies from the USA, UK, Spain and Japan reported data on cooking self-efficacy and attitudes towards cooking. Cooking hours for these interventions ranged from 1 to 28 hours in total. A small increase (median difference between arms of 0.18) was reported in cooking confidence. Three studies reported small increases in food literacy with a median difference of 1.21 between arms.

**Conclusions** Results of school based policies and programmes may vary by region and are highly dependent on contextual factors. It is important that implementation of a policy or programme is followed by high quality evaluation research.

# The impact of selected methodological factors on data collection outcomes in observational studies of device-measured physical behaviour in adults: A systematic review

**S.3.57 - The Prospective Physical Activity, Sitting and Sleep consortium (ProPASS): First Results and Future Directions, UKK - K3+4 (Level 3), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Accelerometer measures of physical behaviours (physical activity, sedentary behaviour and sleep) in observational studies offer detailed insight into associations with health and disease. Maximising recruitment and accelerometer wear, and minimising data loss remain key challenges. How varying methods used to collect accelerometer data influence data collection outcomes is poorly understood. In order to inform best practice for at-scale accelerometer assessment of physical behaviours we examined the influence of accelerometer placement and other methodological factors on participant recruitment, adherence and data loss in observational studies of adults.

**Methods:** The review was in accordance with the Preferred Reporting Items for Systematic Reviews and Meta Analyses (PRISMA). Observational studies of adults including accelerometer measurement of physical behaviours were identified using database (MEDLINE (Ovid), Embase, PsychINFO, Health Management Information Consortium, Web of Science, SPORTDiscus and Cumulative Index to Nursing & Allied Health Literature) and supplementary searches to May 2022. Information regarding study design, accelerometer data collection methods and outcomes were extracted for each accelerometer measurement (study wave). Random effects meta-analyses and narrative syntheses were used to examine associations of methodological factors with participant recruitment, adherence and data loss.

**Results:** 123 accelerometer data collection waves were identified from 95 studies (92.5% from high-income countries). In-person distribution of accelerometers was associated with a greater proportion of invited participants consenting to wear an accelerometer (+30% [95% CI 18%, 42%] compared to postal distribution), and adhering to minimum wear criteria (+15% [4%, 25%]). The proportion of participants meeting minimum wear criteria was higher when accelerometers were worn at the wrist (+14% [5%, 23%]) compared to waist. Daily wear-time tended to be higher in studies using wrist-worn accelerometers compared to other wear locations. Reporting of information regarding data collection was inconsistent.

**Conclusion:** Methodological decisions including accelerometer wear-location and method of distribution may influence important data collection outcomes including recruitment and accelerometer wear-time. Consistent and comprehensive reporting of accelerometer data collection methods and outcomes is needed to support development of future studies and international consortia. Review supported by the British Heart Foundation (SP/F/20/150002) and registered (Prospero CRD42020213465)

# ActiPASS – A tool for processing thigh-worn accelerometer data in PROPASS

**Dr. Peter J. Johansson**<sup>1</sup>, Dr. Pasan Hettiarachchi<sup>1</sup>, Dr. Patrick Crowley<sup>2</sup>, Prof. Magnus Svartengren<sup>1</sup>

<sup>1</sup>Department of Medical Sciences, Occupational and Environmental Medicine, Uppsala University, Uppsala, Sweden, <sup>2</sup>The National Research Centre for the Working Environment, Copenhagen, Denmark

**S.3.57 - The Prospective Physical Activity, Sitting and Sleep consortium (ProPASS): First Results and Future Directions, UKK - K3+4 (Level 3), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** To develop and evaluate a tool for processing raw data, from different brands of thigh-worn accelerometers, which produces variables according to the ProPASS 24-hour physical behaviour construct.

**Methods:** The validated, decision-based Acti-4 algorithm, which identifies sitting, standing, moving, walking, running, stair walking, and bicycling with high precision was used as a starting point (1). Additional automatic functions were added: to calibrate the accelerometer devices; adjust if the accelerometer has been placed upside-down or inside-out; adjust for minor deviations in the placement of the accelerometer on the thigh. Algorithms to identify lying down and sleep were also added to Acti-4. The lying-down algorithm was evaluated in a dataset where 47 participants wore two Axivity-AX3 devices for 7 days, one on the thigh and one on the back as a reference (2).

The sleep algorithm was developed and optimized on a dataset consisting of 23 single-night polysomnography registrations (PSG). Then this algorithm was evaluated on another dataset, in which, 71 adult males (age 57 ± 11 years) wore ambulatory PSG equipment and one Axivity-AX3 on the thigh simultaneously, while sleeping one night in their homes (3).

**Results:** The mean difference between the total identified lying down time/day, between the refined algorithm and the back accelerometer was +2.9 (95% limits-of. Agreement (LoA); -135 to +141) minutes per day (2). Sleep intervals were slightly underestimated by -21 (95% LoA -86 to +44) minutes. Total sleep time was underestimated by -32 (95% LoA -148 to +85) minutes (3).

**Conclusions** All these functions are now integrated into ActiPASS, which is a new streamlined, automated tool for processing raw accelerometer data in large batches that fits the need for the ProPASS consortium.

# Findings from ProPASS' proof -of-concept IPD analyses: device-measured movement behaviours and cardiometabolic outcomes

**Dr. Joanna Blodgett<sup>1</sup>**, Dr. Matthew Ahmadi<sup>2</sup>, Dr. Andy Atkin<sup>3</sup>, Dr. Hsiu Wen Chan<sup>4</sup>, Dr. Sari Stenholm<sup>5</sup>, Dr. Thijs Eijssvogels<sup>6</sup>, Prof. Andreas Holtermann<sup>7</sup>, Associate Professor Annemarie Koster<sup>8</sup>, Prof. Emmanuel Stamatakis<sup>2</sup>, Prof. Mark Hamer<sup>1</sup>

<sup>1</sup>Institute of Sport Exercise & Health, UCL, London, United Kingdom, <sup>2</sup>Charles Perkins Centre, School of Health Sciences, Faculty of Medicine and Health, The University of Sydney, Sydney, Australia, <sup>3</sup>School of Health Sciences, University of East Anglia, Norwich, United Kingdom, <sup>4</sup>University of Queensland, Queensland, Australia, <sup>5</sup>University of Turku, Turku, Finland, <sup>6</sup>Radboud University Medical Center, Nijmegen, Netherlands, <sup>7</sup>National Research Centre for the Working Environment, Copenhagen, Denmark, <sup>8</sup>Department of Social Medicine, CAPHRI Care and Public Health Research Institute, Maastricht University, Maastricht, Netherlands

**S.3.57 - The Prospective Physical Activity, Sitting and Sleep consortium (ProPASS): First Results and Future Directions, UKK - K3+4 (Level 3), June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Using a novel algorithm for identifying movement behaviours, we investigated: i) interdependent associations of moderate-vigorous physical activity(MVPA), light intensity PA(LIPA), sedentary behaviour(SB) and sleep with cardiometabolic outcomes; and ii) dose-response associations between activity type(i.e. standing, walking, stair climbing, fast walking/running) and cardiometabolic outcomes.

**Methods:** We harmonised data from up to 15,285 participants across six cohort studies: 1970 British Cohort Study, Australian Longitudinal Study on Women's Health, Finnish Retirement and Aging Study, the Maastricht Study, Nijmegen Exercise Study and Danish PHysical ACTivity cohort with Objective measurements. Outcomes included body mass index(BMI), waist circumference, high-density lipoprotein(HDL) cholesterol, total cholesterol, triglycerides and HbA1c. Covariates included sex, age, cohort, alcohol consumption, smoking, self-reported health, medication use, cardiovascular disease history, occupational class, education and ethnicity. For aim i, we conducted compositional logistic regression to examine associations between different compositions of time spent in movement behaviours and each outcome. For aim ii, we used generalised linear models with splines to examine dose-response associations between each activity type and each outcome.

**Results:** In compositional analyses, more time spent in MVPA and less time spent in SB, relative to other behaviours, was associated with lower BMI, waist circumference, hbA1c and triglycerides and with higher HDL and total cholesterol levels. Associations were similar for LIPA, however effect sizes were substantially smaller and there were weaker associations with HbA1c and total cholesterol. There were inconsistent associations between time spent sleeping and adiposity and lipid outcomes. In generalised linear models, more time spent stair climbing or fast walking/running was associated with lower BMI, waist circumference, hbA1c and triglycerides and with higher HDL and total cholesterol levels, with substantial impact over a 15 minute duration. Smaller associations were observed for walking (greatest benefit obtained in the first 90minutes), while three times longer standing time was required to observe an equivalent association to walking

**Conclusions:** Higher PA levels were associated with favourable cardiometabolic outcomes, however greatest benefits were seen with higher intensity activities(e.g. fast walking/running, stair climbing). Reducing time spent sedentary was associated with better cardiometabolic health. Finally, more research is needed to better understand the complex association between sleep and health.

# The Nutrition Now project- implementing digital dietary interventions in Norway targeting diet in the first 1000 days of life

**Prof. Nina Cecilie Øverby<sup>1</sup>**, Prof. Elisabet R Hillesund<sup>1</sup>, Associate Professor Anine C Medin<sup>1</sup>, Prof. Frøydis Vik<sup>1</sup>

<sup>1</sup> Department of Nutrition and Public Health, University of Agder, Agder, Norway

**S.3.58 - Implementation of digital health interventions promoting healthy lifestyle behaviours in the first 2000 days of life, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Poor diet quality is a leading cause of non-communicable diseases and nutrition in early life strongly influences health throughout life. Still, there is a lack of public health response to these insights. There is also a lack of action on the existing evidence-to-practice gap; that successful interventions are not implemented at scale. The overall aim of the *Nutrition Now project* is to improve dietary care in the first 1000 days of life. We will do so by implementing previously evaluated digital dietary interventions (combined into the *Nutrition Now resource*) in a municipality, in co-creation with stakeholders.

Specific project objectives are to a) evaluate the effectiveness of the resource on child dietary outcomes, b) gather information on how the implementation strategies perform to inform forthcoming scale-up and c) perform trial-and model-based economic evaluations.

**Methods:** The study is a hybrid type 1 implementation study. A quasi-experimental design with pre-and post-tests, where one municipality gets access to the resource (n~800), while a matched non-equivalent control municipality (n~800) does not, will be used. The resource will be implemented in kindergartens and made available to pregnant women and parents through the Norwegian system of maternal and child health (MCH) care. The implementation process includes iterative adjustments and strategies from the implementation framework Expert Recommendations for Implementing Change informed by dialogues with stakeholders. Implementation outcomes (e.g., acceptability, adoption) will be assessed through questionnaires and interviews with parents, kindergarten and MCH staff.

**Results:** Nutrition Now recruits participants during 2022-23. We will present preliminary results including 1) the development and adaptations done to the digital resource in response to insights from midwives, health care nurses and kindergarten personnel, 2) results from the iterative processes used when implementing the resource and how this affected the implementation and 3) experiences from the implementation process e.g. assessing barriers and facilitators.

**Conclusion:** Nutrition Now will bridge the existing evidence-to-practice gap through rigorous scientific effectiveness evaluation of municipal scale-up and inform subsequent county scale-up. The study is one of the first to implement efficacious digital nutrition interventions in early life targeting both parental and MCH dietary guidance and kindergarten practice.

# From efficacy to large-scale implementation (MINISTOP 1.0 - 3.0): Promoting healthy lifestyle behaviours in the first 2000 days of life using a mHealth intervention

**Associate Professor Christine Delisle Nyström<sup>1</sup>**, Mrs. Christina Alexandrou<sup>1,2</sup>, Associate Professor Kristin Thomas<sup>2</sup>, Prof. Marie Lof<sup>1,2</sup>

<sup>1</sup>Department of Biosciences and Nutrition, Karolinska Institutet, Stockholm, Sweden, <sup>2</sup>Department of Health, Medicine and Caring Sciences, Linköping University, Linköping, Sweden

**S.3.58 - Implementation of digital health interventions promoting healthy lifestyle behaviours in the first 2000 days of life, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The overall aim is to present the Mobile-based intervention intended to stop obesity in preschoolers (MINISTOP) studies from efficacy to large-scale implementation within Swedish primary child healthcare.

**Methods:** The MINISTOP app consists of a 6-month comprehensive program with information grounded in evidence-based recommendations for healthy eating, physical activity, and screen time for parents of preschoolers. MINISTOP 1.0 was a randomized controlled trial (RCT) which utilized objective measures to assess body composition (BodPod), physical activity (ActiGraph), and diet (food pictures) and was delivered under controlled conditions (n=315). MINISTOP 2.0 was a type I implementation-effectiveness trial delivered by nurses within primary child healthcare (n=521). Children's weight and height were collected at primary child healthcare and questionnaires were used to assess key dietary indicators and physical activity/sedentary behaviours. MINISTOP 3.0 is a type III hybrid implementation-effectiveness trial that will test two different implementation strategies 'MINISTOP basic' vs. 'MINISTOP plus'. Child healthcare centers will be randomized in a 1:1 ratio and the implementation outcomes that will be assessed are: acceptability, appropriateness, feasibility, fidelity, adoption, costs, sustainability, and reach (measured quantitatively and qualitatively) and data on children's health behaviours will be collected at intervention start and 6-months later through the MINISTOP app.

**Results:** The MINISTOP 1.0 trial showed that the intervention group (MINISTOP app) compared to the control group significantly improved their composite score including body composition, dietary, and physical activity variables compared to the control group (p=0.021). Preliminary results from the MINISTOP 2.0 trial are showing that the intervention group compared to the control group has increased their consumption of fruits and vegetables (p=0.032) and decreased their consumption of sweet and savoury snacks as well as sweetened beverages (p<0.03). Children in the intervention group also reduced their screen time compared to the control group (p=0.009). Data collection for MINISTOP 3.0 will begin in January 2023 and preliminary findings will be presented in June 2023.

**Conclusions:** Following the MINISTOP 3.0 trial, MINISTOP has great potential to be implemented in primary child healthcare across Sweden to support all parents to create healthy lifestyle behaviours in their children, in order to prevent overweight and obesity.

# Development and formative usability intervention of the Let's Grow mobile web app

Dr. Katherine L Downing<sup>1</sup>, Ms. Brittany R Markides<sup>1</sup>, Dr. Harriet Koorts<sup>1</sup>, Prof. Jo Salmon<sup>1</sup>, **Prof. Kylie D Hesketh<sup>1</sup>**

<sup>1</sup>Institute for Physical Activity and Nutrition (IPAN), School of Exercise and Nutrition Sciences, Deakin University, Geelong, Australia

**S.3.58 - Implementation of digital health interventions promoting healthy lifestyle behaviours in the first 2000 days of life, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 11:45 AM - 1:00 PM**

## **SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** To describe the development and formative usability evaluation of a mobile web application (app) for parents to improve the composition of movement behaviours in 2-year-olds.

**Methods:** The development of Let's Grow was an iterative process, with content developed with user input for acceptability and utility and stakeholder input on delivery to ensure future scalability. During development, parents were engaged in a series of focus groups and interviews. Four samples of parents of young children were recruited between November 2019 and October 2020 (n=53 total; 92% female). Parents participated in focus groups or one-on-one interviews and provided feedback on an app prototype, including technical functionality, educational module contents, and the content and timing of notifications. A formal Stakeholder Group (n=22; comprising government from various jurisdictions, health and care delivery, and community facing not-for-profit organisations) was established during the development phase. The group participated in an online PRACTIS workshop to ascertain their views on effective dissemination, requirements to ensure future sustainable promotion in the community, aspects of the app that should remain intact when scaling up, and how it could align with each organisation's missions, values or existing infrastructure. Focus groups, interviews and the PRACTIS workshop were recorded and transcribed verbatim.

**Results:** Feedback from parents on the app content and utility was mostly positive; parents liked that it was engaging, easy to navigate, and contained a combination of information, videos, and activities. Suggestions for improvement, which were used to inform iterative refinements to the app prototype, included allowing more flexibility and personalisation for some activities, incorporating additional information around sleep, and making the language around screen time less judgemental. There was strong support from the Stakeholder Group, with suggestions for aligning or embedding the app content with already existing offerings or programs and disseminating through a centralised source (e.g., national government).

**Conclusions:** We have taken an innovative approach to developing Let's Grow by incorporating not only iterative end-user input for acceptability and utility, but also early stakeholder input to ensure future scalability. Throughout the trial (ending December 2023), we are continuing to engage with the Stakeholder Group around future scalability pathways.

# The development of an online platform for lifestyle professionals to support the use of e-coaching

**Dr. Joan Dallinga<sup>1,2,4</sup>**, Dr. Daniel Bossen<sup>1</sup>, Dr. Katja Braam<sup>2</sup>, Ms. Monique Bak<sup>1</sup>, Ms. Colette van het Schip<sup>1</sup>, Mr. Luke Boerdijk<sup>1</sup>, Dr. Jasmijn Holla<sup>2,3</sup>, Dr. Bart Visser<sup>1</sup>

<sup>1</sup>Faculty of Health, Centre of Expertise Urban Vitality, Amsterdam University of Applied Sciences, Amsterdam, Netherlands, <sup>2</sup>Faculty of Health, Sports and Social Work, Inholland University of Applied Sciences, Haarlem, Netherlands, <sup>3</sup>Amsterdam Rehabilitation Research Center, Amsterdam, Netherlands, <sup>4</sup>Centre of Expertise Health Innovation, The Hague University of Applied Sciences, The Hague, Netherlands

**S.3.59 - Supporting the lifestyle professional in the application of (digital) tools for supporting lifestyle change, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** The aim was to develop an online platform for lifestyle coaches to support the use of e-coaching in their guidance trajectory for overweight clients.

## **Research questions:**

1. - How can online- and offline behavior change techniques (BCT's) be applied in the guidance of overweight clients?
2. - What are the wishes and needs of lifestyle coaches in regard to e-coaching?
3. - How to integrate e-coaching in the coaching trajectory of lifestyle coaches?

**Methods:** A mixed method approach was used. Qualitative methods included interviews with lifestyle coaches with focus on online and offline BCT's (n= 38), two focus groups with lifestyle coaches on wishes and needs (n=10) and three co-creation sessions with lifestyle coaches, clients and stakeholders (n=9;7;8) to develop an online platform. The qualitative data were transcribed and analyzed through an inductive thematic approach. Quantitative studies included online surveys with lifestyle professionals (n=79).

**Results:** Monitoring and feedback are fundamental BCTs in online lifestyle interventions but less used in offline interventions. Also, shaping knowledge and social support are commonly used online BCT's. Coaches who work predominantly offline use goal setting, action planning and shaping knowledge as techniques. Online group sessions were perceived as less effective. Almost all lifestyle coaches (91%) indicate that they were not educated to apply technology. They need insight in available e-coaching tools, in how to use them and are open to experiences of other professionals. Specifically, there is need for information how to assist clients with limited health literacy. In the co-creation sessions researchers, lifestyle coaches and clients worked towards a prototype of an online platform. As a result, the online platform *eCoachGids* was developed which will be presented.

**Conclusions:** The *eCoachGids* provides an overview of e-coaching tools per phase of behavior change, suggestions how to use online tools and e-coaching experiences of lifestyle professionals. The platform can be used by lifestyle coaches and should be improved further through usability testing. In the next step, we will implement the platform in practice. Also, we will study how to apply blended coaching and how clients with low health literacy can benefit most from e-coaching tools.

# Experiences, needs, and wishes of healthcare professionals with supporting behavior change maintenance

**S.3.59 - Supporting the lifestyle professional in the application of (digital) tools for supporting lifestyle change, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Combined lifestyle interventions (CLIs) aim to improve health-related behaviors such as exercise, nutritional intake, and smoking. Although support of *initial* behavior change is well addressed in CLIs, *maintenance* of behavior change remains challenging. In addition, research indicates that effects of lifestyle interventions decrease over time, and that relapse is a prevalent issue. Therefore, the aim of this study was to identify experiences, needs, and wishes of CLI-providers (physiotherapists, dietitians, lifestyle coaches,) regarding the support of adults in maintaining their healthier behavior.

**Methods:** Semi-structured interviews (n=12) and one finalizing focus-group (n=3) were held with physiotherapists, dietitians, and lifestyle coaches who offer CLIs focused on improved nutritional intake and physical activity. Topics in the interview guide included experiences with and insights in behavior change maintenance, current support and use of tools aimed at behavior change maintenance, and needs and opportunities to support behavior change maintenance. Data were analyzed following an inductive thematic approach.

**Results:** Participants confirmed that the main focus of CLIs is initial behavior change and maintenance on the short term. They lack insights into the maintenance of their clients' behavior change after finishing a CLI. The support of professionals usually ends after the intervention has finished, although some professionals keep seeing their clients afterwards on an irregular basis. However, practical (digital) tools and theoretical models focused on supporting sustained behavior change are lacking. Opportunities indicated by participants included increasing the focus on behavior change maintenance during the CLI, incidental meeting in the final phase of the CLI, tracking clients after finishing the CLI, increasing self-management of clients, and developing tools, models or a platform focused on support during behavior change maintenance. In addition, professionals emphasize the need of practical guidance to implement tools or models in their daily practice.

**Conclusions:** These results show the lack of insights, tools and theoretical models focused on supporting healthy behavior maintenance. Future research should focus on indicating or developing suitable (blended) tools and models in cooperation with professionals as well as clients to support clients in maintaining their behavior change. Special attention should be given to the implementation of these tools in practice.

# Wishes and needs of children, parents and healthcare professionals for blended care for children with overweight.

**Dr. Machteld van Lieshout<sup>1</sup>**, Mrs. Wendy Scholtes-Bos<sup>1,2</sup>, Mrs. Maria F. Arias-Arias<sup>1</sup>, Prof. Sanne I. de Vries<sup>1</sup>

<sup>1</sup>The Hague University of Applied Sciences, The Hague, Netherlands, <sup>2</sup>Medical Delta Living Lab VIT for Life, Rotterdam, Netherlands

**S.3.59 - Supporting the lifestyle professional in the application of (digital) tools for supporting lifestyle change, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 11:45 AM - 1:00 PM**

## **SIG - Primary Choice:** D. e- & mHealth

Overweight children experience barriers to incorporate healthy lifestyle recommendations and assignments given by healthcare professionals into their daily life. In return, it is difficult for healthcare professionals to keep track of compliance to their recommendations and assignments. Bridging the gap between the health care centre (on site) and home (off site) could support the care process. Digital support through an application is a logical tool for blending on site and off site support. Therefore, we studied the needs and wishes of children, their parents and healthcare professionals for such an application.

We used desing thinking in two simultaneous processes to gather data from different contexts: the household and healthcare setting. For understanding user needs, a total of six diary studies and six semi-structured interviews were executed with parents, children, dieticians and physiotherapists. Convergence was sought through looking at overlapping needs using an affinity diagram. These needs were translated into a hi-fi clickable prototype with separate interfaces for professionals and children. In addition, the perspectives of healthcare professionals about the use and implementation of such digital applications were identified. Furthermore, the value and relevance of designed prototypes was studied qualitatively in semi-structured interviews with three physiotherapists and four dieticians. A thematic content analysis, based on relevance and feasibility, was used to validate a series of user needs by five individuals including users, knowledge, and design experts in an online focus group.

In the prototypes theoretical knowledge was translated into functional design, resulting in positive feedback from the professionals. One of them stated “the prototype has a beautiful appearance and already includes some of my wishes”. Some wishes and needs were viewed very differently by experts in different fields. Further research and development is required to include practical tools such as diaries to record food intake and mood, enable monitoring of compliance and progress by parents and healthcare professionals. Given the positive respons of all involved, we conclude digital support through an application is a logical tool for blending on site and off site support. Provided, it fulfils the needs of all involved.

# Trajectories of physical activity before and after a cancer diagnosis in persons with type 2 diabetes

**Dr. Emerald G. Heiland**<sup>1,2</sup>, Dr. Stanley Teleka<sup>1</sup>, Prof. Ingrid Glimelius<sup>3</sup>, Prof. Karl Michaëlsson<sup>1</sup>, Prof. Liisa Byberg<sup>1</sup>, Associate Professor Hannah L. Brooke<sup>1</sup>

<sup>1</sup>Department of Surgical Sciences, Uppsala University, Uppsala, Sweden, <sup>2</sup>Department of Physical Activity and Health, The Swedish School of Sport and Health Sciences (GIH), Stockholm, Sweden, <sup>3</sup>Department of Immunology, Genetics and Pathology, Experimental Oncology, Uppsala University, Uppsala, Sweden

**S.3.60 - Using routinely collected physical activity and cardiorespiratory fitness data for longitudinal studies within cancer epidemiology, Clarion Hotel Gillet - Room Swedenborg, June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose** Physical activity (PA) is a known preventative and rehabilitative approach for cancer and diabetes. Identifying PA patterns before and after cancer diagnosis can provide important information regarding high risk groups, but patterns remain unknown. We identified PA trajectories pre- and post-cancer diagnosis in persons with type 2 diabetes, using routinely collected data, and explored determinants of these trajectories.

**Methods** We included 26 258 persons with type 2 diabetes, who had a cancer diagnosis (from January 1, 2004, onwards). Data were retrieved from the Swedish National Diabetes Register and National Cancer Register. Annual (2000-2021) self-reported PA (frequency of walking 30 min or equivalent) collected at healthcare centers was used, excluding the year immediately before and after cancer diagnosis. Trajectories were identified using group-based trajectory modelling. Multivariable logistic regression was used to assess associations of potential determinants of trajectory membership.

**Results** Seven trajectories emerged pre-diagnosis: average maintainers (50.0%), high maintainers (12.3%), increasers (11.1%), very high maintainers (11.0%), decreasers (6.3%), low maintainers (6.0%), and low decreasers (3.3%). Six similar trajectories emerged post-diagnosis. Pre-diagnosis decreasers, compared with average maintainers, were more likely to be older, women, single, with lower education, higher HbA1c and body mass index (BMI), and smokers. Increasers were more likely to be older, men, married/cohabiting, low HbA1c and BMI, and non-smokers. Post-diagnosis decreasers compared with average maintainers were more likely to start with high PA, and be married/cohabiting men, with low HbA1c and BMI, and non-smokers. Post-diagnosis increasers initially had low PA, and were more likely to be older, women, with lower education, single, more advanced diabetes treatment, higher BMI, and smokers compared with average maintainers. Those who were post-diagnosis decreasers were more likely to be in the high PA trajectories pre-cancer diagnosis, whereas those who were post-diagnosis increasers were more likely to have had been in the low PA trajectories at pre-diagnosis.

**Conclusions.** The majority of patients were in the average or high PA groups before and after a cancer diagnosis. PA behaviour may depend on sociodemographic factors, glycemic control, and body composition. Register data can provide high resolution, long-term information to answer research questions in innovative ways.

# Physical activity before and after a cancer diagnosis in relation to total and cancer-specific mortality among individuals with diabetes

**Dr. Stanley Teleka<sup>1</sup>**, Dr. Emerald G. Heiland<sup>1,2</sup>, Prof. Ingrid Glimelius<sup>3</sup>, Prof. Karl Michaëlsson<sup>1</sup>, Prof. Liisa Byberg<sup>1</sup>, Associate Professor Hannah L. Brooke<sup>1</sup>

<sup>1</sup>Department of Surgical Sciences, Uppsala University, Uppsala, Sweden, <sup>2</sup>Department of Physical Activity and Health, The Swedish School of Sport and Health Sciences (GIH), Stockholm, Sweden, <sup>3</sup>Department of Immunology, Genetics and Pathology, Experimental Oncology, Uppsala University, Uppsala, Sweden

**S.3.60 - Using routinely collected physical activity and cardiorespiratory fitness data for longitudinal studies within cancer epidemiology, Clarion Hotel Gillet - Room Swedenborg, June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose** Diabetes and physical inactivity have been associated with risk of cancer at specific anatomical sites. However, the impact of physical activity (PA) before and after a cancer diagnosis on total cancer and cancer-specific mortality remains unclear, especially among individuals with type 2 diabetes (T2D). We investigated the association of pre-cancer diagnosis PA, post-cancer diagnosis PA, and change in PA from pre- to post-cancer diagnosis, with mortality among individuals with T2D.

**Methods** We analysed participants diagnosed with T2D using large-scale, high-quality data from the Swedish National Diabetes Register with incident cancer, recorded in the national cancer register, from 2004 to 2021. PA (30 minutes/day of walking or equivalent) was routinely collected annually. It was categorised as never, less than once/week, 1-2 times/week, 3-5 times/week, daily and recorded >12 months before cancer diagnosis and >12 months after cancer diagnosis. Change in PA was categorised as low maintainers, increasers, decreasers and high maintainers. Cox regression was used to calculate hazard ratios (HR) and 95% confidence intervals (CI) for total cancer mortality and cancer-specific mortality adjusted for relevant confounders including body mass index, smoking, age at diagnosis, types of diabetes treatment and several socio-economic factors.

**Results** We found an inverse association between PA and total cancer mortality for both pre-diagnostic PA and post-diagnostic PA; HR (95% CI) for those performing daily PA were 0.81 (0.78-0.85) and 0.70 (0.66-0.74), respectively, compared to those performing no PA. Compared with those who had low PA both before and after cancer diagnosis, individuals with higher levels of PA prior to diagnosis had lower total cancer mortality even if they decreased their PA after diagnosis [maintained high PA: 0.77 (0.71-0.84), decreased PA: 0.81 (0.72-0.90)].

**Conclusions** Higher levels of PA before and after cancer diagnosis were associated with lower total cancer mortality. For some cancer types, higher levels of PA before cancer diagnosis seem to represent a health 'buffer' with regards to mortality.

# The association between change in fitness and prostate cancer incidence and mortality in 59197 men

**Dr. Emil Bojsen-Møller**<sup>1</sup>, Dr. Kate A. Bolam<sup>1,2</sup>, Dr. Peter Wallin<sup>3</sup>, Prof. Magnus Lindwall<sup>1,4</sup>, Dr. Helene Rundqvist<sup>5</sup>, Associate Professor Elin Ekblom-Bak<sup>1</sup>

<sup>1</sup>Department of Physical Activity and Health, The Swedish School of Sport and Health Sciences (GIH), Stockholm, Sweden, <sup>2</sup>Department of Neurobiology, Care Sciences and Society, Karolinska Institute, Huddinge, Sweden, <sup>3</sup>Research Department, HPI Health Profile Institute, Stockholm, Sweden, <sup>4</sup>Department of Psychology, University of Gothenburg, Gothenburg, Sweden, <sup>5</sup>Department of Laboratory Medicine, Karolinska Institute, Stockholm, Sweden

**S.3.60 - Using routinely collected physical activity and cardiorespiratory fitness data for longitudinal studies within cancer epidemiology, Clarion Hotel Gillet - Room Swedenborg, June 17, 2023, 11:45 AM - 1:00 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Low cardiorespiratory fitness (CRF) is a well-known risk factor for cancer incidence and mortality. However, limited evidence exists about how changes in CRF relates to incidence and mortality of specific cancer types. We aim to investigate the association of changes in CRF in midlife with subsequent diagnosis of incident prostate cancer and prostate cancer mortality in men.

**Methods:** Data was obtained from the unique, high-quality Health Profile Institute (HPI) database containing health profile assessments at Swedish companies from 1982 until 2019. The assessment consists of questionnaires on lifestyle factors, measurements of anthropometry, and a submaximal bike CRF test. We identified 59,197 men from the routinely collected data, who had performed at least two CRF tests. Cancer outcomes subsequent to CRF tests were retrieved from the Swedish National Cancer Register. Cox proportional hazards models will be used to examine the association between changes in CRF and prostate cancer incidence and mortality. To help account for time varying confounding, inverse probability treatment weights will be applied. Models will be performed for both estimated relative and absolute CRF and adjusted for age, socioeconomic position, smoking, and co-morbidities.

**Results:** The HPI database in combination with cancer registers gives unique opportunities to study changes in lifestyle factors and cancer related outcomes using routinely collected, objective measures of CRF. The time between CRF tests was on average 4.8 (standard deviation [SD] 3.6) years. Among prostate cancer cases risk time was on average 6.1 (SD 4.1) years. The individuals included were a mean age of 41 years, had a body mass index of 26 kg/m<sup>2</sup>, and a CRF level of 37 mL · kg<sup>-1</sup>·min<sup>-1</sup>. Of the 59,197 men included, 608 prostate cancer cases were identified.

**Conclusions:** The results of this study will add to our limited knowledge of the association between change in CRF and prostate cancer specific incidence and mortality. Understanding the role of change in cardiovascular fitness over a lifetime will allow us to develop more nuanced and targeted preventative strategies that more accurately reflect the natural changes in a person's health over their life, and the effects of these changes on cancer outcomes.

# SHORT ORAL PRESENTATIONS

## Sedentary behaviours of children during the COVID-19 pandemic and their association with maternal employment in Bangladesh: a cross-sectional study

**Mrs. Sabiha Afrin**<sup>1</sup>, Prof. Amy B. Mullens<sup>2</sup>, Prof. Stuart J.H. Biddle<sup>1</sup>

<sup>1</sup>University Of Southern Queensland, Centre for Health Research, Springfield Central, Brisbane, Australia,

<sup>2</sup>University of Southern Queensland, School of Psychology and Wellbeing, Ipswich, Australia

**SO.1.01 - Latest findings in Epidemiology and COVID-related studies, UKK - Main Hall (Level 6), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** To prevent the spread of COVID-19, a country-wide lockdown was instigated in Bangladesh. School closures during the COVID-19 pandemic are likely to have had a substantial impact on young people's sedentary behaviour. This study aims to investigate the patterns of sedentary behaviour among children (aged 6-18 years old) in Bangladesh during the pandemic and their relationship with maternal employment.

**Methods:** A cross-sectional study was undertaken with 383 children (50.4% female) between February-September 2021. We used the 7-day Adolescent Sedentary Activity Questionnaire (ASAQ) to assess children's screen activities and times in inactive sitting. Mothers were the proxy respondents. Logistic regression estimates the association using odds ratios (OR) and 95% confidence intervals (CI). Statistical significance was considered at  $p < 0.05$ .

**Results:** During the pandemic, about 81% of children had high recreational sedentary behaviour (>2 hours/day), 49% had high 'productive' sedentary behaviour of >369 min/day and 50% had high 'less productive' sedentary behaviour (>257 min/day). Multivariate logistic regression showed that age [adolescents (13-18 years)] and sex [boys] were significant predictors of recreational, productive, and less productive sedentary behaviour. During weekdays, recreational sedentary behaviour was less likely among boys (OR: 0.31; 95% CI: 0.19-0.52); productive sedentary behaviour was more likely among adolescents (OR: 2.21; 95% CI: 1.37-3.56), and less productive sedentary behaviour was more likely among adolescents (OR: 1.71; 95% CI: 0.99-2.61) and less likely among boys (OR: 0.49; 95% CI: 0.32-0.74). During weekend days, for productive sedentary behaviour OR for boys was 1.82 (95% CI: 1.21-2.77) and for adolescents OR: 2.35 (95% CI: 1.47-3.75). For less productive sedentary behaviour OR for boys was 2.29 (95% CI: 1.50-3.48) and for adolescents OR: 1.61 (95% CI: 0.99-2.61). Sex [boy] was the only predictor of weekend recreational sedentary behaviour [OR: 1.81 (95% CI: 1.07-3.07)]. Children's sedentary behaviour was not associated with maternal employment status.

**Conclusion:** Children and adolescents in Bangladesh exhibited high levels of sedentary behaviour during COVID-19 lockdowns, with older children and boys being more sedentary than younger children and girls. Schools and parents need to consider implementing effective interventions to minimize the detrimental effects of excessive sedentary behaviour on children and adolescents.

# Child and parent accelerometer-measured physical activity and sedentary time post-lockdown: a natural experiment comparison with pre-pandemic data

**Prof. Russell Jago<sup>1</sup>**, Dr. Danielle House<sup>1</sup>, Dr. Lydia Emm-Collison<sup>1</sup>, Dr. Robert Walker<sup>1</sup>, Dr. Ruth Salway<sup>1</sup>  
<sup>1</sup>University of Bristol, Bristol, United Kingdom

**SO.1.01 - Latest findings in Epidemiology and COVID-related studies, UKK - Main Hall (Level 6), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The COVID-19 pandemic resulted in marked impacts on children's physical activity, with large reductions in MVPA reported during lockdowns. We have showed that children's activity levels were lower and their sedentary time higher immediately post-pandemic. In contrast, there was little change in parental physical activity. We need to know if these patterns persist beyond the short-term.

**Methods:** Active-6 is a repeated cross-sectional natural experiment conducted in two waves. Accelerometer data were collected on 393 children aged 10-11 and their parents from 23 schools in Wave 1 (May to December 2021), and 436 children and parents from 27 schools in Wave 2 (January to July 2022). These were compared to a pre-COVID-19 comparator group of 1296 children and parents in the same schools in March 2017-May 2018. Mean minutes of accelerometer-measured moderate-to-vigorous physical activity (MVPA) were derived for week- and weekend-days and compared across waves via linear multilevel models. We also explored how the post-COVID-19 differences changed over time via generalised additive mixed models (GAMMs).

**Results:** There was no difference in children's mean MVPA in Wave 2 (weekdays: -2.3 min; 95% CI: -5.9 to 1.3 and weekends: 0.6 min; 95% CI: -3.5 to 4.6) when compared to the pre-covid data. Sedentary time remained higher than pre-pandemic at 13.2 min (95% CI: 5.3 to 21.1) on weekdays. Parents' sedentary time and weekday MVPA was similar to pre-COVID-19 levels, with MVPA higher than pre-pandemic by 7.7 min (95% CI: 1.4 to 14.0) on weekends. The COVID-19 difference changed over time, with children's MVPA decreasing over winter and coinciding with COVID-19 outbreaks, and only returning to pre-pandemic levels towards May/June 2022.

**Conclusions:** Children's MVPA has returned to pre-pandemic levels, while sedentary time remained higher. Parents' MVPA remained higher, especially at weekends. The recovery in physical activity is precarious and potentially susceptible to future COVID outbreaks or changes in provision, and so robust measures to protect against future disruptions are needed. Furthermore, many children are still inactive, with only 41% meeting UK physical activity guidelines, and so there is still a need to increase children's physical activity.

# Changes in movement behaviours among Canadian toddlers and preschoolers throughout two years of the COVID-19 pandemic

**Dr. Valerie Carson<sup>1</sup>**, Dr. Zhiguang Zhang<sup>1</sup>, Mrs. Madison Boyd<sup>1</sup>, Mrs. Morgan Potter<sup>1</sup>, Mr. Joshua Li<sup>1</sup>, Dr. Nicholas Kuzik<sup>1,2</sup>, Dr. Stephen Hunter<sup>1</sup>

<sup>1</sup>University of Alberta, Edmonton, Canada, <sup>2</sup>Children's Hospital of Eastern Ontario - Research Institute, Ottawa, Canada

**SO.1.01 - Latest findings in Epidemiology and COVID-related studies, UKK - Main Hall (Level 6), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** To examine the changes in movement behaviours (i.e., organized physical activity, outdoor play, screen time, sleep time) across two years of the COVID-19 pandemic among Canadian toddlers and preschoolers.

**Methods:** Participants were 359 parents of toddlers and preschoolers (1-4 years at baseline) from across Canada. Participants were asked to complete an online questionnaire at 5 time-points representing unique time-points in the pandemic. Time-point 1 (T1) was completed retrospectively and corresponded with pre-COVID-19 pandemic (Before March 11, 2020; average Canadian restriction severity index (RSI)= 4.7/100). Time-point 2 (T2) corresponded with wave 1 (April 15, 2020; RSI=72.8/100). Time-point 3 (T3) corresponded with post-wave 1 (October 1, 2020; RSI=36.7/100). Time-point 4 (T4) corresponded with wave 2 (January 17, 2021; RSI =48.8/100). Time-point 5 (T5) corresponded to post-Omicron waves or post-waves 5 and 6 (April 14, 2022; RSI=11.7/100). Parents reported on their children's organized physical activity, outdoor play, screen time, and sleep time using tools with established psychometric properties. Linear mixed models were conducted.

**Results:** Organized physical activity was on average 62, 44, 37 minutes/day lower at T2, T3, T4, respectively, compared to pre-COVID-19 (T1). However, no significant differences were observed in organized physical activity between T5 and pre-COVID-19. Outdoor play at T2 and T3 was on average 30 minutes/day higher compared to pre-COVID-19. Outdoor play at T4 and T5 were not significantly different compared to pre-COVID-19. Screen time was on average 67, 17, 38, 52 minutes/day higher at T2, T3, T4, T5, respectively, compared to pre-COVID-19. Sleep time was 30, 36, 82 minutes/day lower at T3, T4, T5, respectively, compared to pre-COVID-19. However, no significant differences in sleep were observed between T2 and pre-COVID-19.

**Conclusions:** Changes were observed in all movement behaviours across two years of COVID-19 but patterns were behaviour-specific. Findings suggests organized sport and outdoor play may have returned to pre-pandemic levels. However, screen time remains significantly higher compared to pre-COVID-19. Though sleep remains lower than pre-pandemic levels, this finding may reflect typical developmental changes in sleep. Future research is needed to understand the moderators of change in movement behaviours among this age group to support an equitable COVID-19 recovery.

# A prospective look at the influence of parenting practices on children's physical activity before and during the pandemic

**Prof. Louise C. Mâsse<sup>1,2</sup>**, Dr. Olivia De-Jongh González<sup>2,1,2</sup>, Mrs. Karen Sauve<sup>1,2</sup>

<sup>1</sup>University of British Columbia, Vancouver, Canada, <sup>2</sup>BC Children's Hospital Research Institute, Vancouver, Canada

**SO.1.01 - Latest findings in Epidemiology and COVID-related studies, UKK - Main Hall (Level 6), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Background:** Parents play a critical role in supporting many aspects of children's behaviours including their engagement in physical activity (PA). Their parenting practices may change as children age and become more independent. Moreover, evidence suggests the pandemic decreased the PA level among children, but familial influences during the pandemic remain unknown.

**Purpose:** This paper examined longitudinally whether child engagement in PA during the transition into secondary school is influenced by PA parenting practices in elementary school or by the change in PA parenting practices that occurs with the transition to secondary school. These associations were examined in a pre-pandemic and a pandemic cohort.

**Methods:** In total, 689 parent-child dyads ([parent age=46.0(5.4) & 79% mothers; child age=12.9(0.3) & 54% female] from British Columbia, Canada, completed questionnaires when children were in elementary school (grade 7) and in secondary school (grade 8). The pre-pandemic cohort (43% of the sample) had all their data collected before the pandemic, and the pandemic cohort had all their data collected during the pandemic. At both time points, parents and children self-reported their PA parenting practices and PA, respectively and 57% of children wore AX3 accelerometers for 1 week to measure their involvement in moderate-vigorous PA (MVPA). Linear regressions were used to address the main study question.

**Results:** Overall, PA significantly decreased when children transitioned to secondary school but the level of PA (measured with self-report and accelerometry) did not differ between the pandemic and pre-pandemic samples. Positive PA parenting practices were significantly associated with higher levels of PA in elementary and secondary schools. In addition, an increase in positive PA parenting practices during the transition was associated with more involvement in PA in secondary school in both samples. These effects were mainly observed with children's self-reported (versus accelerometry) data.

**Conclusions:** This study highlights the role that parents play in supporting PA of children and that parental influence was not altered during the pandemic. However, the steep decline in PA resulting from the transition to secondary school remains a concern as this can set children on a lifelong pattern of inactivity as they grow.

# Children's and Parents' Perspectives of the Impact of the COVID-19 Pandemic on Ontario Children's Physical Activity, Play, and Sport Behaviours

**Ms. Monika Szpunar**<sup>1</sup>, Dr. Leigh Vanderloo<sup>2,3</sup>, Dr. Brianne Bruijns<sup>3</sup>, Dr. Stephanie Truelove<sup>4</sup>, Dr. Shauna Burke<sup>5,6</sup>, Dr. Jason Gilliland<sup>5,6,7,8,9</sup>, Dr. Jennifer Irwin<sup>5</sup>, Dr. Patricia Tucker<sup>3,5,6</sup>

<sup>1</sup>Health and Rehabilitation Sciences, University of Western Ontario, London, Canada, <sup>2</sup>ParticipACTION, Toronto, Canada, <sup>3</sup>School of Occupational Therapy, University of Western Ontario, London, Canada, <sup>4</sup>Member Interest Groups Section, Professional Development and Practice Support, College of Family Physicians of Canada, Mississauga, Canada, <sup>5</sup>School of Health Studies, Faculty of Health Sciences, University of Western Ontario, London, Canada, <sup>6</sup>Children's Health Research Institute, Lawson Health Research Institute, London, Canada, <sup>7</sup>Department of Geography and Environment, University of Western Ontario, London, Canada, <sup>8</sup>Department of Pediatrics, University of Western Ontario, London, Canada, <sup>9</sup>Department of Epidemiology & Biostatistics, University of Western Ontario, London, Canada

**SO.1.01 - Latest findings in Epidemiology and COVID-related studies, UKK - Main Hall (Level 6), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The COVID-19 pandemic and associated public health measures have had an impact on children's health behaviours, including opportunities for physical activity and play/sport. This study examined parents' and children's perspectives of the impact of COVID-19 on children's physical activity behaviours, return to play/sport, as well as barriers/facilitators to re-engaging in physical activity.

**Methods:** Parents of children (0-12 years) living in Ontario, Canada were invited to participate in online interviews. Twelve parent and 9 child interviews were conducted via Zoom between December 2020 and January 2021, were digitally recorded, and transcribed verbatim. Deductive and inductive thematic content analysis using NVivo was undertaken to identify pronounced themes.

**Results:** Three pronounced themes emerged from the parent and child interviews: 1) barriers and facilitators for getting children active amid COVID-19 restrictions; 2) changes in children's physical activity levels; and 3) perspectives on return to play/sport during and post-pandemic. Various subthemes were identified, which varied between parents and children. The most common facilitator for promoting children's activity voiced by parents was getting active outdoors, while screen-time was often mentioned as a prominent barrier. Parents noted their willingness to have their children return to play/sport in the community once deemed safe by public health officials, and children's willingness to return stemmed primarily from missing their friends and other important authority figures (e.g., coaches, recreation staff) and sporting events (e.g., tournaments, club meets). Finally, children who returned to sport/play reported having no issues with following health protocols (e.g., masking).

**Conclusions:** Findings from this study could inform families of pragmatic strategies for increasing children's physical activity during community closures. Results could also provide public health experts with information regarding which supports, or infrastructure changes may be required during future lockdown periods and/or pandemics to support active behaviours among pediatric populations

# Longitudinal trends in movement behaviors among Singaporean children aged, 5.5, 8, and 10 years old

**SO.1.01 - Latest findings in Epidemiology and COVID-related studies, UKK - Main Hall (Level 6), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Engaging in moderate-to-vigorous physical activity (MVPA), adequate sleep and limiting screen viewing (SV) are important for children's health and development. We aimed to describe the trends in the 24-hour movement behaviors in Singaporean children from age 5.5 to 10 years.

**Methods:** Children from the Growing Up in Singapore Towards healthy Outcomes (GUSTO) cohort were asked to wear an accelerometer (Actigraph-GT3X+) for seven consecutive days to measure their movement behaviors at ages 5.5, 8, and 10 years. Mean time spent in MVPA and sleep were estimated using the R-Package GGIR 2.0. SV time was reported by parents/caregivers at the same timepoints. Adherence to the guidelines was defined as  $\geq 60$  min of MVPA/day,  $\leq 2$  h of screen time/day, and 9–11 h of sleep/night.

**Results/findings:** 321 children with valid accelerometer and questionnaire data at 5.5, 8, and 10 years engaged on average in 72.2 ( $\pm 23.9$ ), 71.3 ( $\pm 28.8$ ) and 50.5 ( $\pm 24.8$ ) minutes of MVPA, 543.2 ( $\pm 40.8$ ), 525.8 ( $\pm 44.0$ ), 516.2 ( $\pm 51.8$ ) minutes of sleep, and 110.6 ( $\pm 97.5$ ), 174.21 ( $\pm 128.9$ ) and 253.7 ( $\pm 139.4$ ) minutes of SV per day, respectively. The proportion of children meeting guidelines decreased as children grew older for MVPA (age 5.5: 70.4%, age 8: 61.1%, age 10: 28.66%), sleep (age 5.5: 52.7%, age 8: 36.8%, age 10: 26.8%) and SV (age 5.5: 64.8%, age 8: 40.8%, age 10: 14.6%). The proportions of children meeting all guidelines at ages 5.5, 8 and 10 were 26.2%, 6.2% and 2.8% respectively.

**Conclusions:** Worrying trends in movement behaviors were observed as the children grew older, with fewer adhering to the 24-hour movement guidelines. The decline was particularly pronounced between age 8 and 10. Developing and implementing evidence-based interventions to promote children's health and development is a key public health challenge.

# Physical activity, sedentary behaviour, sleep sufficiency and health-related quality of life among primary school children in regional Victoria, Australia, pre- and post-COVID-19 restrictions (2019-2022)

**Dr. Michelle Jackson<sup>1</sup>**, Ms. Denise Becker<sup>2</sup>, Dr. Josh Hayward<sup>1</sup>, Ms. Monique Hillenaar<sup>1</sup>, Mr. Andrew Brown<sup>1</sup>, Dr. Victoria Brown<sup>1</sup>, Prof. Colin Bell<sup>1</sup>, Prof. Liliana Orellana<sup>2</sup>, Dr. Jill Whelan<sup>1</sup>, Dr. Lena D Stephens<sup>1</sup>, Ms. Hayley Jensen<sup>1</sup>, Ms. Isobel Gribben<sup>3</sup>, Prof. Steven Allender<sup>1</sup>, Dr. Claudia Strugnell<sup>1</sup>

<sup>1</sup>Deakin University - Global Centre for Preventative Health and Nutrition, Geelong, Australia, <sup>2</sup>Deakin University - Biostatistics Unit, Melbourne, Australia, <sup>3</sup>Department of Rural Health - University of Melbourne, Shepparton, Australia

**SO.1.01 - Latest findings in Epidemiology and COVID-related studies, UKK - Main Hall (Level 6), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** This study aimed to examine changes over time on weight status and associated health behaviours of Australian primary school-aged children living in North-East Victoria involved in a community-based systems intervention. During Victorian COVID-19 pandemic restrictions, residents could only leave home for essential reasons including, among others, exercise ( $\leq 2$  hrs/day within 5km of home), work/education, and for vaccinations. While the intervention was disrupted due to COVID-19, there is opportunity to examine health measures measured pre- and post-COVID-19 restrictions (2019 and 2022), including self-reported physical activity (PA), sedentary behaviour (SB), sleep behaviours, health-related quality of life (HRQoL) and objectively measured obesity prevalence.

**Methods:** This is a secondary analysis of data collected from RESPOND (Reflexive Evidence and Systems Interventions to Prevent Obesity and Non-Communicable Disease), a cluster-randomised trial. Primary schools across the Goulburn Valley and Ovens Murray regions participated between April-June 2019 (n=91/162 schools, n=3702 students) and April-August 2022 (n=54/161 schools, n=1694 students). Participant students in grades 2, 4 and 6 (aged 7-12y) were invited to have their height and weight measured; grade 4 and 6 students completed an online self-report health behaviours questionnaire. Mixed logistic or linear models with school as random effect and controlling for intervention, gender, grade, and socioeconomic status, were fitted to estimate changes between 2019 and 2022 in: prevalence of overweight and obesity (WHO), adherence to PA (>60min moderate-to-vigorous PA/day), SB (<2hr screen-time for recreation/day), and sleep duration (9-11hrs/night) recommendations and self-rated HRQoL.

**Results:** Preliminary adjusted results showed no evidence of change in the prevalence of combined overweight and obesity between 2019 (35.9%) and 2022 (37.6%); (change=1.7 percentage points; 95%CI:-1.3, 4.6; p=0.28). Adherence to moderate-to-vigorous PA recommendation significantly decreased between 2019 (23.2%) and 2022 (15.4%); (change=-7.8 percentage points; 95%CI:-10.7, -4.9; p<0.01). Similarly, adherence to sedentary screen-time recommendations decreased between 2019 (54.8%) and 2022 (46.5%); (change=-8.3 percentage points; 95%CI:-12.1, -4.5; p<0.01). Global HRQoL scores were statistically, and clinically, significantly lower in 2022 than in 2019 ( $\beta$ =-4.77, 95%CI:-5.90,-3.64).

**Conclusions:** Health behaviours and HRQoL significantly deteriorated in this population of Australian children between 2019-2022 with the COVID-19 pandemic response being one of the main factors that could explain these results.

# Has COVID-19 led to changes in physical activity patterns, screen time and sleep among Swedish adolescents? - A cohort study

**Dr. Björg Helgadóttir**<sup>1,2</sup>, Associate Professor Andreas Fröberg<sup>3</sup>, Ms. Karin Kjellenberg<sup>1</sup>, Prof. Örjan Ekblom<sup>1</sup>, Associate Professor Gisela Nyberg<sup>1,2</sup>

<sup>1</sup>Swedish School of Sport and Health Sciences, Stockholm, Sweden, <sup>2</sup>Karolinska Institutet, Stockholm, Sweden, <sup>3</sup>University of Gothenburg, Gothenburg, Sweden

**SO.1.01 - Latest findings in Epidemiology and COVID-related studies, UKK - Main Hall (Level 6), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The COVID-19 pandemic has had an impact on daily life around the world though in Sweden the restrictions have been rather mild. The aim is to explore whether the pandemic has led to changes in physical activity (PA) patterns, including sedentary time, Light Physical Activity (LiPA) and Moderate-to-Vigorous-Physical Activity (MVPA) during weekdays and weekends, as well as screen time and sleep. The potential predictors explored include gender, parental education, anthropometrics, and cardiovascular fitness (CVF).

**Methods:** Data were collected in the fall of 2019 and the spring of 2021. The participants were 13-14 years-old at baseline and lived in the Stockholm area. In total 585 participated at both baseline and follow-up. PA and sedentary time were measured with accelerometers and sleep and screen time with questionnaires at baseline and follow-up. The exposure variables were collected at baseline: gender and parental education via questionnaire, anthropometrics (BMI and body fat percentage measured with standard methods by researchers) and CVF with a submaximal test. Multilevel linear regression analyses were performed.

**Results:** MVPA remained unchanged while LiPA decreased by 25.5 minutes on weekdays and 10.3 minutes on weekends (both  $p < 0.001$ ) and sedentary time increased by 9.4 minutes on weekdays ( $p = 0.023$ ). Sleep duration decreased by 27.4 minutes on weekdays and 19.1 minutes on weekends (both  $p < 0.001$ ) and screen time increased by around 45 minutes both on weekdays and weekends ( $p < 0.001$ ). Girls, adolescents with overweight/obesity (BMI and percent body fat), and those with lower CVF at baseline had less favourable changes in PA patterns, sleep and screen time.

**Conclusions:** Previous self-reported data seems to suggest a decrease in physical activity due to the pandemic; this study only found such changes to be present in the lower intensity levels of physical activity but not in the MVPA. It is possible that more strenuous physical activity is more often part of organized sport which seems to have prevailed in Sweden despite the pandemic while habitual less intense activity decreased. Some groups were found to be more vulnerable and might need more support to maintain their physical activity levels, both now in the post-pandemic periods and during future pandemics.

# The relationship between home environment factors and paternal snack and food parenting practices during the COVID-19 pandemic

**Dr. Elena Jansen<sup>1</sup>**, Dr. Susan Carnell<sup>1</sup>

<sup>1</sup>Johns Hopkins School of Medicine, Baltimore, USA

SO.1.01 - Latest findings in Epidemiology and COVID-related studies, UKK - Main Hall (Level 6), June 15, 2023, 12:00 PM - 1:15 PM

**SIG - Primary Choice:** G. Children and families

**Purpose:** The role of fathers in child feeding interactions is not well understood. While parents do not act in isolation from environmental contexts, it is currently unclear how home environment factors relate to how fathers feed their young children, particularly during the COVID-19 pandemic where more parents and children stayed at home and thus shared more meal occasions together.

**Methods:** In August 2021, fathers of 2-12-year-old children (n=60) completed a survey investigating reported changes in food parenting practices and associated factors in comparison to a survey completed earlier during the pandemic. Associations between home environment factors (i.e., household chaos, family dysfunction, marital conflict, parental burnout, parenting stress, social support) and both snack-specific and general food parenting practices, including structure-related practices, were examined.

**Results/findings:** For snack parenting, challenges within the home (family dysfunction, chaos, parental burnout, parenting stress) were mainly associated with less monitoring of healthy snacks while social support was associated with more monitoring. For food parenting, challenges (chaos, marital conflict, parental burnout) were similarly associated with more non-responsive practices such as using food to manage emotions and behaviors, while social support was associated with lower levels of these practices. Only family dysfunction and household chaos were related to lower implementation of structure-related snack and food parenting practices such as using snack rules and limits or structuring the meal setting and timing, while social support fostered the implementation of structure.

**Conclusion:** Home environment factors appear to be related to fathers' general food parenting and snack-specific parenting practices, potentially due to their impact on the capacity and energy that fathers can bring to mealtime interactions. Social support, either from within or outside the family, could function as a buffer preventing home environment challenges from translating into non-responsive practices that could promote unhealthy eating behaviors and growth in children.

# Results from the Ireland North and South Report Card on Physical Activity for Children and Adolescents

**Dr. Angela Carlin**<sup>1</sup>, Ms. Sinead Connolly<sup>1</sup>, Dr. Tamsyn Redpath<sup>1</sup>, Dr. Sarahjane Belton<sup>2</sup>, Dr. Tara Coppinger<sup>3</sup>, Dr. Conor Cunningham<sup>4</sup>, Prof. Alan Donnelly<sup>5</sup>, Dr. Kieran Dowd<sup>6</sup>, Dr. Deirdre Harrington<sup>7</sup>, Dr. Helen McEvoy<sup>4</sup>, Dr. Elaine Murtagh<sup>5</sup>, Dr. Kwok Ng<sup>5,8</sup>, Ms. Lauren Rodriguez<sup>4</sup>, Prof. Catherine Woods<sup>5</sup>, Prof. Marie Murphy<sup>1</sup>

**SO.1.01 - Latest findings in Epidemiology and COVID-related studies, UKK - Main Hall (Level 6), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** The Ireland North and South Report Card on Physical Activity (PA) for Children and Adolescents is produced as part of the Active Healthy Kids Global Alliance (AHKGA) and aims to monitor change across a range of PA indicators. The Report Card will provide an update on grades from 2016, and will, for the first time, include an indicator on 'Physical Fitness' and a set of grades specific to children and adolescents with disabilities.

**Methods:** Available data were extracted and collated for each indicator and graded following the harmonised AHKGA Report Card process. Grades were produced for 10 common indicators related to PA and sedentary behaviour. Indicators were awarded a grade A-F (including '+' or '-') or 'Incomplete' (INC). A separate set of grades were produced for children and adolescents with disabilities.

**Results:** Overall, 5 grades stayed the same, 2 increased, and 2 indicators ('Family and Peers,' and 'Government') were awarded grades for the first time, previously graded as incomplete (INC). 'Physical fitness' was included for the first time, but graded as INC. Grades were assigned as follows: 'Overall physical activity', C- (increase); 'Organised Sport and Physical Activity', C; 'Active Play', INC; 'Sedentary Behaviours', C-; 'Physical Fitness', INC; 'Family and Peers', D+; 'School', C- (increase); 'Community and Environment', B+ and 'Government', B. Separate grades were awarded for disability as follows; 'Overall physical activity', F; 'Organised Sport and Physical Activity', D; 'Sedentary Behaviours', C-; 'Family and Peers', C; 'School', C- and 'Government', B. 'Active Play', 'Physical Fitness' and 'Community and Environment' were all graded INC.

**Conclusions:** Positive trends were observed across several indicators, with grades for 'Overall physical activity', and 'School' increasing. Grades specific to children and adolescents with disability were generally lower for each indicator, with <20% of children and adolescents meeting the benchmark for 'Overall PA'. Findings have indicated there is a need to prioritise research specifically designed to measure levels of activity in children and adolescents with disabilities. Data obtained since the implementation of COVID-19 public health measures were not included, therefore future report cards will consider the impact of the pandemic on PA for children and adolescents

# The NOURISHING and MOVING policy indexes: assessing nutrition and physical activity policy areas in 27 European countries

**Dr. Ioana Vlad**<sup>1</sup>, Miss Jennifer O'Mara<sup>1</sup>, Mrs. Kate Oldridge-Turner<sup>1</sup>, Dr. Arnfinn Helleve<sup>2</sup>, Dr. Janetta Harbron<sup>3</sup>, Dr. Knut-Inge Klepp<sup>2</sup>, Dr. Kate Allen<sup>1</sup>

<sup>1</sup>World Cancer Research Fund International, London, United Kingdom, <sup>2</sup>Norwegian Institute for Public Health, Oslo, Norway, <sup>3</sup>University of Cape Town, Cape Town, South Africa

**SO.1.02 - Policies for healthy environments, UKK - Level 6 Foyer, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Nutrition and physical activity policies play a key role in creating healthier environments where population health is prioritised. This research presents the results of the NOURISHING and MOVING policy indexes, that assess and compare physical activity and nutrition policy areas in 27 European countries.

**Methods:** National-level nutrition and physical activity policy actions in 27 European countries were identified through a comprehensive scan, with a set methodology. The policy actions, which are available online in the NOURISHING and MOVING databases, were benchmarked to assess the strength of policy design, based on evidence-informed and aspirational attributes and the results were presented in a policy index.

**Results:** The NOURISHING and MOVING policy index produced an assessment of nutrition and physical activity policy areas across 27 European countries. No country took a comprehensive approach to diet-related policies, and only about a third of the European countries included had a comprehensive approach to physical activity policies.

In the MOVING policy index, the weakest policy design is seen for policy actions targeting built environment and infrastructure policy. The strongest policy across the 27 European countries was found for policies supporting physical activity in schools and the community.

In the NOURISHING index, key weaknesses are identified across the 27 countries for policy areas related to food taxes and other economic tools to address food affordability and availability as well as policies to ensure coherence between food systems and health, such as nutrition standards for public procurement. In contrast, the strongest policy design is seen in policy areas that aim to inform people about food and nutrition through public awareness.

**Conclusion:** The NOURISHING and MOVING policy indexes show that greater action is needed to implement adequate policies across the 27 European countries. Key gaps on structural policies, such as health-related food taxes, food systems and active environments were identified. The policy indexes also highlight where greater action is needed in each country. Thus, the policy indexes results can be used by policymakers, researchers, and civil society at European or country level to inform advocacy for and design of policies in nutrition and physical activity.

# Supporting Companies to Reform Nutrition Policies and Practices (REFORM): A Multi-centre Cluster Randomised Controlled Trial

**Prof. Cliona Ni Mhurchu**<sup>1</sup>, Dr. Gary Sacks<sup>2</sup>, Ms. Jasmine Chan<sup>2</sup>, Ms. Sally Schultz<sup>2</sup>, Miss Stephanie Shen<sup>1</sup>, Ms. Josephine Marshall<sup>2</sup>, Ms. Jacqui Grey<sup>1</sup>, Dr. Yannan Jiang<sup>1</sup>, Dr. Helen Eyles<sup>1</sup>, Dr. Leanne Young<sup>1</sup>

<sup>1</sup>University of Auckland, Auckland, New Zealand, <sup>2</sup>Deakin University, Melbourne, Australia

**SO.1.02 - Policies for healthy environments, UKK - Level 6 Foyer, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Unhealthy food environments are major drivers of obesity and diet-related diseases. Improving the healthiness of food environments requires a widespread organised response from governments, civil society, and industry. However, current actions often rely on voluntary participation by industry, such as opt-in nutrition labelling schemes, school/workplace food guidelines, and food reformulation programmes. The aim of the REFORM study is to determine the effects of the provision of tailored support to companies on their nutrition-related policies and practices, compared to food companies that are not offered the programme (the control).

**Methods:** REFORM is a two-country, parallel cluster randomised controlled trial. 150 food companies were randomly assigned (2:1 ratio) to receive either a tailored support intervention programme or no intervention. Randomisation was stratified by country (Australia, New Zealand), industry sector (fast food, other packaged food/beverage companies), and company size. The primary outcome is the nutrient profile measured using the Health Star Rating (HSR) of foods and drinks produced by participating companies at 24 months post-baseline. Secondary outcomes include company nutrition policies and commitments, the nutrient content (sodium, sugar, saturated fat) of products produced by participating companies, display of HSR labels, and engagement with the intervention.

**Results:** 82/132 eligible intervention companies were invited to take part in the REFORM programme and 21 (25.6%) accepted and were enrolled. Over 100 meetings were held with company representatives between September 2021 and December 2022. Resources and tailored reports were developed for 6 touchpoints covering product composition and benchmarking, nutrition labelling, consumer insights, nutrition policies, and incentives for companies to act on nutrition. Detailed information on programme resources and preliminary 12-month findings will be presented at the conference.

**Conclusion:** The REFORM programme will assess if provision of tailored support to companies on their nutrition-related policies and practices incentivises the food industry to improve their nutrition policies and actions.

# Food and drink availability in New Zealand hospitals 2021/22: Alignment with a voluntary National Healthy Food and Drink Policy

**Prof. Cliona Ni Mhurchu**<sup>1</sup>, Miss Stephanie Shen<sup>1</sup>, Mr. Bruce Kidd<sup>1</sup>, Dr. Yannan Jiang<sup>1</sup>, Mrs. Elaine Umali<sup>1</sup>, Dr. Sarah Gerritsen<sup>1</sup>, Dr. Sally Mackay<sup>1</sup>, Associate Professor Lisa Te Morenga<sup>2</sup>, Miss Magda Rosin<sup>1</sup>

<sup>1</sup>University of Auckland, Auckland, New Zealand, <sup>2</sup>Massey University, Wellington, New Zealand

**SO.1.02 - Policies for healthy environments, UKK - Level 6 Foyer, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Unhealthy food environments are major drivers of obesity and diet-related diseases. Improving the healthiness of food environments requires a widespread organised response from governments, civil society, and industry. However, current policies and programmes are often voluntary, such as opt-in healthy food guidelines for schools or hospitals. The aim of the HYPE study was to assess the implementation and impact of the National Healthy Food and Drink Policy (the Policy), a voluntary Policy introduced in 2016 that supports and encourages provision of healthier food and drink options in New Zealand hospitals and public sector organisations.

**Methods:** Comprehensive audits of food and beverage availability were undertaken between March 2021 and June 2022 across New Zealand. In total, 39 hospital sites/organisations were audited, comprising 230 retail settings (staff canteens, shops, vending machines etc.). Information was collected for >8500 foods and drinks available across all sites and settings. The primary outcome was alignment of on-site food availability with the Policy guidelines ( $\geq 55\%$  green category items,  $\leq 45\%$  amber category items, and 0% red category items). Secondary outcomes were proportions of green, amber, and red category items; average nutrient profile (Health Star Rating) of foods and drinks available, food marketing and promotion practices, and average price of food/drink items.

**Results:** Across all sites audited, 39.6% of food/drink items were rated red, 38.7% amber, and 22.7% green. No organisation met the Policy target of 0% red items, with the prevalence of red food/drinks ranging from 24% to 65%. Organisations that reported adopting the Policy ( $n=8$ ) did better than those who did not ( $n=12$ ), but 33% of foods and drinks available at those sites were still rated red (versus 48% at sites with their own policies). Drink only vending machines had the least red items (13.5%) compared with other retail settings (27% in sushi outlets to 91% in on-site fundraisers)

**Conclusion:** A voluntary National Healthy Food and Drink Policy was not effective in ensuring provision of healthier food and drink options in New Zealand hospitals and public sector organisations. A uniform mandatory national policy should be implemented.

# Policy evaluation on the whole-of-school investment in physical activity promotion in Thailand

**Miss Nattaporn Nilwatta**<sup>1,2</sup>, Dr. Dyah Anantalia Widyastari<sup>1,2</sup>, Associate Professor Piyawat Katewongsa<sup>1,2</sup>

<sup>1</sup>Institute for Population and Social Research , Mahidol University, Salaya, Phutthamothon, Nakhon Pathom , Thailand, <sup>2</sup>Thailand Physical Activity Knowledge Development Centre (TPAK), Nakhon Pathom, Thailand

**SO.1.02 - Policies for healthy environments, UKK - Level 6 Foyer, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Whole-of-school (WoS) has been widely acknowledged as one of the policies/investments that are effective in increasing physical activity (PA) of children. However, evidence is lacking on how this investment may or may not actually be implemented and benefit the population. This study aims to evaluate the WoS policy in terms of its availability, implementation and public participation.

**Methods:** Desk review was employed to evaluate policy availability. We scored the policy documents using the Comprehensive Analysis of Policy on Physical Activity (CAPPA) framework in terms of the stage of policy cycle, policy sector, type of policy and policy level - whether its covered international, national, subnational, regional or institutional/local. Data for evaluating policy implementation and public participation was driven from Thailand Report Card Survey 2021. A total of 5,460 national representative samples of children and youth aged 5-17 years were included in the analysis. Policy implementation and public participation was assessed from the students' perception and those who reported participated in the WoS program.

**Results:** From the CAPPA policy evaluation framework, WoS policy scored 73.5% for its availability, which means, there have been adequate amounts of policies/programs, available either in national or community level, in various policy stages (agenda setting, formulation, endorsement/ legitimization, implementation, evaluation, maintenance or termination), and in any forms (formal written, unwritten). However, only 11.6% of the beneficiaries reported to have access to the WoS, and 26.9% participated in the programs. Girls (OR 0.670, p-value 0.000) and older adolescents in secondary schools (OR 0.654, p-value 0.000) are less likely to participate in the WoS programs compared to boys and primary school students. Students who resided in the rural areas participated more than their urban counterparts (32.1% vs 24.1), and students who lived in Bangkok and the Central region reported to have the least access to the WoS policy.

**Conclusions:** The gaps in the implementation and participation indicate there is an inequality of access to the WoS investments. To have impact at the population level, the WoS program must be widespread and sustained until daily MVPA becomes an ingrained habit of the students and, hopefully, a social norm.

# The association between unhealthy dietary behaviors and SNAP (Supplemental Nutrition Assistance Program) participation: A test of the self-selection hypothesis

Dr. Francesco Acciai<sup>1</sup>, Ms. Sarah Uehara<sup>1</sup>, Dr. Punam Ohri-Vachapsati<sup>1</sup>

<sup>1</sup>Arizona State University, Phoenix, USA

SO.1.02 - Policies for healthy environments, UKK - Level 6 Foyer, June 15, 2023, 12:00 PM - 1:15 PM

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** SNAP participants typically have worse dietary behaviors compared to eligible non-participants. It has been conjectured that individuals who enroll in (i.e., self-select into) SNAP may already have unhealthier diets prior to program participation. We examined the association between adults' SNAP participation status and prior dietary behaviors to empirically test the argument of selection of unhealthy individuals into SNAP.

**Methods:** A sample of households from lower-income cities in the U.S. were surveyed at baseline (T1) and at follow-up (T2), on average 3 years later. Analyses were restricted to households (n=170) that did not participate in SNAP at T1 and that had an income < 200% of the federal poverty line at both time points. Respondents were adults responsible for household food shopping and were grouped into two categories based on their household's SNAP participation at T2: Never participants (n=132) and T2 participants (n=38). Respondents self-reported their daily consumption frequency of whole fruits, fruit juice, vegetables, sugar-sweetened beverages (SSBs), and energy dense snacks. To observe dietary differences prior to SNAP participation, T1 dietary behaviors of the two groups were compared via a series of multivariable negative binomial models—one for each of the food groups examined—that controlled for relevant individual and family level variables.

**Findings:** Results from the regression analysis show that there were no differences ( $p>0.05$ ) in consumption at T1 between the never participants and the T2 participants; in fact, the two groups reported very similar consumption frequencies at T1 for all five dietary measures.

**Conclusions:** The longitudinal cohort design of the current study provided a unique opportunity to compare dietary behaviors of low-income individuals before some of them self-selected into SNAP. This study found no empirical evidence to support the hypothesis that individuals with pre-existing unhealthier behaviors are more likely to participate in SNAP. While these null findings do not rule the possibility of self-selection into the program, it is highly likely that explanations for the unhealthier dietary patterns of SNAP participants lie elsewhere. To help improve dietary behaviors of SNAP participants, future policies and research should examine the impact of restricting unhealthy food and beverage purchases using SNAP benefits.

# UK Government's new placement legislation is a “good first step”: A rapid qualitative analysis of consumer, business, enforcement and health stakeholder perspectives

**Prof. Christina Vogel**<sup>1,2</sup>, Mrs. Preeti Dhuria<sup>2</sup>, Prof. Emma Roe<sup>2</sup>, Dr. Wendy Lawrence<sup>2</sup>, Prof. Janis Baird<sup>2</sup>, Dr. Sarah Muir<sup>2</sup>

<sup>1</sup>City, University of London, London, United Kingdom, <sup>2</sup>University of Southampton, Southampton, United Kingdom

**SO.1.02 - Policies for healthy environments, UKK - Level 6 Foyer, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The current food system in England promotes a population diet that is high in fat, sugar and salt (HFSS). To address this, the UK government will implement legislation to restrict the promotion of HFSS products in prominent locations (e.g., store entrances, checkouts) in qualifying retailers from October 2022. This study investigated the perceived impact of the legislation for affected stakeholders.

**Methods:** A pre-implementation rapid qualitative evaluation of stakeholder interviews. 108 UK stakeholders participated in the study including 34 consumers, 24 manufacturers and retailers, 22 local authority enforcement officers, and 28 academic and charitable health representatives. A participatory conference was used to enable policy recommendations to be confirmed by stakeholders.

**Results:** Stakeholders perceived the legislation to be a “good first step” towards improving population diet but recognised this needed to be considered amongst a range of long-term obesity policies. Areas of further support were identified and these are presented as six recommendations for government to support successful implementation of the legislation: 1) provide a free central HFSS calculator, 2) refine legislation to enhance intent and clarity, 3) conduct a robust evaluation to assess intended and unintended outcomes, 4) provide greater support for smaller businesses, 5) provide ring-fenced resources to local authorities, and 6) create and communicate a long-term roadmap for food and health.

**Conclusions:** This legislation has potential to reduce impulse HFSS purchases and makes a solid start towards creating healthier retail outlets for consumers. Immediate government actions to create a freely accessible HFSS calculator, support smaller businesses and provide additional resources to local authorities would support successful implementation and enforcement. Independent evaluation of the implementation of the legislation will enable monitoring of potential unintended consequences identified in this study and support refinement of the legislation. A long-term roadmap is necessary to outline strategies to support equal access to healthier and sustainable food across the whole food-system within the next 20-30 years.

# Obesogenic environment and the prevalence of cardiovascular disease risk factors in the Netherlands: A pooled analysis of 5 cohort studies.

**SO.1.03 - Hot topics on metabolic health, UKK - Hall B (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** To examine the combined effect of obesogenic neighbourhood characteristics on the prevalence of hypertension and dyslipidaemia in Dutch adults.

**Methods:** Observational cross-sectional design using baseline data from five Dutch cohort studies: Donor InSight (DIS-III), Healthy Live in an Urban Setting, Lifelines, New Hoorn Study, and The Maastricht Study (n total = 183,871). The Obesogenic Built-environmental Characteristics (OBCT) index was calculated for 1000m circular buffers around participants' home addresses. Components of the index included: healthiness of the food environment, walkability, driveability, and sports facilities. Componential z-scores were averaged, and rescaled between 0 (leptogenic) and 100 (obesogenic). In each cohort, standardized blood pressure measurements were conducted and venous blood samples were collected. Prevalence of hypertension and dyslipidaemia was determined by guideline-based classification, reported diagnosis, or medication use. Furthermore, continuous measures of systolic blood pressure in mmHg and LDL-cholesterol in mmol/L were analysed. Poisson regression models were adjusted for age, sex and education level. Linear regression models were additionally adjusted for blood pressure lowering and lipid lowering medication use. Cohort-specific estimates were pooled using random-effects meta-analyses.

**Results:** Median age varied from 44.0 to 61.0 across cohorts. The percentage of female sex varied from 49.6% to 58.5%, high level of education from 25.6% to 37.1%, and percentage of overweight/obese from 46.0% to 64.5%. The preliminary pooled analysis results show that a 10% increase in OBCT index score was significantly associated with a higher prevalence of hypertension (Prevalence ratio (PR): 1.03; 95% CI: 1.01 to 1.05), but not with dyslipidaemia (PR: 1.00; 95% CI: 0.99 to 1.01). A 10% increase in OBCT index score also showed a non-significant association with higher levels of systolic blood pressure ( $\beta$ : 0.24; 95% CI: -0.08 to 0.57), but no association was observed for LDL-cholesterol ( $\beta$ : 0.01; 95% CI: 0.00 to 0.01). Sensitivity analyses showed that a change in buffer size to 500m or 3000m produced similar results.

**Conclusions:** This large-scale pooled analysis of five Dutch cohort studies provides evidence that a higher obesogenic score is associated with a higher prevalence of hypertension, but not dyslipidaemia.

# Clinical practice guidelines employing multimodal behavioural, pharmacological, and surgical treatments for the management of overweight and obesity: Where have we come from, and where are we going?

**Dr. Lena D. Stephens<sup>1,2</sup>**, Dr. Cadeyrn J. Gaskin<sup>1,2</sup>, Ms. Kelly Cooper<sup>1</sup>, Prof. Anna Peeters<sup>2</sup>, Prof. Jo Salmon<sup>1</sup>, Prof. Judi Porter<sup>1</sup>

**SO.1.03 - Hot topics on metabolic health, UKK - Hall B (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** With global obesity rates tripling since 1975, many countries have responded by implementing clinical practice guidelines to support patients, health practitioners, and policy makers in managing overweight and obesity. Guidelines must continue evolving to align with contemporary ideologies and practice. This scoping review identified target populations and modalities included in contemporary guidelines for obesity management.

**Methods:** Four databases (Ovid MEDLINE, Google, Google Scholar, and Guidelines International Network library) and other grey literature were searched to identify guidelines published January 2010-August 2022. Inclusion criteria: overweight and obesity clinical management guidelines employing multimodal treatments (e.g., nutrition, physical activity, sedentary behaviour, sleep, psychology, pharmaceuticals, surgery) in any age group and setting. Exclusion criteria: guidelines only for use by people with overweight or obesity or for the prevention or treatment of obesity-related conditions. Data extracted included citation details, guideline development methodology, target populations, overweight/obesity measures, and treatment modalities and settings.

**Results:** From n=696 records, 47 documents (representing 38 guidelines) were identified. WHO regions represented: Europe (n=13;34%), Americas (n=12;32%), Western Pacific (n=7;18%), Eastern Mediterranean (n=4;11%), and South-East Asia (n=2;5%). Most guidelines were age-based (n=30;79%), with remaining guidelines focused on pregnancy (n=6;16%), midlife women (n=1;3%), and adults with end-stage kidney disease (n=1;3%). The 30 age-based guidelines covered infants (n=9;30%), children (n=17;57%), adolescents (n=18;60%), and adults (n=23;77%). Guidance for specific sub-populations including pregnant women; older adults; Indigenous People; and people with eating disorders, mental disorders, disabilities, or from culturally and linguistically diverse backgrounds was identified. Treatment modalities included nutrition (n=38;100%), physical activity (n=38;100%), behavioural/psychological interventions (n=37;97%), pharmacotherapy (n=32;84%), and bariatric surgery (n=31;82%). Sedentary behaviour (n=24;63%), family-centred interventions (n=16;42%), and sleep (n=13;34%) were included less frequently.

**Conclusions:** Modernising is essential to ensure future guidelines represent the perspectives of people with lived experience of overweight and obesity, and sub-populations (e.g., Indigenous People, people with disabilities, people with mental health disorders, older adults) and reflect scientific advances (e.g., emerging behavioural and pharmacological approaches). In addition to pharmacological and surgical treatments, non-stigmatising and supported multimodal treatments including nutrition, physical activity, psychology, sedentary behaviour, sleep, and family-centred interventions in various settings that health practitioners can feasibly promote and implement are needed.

# A Four-Year Follow-Up of Treatment for Young Children with Obesity: A Randomized Clinical Trial

**Dr. Anna Ek**<sup>1</sup>, Dr. Markus Brissman<sup>1,2</sup>, Mrs. Karin Nordin<sup>1,2</sup>, Dr. Karin Eli<sup>3,4</sup>, Prof. Paulina Nowicka<sup>1,5</sup>

<sup>1</sup>Karolinska Institutet, Stockholm, Sweden, <sup>2</sup>Karolinska University Hospital, Stockholm, Sweden, <sup>3</sup>University of Oxford, Oxford, United Kingdom, <sup>4</sup>University of Warwick, Warwick, United Kingdom, <sup>5</sup>Uppsala University, Uppsala, Sweden

**SO.1.03 - Hot topics on metabolic health, UKK - Hall B (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose** To assess change in weight status after 4 years in children who started obesity treatment as 4- to 6-year-olds within a randomized controlled trial (RCT).

**Methods** 177 families recruited from 68 child health care centers to a 12-month RCT, the More and Less (ML) study, were eligible to participate in this 4-year follow-up. The ML study was conducted in Sweden 2012–2017, comparing 3 treatment approaches: a 10-week parent support program (1.5 h/w) with (PGB) or without (PGNB) telephone-based follow-up booster sessions, and standard treatment (ST) in an outpatient pediatric clinic. Treatment effects on primary outcome (BMI-SDS) and secondary outcomes (BMI, %IOTF25 i.e., weight status described as percent above cut-off for overweight) were assessed using linear mixed models. Clinically significant reduction of BMI-SDS ( $\geq 0.5$ ) was assessed with risk ratio. Sociodemographic factors and attendance were examined by three-way interactions.

**Results** 171 families (migrant origin 59%, parental university degree 40%) were included in the intention-to-treat analyses. After 4 years, BMI-SDS was reduced in all groups, PGB -0.45 (95% CI -0.18 to -0.73,  $p < 0.001$ ), PGNB -0.34 (95% CI -0.13 to -0.55,  $p < 0.001$ ), ST -0.25 (95% CI -0.10 to -0.40,  $p < 0.001$ ), with no difference between groups. A clinically significant reduction of BMI-SDS  $\geq 0.5$  was obtained in 36% of the children in PGB and thus, over two times more likely compared to 15% in the ST children, 2.0 (95% CI 1.27 to 3.27)  $p = 0.003$ . In PGNB, 23% of the children reached a clinically significant reduction, however, this was non-significant. Similarly, weight status expressed as %IOTF25 was unchanged for PGB 4.5 (95% CI -1.6 to 10.6), significantly lower compared to ST 11.9 (95% CI 8.4 to 15.4)  $p = 0.043$ . Sociodemographic factors or attendance did not affect change in weight status.

**Conclusion** This is the first RCT to demonstrate that an early obesity intervention is effective over a 4-year period. Support in parenting practices with regular booster sessions was particularly powerful in maintaining healthier weight status. Our findings show that the preschool age provides a critical window to treat childhood obesity.

# The effectiveness of a light-intensity physical activity intervention on cardiovascular health in people with type 2 diabetes: a randomized controlled trial

**SO.1.03 - Hot topics on metabolic health, UKK - Hall B (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose** Individuals with type 2 diabetes have an increased risk to develop cardiovascular diseases, which possibly can be modified by physical activity. It is already known that moderate-to-vigorous and vigorous intensity physical activity can reduce the risk by improvement of the macro- and microvascular function. However, if this is also the case for light intensity physical activity remains unclear. We investigated the effects of increasing light intensity physical activity and reducing sedentary time on vascular stiffness and other markers in individuals with type 2 diabetes.

**Methods** Individuals with type 2 diabetes aged 40-70 years were randomly assigned to a intervention (n=65) or control group (n=67) in the Light intensity Physical Activity Trial (LiPAT). The RCT (single-blind) had 6 months intervention and 6 months follow-up. The intervention group received a wrist-worn activity tracker and a custom-made application on their phone with a personal goal (steps/day) to motivate them to perform more light intensity physical activity and less sedentary time and received tips during the workshops. Both groups got workshops (topics: healthy lifestyle) in month 1, 2, 3, and 6. Study measurements took place at baseline, 3, 6, and 12 months. Outcome measures included macro- and microvascular function, physical activity/function, lipid profile, kidney function, fasting glucose, HbA1c, body composition, depressive symptoms, and quality of life. We used mixed-effects regression analyses with a random intercept model.

**Results** There was no difference in total, light, or moderate-to-vigorous and vigorous intensity physical activity between the control and intervention group at any of the measurement moments. Sedentary time also did not differ between the groups except for a small difference after 12 months. After 6 and 12 months, there was no difference in macrovascular function (primary outcome) nor most of the secondary outcome measures.

**Conclusion** This comprehensive study mostly indicates that modifying physical activity as such appears rather difficult. Even with encouragement and personalized goals, we did not find any difference between the control and intervention group. Possible explanation could be: too complex intervention, compensation behavior after more physical activity, and no supervised physical activity

# Do weekly and seasonal fluctuations in weight vary between weight maintainers, gainers and losers?

**Prof. Carol Maher**<sup>1</sup>, Dr. Rachel Curtis<sup>1</sup>, Prof. Tim Olds<sup>1</sup>, Dr. Dot Dumuid<sup>1</sup>, Dr. Francois Frayssé<sup>1</sup>, Dr. Gilly Hendrie<sup>2</sup>, Dr. Adrian Esterman<sup>1</sup>, Dr. Ben Singh<sup>1</sup>, Mr. Ty Ferguson<sup>1</sup>

<sup>1</sup>University of South Australia, Adelaide, Australia, <sup>2</sup>CSIRO, Adelaide, Australia

**SO.1.03 - Hot topics on metabolic health, UKK - Hall B (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Growing evidence links weight gain to temporal events, such as weekends, Christmas, and winter. This study aimed to examine annual weight change in a sample of Australian adults, and examine whether temporal patterns in weight change differed between people who maintained, gained or lost weight.

**Methods:** Participants (n=315) were encouraged to weigh themselves, preferably daily, but at least weekly, using Fitbit smart scales. Participants were categorised as weight maintainers (12-month weight change within 2% of baseline, n=144), gainers (weight gain >2%, n=84) or losers (weight loss >2%, n=87). Data were visually inspected to see the overall yearly pattern in weight change. To do this, data were de-trended by calculating a line of best fit for each individual's annual weight change and subtracting this from each participant's daily weight data. Multi-level mixed-effects linear regression was used to compare weight across the days of the week, season, at Christmas and Easter.

**Results:** Across the 12-month period, participants gained a median of 0.26% (218g) body weight. On average, detrended weight fluctuated by 0.3% (252g) each week, with Mondays and Tuesdays the heaviest days of the week, and Friday the lightest (p<0.001). Weight losers' weight fluctuated within a narrower weekly range (0.1% ;70g) relative to weight gainers and maintainers. Overall, participants were the heaviest in summer (significantly heavier than all other seasons (p<0.001), lightest in autumn (-0.47%, p<0.001), regaining some weight in winter (-0.23% relative to summer, p=0.001), and were lighter in spring (-0.27%, relative to summer, p<0.001). Participants' weight increased sharply at Christmas (+0.65%, 546g, p<0.001) and Easter (+0.29%, 244g, p<0.001). When examined by weight change subgroup, all subgroups showed a steep spike in weight at Christmas, of similar magnitude of around +0.8 to 1.0% (i.e., 672-840g). The weight gainers showed a relatively larger winter weight gain, whilst the weight losers showed no winter weight gain.

**Conclusion:** Gainers' weight appeared to "yo-yo" by a greater amplitude each week and across seasons. Results highlighted weekends, winter and Christmas (which occurs in summer in Australia) as key periods of weight gain, suggesting they could be targeted in weight-gain prevention interventions.

# Impact of Ongoing COVID-19 Symptoms on Physical Activity Participation in People with Type 2 Diabetes

**Dr. Emily R Cox**<sup>1,2</sup>, Prof. Ronald Plotnikoff<sup>1,2,3</sup>, Prof. Peter G Gibson<sup>2,4,5</sup>, Dr. Shelley E Keating<sup>6</sup>, Associate Professor Shamasunder Acharya<sup>7</sup>, Dr. Hayley L Lewthwaite<sup>2,4,5</sup>

**SO.1.03 - Hot topics on metabolic health, UKK - Hall B (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** While people with type 2 diabetes (T2D) are no more likely to be infected with COVID-19 than the general population, they are twice as likely to develop critical COVID-19 illness if infected. This places them at greater risk of having ongoing symptoms, the presence of which will not only impact their ability to complete their activities of daily living, but also their ability and willingness to participate in exercise. Therefore, the aim of this research was to understand the impact of ongoing COVID-19 symptoms on physical activity participation and T2D management in people with T2D.

**Methods:** This study was an online survey (RedCap) of adults with T2D who had confirmed COVID-19 ≥12 weeks ago, in Australia.

**Results/Findings:** 327 people with T2D responded (age  $39.6 \pm 13.0$  years, 37% female, 60% male, 3% non-binary/transgender, BMI  $27.6 \pm 16.2$  kg/m<sup>2</sup>, time since COVID-19 infection  $35.9 \pm 22.3$  weeks), across all Australian states and territories. 60% of respondents reported ongoing symptoms, with respiratory (59%), fatigue (46%), and mental health (35%) symptoms being most prevalent; 27% reported trouble controlling their blood glucose. More than 85% of respondents reported that these symptoms moderately to severely impact their ability to perform activities of daily living, work, and/or exercise, with 15% unable to exercise. Median weekly exercise duration was 65 mins [IQR 0, 200]; ≥60% reported reducing the frequency, duration, and/or intensity of exercise since their COVID-19 infection, with 80% citing ongoing symptoms as the primary reason for this. 38% of respondents reported a worsening of their T2D management since their COVID-19 infection.

**Conclusions:** Physical activity is a crucial component of T2D management. However, the high prevalence of ongoing COVID-19 symptoms is hindering participation in this population, as well as influencing T2D management. Therefore, developing strategies to support people with T2D and ongoing COVID-19 symptoms to recommence safe levels of physical activity is of critical importance

# An almond-enriched energy restricted diet has potential to improve appetite-regulating hormones in adults with overweight and obesity

**Dr. Sharayah Carter**<sup>1</sup>, Dr. Alison Hill<sup>1</sup>, Prof. Jonathan Buckley<sup>1</sup>, Dr. Sze-Yen Tan<sup>2</sup>, Prof. Geraint Rogers<sup>3, 4</sup>, Prof. Alison Coates<sup>1</sup>

<sup>1</sup>University of South Australia, Adelaide, Australia, <sup>2</sup>Deakin University, Geelong, Australia, <sup>3</sup>South Australian Health and Medical Research Institute (SAHMRI), Adelaide, Australia, <sup>4</sup>Flinders University, Bedford Park, Australia

**SO.1.03 - Hot topics on metabolic health, UKK - Hall B (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** To examine the effects of almonds (AL) or carbohydrate-rich snack bars (SB) on postprandial appetite and energy intake pre- and post-weight loss (WL) and post-weight maintenance (WMx).

**Methods:** Participants (25-65yrs, BMI 27.5-34.9kg/m<sup>2</sup>) were randomised to consume isoenergetic AL (n=68) or SB (n=72). Appetite-regulating hormones and appetite ratings were measured prior to, and every 30mins for 120mins following snack consumption, after which a buffet meal was freely consumed, and energy intake measured. Testing occurred at baseline, after 3 months of WL (8% WL) and after 6 months of WMx (additional 1.3% WL). Area under the curve (AUC) was calculated and mixed model analyses used to determine treatment and time differences.

**Results/findings:** There were no group by time differences, however AL were consistently higher at each timepoint compared to the SB for postprandial glucagon and pancreatic polypeptide (PP) AUC; +66% and +83% respectively at preWL (both  $p<0.001$ ), +91% and +87% respectively at postWL (both  $p<0.001$ ) and +65% and +72% respectively at postWMx (both  $p<0.001$ ). Glucose-dependent insulintropic polypeptide (GIP) and glucagon-like peptide-1 (GLP-1) were also higher with AL compared to SB; GIP preWL (+18%  $p=0.016$ ) and both GIP and GLP-1 postWL (+16%,  $p=0.042$  and +66%,  $p=0.017$  respectively). There were time differences for cholecystokinin (CCK), glucagon and leptin where AUC decreased by 11%, 15% and 46% respectively postWL (all  $p<0.001$ ) and by 9%, 14% and 35% respectively overall (postWMx-preWL) (CCK  $p=0.007$ , others  $p<0.001$ ) in both groups. Hunger AUC increased by 12% postWL in both groups ( $p=0.030$ ). Less total energy and discretionary food energy was consumed at the buffet postWL (16%,  $p=0.002$  and 25%,  $p=0.034$  respectively).

**Conclusions:** Postprandial responses of CCK, glucagon and leptin decreased over the intervention, indicating an increase in appetite-stimulating mechanisms, supported by increased hunger ratings. Despite this, reduced energy consumption occurred and there were no adverse effects on other appetite ratings. When comparing snack groups, almonds attenuated some of the appetite-stimulating effects occurring over time. The heightened response of appetite-inhibiting hormones GIP, GLP-1, glucagon and PP in the almond group suggest almonds could offer appetite benefits long-term.

# Wearable ring measured 24-hour activity cycle and association with cardiometabolic health in adults

**Dr. Maisa Niemelä**<sup>1,2,3</sup>, Ms. Anna Maijala<sup>1</sup>, Ms. Laura Nauha<sup>4,5</sup>, Prof. Timo Jämsä<sup>1,3</sup>, Prof. Raija Korpelainen<sup>2,3,4</sup>, Dr. Vahid Farrahi<sup>1,6</sup>

**SO.1.03 - Hot topics on metabolic health, UKK - Hall B (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose** Physical activity (PA), sedentary time and sleep associate with cardiometabolic health. Activity behaviors occurring within a day are codependent and studying them independently can lead to biased findings. We aimed to determine the association of time composition of sleep, sedentary behavior (SB), light PA (LPA), and moderate-to-vigorous PA (MVPA) with cardiometabolic health in adults.

**Methods** Study population consisted of the Northern Finland Birth Cohort 1986 members who participated in follow-up in 2019-2020 with 2 weeks PA and sleep recording with Oura ring (Gen2, Oura Health) were not pregnant and were free of prior cardiovascular disease and diabetes (N=1,139). Sleep metrics of Oura ring have been validated against polysomnography. Oura ring quantifies physical activity with accelerometry. Duration of sleep, SB, LPA and MVPA was analyzed from the ring data. Average duration of PA levels and sleep period was calculated over valid days defined as  $\geq 10$ h of wear time during waking hours when  $\geq 4$  valid days with recorded sleep were available. Average sleep efficiency (ratio of sleep period spent asleep) was calculated. Compositional means were transformed to isometric log-ratio coordinates.

In study visit, after overnight fasting, blood samples were drawn for the analysis of glucose, low-density lipoprotein (LDL) and high-density lipoprotein (HDL) cholesterol. Blood pressure was measured at rest while seated. Cardiorespiratory fitness (CRF) was measured with a four-minute sub-maximal step test and expressed as peak heart rate during the test. Multivariable linear regression models were conducted to estimate the association between activity composition and cardiometabolic health markers. Models were adjusted for sex, smoking, alcohol consumption, marital status, employment, education, sleep efficiency and CRF. Standardized betas are reported.

**Results** More time in SB relative to other behaviors was associated with higher triglycerides ( $\beta=0.139$ ,  $p=0.013$ ) and lower HDL ( $\beta=-0.206$ ,  $p<0.001$ ) after adjustments. More time in sleep relative to other behaviors was associated with higher HDL ( $\beta=0.106$ ,  $p=0.024$ ).

**Conclusion** Higher SB was associated with poorer lipid profile after accounting for the 24-hour activity composition, sleep efficiency, CRF and confounders. Higher sleep duration was associated with higher HDL cholesterol. Substituting time from SB to sleep might be beneficial for better cardiometabolic health in adulthood.

# Active-to-sedentary transitions and their associations with subjective memory complaints in middle-aged and older adults

**Señor. Borja Del Pozo Cruz**<sup>1,2,3,4</sup>, Prof. Rosa M. Alfonso-Rosa<sup>4,5</sup>, Prof. Jesus del Pozo Cruz<sup>4,6</sup>

**SO.1.04 - Improving measurement of diet and physical activity, UKK - Hall C (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Aim:** In the current study we explored the association between probability of transitioning from an active to a sedentary behaviour and subjective memory complaints (SMC) in middle-aged and older adults.

**Methods:** We used data from 3820 participants in the National Health and Nutrition Examination Survey (2003-2006) with valid accelerometer SMC data. An active-to-sedentary transition probability was calculated as the number of physical activity bouts (i.e., consecutive minutes registering 100+ counts/min) divided by the total sum of minutes spent in physical activity. A multivariable ordinal logistic regression model was conducted to examine the association between active-to-sedentary transition probability (scaled) and SMC (yes/no).

**Results:** A higher active-to-sedentary transition probability was associated with an increased likelihood of self-reported SMC in the study population (Odd Ratio [95% Confidence Interval] = 1.335 [1.067, 1.669]; Average Marginal Effect [95%CI] = 0.029 [0.006, 0.052]; p-value = 0.021). This association was independent of total physical activity volume and sedentary time.

**Conclusions:** The findings provide support that studying sedentary patterns can be useful in identifying those at risk for SMC, over and above total volume of physical activity and sedentary time. Future longitudinal studies are required to establish causality and the temporal order of the observed association. Nevertheless, an increased active-to-sedentary transition probability in middle-aged and older adults may reflect pre-clinical signs of future neurodegenerative processes indicating potential targets for modification through intervention.

# Physical (in)activity in office environments – review and meta-analysis of accelerometer studies

**Prof. Svend Erik Mathiassen<sup>1</sup>**, Associate Prof. David Hallman<sup>1</sup>

<sup>1</sup>Department of Occupational Health Science and Psychology, University of Gavle, Gavle, Sweden

**SO.1.04 - Improving measurement of diet and physical activity, UKK - Hall C (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** Most individuals aged 18-65 spend major parts of their weekdays at work. Thus, for these people exposures at work contribute to overall exposure to a similar extent as exposures during leisure, and guidelines for physical (in)activity should also include work. In occupational life, office work has been particularly in focus, due to the acclaimed risks associated with physical inactivity. Numerous studies have addressed this issue, but often using self-reports. However, self-reports are known to be inaccurate, and accelerometry-based measurements are gaining ground. Thus, the present systematic review summarized the available evidence on accelerometer-measured sitting, standing and moving during office work.

**Methods** We conducted a systematic search in seven databases for studies reporting an exhaustive composition of accelerometer-measured sitting, standing and moving in office environments. After screening titles, abstracts and full texts, 26 studies were included in a weighted meta-analysis of relative time spent in the three activities, and of the variability between workers within a study. Variables documenting temporal patterns of (in)activity were noted.

**Results** The 26 studies, ranging from 26 to 546 participants, included, in total, 2812 workers. The meta-analysis resulted in mean proportions of sitting, standing and moving of 70.3%time, 21.4%time, and 8.2%time, respectively. Studies ranged from 53.1%time to 79%time in sitting. Standard deviations between workers in a study was, on average, 15.8%time, 13.4%time, and 4.2%time; i.e. 22.5%, 62.6%, and 51.2% of the mean. Eight studies reported data on time spent sitting uninterruptedly for more than 30 consecutive minutes.

**Conclusions** Our meta-analysis showed that among 'office workers', sitting occurred, on average, somewhat more than the 60%time recommended by EU, while standing and moving occurred somewhat less than the recommended 30% and 10%, respectively. However, studies differed considerably in mean exposure, casting doubt on 'office workers' as a homogeneous group. Also, the variability between workers was large, further suggesting that 'office workers' may have quite different work tasks. Thus, many office workers were actually sitting less than 60%time. Temporal sitting variables were rarely analyzed further. Sub-dividing 'office workers' according to tasks, and investigating the temporal variation in office work, including recovery, are important issues for further research.

# Can we use video cameras to assess physical activity and other wellbeing behaviours in urban environments?

## Feasibility, reliability and participant reactivity

**Dr. Jack Benton<sup>1</sup>**, Ms. Kexin Wang<sup>1</sup>, Prof. James Evans<sup>1</sup>, Dr. Jamie Anderson<sup>1</sup>, Prof. David French<sup>1</sup>

<sup>1</sup>University of Manchester, Manchester, United Kingdom

**SO.1.04 - Improving measurement of diet and physical activity, UKK - Hall C (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Unobtrusive observation is a promising method of assessing physical activity and other wellbeing behaviours (e.g., social interactions) in urban environments. Notably, it avoids participant burden and non-response and recall biases associated with self-report. However, current observation methods are resource intensive and are limited as they rely on 'live' in-person observers. The aim of the present research was to test the feasibility of conducting observation of physical activity and other wellbeing behaviours by coding video recordings collected from stationary wireless video cameras, and assess its reliability and potential participant reactivity.

**Methods:** Across three studies, 148 hours of video recordings were collected in six outdoor public spaces in Manchester, UK. Recordings were double coded by three researchers using a reliable and valid in-person observation tool for assessing physical activity and two other wellbeing behaviours (social interactions and people taking notice of the environment). Inter- and intra-rater reliabilities were analysed using intraclass correlation coefficients (ICCs). Face-to-face intercept surveys were also conducted at outdoor public spaces to assess whether members of the public were aware of the cameras, and whether they altered their behaviour due to the presence of cameras.

**Results:** Overall, the 148 hours of video recordings were coded in 85 hours. There was mostly excellent inter-rater reliability (ICCs > 0.90) between pairs of independent coders. Inter-rater reliability was generally lower at night, although still mostly excellent (ICCs > 0.90) or good (ICCs > 0.75). Intra-rater reliability within a single coder after a two-week interval was excellent (ICCs > 0.90) or good (ICCs > 0.75), showing that the same researcher can reproduce similar coding outputs over time. Intercept surveys with 86 public space users found no evidence of reactivity.

**Conclusions:** Camera-based observation methods are more reliable than traditional in-person observation methods, without participant reactivity typically associated with self-report. Importantly this method requires considerably less time required to collect and code the data, and allows observation at night without risk to research staff. This is a vital first step in demonstrating the potential for camera-based observation methods to improve and scale-up natural experimental studies of real-world urban environment interventions on physical activity.

# Movement behaviours during walking trips to/from school: different methods of assessing trips matters

**SO.1.04 - Improving measurement of diet and physical activity, UKK - Hall C (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** There is no consensus on how to identify the temporality (i.e., start/end times) of trips to/from school and whether these affect the validity of movement behavior data. Therefore, the aim of this work was to compare sedentary time and physical activity levels across four frequently used methodologies for identifying the temporality of trips to/from school.

**Methods:** 102 Spanish adolescents aged 14.4±0.6 years wore an accelerometer and GPS for two school days. The start/end times of the walking were defined using four methods. Method 1 (reference): start/end times were automatically detected based on the GPS signal. Method 2: participants self-reported the time they left/arrived home, and the school start/end times. Method 3: a fixed 30-min window before/after the start/end of school (w30). Method 4: a fixed 60-min window before/after the start/end of school (w60). Agreement in sedentary time and physical activity levels across methodologies was evaluated using Bland-Altman analysis.

**Results:** Walking trips identified by self-report differed from GPS by 0.7 min for sedentary time (95% confidence interval (CI): -13.6–14.9 min), -0.6 min for light physical activity (LPA) (CI: -7.7–7.4 min), and -2.5 min for moderate-to-vigorous physical activity (MVPA) (CI: -9.6–4.7 min). Differences between w30 and GPS were 8.8 min (CI: -8.3–25.9 min) for sedentary time, 2.3 min (CI: -6.3–10.9 min) for LPA, and -1.6 min (CI: -9.2–6.0 min) for MVPA. Lastly, w60 and GPS showed the highest differences: 31.0 min for sedentary time (CI: 9.9–53.3 min), 7.5 min for LPA (CI: -3.4–18.4 min), and 0.1 min for MVPA (CI: -6.6–6.7 min). The wide confidence intervals indicate variability across individuals was high.

**Conclusion:** Sedentary time and physical activity are comparable between the self-report and w30 methods at group level. The differences from GPS were relatively low across methods, except for sedentary time when using the w60 method. At individual level, high variability across methods were observed. Further investigation on how to improve the trip windows definition at the individual level is warranted, particularly when GPS is not available.

# Defining and operationalising activity patterns: A modified Delphi study

Associate Professor Nicola D Ridgers<sup>1,2</sup>, Ms. Emily Denniss<sup>2</sup>, Dr. Alissa J Burnett<sup>2</sup>, Prof. Jo Salmon<sup>2</sup>, **Dr. Simone JJM Verswijveren<sup>2</sup>**

<sup>1</sup>Alliance for Research in Exercise, Nutrition and Activity, Allied Health and Human Performance, University of South Australia, Adelaide, Australia, <sup>2</sup>Institute for Physical Activity and Nutrition, School of Exercise and Nutrition Sciences, Deakin University, Geelong, Australia

**SO.1.04 - Improving measurement of diet and physical activity, UKK - Hall C (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** There has been significant interest in assessing activity patterns in different populations. However, there has been no consensus concerning the definition and operationalisation of activity patterns, limiting the comparability and interpretability of study findings. The aim of this study was to establish a consensus regarding the way in which activity patterns are defined and operationalised.

**Methods:** A literature review was initially conducted to identify previous activity pattern definitions and how such patterns had been operationalised. A three-round modified Delphi survey was then conducted online (November 2021 to May 2022). In round one, participants were asked to rate their agreement with a proposed activity patterns definition, six activity pattern components (e.g., activity intensity, activity bout, transitions), and six examples of activity patterns (e.g., frequency of postural transitions in discrete time periods). Open-ended questions were also included for participants to provide further comments and suggestions for additional items. Free text responses were provided by 70% of participants. Consensus was defined a priori as  $\geq 80\%$  participants rating their agreement with an item. Following round one, one activity components item was dropped, two additional activity components items were added, and three items were amended based on feedback. The activity patterns definition was amended. In rounds two and three, participants rated their agreement with the revised activity patterns definition, as well as seven activity pattern components and six examples of activity patterns.

**Results:** Twenty participants with expertise in activity patterns research participated in round one, with response rates of 80% and 60% in rounds two and three, respectively. The proposed activity pattern definition, all activity pattern components definitions, and four of the six activity pattern examples achieved consensus. The removal of one activity component item between rounds 1 and 2 also achieved consensus.

**Conclusions:** This modified Delphi study achieved consensus for defining and operationalising activity patterns for the first time. This consensus definition enables standardisation of activity patterns terminology, which is important given the significant interest in quantifying how individuals accumulate their physical activity and sedentary behaviour across the lifespan to inform the development of future public health guidelines and interventions efforts.

# Feasibility of assessing the impact of Play Streets on accelerometer-measured physical activity and social outcomes in rural Louisiana

**Prof. M. Renée Umstattd Meyer<sup>1</sup>, Dr. Marilyn E. Wende<sup>1</sup>**, Mrs. Jessica Stroope<sup>2</sup>, Assistant Professor Denise Holston<sup>2</sup>, Prof. Keshia M. Pollack Porter<sup>3</sup>

<sup>1</sup>Baylor University, Robbins College of Health and Human Sciences, Waco, USA, <sup>2</sup>LSU Agricultural Center, Baton Rouge, USA, <sup>3</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA

**SO.1.04 - Improving measurement of diet and physical activity, UKK - Hall C (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Background:** Play Streets are low-cost, community interventions that use existing public spaces to create safe and accessible opportunities for physical activity (PA) and social interaction. Limited research has evaluated the impact of Play Streets on objectively-measured PA outcomes among youth and social outcomes among parents/guardians in under-resourced, rural communities. This study tested the feasibility of assessing accelerometer-measured PA outcomes among children and survey outcomes among parents/guardians in rural parishes of Louisiana.

**Methods:** This study took place in rural Louisiana, where Play Streets were held from summer-fall of 2022. Extension agents in one control and two intervention/Play Streets parishes agreed to lead local recruitment/implementation. Children (ages 5-11 years, experiencing no physical limitations) were recruited through schools. Recruitment techniques included flyers, in-class announcements, and notifications via web-based parent/guardian portals and social media. Paper and web-based consent/assent forms were provided to parents/guardians. Wrist-worn Accelerometers (ActiGraph GT9X) were administered to child participants via mail, with instructions to wear the device for two full weeks. Parents/guardians were asked to complete daily accelerometer logs and two surveys on social outcomes (baseline; 2-weeks after baseline).

**Results:** 450 recruitment flyers were distributed to Extension agents for recruitment purposes and online classroom communications were also used by teachers in recruitment schools, with a 13.1% (n=59) response rate. Approximately 5.1% (n=3) reported that their child experienced physical limitations and 57.6% (n=34, mean age=7.8 yrs[SD=1.7]) enrolled in the study. In addition, 38.2% (n=13) of parents/guardians enrolled two children. On average, parents/guardians completed 12.9(SD=4.5) daily logs (out of 14). For social outcomes, 97.1% (n=33) of parents/guardians completed baseline surveys and 91.2% (n=31) completed follow-up surveys. Forty-seven accelerometers were distributed, and 14.9% (n=7) of devices were never returned. Participants noted barriers to accelerometer use, such as the fear that the children would harm the device while doing agricultural labor or the need for some children to take the device off at night.

**Conclusions:** As part of this feasibility study, recommendations for recruitment and overcoming barriers to retention of children and parents/guardians will be outlined. These recommendations can help researchers better partner with rural, low-income communities to effectively evaluate community PA programs.

# Comparing national device-based physical activity surveillance systems: A systematic review

**Ms. Inge De Wolf**<sup>1,2</sup>, Dr. Anne Elevelt<sup>2</sup>, Dr. Femke Van Nassau<sup>1</sup>, Dr. Vera Toepoel<sup>2</sup>, Dr. Ellen de Hollander<sup>3</sup>, Dr. Maaïke Kompier<sup>2</sup>, Dr. Annemieke Luiten<sup>2</sup>, Prof. Barry Schouten<sup>2</sup>, Dr. Wanda Wendel-Vos<sup>3</sup>, Associate Professor Hidde van der Ploeg<sup>1</sup>

<sup>1</sup>Amsterdam UMC, Amsterdam, Netherlands, <sup>2</sup>Statistics Netherlands, Den Haag, Netherlands, <sup>3</sup>National Institute for Public Health and the Environment, Bilthoven, Netherlands

**SO.1.04 - Improving measurement of diet and physical activity, UKK - Hall C (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** The importance of physical activity (PA) for our health is well-known. The WHO 2020 guidelines recommend adults to undertake at least 150 minutes of moderate-to-vigorous intensity PA per week and to do muscle-strengthening activities at least 2 days a week. To assess and report on PA guidelines, national population-based surveillance systems are in place. Questionnaires are sensitive to recall bias and social desirability. Therefore wearable, accelerometer-based activity monitors have become more commonly used in observational studies to measure PA levels. When conducting PA research with activity monitors on a population level, numerous decisions about methodology have to be made. This systematic review aims to create an overview of the methodology used in existing device-based national PA surveillance systems.

**Methods:** Four literature databases (PubMed, Embase.com, SPORTDiscus and Web of Science) were searched, supplemented with backward tracking. Articles were included if they reported on population-based observational studies measuring PA, sedentary time and/or adherence to PA guidelines. When available and in English, the methodological reports of the surveillance studies were also included. An extensive quality assessment was performed to score the quality of methods used in the surveillance systems of all countries included.

**Results/findings:** This systematic literature search (following the PRISMA guidelines) yielded 28 articles and an additional 12 methodological reports, reporting on 22 studies. These 22 studies are about one or multiple waves of 12 different national and one international surveillance system. The included studies showed substantial variation between (waves of) systems in number of participants, response rates, population representativeness and recruitment. More agreement was found between systems on data reduction definitions. The quality assessment showed most negative scores on representativeness and response bias.

**Conclusions:** The results of this review indicate that few countries use device-based PA measurement in their surveillance system. The methodology in systems that do use these devices is diverse and often lacks standardization across systems. This review created an overview of the existing device-based national PA surveillance systems and shows the need for standardization on reporting about these surveillance systems. This results from this review can also help inform the development of such systems in other countries.

# Accelerometer measured physical activity and its correlates in two population-based studies from Berlin and Singapore

**Dr. Lilian Krist**<sup>1</sup>, Mr. Paul Kittner<sup>1</sup>, Mr. Thore Bürgel<sup>1</sup>, Miss Claire Goh Jie Lin<sup>2</sup>, Prof. Thomas Keil<sup>1, 3, 4</sup>, Prof. Falk Müller-Riemenschneider<sup>1, 2</sup>

<sup>1</sup>Charité-Universitätsmedizin Berlin, Berlin, Germany, <sup>2</sup>National University of Singapore, Singapore, Singapore, <sup>3</sup>University of Würzburg, Würzburg, Germany, <sup>4</sup>Bavarian Health and Food Safety Authority, Bad Kissingen, Germany

**SO.1.04 - Improving measurement of diet and physical activity, UKK - Hall C (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose** About one-third of the adult population around the world does not meet the Global Recommendations on Physical Activity. However, these estimates are largely based on self-report and differences between countries not fully understood. The aim of this study was to compare PA in two metropolitan areas, Berlin and Singapore, and to investigate cross-cultural differences in sociodemographic, and lifestyle factors associated with PA.

**Methods** Data were used from the German National Cohort Study (NAKO) (study center Berlin-Center) and the Singapore Population Health Studies (SPHS). For better comparability, only data from participants assessed during the same time periods (2014/15 and 2018/19) were used. Sociodemographics, lifestyle factors, and chronic diseases were assessed via questionnaires. PA was objectively assessed via hip-worn accelerometers (Actigraph GT3X/+) for 7 consecutive days. Questionnaire data from both cohorts were harmonized. Raw accelerometry data were analysed using the R-package GGIR. Mean minutes of light (LPA), moderate, moderate-to-vigorous (MVPA), and vigorous PA were calculated, and MVPA was used as outcome in separate regression analyses for NAKO and SPHS.

**Results** Of the Berlin sample n=1969, and of the Singapore sample, n=1199 participants with complete accelerometry data were included in the analyses. Some differences regarding age ( $50.2 \pm 12.4$  vs.  $45.7 \pm 13.6$  years), marital status (50.7 vs. 65.7% married), and smoking behavior (23.3 vs. 12.8% regular smokers) were observed. Participants engaged in LPA for  $216.1 \pm 71.5$  vs.  $365.9 \pm 178.3$  minutes per day (min/day) and in MVPA for  $61.1 \pm 27.5$  vs.  $72.3 \pm 58.4$  min/day in Berlin and Singapore, respectively. Multivariable linear regression analyses showed that in both samples MVPA was positively associated with male sex, younger age, and being employed. In Berlin, MVPA was additionally associated with not being married, high education, and lower BMI, while in Singapore, Chinese ethnicity was positively associated with MVPA.

**Conclusions** Our study across two metropolitan areas in Europe and Asia showed that participants from Singapore engaged in more LPA and MVPA compared to those from Berlin. While some factors were associated with MVPA in both populations, our analyses also showed important differences. Knowing these differences may help when planning targeted prevention measures to promote PA.

# Simultaneous examination of physical and eating behaviours and their context using Ecological Momentary Assessment: the WEALTH pilot study

**Mr. Michael Janek**<sup>1,2</sup>, Dr. Jitka Kuhnova<sup>1</sup>, Dr. Antje Hebestreit<sup>3</sup>, Dr. Christoph Buck<sup>3</sup>, Dr. Richard Cimler<sup>1</sup>, Prof. Greet Cardon<sup>4</sup>, Prof. Jean-Michel Oppert<sup>5</sup>, Dr. Leopold Fezeu<sup>5</sup>, Dr. Janas Harrington<sup>6</sup>, Prof. Alan Donnelly<sup>7</sup>, Dr. Tomas Vetrovsky<sup>1,2</sup>, Dr. Steriani Elavsky<sup>1,8</sup>, Mx. on behalf of the WEALTH consortium

<sup>1</sup>Faculty of Science, University of Hradec Kralove, Hradec Kralove, Czech Republic, <sup>2</sup>Faculty of Physical Education and Sport, Charles University, Prague, Czech Republic, <sup>3</sup>Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, <sup>4</sup>Department of Movement and Sports Sciences, Ghent University, Ghent, Belgium, <sup>5</sup>Nutritional Epidemiology Research Unit (EREN), Universite Paris Sorbonne Paris Nord, Inserm, Inrae, Bobigny, France, <sup>6</sup>School of Public Health, University College Cork, Cork, Ireland, <sup>7</sup>Health Research Institute, University of Limerick, Limerick, Ireland, <sup>8</sup>Department of Human Movement Studies, University of Ostrava, Ostrava, Czech Republic

**SO.1.04 - Improving measurement of diet and physical activity, UKK - Hall C (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** L. Assessment and Methodologies in Behavioral Nutrition and Physical Activity

**Purpose:** Advances in Ecological Momentary Assessment (EMA) enable the triggering of surveys by behavioural events detected by wearable sensors (event-based EMA). The WEALTH (WEearable sensor Assessment of physical and eaTing beHAViours) project harnesses event-based EMA to simultaneously capture physical and eating behaviours and their context. This pilot study aimed to evaluate the feasibility of a complex EMA protocol for use in the WEALTH project.

**Methods:** The protocol was pre-tested in a convenience sample of 25 participants (32±9 years, 68% females) from Germany (n=12) and Czechia (n=13) and included wearing Fitbit Charge 5 and completing EMA surveys for 9 days using the custom-built HealthReact app on their smartphones (Android n=13, iOS n=12). The daily EMA protocol consisted of 7 time-based and up to 10 event-based surveys triggered after 30 minutes of sitting or 10 minutes of walking or running, as detected by Fitbit. Besides, participants were instructed to fill in self-initiated surveys whenever they consumed a meal, snack or drink. The surveys included 12 to 28 questions on the context of physical and eating behaviours (e.g., social company, location, mood) and expired 8 minutes after initiation. We analysed the last 7 out of 9 days to allow for familiarisation and to minimise the reactivity effect.

**Results:** On average, participants received 48.5±2.8 time-based and 11.4±8.7 event-based (10.2±8.0 sitting and 1.2±1.6 walking) surveys per week per person. The response rates were 53.9±22.6%, 33.8±23.9%, 36.5±23.3%, and 34.6±40.0%, and the average latency (time elapsed between survey initiation and the start of responding) was 115±126, 105±132, 77±129, and 195±141 seconds for time-based, event-based, sitting, and walking surveys, respectively. The response rates were higher among iOS than Android users (61.9±13.8% vs 40.2±21.0%, p=0.006). On average, participants self-initiated 27.2±18.4 surveys; of those, 42%, 18%, and 40% reported meals, snacks, and drinks, respectively. The average time needed to complete a survey was 70±46, 67±47, 65±48, 89±14, and 48.0±36.0 seconds for time-based, event-based, sitting, walking, and self-initiated surveys, respectively.

**Conclusions:** The number of event-based surveys, especially those triggered by walking, and their response rates were low, suggesting the need for protocol adjustment prior to wider application in the WEALTH project.

# Co-creation with grandchildren and grandparents to develop an intergenerational physical activity program: what did we do and what did we learn?

**Miss Evelien Iliano**<sup>1</sup>, Drs. Julie Latomme<sup>1</sup>, Prof. Greet Cardon<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium

**SO.1.05 - If it's complex, use participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Intergenerational programming involving grandchildren and grandparents could lead to benefits for both age groups and long term effects. We present what we did and learned during the co-creation of an intergenerational PA program for grandparents and their grandchildren. The process and findings of co-creation sessions will be discussed.

**Methods:** To develop an intergenerational PA program in an evidence based way, the Behaviour Change Wheel (BCW) will be used in combination with a co-creation approach, which is a highly relevant and innovative approach in (PA) intervention development. Five co-creation sessions will be organized; two with grandparents, two with grandchildren and one with both (n = 6 dyads, 6-10 years old children with their grandparents) in November and December 2022 to develop the program. The co-created program will be further refined during a pilot study (May- June 2023) and an RCT (end 2023). Inclusion criteria for both will be: speaking Dutch and not having any severe physical, cognitive or mental health problems. All co-creation sessions will be recorded with a Samsung Galaxy A12 Voice recorder and analyzed in NVivo. Grandparents will complete a questionnaire questioning sociodemographic information about themselves and their grandchildren at the beginning of the sessions. To evaluate the co-creation process, a short questionnaire will be completed by grandparents and grandchildren after each session.

**Results:** The process and findings of the co-creation sessions will be presented. We will present which PA activities grandchildren and grandparents do or want to do together, and which joint activities they indicate as feasible, fun and attractive. In addition, barriers and motivators to be physically active together and contextual factors for an intergenerational PA program will be discussed.

**Conclusions:** The use of a theoretical framework (the BCW), in combination with co-creation sessions will lead to an evidence based development of an intergenerational PA program for grandchildren and grandparents. The use of these co-creation sessions, where researchers take into account the barriers, motivators, needs and preferences of target group, will result in increased empowerment and in more feasible and fun movement activities, which could lead to an effective intergenerational PA intervention.

# A Curated Open-source Database to Consolidate Knowledge About Co-creation: A Health Cascade Study Combining Systematic Review Methodology and Artificial Intelligence

**SO.1.05 - If it's complex, use participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Co-creation is increasingly seen as a way to democratise research and bridge the implementation gap between research and practice. Despite promises of increased effectiveness and relevance, progress is hindered by the lack of comprehensive and consolidated literature about co-creation; which is a crucial step toward making co-creation a more robust, trustworthy, and evidence-based methodology. However, there are two considerable challenges to achieving this. First, there is a lack of clarity and standardization of the terminology about co-creation. Secondly, the rapid increase in scientific publishing means that obtaining exhaustive and comprehensive literature requires dealing with a vast body of information beyond human capacity.

**Methods:** To include all relevant literature, this study developed a novel methodology by combining attributes of systematic review methodology (PRISMA) with artificial intelligence. We set a broad definition of co-creation that captured the essence of existing definitions, and was inclusive of fields beyond public health, while still accommodating the variation in terminology. We then relied on artificial intelligence to filter out effectively, irrelevant information. We implemented a bibliometric analysis and a quality control procedure to assess the content and accuracy of the database.

**Results/findings:** The final version of the Co-Creation Database includes 13,501 papers, which are indexed in Zenodo and accessible in an open-access downloadable format. The quality assessment showed that the database contains 20.35% false positives (irrelevant material) and potentially misses 9.38% of relevant articles; which is lower than the human error rate of 10%. The word participatory, and forms of the term co-creation, occurred most frequently in the title and abstracts of included literature. Furthermore, the analysis of authorship and fields show a fragmentation of the knowledge in different fields and little indication of collaboration between fields.

**Conclusions:** This study consolidated peer-reviewed literature on co-creation into a curated and open-source database. This database makes it possible to perform rapid literature reviews about co-creation. The database lifts the main barrier that most researchers and practitioners will face in seeking evidence about co-creation: the fragmentation of knowledge, the lack of terminology standardization, and the ensuing dilemma of having to deal with a large amount of information.

# A participatory approach to the development of an intervention to reduce screen media use and promote time with friends during leisure time among 10-11-year-old children

Mrs. Teresa Victoria Høy<sup>1</sup>, Assistant Professor Kristian Traberg Larsen<sup>2</sup>, Miss Sarah Overgaard Sørensen<sup>2</sup>, Associate Professor Peter Lund Kristensen<sup>2</sup>, Associate Professor Mette Toftager<sup>2</sup>, Mr. Arne Gårn<sup>3</sup>, Prof. Anders Grøntved<sup>2</sup>, **Assistant Professor Anne Kær Gejl<sup>2</sup>**

<sup>1</sup>National Institute of Public Health, University of Southern Denmark, Copenhagen, Denmark, <sup>2</sup>Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark, <sup>3</sup>Steno Diabetes Center Odense, Odense University Hospital, Odense, Denmark

**SO.1.05 - If it's complex, use participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** High levels of recreational screen media use during childhood seems to contribute to poor physical and mental health, emphasizing the importance of developing viable solutions to balance screen media use in children. Using a participatory approach, we aimed to develop an intervention to reduce time spent alone using screen devices while promoting time spent physically with friends during leisure time in 10-11-year-old children.

**Method** The development of the Screen Free Time with Friends intervention draws on the Medical Research Council UK framework for developing and evaluating complex interventions. The three-stage framework suggested by Hawkins and colleagues guided the development process, comprising four phases: 1) a comprehensive needs assessment including evidence review and fieldwork, 2) co-creation and prototyping of the recruitment strategy and intervention content, 3) development of protocol and outcome measures for the effect and process evaluation and 4) feasibility and pilot testing of the recruitment strategy, intervention content and outcome measures (will be conducted during spring 2023). All phases involved stakeholders.

**Results** The development process resulted in a multicomponent intervention with three core elements targeting families, afterschool clubs and local communities, respectively. The three elements consist of 1) An educational program and two family workshops for children and parents, respectively, aiming to enhance digital education and communication 2) an action learning program with the afterschool club personnel aiming to increase afterschool club attendance and 3) two workshops with local stakeholders aiming to build consensus and encouragement to initiate local actions tailored to the local context and needs.

**Conclusion** The Screen Free Time with Friends intervention provides an example of a complex intervention informed by evidence and contextual needs. The thorough development process has led to a flexible intervention that allows the implementation to vary across different contexts yet maintaining the integrity of the core components. We expect that this approach will increase engagement and ownership among end-users and stakeholders, leading to a more sustainable intervention.

# Designing a co-creation process in small-to-medium sized enterprises (SMEs) for developing interventions on sedentary behaviour – A Health CASCADE study.

**Ms. Mira Vogelsang<sup>1</sup>**, Ms. Lauren McCaffrey<sup>1</sup>, Dr. Gemma Ryde<sup>3</sup>, Dr. Maïté Verloigne<sup>2</sup>, Dr. Philippa Dall<sup>1</sup>  
<sup>1</sup>Glasgow Caledonian University, Glasgow, United Kingdom, <sup>2</sup>Ghent University, Ghent, Belgium, <sup>3</sup>University of Glasgow, Glasgow, United Kingdom

**SO.1.05 - If it's complex, use participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Co-creation provides an excellent methodology to design and implement tailored interventions, yet lacks reporting and transparency on how the co-creation process (the series of participatory sessions conducted with co-creators) is designed. Here we report on the design of a co-creation process for developing interventions on sedentary behaviour (SB) with employees in small-to-medium enterprises (SMEs).

**Methods:** The PRODUCE framework guided initial planning of the co-creation process. Session content was informed by literature on design and conducting of co-creation, discussion with colleagues experienced in co-creation projects, and previous research team experience. Finally, literature, discussion with colleagues, and research team expertise identified participatory methods to jointly engage with the content.

**Results:** The resulting co-creation process aims to address workplace SB (**P**roblem) of office workers in SMEs (end-**U**sers) using participatory action research (**D**esign), in which 6-12 employees (**C**o-creators) develop an intervention plan on SB (**O**bjective). Both process and impact of this co-creation will be evaluated (**E**valuation). The developed plan comprises 9 workshops (W) of 1h30 each over 10 weeks. Firstly, we focus on establishing group cohesion, including introductions and establishing ground rules (W1). We cover knowledge building and raising awareness of SB (W3) and explore the existing situation, including communication possibilities (W2), existing company policies (W4) and the physical environment (W5). Next, we start to co-create interventions by brainstorming possibilities (W6) and checking their feasibility (W7). A short-term intervention is selected (W7) to be implemented by the co-creators over the following 2 weeks. That implementation is reflected on (W8) and learning contributes to development of a finalised intervention plan (W8&9). Lastly, continuation of the group is discussed (W9). The co-creation process will be led by the co-creators with planned time for evaluation after each workshop facilitating this and a mix of participatory methods are used throughout the workshops to maintain engagement.

**Conclusions:** A framework, literature and expertise informed the systematic development of a co-creation process. Future research will implement the planned co-creation process in 3 SMEs where changes in each process will inform the next series of workshops, contributing to a generalisable protocol of how to conduct co-creation for workplace SB interventions.

# Development of a dietary support tool for 8-10-year old Dutch children: Co-creating food (group) illustrations with 8-10-year-old Dutch children and experts. Eetscore Jr.

**Ms. Zoë van der Heijden**<sup>1</sup>, Associate Professor Yuan Lu<sup>2</sup>, Ms. Desiree Lucassen<sup>1</sup>, Ms. Femke de Gooijer<sup>1</sup>, Dr. Arieke Janse<sup>3</sup>, Prof. Edith Feskens<sup>1</sup>, Associate Professor Sanne Nijhof<sup>4</sup>, Dr. Henk Schipper<sup>4</sup>, Assistant Professor Indre Kalinauskaite<sup>4</sup>, Dr. Guido Camps<sup>1</sup>, Assistant Professor Elske Brouwer-Brolsma<sup>1</sup>  
<sup>1</sup>Wageningen University & Research, Wageningen, Netherlands, <sup>2</sup>Eindhoven University of Technology, Eindhoven, Netherlands, <sup>3</sup>Gelderse Vallei Hospital, Ede, Netherlands, <sup>4</sup>University Medical Center Utrecht, Utrecht, Netherlands

**SO.1.05 - If it's complex, use participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Adherence to a healthy diet can prevent unhealthy weight gain and decrease later-life risks of developing related chronic diseases. Despite these benefits, most children do not meet recommended national dietary guidelines. In order to provide personalized dietary support, the development of valid and user-appropriate food intake registration tools is crucial. Currently, no validated tools exist yet that are suitable for self-report among children in the Dutch context. A factor that may have hampered successful development so far is a lack of child-centered perspective and involvement of children throughout the design cycle. To illustrate, pilot data has shown that children had difficulties with categorizing eaten products into predefined food groups, but also with recognizing supporting food group icons. Therefore, as a first step towards child-centered dietary assessment, this study aims to co-create (1) food groups and (2) a corresponding food group illustration set that facilitates finding or self-reporting on dietary intake among Dutch children of 8-10 year's old.

**Methods:** In this qualitative study a series of three co-creation workshops will be held involving children, parents, and experts (pediatric dietitians, graphic designers, and teachers). In the first one-to-one phase (*co-creation with user-perspective*), card sorting method will be used to ask children (n=12) to divide most consumed food items into food groups; subsequently participants will design first versions of corresponding. During the second phase (*co-creation with expert-perspective*), results from phase 1 will be evaluated and updated with experts by means of a mood board-guided discussion (n=9). Subsequently, using photovoice and contextual inquiry, the usability and comprehensiveness of the designed illustrations-set will be evaluated in a real-life setting with children (n=24) (*phase 3 – co-creation for evaluation*). Video recordings and field-notes will be analyzed by a combination of general inductive and deductive approaches of content analysis.

**Results:** First results are expected in April-May 2023.

**Conclusions:** Including end-user's voices throughout the development of dietary tools is expected to contribute to increased comprehensiveness (i.e., coverage of foods), user-friendliness and user-engagement. Insights of the current study will be used for further development of a digital dietary coaching's tool for children of 8-10 years old.

# Changes in capacity for public and political engagement, and attitudes towards obesity and preventive measures among adolescents participating in the CO-CREATE youth Alliance: an exploratory effect analysis

**Mr. Sondre Haugsbø Herstad<sup>1</sup>**, Dr. Navnit Kaur Grewal<sup>1</sup>, Assistant Professor Anna Banik<sup>2</sup>, Prof. Knut-Inge Klepp<sup>3</sup>, Prof. Cecile Knai<sup>4</sup>, Prof. Aleksandra Luszczynska<sup>2</sup>, Miss Sofia Mendes<sup>5</sup>, Dr. Ana Rito<sup>6</sup>, Prof. Harry Rutter<sup>7</sup>, Prof. Nanna Lien<sup>1</sup>

<sup>1</sup>Department of Nutrition, University of Oslo, Oslo, Norway, <sup>2</sup>SWPS University of Social Sciences and Humanities, Wrocław, Poland, <sup>3</sup>Division of Mental and Physical Health, Norwegian Institute of Public Health, Oslo, Norway, <sup>4</sup>Faculty of Public Health & Policy, London School of Hygiene & Tropical Medicine, London, United Kingdom, <sup>5</sup>Center for Studies and Research on Social Dynamics and Health - CEIDSS, Lisbon, Portugal, <sup>6</sup>National Institute of Health Dr. Ricardo Jorge, Lisbon, Portugal, <sup>7</sup>Department of Social and Policy Sciences, University of Bath, Bath, United Kingdom

**SO.1.05 - If it's complex, use participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** The aim of this study was to assess any effects on adolescents' reported readiness to be engaged in dealing with obesity as a societal issue, conceptualization of obesity in terms of personal or societal responsibility, and perceived drivers of unhealthy behavior before, during, and after participating in participatory action research based activities and policy design.

**Method** This was a quasi-experimental study, where adolescents (n=199) came together with researchers in their respective countries (the Netherlands, Norway, Poland, Portugal, and the U.K) and formed 15 youth Alliances to co-create policy ideas for obesity prevention. At baseline and monthly measurement points, the participants completed an online questionnaire, measuring readiness for action through 18 items, and attitudes towards obesity prevention – responsibility and drivers of unhealthy behavior, by 34 items. A control sample (n=280) was recruited from non-participating schools, and assessed twice. We created two sub-samples from the total sample (n=439) at baseline (Control=0, Alliance=1). Sub-sample 1 (n=213) and sub-sample 2 (n=195), which included Alliance members who responded to the questionnaire at baseline, and at a measurement point prior to the COVID-19 lockdown (n=90) as intermediary effects (after 2-3 months), or upon completion (n=72), respectively. A control group (n=123) were included in both samples. We used a two level linear mixed model to control for country variance to assess the effects in the two samples.

**Results** In sub-sample 1, Alliance members scored significantly higher than the control group on responsibility of “government/public policy” (b=0.56, 95% CI=0.11, 1.01), and on “social media” (b=0.50, 95% CI=0.08, 0.91) as a driver of unhealthy behaviour. In sub-sample 2, Alliance members scored significantly higher than the control group on “using social networking platforms to discuss a social issue” (b=0.62, 95% CI=0.21, 1.03), responsibility of “private business” (b=0.50, 95% CI=0.15, 0.85) and “transportation companies” (b=0.42, 95% CI=0.02, 0.82), and on “lack of knowledge/understanding” (b=0.37, 95% CI=0.06, 0.67) and “lack of focus on healthy lifestyle among friends and family” (b=0.44, 95% CI=0.00, 0.87) as drivers of unhealthy behaviour.

**Conclusion** Although few changes were found, significant effects, with the exception of “lack of knowledge/understanding”, were in the expected direction.

# Applying the Context Implementation and Complex Interventions (CICI) Framework to translating a nutrition evidence-based intervention for Latinos in rural Washington, USA.

**Dr. Barbara Baquero**<sup>1</sup>, Mrs. KeliAnne Hara-Hubbard<sup>1</sup>, Miss Norma Garfias Avila<sup>1</sup>, Dr. Lesley E. Steinman<sup>1</sup>, Dr. India J. Ornelas<sup>1</sup>

<sup>1</sup>University of Washington School of Public Health, Seattle, USA

**SO.1.05 - If it's complex, use participatory research designs, UKK - Hall D (Level 2 - main floor), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Contextual factors are critical to the translation of evidence-based health promotion interventions; however, methods to identify these factors are limited. We applied the CICI framework to identify and evaluate contextual factors relevant to translating a nutrition intervention for Latinos in rural Washington, USA.

**Methods:** We used a participatory approach, partnering with community organizations invested in food equity. Using a mixed-method design, we: reviewed scientific, publicly available data on contextual factors (quantitative) and conducted 12 key informant interviews with community leaders (qualitative). Data was coded and categorized into the CICI's five contextual categories. We integrated the data, identifying contextual factors critical to increasing access to healthier foods and the translation of the intervention. A causal loop diagram helped illustrate connections between contextual factors and intervention translation.

**Results/Findings:** We synthesized data sources to determine the impact of contextual factors at different levels of influence. **Geographic factors** indicated a rural agricultural hub with 1-5.75 out of 20 walkability scores and limited access to public transportation. **Epidemiological factors** showed Latinos represented >51.8% in the study region, with many speaking a language other than English at home (20.9%-47.5%), experiencing high rates of obesity (31-37%) and poverty (9.1%-14.8%). **Sociocultural factors** indicated that food preferences and traditions were salient for the community when deciding where to purchase food and what food to eat. The traditional diet included fresh fruits and vegetables; however, there was low fruit and vegetable consumption. **Socioeconomic factors** suggested Latinos have fewer economic opportunities and spent more on housing than whites, and experience food insecurity. **Legal and political factors** indicated immigration status reduced Latinos' power to advocate for living wages, accessible food assistance programs, and healthier food environments.

**Conclusion:** Community partners noted that living wages, transportation, budgeting, and nutrition knowledge were key factors in translating a nutrition intervention in the region. We discuss how we incorporate these factors into the intervention. This research advances methods to include relevant contextual factors that influence the translation and implementation of interventions in community settings. This approach is feasible, rigorous, and effective when conducted in partnership with communities.

# Partner support and physical activity levels in mother-father dyads during pregnancy

**Dra. Vicka Versele**<sup>1,2</sup>, Associate Prof. Annick Bogaerts<sup>2,3,4</sup>, Prof. Roland Devlieger<sup>2,5,6</sup>, Assistant Prof. Tom Deliens<sup>1</sup>, Prof. Peter Clarys<sup>1</sup>, Prof. Dirk Aerenhouts<sup>1</sup>

<sup>1</sup>Faculty of Physical Education and Physiotherapy, Department of Movement and Sport Sciences, Vrije Universiteit Brussel, Brussels, Belgium, <sup>2</sup>Faculty of Medicine, Department of Development and Regeneration, KU Leuven, Leuven, Belgium, <sup>3</sup>Faculty of Medicine and Health Sciences, Centre for Research and Innovation in Care (CRIC), Antwerp, Belgium, <sup>4</sup>Faculty of Health, University of Plymouth, Plymouth, United Kingdom, <sup>5</sup>Obstetrics and Gynaecology, University Hospitals KU Leuven, Leuven, Belgium, <sup>6</sup>Department of Obstetrics, Gynaecology and Fertility, GZA Campus Wilrijk, Antwerp, Belgium

**SO.1.06 - Latest findings in motivational predictors, UKK - K1 (+K2) (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Background and purpose:** Adequate physical activity (PA) levels during pregnancy are important for the health of the mother and her fetus. PA levels however decrease throughout the pregnancy and the postpartum period. Not only pregnant women, but also men experience changes in PA when becoming a parent. The influence of the partner was described as an interpersonal determinant of changes in both parents' PA behavior during the transition to parenthood. The aim of this study was to analyze if perceived partner support has an influence on parents own and partner's moderate-to-vigorous PA (MVPA) levels during the pregnancy of their first child.

**Methods:** A total of 304 expecting parents (i.e., 152 heterosexual couples) were recruited between week 8 and 10 of gestation by means of convenience sampling. Objective anthropometric and PA measurements were performed at 12 weeks of gestation. An online questionnaire was used to assess socio-demographic characteristics and perceived partner support in terms of PA. An Actor-Partner Interdependence Model (APIM) for distinguishable dyads was constructed to examine the relationship between perceived PA support and MVPA levels.

**Results:** For pregnant women, perceived PA support from their male partner was significantly associated with their own MVPA levels (i.e., actor effect;  $\beta=0.344$ ,  $SE=0.168$ ,  $p=0.040$ ) as well as the MVPA levels of the expecting fathers (i.e., partner effect;  $\beta=0.717$ ,  $SE=0.255$ ,  $p=0.005$ ). No significant actor nor partner effects were found for the expecting fathers. Partial intraclass correlation for MVPA levels between partners was positively significant ( $r=0.24$ ,  $p=0.007$ ) and also a positive relation between pregnant women and expecting fathers perceived PA support ( $r=0.40$ ,  $p<.001$ ) was observed.

**Conclusions:** Investigating the couple as a dyad is important as it takes into account daily interpersonal interactions between the partners of the couple. This study shows that partners can act as significant facilitators and may play an important role when promoting PA during pregnancy. Additionally, supportive couples seem to strengthen each other in keeping a healthy lifestyle in early pregnancy. Couple-based interventions need to be explored in the promotion of healthy lifestyle during the transition to parenthood.

# Concept: A configurable agent-based model of how qualitative beliefs influence active commuting

**Mr. Robert Greener**<sup>1</sup>, Dr. Simon Miles<sup>2</sup>, Prof. Nathan Griffiths<sup>3</sup>, Prof. Steven Cummins<sup>1</sup>

<sup>1</sup>London School of Hygiene and Tropical Medicine, London, United Kingdom, <sup>2</sup>Aerogility, London, United Kingdom, <sup>3</sup>University of Warwick, Coventry, United Kingdom

**SO.1.06 - Latest findings in motivational predictors, UKK - K1 (+K2) (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose** Active commuting has been recommended as a method to increase population physical activity, but evidence is mixed. Social norms and beliefs related to travel behaviour may influence the uptake of active commuting interventions but are rarely considered in the design and evaluation of interventions. The purpose of this study was to develop and evaluate an innovative configurable agent-based model of how qualitative beliefs influence commuter travel behaviour, which could then be used to investigate active commuting interventions. Our research focussed on understanding the complex relationship between beliefs and individuals, considering the imperfect information of other's beliefs.

**Methods** We developed an agent-based model for how beliefs influence commuter travel behaviour, based on a mathematical model for how beliefs, in general, spread around social networks. This allows us to model how agents decide to perform commuting behaviours (walking, cycling, taking public transport, or driving) each day, for many agents. The model captures how individuals perceive the beliefs of their peers based upon the observation of behaviour. For example, if one individual sees another cycling to work, they determine that they are likely to have positive beliefs regarding cycling. Individuals belong to social networks, which exhibits small-world properties, with an average of 10 connections per individual. These connections are weighted, such that some peers are more influential than others. The model also captures how beliefs interact with one another, and how holding beliefs influences the performance of behaviour. The model was executed 10,000 times and is available under a permissive license.

**Results** The results will be analysed using a Bayesian hierarchical linear regression model exploring how the number of active journeys, and therefore population physical activity, is affected by input parameters. These results will be discussed during the oral presentation.

**Conclusions** This model serves as a useful instrument for investigating qualitative beliefs relevant to active commuting affect behaviour in a quantitative manner. The configurable nature of the model allows for exploration of the role of different beliefs in influencing travel choices, as well as the potential impact of interventions aimed at promoting active forms of transportation, which would be beneficial for health.

# Inequality regarding the climate impact of food - A comparative study between consumers with different energy consumption

**Mrs. Mari Wollmar**<sup>1</sup>, Dr. Anna Post<sup>1</sup>, Prof. Agneta Sjöberg<sup>1</sup>

<sup>1</sup>Food and Nutrition, and Sport science, Gothenburg, Sweden

SO.1.06 - Latest findings in motivational predictors, UKK - K1 (+K2) (Level 3), June 15, 2023, 12:00 PM - 1:15 PM

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** The food we eat contributes to the global climate impact, and food products contribute to climate impact in varying degrees. On a societal level, the shift towards sustainable meal options has mainly been noticeable among public meals. In this study, we want to problematize whether other groups in society can contribute to reducing their climate impact regarding food and meals – for example, consumers with a high energy intake (athletes). In this study, the carbon footprint from food and meals in high-energy consumers is compared with a group of consumers representing the Swedish average activity level.

**Methods:** The study recruited 49 participants aged 18-40 to one of two groups. The inclusion criteria were an activity level of a minimum of 300 minutes or a maximum of 150 minutes of MVPA and VPA per week. All study participants recorded their food intake and physical activity for seven and fourteen days, respectively. In addition, an online food record collected information on energy and macronutrient intake over seven consecutive days. Total energy expenditure was determined by indirect calorimetry and accelerometers. Further, the RISE climate database assessed carbon footprint (CO<sub>2e</sub>).

**Results:** Measured in absolute numbers, the high-active group, both females and males, increased their carbon footprint with higher energy intake. The low-active group, on the other hand, did not, on a group level, increase its carbon footprint with higher energy intake. The difference in carbon footprint results from macronutrient distribution within the two groups. The high-active group had a significantly higher energy intake, protein, carbohydrates, and fiber intake. The higher energy intake and choice of protein sources resulted in a significantly higher mean carbon footprint per day from the high-active group.

**Discussion/conclusion:** The focus on protein intake in athlete populations can have a substantial climate impact if protein sources are animal-based. It is a challenge to find nutritious and healthy analogs for animal products. But it is not the high energy intake per se that is problematic, but the foods the high energy consumers choose to eat.

# The Varying Influences of Outdoor Experiences During Childhood on Time Spent in Nature as an Adult

**Dr. Debra Kellstedt<sup>1</sup>**, Dr. Courtney Suess-Raeisinafchi<sup>2</sup>, Dr. Jay Maddock<sup>2</sup>

<sup>1</sup>Texas A&M AgriLife Extension, College Station, USA, <sup>2</sup>Texas A&M University, College Station, USA

**SO.1.06 - Latest findings in motivational predictors, UKK - K1 (+K2) (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Multiple factors influence adults' decisions and abilities to be active and spend healthy amounts of time in nature. Physical activity performed in natural environments provides additional health benefits. While supports for physical activity have been well researched, we have less understanding of factors that influence time spent in nature. Over the last 50 years, the time that children spend in nature and free play has dropped dramatically. The purpose of this research was to explore the varying influences of a variety of outdoor childhood experiences on adult time spent in nature.

**Methods:** A multidisciplinary researcher and practitioner team generated 20 childhood experiences in nature items that were previously tested for reliability and validity. A factor analysis was conducted, and two childhood experiences in nature subscales were created to measure 1) everyday (e.g., playing on a playground or riding a bike) and 2) substantial (e.g., camping and hiking) outdoor experiences during childhood. Multiple linear regression was used with responses from a U.S. nationwide sample ( $n=2109$ ; 49.7% female; Mean Age=51.1; 59.8% White, 18.4% Hispanic 13.3% Black) to examine the influence of each outdoor experiences scale along with gender, age, intentions to be in nature, and self-efficacy to be in nature covariates on adult time spent in nature.

**Results/findings:** Everyday outdoor experiences in childhood ( $M = 3.81$ ,  $SD = 0.77$ ) were reported more often than substantial outdoor experiences ( $M = 2.55$ ,  $SD = 0.88$ ). The overall regression was statistically significant ( $R^2 = 0.31$ ,  $F(4, 2025) = 231.78$ ,  $p < 0.001$ ). There was a significant positive relationship between substantial childhood outdoor experiences ( $\beta = 0.16$ ,  $p = 0.01$ ), intentions ( $\beta = 0.83$ ,  $p < 0.001$ ), and self-efficacy ( $\beta = 0.54$ ,  $p < 0.001$ ), and adult time spent in nature, while everyday childhood outdoor experiences did not significantly predict adult time spent in nature ( $\beta = -0.02$ ,  $p = 0.72$ ).

**Conclusions:** Even though everyday childhood outdoor experiences occurred more frequently, they may not translate into activities for adults to spend time in nature. Interventions designed to produce more substantial childhood outdoor experiences may have a greater effect on adult health behaviors.

# Meeting 24 h Movement Guidelines and the relationship with active commuting to school in Spanish urban areas

**Miss Evelyn Martín-Moraleda**<sup>1</sup>, Mr. Iván Pinilla-Quintana<sup>1</sup>, Dr. Cristina Romero-Blanco<sup>2</sup>, Dr. Antonio Hernández-Martínez<sup>2</sup>, Mr. Fabio Jiménez-Zazo<sup>1</sup>, Mr. Alberto Dorado-Suárez<sup>1</sup>, Dr. Virginia García-Coll<sup>1</sup>, Dr. Esther Cabanillas-Cruz<sup>1</sup>, Dr. Matthew Fagan<sup>3</sup>, Dr. Manuel Herrador-Colmenero<sup>4</sup>, Dr. Ana Queralt<sup>5</sup>, Dr. Nuria Castro-Lemus<sup>6</sup>, Prof. Guy Faulkner<sup>3</sup>, Prof. Susana Aznar<sup>1</sup>

<sup>1</sup>PAFS Group University of Castilla-La Mancha , Toledo, Spain, <sup>2</sup>PAFS Group University of Castilla-La Mancha , Ciudad Real, Spain, <sup>3</sup>POP-PA Lab University of British Columbia, Vancouver, Canada, <sup>4</sup>PROFITH Group University of Granada, Granada, Spain, <sup>5</sup>AFIPS Group University of Valencia, Valencia, Spain, <sup>6</sup>FENIX Group University of Sevilla, Sevilla, Spain

**SO.1.06 - Latest findings in motivational predictors, UKK - K1 (+K2) (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** New guidelines from Canada indicate all movement behaviours (physical activity (PA), screen time and sleep) are important for health. Active commuting to school (ACS) provides an opportunity to increase PA levels daily. The aim of this study was to assess the prevalence of ACS, and if meeting the 24h Movement Guidelines is associated with ACS in adolescents.

**Methods:** Our study captured a cross-sectional sample of adolescents from seven Spanish urban areas. Recruitment occurred at two time points, from November 2020 to June 2021 and December 2021 to April 2022. All measurements were carried out as part of the “PACO & PACA” Research Project. Adolescents answered an online questionnaire on the mode of commuting to school and lifestyle behaviors. Logistic regression models were fit to evaluate if meeting the 24h Movement Guidelines was associated with ACS.

**Results:** The final sample included 713 adolescents (mean age= 14.82 ± 0.5 years, 50.8% girls). A total of 55.8% adolescents commuted actively from home to school and only 8.9% met all the Canadian 24h Movement Guidelines. Data showed active commuters (AC) met 24h Movement Guidelines more than passive commuters (PC) (None: 46.3% in AC vs. 53.7% in PC; meeting 1 guideline: 53.8 % in AC vs. 46.2% in PC; meeting 2 guidelines: 62% AC vs. 38% in PC; meeting 3 guidelines: 59% in AC vs. 41 % PC; p=0.041). Evidence from the binary logistic regression indicated those who did not meet any 24 h Movement Guidelines had lower odds of ACS than those who met 2 guidelines (OR=1.89 , 95% CI: 1.19-3.01). In particular, girls who met 2 or all 24h Movement Guidelines had higher odds of ACS than those who met none (OR=2.06, 95% CI: 1.10-3.87; OR=2.30, 95% CI: 1.00-5.27, respectively).

**Conclusion:** These findings showed an association between meeting the 24 h movement guidelines and higher odds of ACS in adolescent girls.

# Effective behaviour change techniques in e- and mHealth interventions targeting risk factors for non-communicable diseases: an umbrella review

**Dr. Jacqueline Mair**<sup>1,2,6</sup>, Dr. Alicia Salamanca-Sanabria<sup>1</sup>, Dr. Mareike Augsburger<sup>3</sup>, Ms. Stefanie Abend<sup>3</sup>, Ms. Bea Frese<sup>1</sup>, Mr. Robert Jakob<sup>6</sup>, Prof. Severin Haug<sup>3</sup>, Prof. Tobias Kowatsch<sup>1,4,5,6</sup>

<sup>1</sup>Future Health Technologies, Singapore-ETH Centre, Singapore, Singapore, <sup>2</sup>Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore, <sup>3</sup>Swiss Research Institute for Public Health and Addiction, University of Zurich, Zurich, Switzerland, <sup>4</sup>Institute for Implementation Science in Health Care, University of Zurich, Zurich, Switzerland, <sup>5</sup>School of Medicine, University of St. Gallen, St Gallen, Switzerland, <sup>6</sup>Centre for Digital Health Interventions, ETH Zurich, Zurich, Switzerland

**SO.1.06 - Latest findings in motivational predictors, UKK - K1 (+K2) (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Despite an abundance of e- and mHealth interventions targeting the prevention and management of common non-communicable diseases (NCDs), it is unclear what specific components make an intervention effective in changing human behavior. The aim of this umbrella review was to identify the most effective behavior change techniques (BCTs) in e- and mHealth interventions that target the most common NCDs and provide recommendations that will guide future research and design frameworks for the development of effective interventions.

**Methods:** Five electronic databases were searched for articles published in English between 1st January 2007 and 24th January 2021. Studies were included if they were systematic reviews or meta-analyses of e- or mHealth interventions targeting the modification of one or more NCD-related risk factors in adults. BCTs were coded using the Behaviour Change Technique Taxonomy (BCTTv1) where possible. Study quality was assessed using AMSTAR 2. Please note the search is currently being updated to 1 December 2022.

**Results:** Following screening of 342 articles from the initial search, 61 articles spanning 10 health domains and comprising over 500,000 individual participants were included in the review. We found that e- and mHealth interventions are favorably associated with improved health outcomes for patients with cardiovascular disease, cancer, type 2 diabetes, and asthma, and health-related behaviors including physical activity, sedentary behavior, diet, weight management, medication adherence, and abstinence from substance use. There was strong evidence from sub-group or regression analyses to suggest that education, communication with a professional, tailored reminders, goals and planning, feedback and monitoring, and personalization components increase the effectiveness of e- and mHealth interventions targeting NCDs and lifestyle behaviours. There was either no, or inadequate, evidence for effective BCTs in e- and mHealth interventions targeting cancer and asthma self-management. Reviews of nutritional and medication adherence interventions were unable to establish any association between specific BCTs and intervention effectiveness.

**Conclusions:** Common BCTs across several health domains, such as 'goals and planning', increase e- and mHealth intervention effectiveness and should be prioritized for inclusion within future interventions.

# A formative evaluation of NY SNAP Express among income-eligible food assistance beneficiaries using the COM-B Model

**Ms. Reah Chiong<sup>1</sup>**, Mr. Julio Salas<sup>1</sup>, Ms. Julia Kohn<sup>1</sup>, Ms. Emily St. John<sup>1</sup>, Assistant Professor Roger Figueroa<sup>1</sup>

<sup>1</sup>Cornell University, Ithaca, USA

**SO.1.06 - Latest findings in motivational predictors, UKK - K1 (+K2) (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose.** The purpose of the study is to assess the barriers and facilitators to online grocery shopping through an online meal kit and grocery shopping platform titled NY SNAP Express among adults eligible for the Supplemental Nutrition Assistance Program (SNAP), a U.S. federal nutrition assistance program.

**Methods.** SNAP-eligible adults residing in NY state were purposively sampled to participate in 1-hour phone or virtual interviews. An interview facilitation guide was used and adapted using constructs from the Capabilities, Opportunities, Motivations, and Behaviors (COM-B) model. Interviews were conducted, transcribed verbatim, and analyzed using a grounded theory framework beginning with line-by-line coding followed by selective coding. At every coding stage, at least two researchers coded the transcripts independently and wrote analytic memos. Consensus was drawn between all researchers on major themes related to barriers and facilitators to online grocery shopping through the NY SNAP Express platform.

**Results/Findings.** Participants (n=32) were mainly female, White-identifying, and made less than \$9,999 annually. Major Capability barriers to participation include physiological and health conditions, weight of food, technology, and language. Additional barriers related to Opportunities include the price of foods, a lack of a reliable mode of transportation, and stigma associated with the SNAP program. Lastly, barriers related to one's Motivations to participate in the program include concerns regarding the quantity and quality of meal kits. Among Capability-related facilitators, most participants indicated that they would use the platform if their health and nutrition is improved and they gain food-related knowledge and skills. Among facilitators related to Opportunities, SNAP-eligible adults would be willing to participate if the program helped them save money, received support from family and friends, and offered culturally relevant meals. Finally, facilitators related to Motivations include the potential for efficiency in food purchasing and preparation and customization of meal kits that meets their and their household's needs.

**Conclusions.** Platforms like NY SNAP Express could maximize food access, especially among marginalized groups. Future studies aiming to improve online grocery services should consider the barriers and facilitators identified in this formative study.

# Exploring the Use of Context Specific Behavioral Economic Principles to Enable Patients to Change Their Physical Activity Patterns

**Dr. Brittany Barber<sup>1</sup>**, Prof. Daniel Rainham<sup>1</sup>, Dr. Michael Vallis<sup>1</sup>, Prof. Ruth Martin-Misener<sup>1</sup>, Prof. George Kephart<sup>1</sup>

<sup>1</sup>Dalhousie University, Halifax, Canada

**SO.1.06 - Latest findings in motivational predictors, UKK - K1 (+K2) (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Cardiovascular diseases (CVD) are the leading cause of death worldwide, accounting for more than 17 million deaths annually, and 1/5 of all deaths in Canada. Behavioral interventions for modifying risk factors are critical for reducing risk of CVD or a repeat event. The effectiveness of interventions to reduce risk of CVD is hindered by poor maintenance of behaviors after an intervention when patients no longer have regular contact with healthcare professionals and peers, and use of digital tools that do not adequately consider the spatiotemporal contexts within which patient health behaviors occur. This additional knowledge is critical to ensure intervention strategies are tailored to incorporate the timing and location of seemingly automatic decisions patients make as part of their daily routines. This study explores how context-specific behavioral economic principles can be employed to tailor interventions to support patients' efforts to modify day-to-day routines.

**Methods:** Semi-structured interviews were used to gather in-depth descriptions about facilitators and barriers to increasing physical activity (PA) and contexts influencing decisions about day-to-day activities. Data were analyzed using the COM-B model for behavior change and MINDSPACE framework of behavioral economic principles as coding frameworks.

**Results:** Data were gathered from patients at one cardiac prevention and rehabilitation intervention in Nova Scotia, Canada. A total of 29 patients (19 men and 10 women) between the ages of 45 to 81 who were referred to the program after a cardiac event participated in this study. Findings indicate patients were capable and motivated to increase their PA but were challenged to identify opportunities to adapt day-to-day routines for increasing PA. Patients described disrupting default routines, increasing commitments, changing the messenger, and introducing incentives as potentially useful behavioral economic principles that could be applied to improve day-to-day decisions about increasing PA.

**Conclusions:** Coupling behavioral economic principles with spatiotemporal contexts of patients' day-to-day routines provides critical information of what behavioral economic principles can be tailored to when and where patients' health activities occur. Patients had insight into potential behavioral economic principles, although they were not previously educated, and could be valuable partners in developing behavioral intervention strategies.

# Factors influencing the physical activity of adolescent girls living in an informal settlement in Kenya: A mixed-methods sequential explanatory study

Dr. Stephanie Martin<sup>1</sup>, Dr. Erick Nandoya<sup>2</sup>, Mr. Nathan Ruto Kipkoech<sup>2</sup>, Ms. Mercy Owuor<sup>2</sup>, Ms. Wilkister Olando<sup>2</sup>, Mr. Mark Muasa<sup>2</sup>, Mr. Yunus Mohammed<sup>2</sup>, Mr. Hillary Omala<sup>2</sup>, Ms. Emily Seiger<sup>1</sup>, Dr. Alice Ammerman<sup>1</sup>, Dr. Katie Meyer<sup>1</sup>, Dr. Saroja Voruganti<sup>1</sup>, Dr. Margaret Bentley<sup>1</sup>, **Dr. Leslie Lytle<sup>1</sup>**

<sup>1</sup>University of North Carolina At Chapel Hill, Chapel Hill, USA, <sup>2</sup>CFK Africa, Nairobi, Kenya

**SO.1.06 - Latest findings in motivational predictors, UKK - K1 (+K2) (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** In Nairobi Kenya, 70% of the population lives in informal settlements; Kibera is the largest. Physical activity can be negatively impacted by this environment and understanding specific factors related to physical activity in informal settlements is critical to designing effective interventions. Led by CFK Africa, an organization supporting participatory development and public health in informal settlements, this study examined factors that influence adolescent girls' physical activity.

**Methods:** Data from a mixed-methods sequential explanatory design were used to explore physical activity among adolescent girls in Kibera. Girls ages 15-16 from Kibera participated in a cross-sectional survey (n=316). The Global Physical Activity Questionnaire previously adapted for Kenya was used to collect self-reported physical activity data. A purposive sample of adolescent girls ages 13-19 years and their parents participated in focus group discussions (FGDs) to examine factors that influence adolescents' physical activity.

**Results:** The mean age of survey participants was 17.5 years (SD 1.34) and most were enrolled in school (79.8%). Walking was the main form of transportation among survey participants (83.1%) and more than half (56.9%) reported amounts of walking for transportation that met the WHO weekly guidelines for physical activity. Physical activity levels did not vary by sociodemographic characteristics. It was uncommon for participants to engage in recreational physical activity more than one day each week (13.9%) and 22.2% reported almost no recreational physical activity. In FGDs, girls expressed an interest in recreational physical activity, but adolescent girls and parents identified several barriers to recreational physical activity, including lack of space at schools and in the community, lack of clothes and equipment, concerns about safety, and lack of time because of household chores and schoolwork. Parents also identified adolescents' screen time as a barrier. FGD participants suggested organized family recreational activities (e.g. fun runs, dances) and providing school-based sports as a way to increase physical activity.

**Conclusion:** While walking for transportation was common, adolescent girls face considerable environmental, social, and economic barriers to recreational physical activity in Kibera. Tailored, contextually appropriate interventions are needed to address the barriers to physical activity that adolescent girls in informal settlements experience.

# ‘Maintaining balance in life’ - Exploring older adults’ long-term engagement in self-managed digital fall prevention exercise

**Dr. Beatrice Pettersson**<sup>1</sup>, Dr. Sara Lundell<sup>1, 2</sup>, Prof. Lillemor Lundin-Olsson<sup>1</sup>, Dr. Marlene Sandlund<sup>1</sup>  
<sup>1</sup>Umeå University, Department of Community Medicine and Rehabilitation, Umeå, Sweden, <sup>2</sup>Umeå University, Department of Sociology, Umeå, Sweden

SO.1.07 - Latest findings in Ageing, UKK - K3+4 (Level 3), June 15, 2023, 12:00 PM - 1:15 PM

**SIG - Primary Choice:** A. Ageing

**Background** Accidental falls are one of the greatest threats to older adults’ health and well-being. The risk of falling can be significantly reduced with strength and balance interventions. However, there needs to be further knowledge into how older adults can be supported to achieve a maintained exercise behaviour. Therefore, the aim of this study was to explore factors related to older adults’ long-term engagement during an intervention of self-managed digital fall prevention exercise.

**Methods** This study used a grounded theory methodology. Semi-structured individual interviews were conducted by phone or conference call. Eighteen community-dwelling older adults aged 70 years or more participated. The participants had a self-reported exercise dose 60 minutes or more during the last three months of participation in a 12-months intervention of self-managed digital fall prevention exercise, the Safe Step randomized controlled trial. Open, axial, and selective coding, along with constant comparative analysis, was used to analyze the data.

**Results** The analysis resulted in a theoretical model. We found that the fall prevention exercise habits of adults were developed through three stages: *Acting against threats to one’s own identity*, *Coordinating strategies to establish a routine*, and *Forming habits through cues and evaluation*. The main category of *Maintaining balance in life* encases the participants transition through the three stages and reflects balance in both physical aspects and in between activities in daily life. The process of maintaining balance in life and desire to do so were mediated both by intrinsic person-dependent factors and the Safe Step application acting as an external mediator.

**Conclusion** This study identified three stages of how older adults developed self-managed fall prevention exercise habits, supported by a digital application. The generated theoretical model can inform future interventions aiming to support long-term engagement in digitally supported and self-managed fall prevention interventions.

# Community-dwelling and institutionalized older adults' experiences of a physical activity and sedentary behaviour intervention: role of self-management strategies

**Prof. Maria Giné-Garriga<sup>1,2</sup>**, Dr. Nicole Blackburn<sup>3</sup>, Dr. Laura Coll-Planas<sup>4</sup>, Prof. Dawn Skelton<sup>5</sup>

<sup>1</sup>Department of Sport Sciences, Faculty of Psychology, Education and Sport Sciences Blanquerna, Universitat Ramon Llull, Barcelona, Spain, <sup>2</sup>Department of Physical Therapy, Faculty of Health Sciences Blanquerna, Universitat Ramon Llull, Barcelona, Spain, <sup>3</sup>Institute of Nursing and Health Research, School of Health Sciences, Ulster University, Ulster, United Kingdom, <sup>4</sup>Research Group on Methodology, Methods, Models and Outcome of Health and Social Sciences (M3O), Faculty of Health Sciences and Welfare, University of Vic - Central University of Catalonia (UVIC-UCC), Vic, Spain, <sup>5</sup>School of Health and Life Sciences, Glasgow Caledonian University, Glasgow, United Kingdom

**SO.1.07 - Latest findings in Ageing, UKK - K3+4 (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** A. Ageing

**Background:** Two different studies comprising a physical activity and sedentary behaviour-based program enhanced with self-management strategies were evaluated in a trial in several European countries and England. The aim of these qualitative studies was to understand the role of self-management strategies in the sustainability of the intervention at 18 and 6-month follow up as mechanisms of impact, as well as to explore the perceived effects.

**Methods:** Qualitative methodologies were nested in the one trial including 71 individual interviews and 12 focus groups targeting intervention and control group participants from postintervention to 18-month follow-up in all intervention sites based on a semi-structured topic guide. Qualitative methodologies were applied in another trial including 9 individual interviews and 4 focus groups targeting intervention and control group participants from postintervention to 6-month follow-up in two intervention sites based on a semi-structured topic guide.

**Results:** Overarching themes were identified under the framework categories of context, implementation, sustainability of the intervention (mechanisms of impact) and perceived effects. The findings highlight the perceived barriers and facilitators to older adults' engagement in PA and SB programs, and differences were noted between community-dwelling and institutionalized older adults and between gender. Social interaction and enjoyment through the group-based programmes are key components to promote adherence and encourage the maintenance of targeted behaviours through peer support and connectedness. Exit strategies and signposting to relevant classes and facilities enabled the maintenance of positive lifestyle behaviours, and increased their adherence and maintenance.

**Conclusions:** When designing and implementing interventions, key components enhancing social interaction, enjoyment and continuity should be in place to successfully promote sustained behaviour change.

# Healthy Grandparenting Project: The impact of non-residential grandchild care on physical activity and sedentary behavior in people aged 50 years and over.

**Ms. Marie Vermote<sup>1, 2, 3</sup>**, Prof. Benedicte Deforche<sup>1,2</sup>, Prof. Tom Deliens<sup>1</sup>, Prof. Eva D'Hondt<sup>1</sup>

<sup>1</sup>Department of Movement and Sport Sciences, Vrije Universiteit Brussel, Brussels, Belgium, <sup>2</sup>Department of Public Health and Primary Care, Ghent University, Ghent, Belgium, <sup>3</sup>Research Foundation – Flanders (FWO), Brussels, Belgium

**SO.1.07 - Latest findings in Ageing, UKK - K3+4 (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Given the widespread provision of grandparental childcare, examining its impact on older adults' energy-expenditure related behavior in the broader context of health is imperative. Therefore, the Healthy Grandparenting Project aims to investigate the levels of physical activity (PA) and sedentary behavior (SB) in grandparents caring for their grandchildren (aged between 0 and 5 years) and to compare these outcomes with non-caregiving grandparents and older adults without grandchildren, both momentarily and over time.

**Methods:** A prospective cohort study ran over a one-year period, including three test occasions with a six-month time interval in between (T0 = baseline, T1 = 6 months, T2 = 12 months). Participants' levels of PA and SB were measured objectively by means of accelerometry. Information about their grandchildren and the provided grandparental care was assessed using self-report questionnaires. Mixed modelling was used to identify differences in PA and SB between the subsamples at baseline. Comparing changes in energy-expenditure related behavior over time between subsamples and identifying the predictors of these detected changes will be investigated in future analyses and presented at the conference.

**Results:** Initially, 98 were caregiving grandparents, 64 non-caregiving grandparents and 91 non-grandparents were included in the cross-sectional baseline analyses. The total sample (N=253) was  $65.6 \pm 5.8$  years old, consisted of 64.6% females and had a mean body mass index of  $25.7 \pm 4.1$  kg/m<sup>2</sup>. Preliminary results concerning the differences in PA and SB showed a significantly higher amount of light intensity PA in caregiving grandparents ( $1808.6 \pm 413.8$  min/week) compared to non-caregiving grandparents ( $1642.9 \pm 528.4$  min/week) ( $p=0.004$ ) and between caregiving grandparents and non-grandparents ( $1670.4 \pm 430.6$  min/week) ( $p=0.015$ ), whereas no differences were observed between non-caregiving grandparents and non-grandparents ( $p=0.509$ ). No subgroup differences were found in moderate-to-vigorous PA ( $p=0.275$ ) or SB ( $p=0.311$ ).

**Conclusion:** Regular care for grandchildren might have a beneficial effect on levels of light intensity PA. Within the next step(s) of data analysis, it should be examined whether these higher amounts of light intensity PA were obtained in presence or in absence of the grandchildren and whether the difference in light intensity PA has an impact on grandparents' health.

# Lifestyle factors and incidence of multimorbidity of chronic diseases: a population-based cohort study in 132,444 adults

Dr. Yihui Du<sup>1,2</sup>, Prof. Geertruida H. de Bock<sup>1</sup>, Dr. Judith M. Vonk<sup>1</sup>, Ms. An Thanh Pham<sup>1</sup>, Dr. Yldau van der Ende<sup>3</sup>, Prof. Harold Snieder<sup>1</sup>, Associate Professor Nynke Smidt<sup>1</sup>, Associate Professor Paul F. M. Krabbe<sup>1</sup>, Associate Professor Behrooz Z. Alizadeh<sup>1</sup>, Prof. Gerton A. Lunter<sup>1</sup>, **Associate Professor Eva Corpeleijn<sup>1</sup>**

<sup>1</sup>University of Groningen, University Medical Center Groningen, Department of Epidemiology, Groningen, Netherlands, <sup>2</sup>School of Public Health, Faculty of Medicine, Hangzhou Normal University, Department of Epidemiology and Health Statistics, Hangzhou, China, <sup>3</sup>Department of Cardiology, Division of Heart and Lungs, Utrecht University, University Medical Center Utrecht, Utrecht, Netherlands

**SO.1.07 - Latest findings in Ageing, UKK - K3+4 (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose** Multimorbidity, the co-existence of two or more chronic conditions in the same individual, is a growing health challenge globally. This study aimed to evaluate the role of a comprehensive set of lifestyle factors in the development of multimorbidity.

**Methods** From the Dutch prospective Lifelines cohort, we included 132,447 adult participants without or with one chronic disease at baseline. Incidence of multimorbidity was defined as the co-occurrence of two or more diseases (cardiovascular disease, cancer, chronic respiratory disease and/or type-II diabetes) at follow-up, based on self-reported and clinical data. Eleven lifestyle factors were defined by the six Lifestyle Medicine domains, including diet quality, physical activity (daily physical activity, sedentariness (TV watching)), stress/relaxation (acute stress, chronic stress), substance use (alcohol consumption, smoking status), sleep (sleep duration, sleep treatment), and social connectedness (number of social contacts, marital status) from questionnaires. Cox regression models were constructed for evaluating the associations between baseline lifestyle factors and incident multimorbidity, separately for chronic disease-free participants (n=103,215), and participants with one chronic disease (n=29,232) at baseline. The follow-up time was counted from baseline to the time reporting disease or to last time of follow-up assessment, whichever came first. All analyses were adjusted for socio-demographical factors.

**Results** During a median follow-up of 3.4 (IQR:2.2-4.3) years, 433 chronic disease-free participants and 3677 participants with one disease at baseline developed multimorbidity. The top unhealthy lifestyle factors shared by both populations included current smoking (HR, 95%CI: 2.34, 1.77-3.09 and 1.34, 1.23-1.47, respectively), prolonged TV watching ( $\geq 5$  hrs/day, HR 1.71, 1.24-2.37 and 1.33, 1.18-1.50, respectively) and chronic stress (HR 1.70, 1.28-2.25 and 1.21, 1.09-1.33, respectively). Additionally in people with one chronic condition at baseline, high alcohol consumption ( $>1.5$  drinks/day and/or binge drinking, HR 1.28, 1.16-1.42) and inadequate sleep duration (too short/too long, HR 1.21, 1.01-1.44) were associated with a higher risk of developing multimorbidity.

**Conclusions** Current smoking, prolonged TV watching and chronic stress are strongly associated with the development of multimorbidity of chronic diseases in individuals with no or already one disease. The findings indicate interventions targeting a broad spectrum of unhealthy lifestyle factors in addition to traditional risk factors.

# Physical activity programs and services for older adults: a review of effectiveness from primary studies

**Dr. Heidi Gilchrist**<sup>1,2</sup>, Dr. Marina B. Pinheiro<sup>1,2</sup>, Dr. Jennifer Baldwin<sup>1,2</sup>, Dr. Juliana S. Oliveira<sup>1,2</sup>, Associate Professor Leanne Hassett<sup>2,3</sup>, Dr. Nathalia Costa<sup>1,2</sup>, Ms. Belinda Wang<sup>1,2</sup>, Dr. Wing Kwok<sup>1,2</sup>, Ms. Bruna S. Albuquerque<sup>1,2</sup>, Ms. Luiza R. Pivotto<sup>1,2</sup>, Ms. Ana Paula M. C. Carvalho-Silva<sup>1,2</sup>, Dr. Sweekriti Sharma<sup>1,2</sup>, Dr. Steven Gilbert<sup>1,2</sup>, Prof. Adrian Bauman<sup>1,4</sup>, Dr. Fiona Bull<sup>5</sup>, Dr. Juana Willumsen<sup>5</sup>, Prof. Anne Tiedemann<sup>1,2,4</sup>, Prof. Catherine Sherrington<sup>1,2,4</sup>

<sup>1</sup>School of Public Health, Faculty of Medicine and Health, The University of Sydney, Camperdown, Gadigal Country, Australia, <sup>2</sup>Institute for Musculoskeletal Health, The University of Sydney, Sydney Local Health District, Camperdown, Gadigal Country, Australia, <sup>3</sup>School of Health Sciences, Faculty of Medicine and Health, University of Sydney, Camperdown, Gadigal Country, Australia, <sup>4</sup>World Health Organization (WHO) Collaborating Centre for Physical Activity, Nutrition and Obesity, Charles Perkins Centre, The University of Sydney, Camperdown, Gadigal Country, Australia, <sup>5</sup>Physical Activity Unit, Department of Health Promotion, Division of Universal Health Coverage and Healthier Populations, World Health Organization (WHO), Geneva, Switzerland

**SO.1.07 - Latest findings in Ageing, UKK - K3+4 (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose** Knowledge of which physical activity programs are most effective for older adults in different sub-populations and contexts is limited. The objectives of this World Health Organisation (WHO) commissioned rapid review were to: 1) overview evidence evaluating physical activity programs/services for older adults; and 2) describe impact on physical activity, falls, intrinsic capacity (physical domain), functional ability (physical, social, and cognitive/emotional domains), and quality of life.

**Methods** We conducted a rapid review, following Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA), of primary studies from 350 systematic reviews identified in a previous scoping review (March 2021: PEDro, MEDLINE, CINAHL, Cochrane Database). We included good quality ( $\geq 6/10$  PEDro scale) randomised controlled trials (RCTs) with  $\geq 50$  participants per group. The intervention effect for each relevant outcome was categorised and a positive effect was defined as more than 50% of between-group comparisons being in a positive direction.

**Results** Of the 1421 intervention studies identified from 8267 records, 79% were RCTs, 87% were in high income countries and 39% were good quality. We identified 87 large, good quality RCTs (26,861 participants). Overall activity promotion, structured exercise and recreation/sport had positive impacts ( $\geq 50\%$  between-group comparisons positive) across all outcome domains. For overall activity promotion (21 intervention groups), greatest impacts were on physical activity (100% positive) and social outcomes (83% positive). Structured exercise (61 intervention groups) had particularly strong impacts on falls (91% positive), intrinsic capacity (67% positive) and physical functioning (77% positive). Recreation/sport (24 intervention groups) had particularly strong impacts on cognitive/ emotional functioning (88% positive). Multicomponent exercise (39 intervention groups) had strong impacts across all outcomes, particularly physical activity (95% positive), falls (90% positive) and physical functioning (81% positive). Impacts varied across outcomes for different populations and settings.

**Conclusions** Evidence supporting physical activity for older adults is positive. The findings presented in this review for different populations and settings will provide guidance for developing physical activity programs for different populations, locations and settings globally.

# Avoiding God's waiting room: Lessons from the lived experiences of older people who use technology to support physical activity

**Dr. Abby Haynes<sup>1,2</sup>**, Dr. Heidi Gilchrist<sup>2,1</sup>, Dr. Juliana S Oliveira<sup>1,2</sup>, Prof. Catherine Sherrington<sup>1,2</sup>, Prof. Anne Tiedemann<sup>1,2</sup>

<sup>1</sup>Institute for Musculoskeletal Health, The University of Sydney and Sydney Local Health District, Sydney, Australia, <sup>2</sup>School of Public Health, The University of Sydney, Sydney, Australia

**SO.1.07 - Latest findings in Ageing, UKK - K3+4 (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose** Digital technologies provide new opportunities to promote, incentivise and support physical activity for healthy ageing, but their potential is not fully realised. There is mixed information about older people's capacity to use new technologies to support physical activity, including how it can benefit them. This study sought to describe the characteristics and influences of older people's 'successful' uses of technology to support physical activity, and identify ways of building on existing strengths.

**Methods** We conducted narrative interviews with 17 purposively sampled people aged 70+ who, in a previous survey, reported using technology to support physical activity. Interview questions invited interviewees to reflect on their relationships with technology, physical activity and wellbeing, and to explore how their views and experiences were shaped by contextual factors. Data was analysed inductively, and then deductively using a framework of sensitising concepts (e.g. narratives of innovation, resistance, ageing and identity).

**Results** Interviewees perceived technology as a facilitator and motivator for physical activities that included walking, running, cycling, swimming, aqua aerobics, golf and online classes in yoga, Pilates, Tai Chi, seniors' exercise and dance. Many disparaged their technical skills yet used technology creatively to access, enhance and sustain physical activity. Interviewees were driven by philosophies of active living which underpinned their refusal to "sit in God's waiting room", and were bolstered by experiencing multiple health benefits. Technology use was influenced by social and health relationships. Gender difference were noted in how activity data was curated. Most interviewees reported navigating challenges associated with ageing in a discriminatory society, compounded by COVID-19. We identified four transferable 'lessons': 1. Embrace technology, 2. Find your thing, 3. Be adaptive and 4. Resist 'being old'.

**Conclusions** Older people's use of technology to support physical activity may be encouraged by leveraging trusted social and health relationships to model, promote and collaborate in technology-supported physical activity. More could be done to strengthen the value proposition of technology for older people by harnessing their expertise using co-design. In contrast to stereotypes, many older people are highly engaged in living active, resourceful lives, despite considerable challenges, and have valuable advice to offer.

# Changes in 24-hour (non-)movement behaviour during the retirement transition: the 'Move into Retirement' study

**Ms. Nina Vansweevelt<sup>1</sup>**, Prof. Jannique van Uffelen<sup>1</sup>, Prof. Filip Boen<sup>1</sup>, Prof. Jan Seghers<sup>1</sup>

<sup>1</sup>KU Leuven, Leuven, Belgium

**SO.1.07 - Latest findings in Ageing, UKK - K3+4 (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** This study investigates the longitudinal changes in 24-hour (non-)movement patterns during the retirement transition in Flemish adults. Based on previous literature, it is hypothesized that the time spent in light physical activity (LPA) and moderate-to-vigorous physical activity (MVPA) will decrease, while the time spent in sedentary behaviour (SB) and sleep will increase. Besides this, it is expected that more favourable changes will occur in higher socio-economic groups compared to lower socio-economic groups. Moreover, changes are expected to be associated with several social-ecological factors.

**Methods:** The (non-)movement behaviour of the sample was measured with an Actigraph wGT3X-BT worn on the non-dominant wrist for 7 days and nights at two time points, namely up to six months prior to retirement and at three months after retirement. Questionnaires have been used to measure the following social-ecological factors: physical health status, mental health status, social connectedness and social group membership, exercise during the life course, exercise motivation, expectations regarding aging, several socio-economic status indicators and other demographic factors. The daily proportions in LPA, MVPA, SB and SLEEP will be estimated using the R package GGIR. Compositional data analysis will be used to analyse the data.

**Results:** We aim to recruit 100 participants pre-retirement (recruitment is still ongoing). The current sample (status 2022-12-01) measured at pre-retirement n = 88 and at 3 months post-retirement n = 62 (56% female; 2 % drop-out). Changes in (non-)movement behaviour during the retirement transition will be presented, alongside changes in the other measured factors. We will also present the absolute values of (non-)movement behaviour prior to retirement as well as after retirement.

**Conclusions:** This is one of the first studies to investigate device-based 24-hour (non-)movement behaviour in combination with a set of potentially influencing factors. The overarching aim of this study is to gain insight in the need for an intervention and to inform the development of an optimal lifestyle intervention during the retirement transition. The transition from work to retirement is a promising event to target with lifestyle interventions, since daily routines are often strongly impacted and mostly more free time becomes available.

# The equity of healthy eating and active living digital interventions for older adults

**Dr. Bronwyn McGill<sup>1</sup>**, Dr. Sarah Marshall<sup>1</sup>, Ms. Nicole Halim<sup>1</sup>, Dr. Sarah Yeun Sim Jeong<sup>2</sup>, Ms. Dee Upton<sup>2</sup>, Prof. Margaret Allman-Farinelli<sup>1</sup>

<sup>1</sup>Prevention Research Collaboration, The University of Sydney, Sydney, Australia, <sup>2</sup>NSW Ministry of Health, Sydney, Australia

**SO.1.07 - Latest findings in Ageing, UKK - K3+4 (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose** Healthy eating and active living among people aged 65+ years contributes to healthy ageing. While health behaviour change interventions increasingly use digital technologies, there is debate about the equity of such interventions, particularly among older adults of low socioeconomic status, those living in regional and rural areas, those from culturally and linguistically diverse backgrounds and those with lower levels of education. This systematic review examined the equity of digital healthy eating and active living interventions in older Australian adults.

**Methods** We searched six electronic databases and grey literature. Eligibility criteria were: i) interventions targeting community-dwelling older Australians aged 65+ years, ii) delivered using digital technology to support behaviour change, iii) primary outcomes of promoting healthy eating and/or active living (physical activity and/or sedentary behaviour), iv) published evaluation results. Interventions delivered in rehabilitation or residential care settings were excluded. All study designs were included. Quality appraisal of studies was conducted by two independent authors using the Mixed Methods Appraisal Tool. A narrative synthesis was undertaken.

**Findings** Twenty-four reports of 17 interventions were included. From 1789 unique records identified, 110 full texts were assessed for eligibility. Of 66 grey literature listings assessed, none were eligible (e.g., government policy reports, local council documents, and local exercise groups). In the 17 interventions included, the primary outcomes included active living behaviours (n=13), healthy eating behaviours (n=1), or both (n=3). Digital delivery components included telephone (n=10), websites (n=6), fitness trackers (n=4), email (n=2), video conferencing (n=1), and mobile phone apps (n=1). Intervention duration ranged from 2 weeks to 18 months and were predominately delivered by allied health professionals (n=9). Four interventions specifically targeted older adults in regional or remote areas. No other equity-related characteristics were targeted. Healthy equity factors were either not discussed or minimally considered in the published evaluations.

**Conclusions** Our results highlight the scarce yet emerging evidence for digital healthy eating and active living interventions for older Australian adults. As interventions are developed or adapted, and evaluation evidence builds, it is essential to consider health equity to support all older adults to achieve a healthy and active lifestyle for maintaining independence and wellbeing.

# Maternal and paternal dietary quality and dietary inflammation associations with offspring DNA methylation and epigenetic biomarkers of aging

**Dr. Marion Lecorguillé<sup>1</sup>**, Dr. Pilar Navarro<sup>1</sup>, Dr. Ling-Wei Chen<sup>1,2</sup>, Dr. Celine Murrin<sup>1</sup>, Dr. Karien Viljoen<sup>1</sup>, Mr. John Mehegan<sup>1</sup>, Dr. Nitin Shivappa<sup>3</sup>, Prof. James R Hébert<sup>3,4</sup>, Prof. Cecily C Kelleher<sup>1</sup>, Dr. Matthew Suderman<sup>5</sup>, Dr. Catherine M Phillips<sup>1</sup>

<sup>1</sup>School of Public Health, Physiotherapy and Sports Science, University College Dublin, Dublin, Ireland,

<sup>2</sup>Institute of Epidemiology and Preventive Medicine, College of Public Health, National Taiwan University, Taipei, Taiwan, <sup>3</sup>Cancer Prevention and Control Program and Department of Epidemiology and Biostatistics, Arnold School of Public Health, University of South Carolina, Columbia, South Carolina, USA, <sup>4</sup>Connecting Health Innovations, LLC, Columbia, South Carolina, USA, <sup>5</sup>MRC Integrative Epidemiology Unit, Population Health Sciences, Bristol Medical School, University of Bristol, Bristol, United Kingdom

**SO.1.07 - Latest findings in Ageing, UKK - K3+4 (Level 3), June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** A. Ageing

**Purpose:** Maternal diet and chronic inflammation may influence early-life offspring health. Some evidence suggests these associations may be driven by epigenetic changes. New research described epigenetic aging – an age estimation based on DNA markers – as a mechanistic link between early-life exposures and long-term health. However, parental dietary quality effects on offspring DNA methylation (DNAm) remain poorly described. We aim to fill this gap by elucidating the influence of maternal and paternal whole-diet quality and inflammatory potential on offspring DNAm in the Lifeways Cross-generation cohort.

**Methods:** Irish families (n=1124) were recruited around 16 weeks of gestation. Maternal dietary intake during the first trimester and paternal diet during the 12 previous months were assessed with a food-frequency questionnaire. Parental dietary inflammatory potential and quality were determined using the energy-adjusted Dietary Inflammatory Index (E-DII<sup>TM</sup>), the Healthy Eating Index 2015 (HEI-2015), and the maternal Dietary Approaches to Stop Hypertension index (DASH) score. DNAm in the saliva tissue of 246 children at age nine was measured using the Illumina Infinium HumanMethylationEPIC array. DNAm-derived biomarkers of aging, the Pediatric-Buccal-Epigenetic clock (PedBE) and DNAm estimator of telomere length (DNAmTL), were calculated. Using an agnostic genome-wide approach, we examined parental dietary score associations with DNAm-derived biomarkers of aging and DNAm levels of 850K CpG sites.

**Results/findings:** We did not report major associations between parental dietary scores and epigenetic biomarkers of aging. However, maternal HEI-2015 scores were inversely associated with DNAm at CpG site (cg21840035) located near the *PLEKHM1* gene, whose functions involve regulation of bone development ( $\beta = -0.0036$ , per 1-point increase in the score,  $p\text{-value} = 5.6 \times 10^{-8}$ ). An increase in paternal HEI-2015 score was related to lower methylation at CpG site (cg22431767), located near cell signaling gene *LUZP1* ( $\beta = -0.0022$ , per 1-point increase in the score,  $p\text{-value} = 4.1 \times 10^{-8}$ ).

**Conclusions:** Parental dietary quality in the prenatal period, evaluated by the HEI-2015, may influence offspring DNAm but not DNAm biomarkers of aging during childhood. Further research to improve our understanding of parental nutritional programming is warranted, with a view to providing further evidence for public health action to promote health and longevity in future generations.

# Community implementer perceptions of the attributes of a packaged family healthy weight program with and without participation in a learning collaborative.

**Dr. Jennie Hill**<sup>3</sup>, Dr. Kate Heelan<sup>1</sup>, Dr. Tzeyu Michaud<sup>2</sup>, Ms. Caitlin Golden<sup>2</sup>, Dr. Bryce Abbey<sup>1</sup>, Dr. R. Todd Bartee<sup>1</sup>, Dr. Gwenndolyn Porter<sup>2</sup>, Dr. Paul Estabrooks<sup>3</sup>

<sup>1</sup>University of Nebraska Kearney, Kearney, USA, <sup>2</sup>University of Nebraska Medical Center, Omaha, USA,

<sup>3</sup>University of Utah, Salt Lake City, USA

**SO.1.08 - Lessons learned from implementation in the school setting, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Despite the efficacy of family healthy weight programs (FHWP), adoption and implementation, particularly in rural areas, has been challenging. The adoption of evidence-based interventions, such as FHWP, is enhanced when potential implementers positively perceive the intervention attributes. Further, facilitation and guidance through action learning collaboratives (LCs) are hypothesized to enhance potential implementers' positive perceptions of program attributes. This abstract describes the degree to which rural community implementation teams (CITs) positively evaluate the attributes of a prototype packaged program, the Building Healthy Families Online Training Resources and Program (BHF Resources) with and without participation in a LC.

**Methods:** This Type 3 Hybrid Effectiveness Implementation pilot trial was guided by the RE-AIM and Promoting Action on Research in Health Services (PARiHS) Frameworks. CITs were assigned to receive the BHF Resources with (n=4) or without (n=3; Package Only) participation in a LC. Members of the CITs (n=24) completed baseline and 1 year follow-up surveys with validated scales assessing intervention attributes including relative advantage, compatibility, ease of use, trialability and observability (7-point scale) as well as intervention acceptability, appropriateness, and feasibility (5-point scale). We conducted a Wilcoxon Rank Sum test to examine the group differences.

**Results:** CIT member perceptions of the attributes of the BHF Resources were positive and, as expected, did not differ based on LC and PO assignment at baseline (range=5.3-6.7/7; 4.3-4.7/5). At 1 year follow-up, LC CIT members either sustained or increased positive evaluations of all BHF Resources attributes while PO CIT members experienced decreases in positive evaluation of the attribute. All CIT member perceptions of the BHF Resources were significantly higher for those in LC than in PO at 1 year follow-up. The largest differences were in compatibility (LC: M=6.3 [SD=1.0] vs PO: M=4.7 [SD=1.1]; p<0.01) and relative advantage (LC: M=6.46[SD=0.9] vs PO: M=5.49[SD=0.9]; p=0.02).

**Conclusions:** CIT perceptions of program attributes are not solely based on the design and packaging of interventions. Interaction and facilitation with other CITs and program developers can further enhance positive views of factors that have been demonstrated to increase the likelihood of adoption, implementation, and program maintenance in rural communities.

# Participation and initial outcomes of a Family-based Healthy Weight Program- Building Healthy Families- implemented in rural US communities.

**Dr. Kate Heelan<sup>1</sup>**, Prof. Jennie Hill<sup>2</sup>, Dr. R. Todd Bartee<sup>1</sup>, Dr. Bryce Abbey<sup>1</sup>, Mrs. Ali Malmkar<sup>1</sup>, Dr. Paul Estabrooks<sup>2</sup>

<sup>1</sup>University of Nebraska at Kearney, Kearney, USA, <sup>2</sup>University of Utah, Salt Lake City, USA

**SO.1.08 - Lessons learned from implementation in the school setting, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** E. Implementation and scalability

The United States expected 1.27 million new childhood obesity cases post pandemic. With the documented lack of evidence- and family-based healthy weight programs available in rural areas, this increase will likely exacerbate existing geographic disparities in obesity. Dissemination and implementation strategies such as packaging program materials and training resources for rural community implementation and action learning collaboratives (LC) have the potential to advance geographic health equity related to rural childhood obesity.

**Purpose:** To describe the utility of a resource package for the implementation of a 12-week family-based healthy weight program (Building Healthy Families: BHF) to improve participation and weight outcomes in rural midwestern US communities (mid and post pandemic) with and without a LC.

**Methods:** A pilot type-3 hybrid effectiveness-implementation trial was used to assign 7 communities to receive a turn-key, train-the-trainer, implementation package of BHF without a LC (PO: n=3) and with participation in a LC (n=4) that included bimonthly sessions with BHF developers and research team members. Families with at least one 6–12-year-old child with a BMI  $\geq$  95th percentile were eligible to participate. Programs were also intended to reach lower socioeconomic status families.

**Results:** Thirty-six families enrolled in the program with 19 qualifying children (BMI percentile =  $98.7 \pm 0.07$ , age =  $10.5 \pm 1.6$  yrs). Twelve families (9 children) were in LC communities and 14 families (12 children) were in PO communities. In LC, 47% of families had high school education and 21% reported food insecurities compared to 60% of PO families having pre-high school or high school education and 30% food insecurity. Ninety-two percent of families completed the 12-week program in LC compared to 71% in PO communities. LC children attended  $94.3 \pm 9.4\%$  of sessions and had a BMI z-score change of  $-0.15 \pm 0.08$ . PO children attended  $73.7 \pm 12.4\%$  of sessions and BMI z-score change was  $-0.09 \pm 0.11$  ( $p < 0.05$ ).

**Conclusions:** The LC implementation strategy improved adherence, reduced program attrition, and increased weight status reduction over and above providing the packaged BHF resources and training. A larger trial will be necessary to confirm the finding that rural communities providing services to lower socioeconomic families may need additional guidance to maximize success.

# Investigating implementation of school health policies through a health equity lens: Study protocol and initial findings

**Dr. Gabriella Mcloughlin<sup>1,2</sup>**, Ms. Callie Walsh-Bailey<sup>3</sup>, Ms. Rachel Inman<sup>4</sup>, Dr. Chelsea Singleton<sup>5</sup>, Dr. Lindsey Turner<sup>6</sup>

<sup>1</sup>Temple University, Philadelphia, USA, <sup>2</sup>Washington University Implementation Science Center for Cancer Control, St. Louis, USA, <sup>3</sup>Brown School Washington University in St. Louis, St. Louis, USA, <sup>4</sup>Drexel University, Philadelphia, USA, <sup>5</sup>Tulane University, New Orleans, USA, <sup>6</sup>Boise State University, Boise, USA

**SO.1.08 - Lessons learned from implementation in the school setting, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Policy, systems, and environmental interventions are an optimal vehicle for driving health promotion and addressing health disparities, yet much of the research fails to consider a policy's implementation as a precursor to its' population health impact. We are developing equity-focused measurement tools through a participatory approach comprising three aims: 1) identify priority constructs related to equitable implementation of school health policies; 2) create measures of key implementation determinants, processes, and outcomes; and 3) conduct cognitive testing to establish face and content validity.

**Methods:** We used a consensus approach to identify key implementation science and health equity frameworks, then selected constructs. We developed a survey containing key constructs, definitions, and example assessment items to gather input from an array of researchers, practitioners, and groups who implement or are affected by school wellness policies. We recruited respondents from over 20 professional groups across the United States to rate the importance (1= lowest; 5= highest) of these constructs and suggest additional topics to measure. Then, we solicited feedback from a group (n=8) of high school students. We conducted descriptive analyses; free response data were analyzed inductively to reveal themes and potential constructs to add.

**Results:** We received 121 survey responses, mainly from school staff and leaders (n=76; 62.8%) and researchers (21; 17.4%). Mean construct importance ranged from 3.82 to 4.62; the highest rated constructs were 'large-scale unanticipated events' (determinant; 4.62); 'socioeconomic, cultural, and political context' (determinant; 4.5); and 'provide access to healthy options that avoid stigmatization' (process; 4.5). Constructs rated below 4 (i.e., somewhat important) were dropped and two were added based on survey results and youth engagement, yielding 41 total. From these results, our team developed surveys and interview guides for multiple participant groups (i.e., students; parents/community members; teachers and staff; administrators) for cognitive testing.

**Conclusions:** Co-creating measurement tools with community partners and practitioners is a vital step to bridging the policy-practice gap. Grounding measures in health equity marks a key innovation in school policy research. This study will yield measurement tools that will undergo further psychometric testing and be made available to implementation researchers and practitioners.

# Let's Make a SPLASH: Results of the Supporting Physical Literacy at School and Home Feasibility Trial

**Dr. Erin Hennessy**<sup>1</sup>, Ms. Breanne Wilhite<sup>1</sup>, Dr. Kenneth Chui<sup>3</sup>, Dr. Christina Economos<sup>1</sup>, Dr. Daniel Hatfield<sup>1</sup>, Ms. Stephanie Herrick<sup>4</sup>, Ms. Chrissy Odalen<sup>4</sup>, Dr. Jennifer Sacheck<sup>2</sup>

<sup>1</sup>Tufts University Friedman School of Nutrition Science and Policy, Boston, USA, <sup>2</sup>George Washington University Milken School of Public Health, Washington, DC, USA, <sup>3</sup>Tufts University School of Medicine, Boston, USA, <sup>4</sup>New York Road Runners, New York City, USA

**SO.1.08 - Lessons learned from implementation in the school setting, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Physical literacy (PL)—the competence, confidence, and motivation to be physically active—has gained attention as a means to increase children's physical activity (PA) levels which have been stagnating below recommendations. Both the school and home environment are critical for supporting children's PL and PA, yet few multilevel interventions exist. This study examined the feasibility of SPLASH, a multilevel, comprehensive, PL-focused program to support children's PA at school and home.

**Methods:** During the 2021-2022 academic year, six NYC public schools completed a 5-month feasibility trial including implementation of a novel PL-focused school curriculum for 3<sup>rd</sup>-5<sup>th</sup> grade students and complementary family engagement materials. Families opted into receiving direct email and/or text messages with embedded video links while all families had access to print materials and social media (Facebook) posts. A mixed-methods evaluation included multiple web-based surveys distributed to families along with surveys and interviews with program implementers (e.g., PE teachers) during early- and late-phase implementation. Interviews were also conducted with families who opted into receiving email/text messages.

**Results/findings:** A total of 91 English- and Spanish-speaking families opted into receiving direct family engagement materials. Approximately 80% (72/91) of families who initially enrolled remained in the program at study completion. Email open rates ranged from 32-67% (mean, 50%). Parent surveys indicated higher reported encouragement of and engagement in PA from survey 1 to survey 3 ("always encourage PA" increased from 37.8% to 64.7% and "always enjoy sports and PA as a family" increased from 22.4% to 58.5%). Program implementers reported that program materials were easy to use and deliver to families, helped their students be more physically active at school, and elicited high levels of student enjoyment overall. Implementers reported making modifications to lesson plans to accommodate unique situations based on class size, class dynamics, and physical space.

**Conclusions:** Overall it was feasible to implement the multilevel (school-home) intervention despite ongoing challenges due to the COVID-19 pandemic. A randomized-controlled trial will be implemented in the 2023-2024 academic year to test the efficacy of this intervention for increasing children's PA levels.

# Potential implementation strategies to facilitate recess in elementary schools

**Dr. Allison Poulos<sup>1</sup>, Dr. Pamela Kulinna<sup>1</sup>**, Dr. Mengyi Wei<sup>1</sup>, Ms. Kylie Wilson<sup>1</sup>, Ms. Marissa Schulke<sup>1</sup>, Mr. Kahyun Nam<sup>1</sup>

<sup>1</sup>Arizona State University, Phoenix, USA

**SO.1.08 - Lessons learned from implementation in the school setting, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Recess is a critical physical activity opportunity for children, but often not prioritized in schools. The purpose of this research was to identify determinants of recess, and determine potential implementation strategies to overcome barriers to improve recess uptake.

**Methods:** In this qualitative case study, we retrospectively identified determinants of recess using data from five open-ended questions in a survey administered online to elementary school teachers (N=81) in Arizona in fall 2021. Questions were based on principles of Diffusion of Innovations' Theory, as these factors influence the likelihood of adopting an innovation, or practice such as recess. Determinants were classified as facilitators (advantage and compatibility) and barriers (challenges to implementation, problems for students, and needed supports). Data were analyzed using a reflexive thematic analysis to identify common barriers and facilitators, incorporating peer debriefing and negative case searches to ensure trustworthiness. We mapped barriers using the Expert Recommendations for Implementation Change (ERIC) tool aligned with Proctor's reporting guidelines to identify optimal implementation strategies to facilitate recess uptake.

**Results/findings:** Major reported facilitators of recess included physical health and socialization (relative advantage) and available equipment (compatibility). The most prominent barrier to offering recess was lack of supervision (challenge). Potential implementation strategies to address this barrier included incentivizing recess adoption and implementation, funding and contracting for recess, and accessing new funding. Bullying, behavior issues, and space and safe play spaces were the main reported issues for children during recess (problems for students). Potential implementation strategies to address these barriers included training recess staff to facilitate social and emotional learning competencies and evaluating conditions and adapting physical structures and equipment. Additional supervision, supervisor training, and equipment were the most prominent requests (needed supports). Potential implementation strategies to overcome barriers included conducting ongoing training, providing consultation for recess supervision, and accessing new funding.

**Conclusions:** The provision of recess in elementary school is a public health strategy and national recommendation in the United States of America. Implementation strategies defined using existing integrated implementation science frameworks can provide uniform guidance on overcoming common barriers to recess, supporting opportunities for physical activity in schools to foster children's health.

# Features of effective staff training programmes within school-based interventions targeting student activity behaviour: a systematic review and meta-analysis

Ms. Mairead Ryan<sup>1</sup>, Ms. Olivia Allcott<sup>1</sup>, Dr. Erika Ikeda<sup>1</sup>, Dr. Jian'an Luan<sup>1</sup>, Prof. Riikka Hofmann<sup>1</sup>, **Dr. Esther Van Sluijs<sup>1</sup>**

<sup>1</sup>University of Cambridge, Cambridge, United Kingdom, <sup>2</sup>University of Cambridge, Cambridge, United Kingdom, <sup>3</sup>University of Cambridge, Cambridge, United Kingdom, <sup>4</sup>University of Cambridge, Cambridge, United Kingdom, <sup>5</sup>University of Cambridge, Cambridge, United Kingdom, <sup>6</sup>University of Cambridge, Cambridge, United Kingdom

**SO.1.08 - Lessons learned from implementation in the school setting, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Evaluations of school-based activity behaviour interventions suggest limited effectiveness on students' device-measured outcomes. Teacher-led implementation is common but the training provided is poorly understood and may affect implementation and student outcomes. We reviewed staff training delivered within interventions and explored if specific features are associated with intervention fidelity and student activity behaviour outcomes.

**Methods:** We searched seven databases (01/2015-05/2020) for randomised controlled trials of teacher-led school-based activity behaviour interventions reporting on teacher fidelity and/or students' device-measured activity behaviour. Pilot, feasibility and small-scale trials were excluded. Study authors were contacted if staff training was not described using all items from the Template for Intervention Description and Replication reporting guideline. Training programmes were coded using the Behaviour Change Technique (BCT) Taxonomy v1. The Effective Public Health Practice Project tool was used for quality assessment. Promise ratios were used to explore associations between BCTs and fidelity outcomes (e.g. % of intended sessions delivered). Differences between fidelity outcomes and other training features were explored using chi-square and Wilcoxon rank-sum tests. Random-effects meta-regressions were performed to explore associations between training features and changes in students' activity behaviour.

**Results/findings:** We identified 68 articles reporting on 53 eligible training programmes and found evidence that 37 unique teacher-targeted BCTs have been used (mean per programme=5.1 BCTs; standard deviation=3.2). The only frequently identified BCTs were 'Instruction on how to perform the behaviour' (identified in 98.1% of programmes) and 'Social support (unspecified)' (50.9%). We found moderate/high fidelity studies were significantly more likely to include shorter ( $\leq 6$  months) and theory-informed programmes than low fidelity studies, and 19 BCTs were independently associated with moderate/high fidelity outcomes. Programmes that used more BCTs (estimated increase per additional BCT,  $d$ : 0.18; 95% CI: 0.05, 0.31) and BCTs 'Action planning' (1.40; 0.70, 2.10) and 'Feedback on the behaviour' (1.19; 0.36, 2.02) were independently associated with positive physical activity outcomes ( $N=15$ ). No training features associated with sedentary behaviour were identified ( $N=11$ ).

**Conclusions:** Few evidence-based BCTs have been used to promote sustained behaviour change amongst teachers in school-based activity behaviour interventions. Our findings provide insights into why interventions may be failing to effect student outcomes.

# The cost-effectiveness of a campus food pantry: food quality and nutrition security

**Ms. Ana Mitchell<sup>1</sup>**, Dr. Alana Harris<sup>1</sup>, Dr. Brenna Ellison<sup>1,2</sup>, Dr. Melissa Pflugh Prescott<sup>1</sup>

<sup>1</sup>University of Illinois at Urbana-Champaign, Urbana, USA, <sup>2</sup>Purdue University, West Lafayette, USA

**SO.1.08 - Lessons learned from implementation in the school setting, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Traditionally, food pantries were designed to support food sufficiency, measuring effectiveness as the quantity of food distributed, regardless of nutritional quality. Given burgeoning diet-related health disparities, the focus is shifting to improving nutrition security and measuring food quality. Food pantries have been the most implemented program on US college campuses to support food-insecure students and the sustainability and scale-up of these programs are largely cost-dependent. The aim of this study was to determine the cost-effectiveness of implementing a campus food pantry where effectiveness is measured as the amount and healthfulness of food distributed and the number of students served.

**Methods:** In August 2020, a campus, client-choice, satellite food pantry opened at a large Midwest university with MyPlate-inspired distribution guidelines. Student usage, item inventory, and costs were tracked by pantry staff. Items were analyzed for specific nutrients using the Nutrition Data System for Research. The servings of food distributed were estimated using serving sizes presented on food labels and analyzed for nutritional quality using the Healthy Eating Research Nutrition Guidelines for the Charitable Food System. This 3-tier system (*choose often* (green), *choose sometimes* (yellow), and *choose rarely* (red)) has thresholds based on levels of saturated fat, added sugar, and sodium. The cost per visit and per serving of 'choose often' food distributed were calculated for both total preliminary costs and implementation costs.

**Results/findings:** A total of 48,857 servings of food were distributed: 52.2% green, 24.2% yellow, and 23.6% red. Condiments and cooking staples were not ranked (3,373 servings). About 1 serving of 'choose often' food was distributed per dollar invested in the program and nearly 60% of the 'choose often' foods distributed were fruits and vegetables. For implementation costs only, the cost per serving of 'choose often' food was \$0.78, and per serving distributed was \$0.38.

**Conclusions:** Campus food pantries are uniquely positioned to promote health equity with the foods they make accessible and can be a relatively cost-effective way to get healthy foods to food-insecure students. More research is needed to assess the cost-effectiveness of other programs that promote nutrition security on college campuses.

# Investigating implementation determinants and implementation outcomes of the school-based obesity prevention intervention in the Family+ project: a mixed methods approach

**Ms. Friederike Butscher<sup>1</sup>**, Mr. Jan Ellinger<sup>1</sup>, Dr. Doris Gebhard<sup>1</sup>

<sup>1</sup>Department of Sport and Health Sciences, Technical University Munich, Munich, Germany

**SO.1.08 - Lessons learned from implementation in the school setting, Clarion Hotel Gillet - Room Gillesalen, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The school setting is of great importance for obesity prevention interventions in children. Evidence on how these interventions can be implemented successfully is scarce, though it is known that the implementation of an intervention affects its effectiveness. The aim of this study is to investigate the implementation determinants (ID) and implementation outcomes (IO) of a school-based obesity prevention intervention in the project Family+, using a mixed methods approach.

**Methods:** The intervention comprised the topics physical activity, sedentariness, nutrition, and sleep. It was conducted by teachers throughout the school year 2021/2022. In nine primary schools, a total of 47 classes participated.

The investigation of the ID and IO follows the Consolidated Framework for Implementation Research (CFIR). Based on the CFIR a questionnaire and a semi-structured interview guideline was developed. ID, their valence and IO were collected post-intervention from teachers, who conducted the intervention. The data sources complement each other.

In the first step, interviews will be analyzed using qualitative content analysis. The procedure of content-related structuring will be applied to the material following the CFIR constructs as deductive category system. Quantitative data will be analyzed and frequencies and correlations between ID, their valences and IO will be reported.

In the second step, results from both data sets will be merged, systematically compared, and jointly displayed in a convergence coding matrix.

Third, qualitative data will be quantified and merged with quantitative data. The merged data will be analyzed and construct frequencies and co-occurrences of ID, their valences and IO will be investigated for possible dependencies.

**Preliminary Results:** Data collection is completed, the online questionnaire was answered by n=20 teacher of which n=7 agreed to participate in an interview (on average 45min).

**Conclusions:** The presented results of the mixed methods analysis will contribute to better understanding ID and IO, and the relationship between them. Actionable recommendations for successful implementation of school-based obesity prevention interventions will be derived.

# Inequalities in exclusively mobile interventions targeting weight-related behaviours: A systematic review of observational studies

**Dr. Laura M. König<sup>1</sup>**, Dr. Cynthia C. Forbes<sup>2</sup>, Dr. Heide Busse<sup>3,4</sup>, Dr. Ann DeSmet<sup>5</sup>, Dr. Dorothy Szinay<sup>6,7</sup>, Dr. Eline S. Smit<sup>8</sup>

<sup>1</sup>University of Bayreuth, Kulmbach, Germany, <sup>2</sup>University of Hull, Hull, United Kingdom, <sup>3</sup>Leibniz Institute of Prevention Research and Epidemiology -BIPS, Bremen, Germany, <sup>4</sup>Leibniz Science Campus Digital Public Health, Bremen, Germany, <sup>5</sup>Université Libre de Bruxelles, Brussels, Belgium, <sup>6</sup>University College London, London, United Kingdom, <sup>7</sup>Evidera, London, United Kingdom, <sup>8</sup>University of Amsterdam, Amsterdam, Netherlands

**SO.1.09 - The Latest Research on Mobile Interventions for Weight-Related Behaviors, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Mobile health interventions are promising behaviour change tools. However, recent evidence suggests that they might benefit deprived populations less, consequently widening existing inequalities in health. Most evidence so far stems from analyses of clinical trial data, which may suffer from selection bias. This systematic review investigated differences in uptake of, engagement with, and effectiveness of exclusively mobile interventions for weight-related behaviours (i.e., diet, physical activity, sedentary behaviour) in real-life contexts.

**Methods:** The protocol was registered on PROSPERO (CRD42021290769). Five databases (CINAHL, EMBASE, PsycINFO, PubMed, Web of Science) were searched, identifying 6466 individual records. Records were independently screened by two authors. Observational studies were eligible for inclusion if they reported on uptake, engagement, and/ or effectiveness of an exclusively mobile intervention, and examined outcomes by at least one inequality indicator included in the PROGRESS-Plus framework.

**Results:** Twenty-four publications reporting on 25 studies were included. The majority of studies investigated mobile intervention uptake by comparing users and non-users. Most studies examined multiple inequality indicators, with the majority studying age or gender (each n=21). Furthermore, studies investigated education (n=8), income (n=6), race/ ethnicity (n=4), the number of chronic conditions, having health insurance, location, socio-economic status composite scores (each n=2), disability status, employment, and migration status (each n=1). Younger age and higher socio-economic status were mostly associated with increased uptake, and ethnicity and location were unrelated to uptake. Results for other inequality indicators were mixed, as were results regarding engagement and effectiveness.

**Conclusions:** This review provides additional evidence in favour of a digital divide, especially regarding age and socioeconomic status, in mHealth interventions for weight-related behaviours based on observational studies by investigating the uptake of exclusively mobile interventions outside of clinical trials. More research, however, is needed on potential differences in engagement and effectiveness in real-life contexts.

# Predicting High-Risk Periods for Weight Regain Following Initial Weight Loss

**Dr. Kathryn Ross<sup>1</sup>**, Dr. Lu You<sup>1,2</sup>, Dr. Peihua Qiu<sup>1</sup>

<sup>1</sup>University of Florida, Gainesville, USA, <sup>2</sup>University of South Florida, Tampa, USA

**SO.1.09 - The Latest Research on Mobile Interventions for Weight-Related Behaviors, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Newer, individually-adaptive intervention models focus on providing tailored support at times when individuals are at high risk for adverse health outcomes. It is unclear what constitutes a “high-risk” period for weight regain following initial weight loss.

**Methods:** We developed an algorithm to detect high-risk periods for weight regain using data collected from 74 adults (age=50.6±10.4 years, BMI=31.2±4.5 kg/m<sup>2</sup>, 69% Female, 83% Non-Hispanic White) with overweight or obesity who completed an initial 3-month Internet-based weight loss program followed by a 9-month maintenance period. Daily e-scale data were collected along with weekly self-report questionnaire items querying behaviors, cognitions, and moods hypothesized to be proximally associated with weight regain. Using data from participants who lost ≥5% of their baseline weight during the initial intervention (n=46), a linear mixed effects model was used to select predictors most highly associated with weight regain. Next, random forest regression was used to build a tree model predicting weight regain the following week. Algorithm performance was tested using data from the remaining participants not included in model development (n=28) and using pilot data collected over 6 months from 30 participants who self-reported recent weight losses of ≥5% (age=38.9±14.8 BMI=28.1±5.3 kg/m<sup>2</sup>, 67% Female, 60% Non-Hispanic White).

**Results:** The final algorithm retained frequency of self-monitoring caloric intake and weight over the past week along with self-report ratings of hunger and the importance of weight management goals compared to competing life demands. In the initial training dataset (n=46), the algorithm predicted weight regain the following week with a sensitivity of 75.6% and a specificity of 45.8%; in the initial test dataset (n=28), sensitivity was 82.0% and specificity was 30.4%. In the pilot dataset sensitivity was 81.1% and sensitivity was 31.7%.

**Conclusion:** Results demonstrate that patterns of self-monitoring and responses on two self-report questionnaire items can successfully be used to predict weight regain a week later. Our team has an ongoing, NIH-funded R01 clinical trial assessing whether the provision of extended-care intervention at times when this algorithm determines that individuals are at high risk for weight regain can improve long-term weight loss maintenance compared to standard, once-per month extended-care contact.

# A cluster RCT of a nudging intervention to increase healthier foods and drinks pre-ordered online from high school canteens

**Ms. Tessa Delaney**<sup>1,2,3</sup>, Ms. Hannah Lamont<sup>1,2,3</sup>, Associate Professor Sze Lin Yoong<sup>1,4</sup>, Prof. Luke Wolfenden<sup>1,2,3</sup>, Mr. Christophe Lecathelinais<sup>1,2,3</sup>, Dr. Tara Clinton-McHarg<sup>1,2,3</sup>, Dr. Rachel Sutherland<sup>1,2,3</sup>, Dr. Rebecca Wyse<sup>1,2,3</sup>

<sup>1</sup>Hunter New England Population Health, Wallsend, Australia, <sup>2</sup>School of Medicine and Public Health, The University of Newcastle, Wallsend, Australia, <sup>3</sup>Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>4</sup>Global Preventive Health and Nutrition, Institute for Health Transformation, Deakin University, Geelong, Australia

**SO.1.09 - The Latest Research on Mobile Interventions for Weight-Related Behaviors, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Background:** The World Health Organization recommends the use of 'nudging' to promote healthier food choices within school food settings. The rise in online school canteen lunch ordering systems, where students pre-order and pay for foods and drinks online, represents a unique opportunity to apply strategies that nudge users towards healthier food choices with high fidelity. Despite this, no study has tested the efficacy of an online nudging intervention on increasing healthier foods and drinks pre-ordered from high-school canteens.

**Purpose:** To assess the impact of embedding healthy food nudges (menu labelling, positioning, prompts and tailored feedback) in an online lunch ordering system on the nutritional quality of school canteen lunch purchases of high school students (aged 12–19 years).

**Method:** A cluster-RCT was conducted with nine high schools (1331 students) in one Australian state. Schools were randomised to a 2-month multi-strategy nudging intervention implemented in the school's online canteen or control (usual online ordering). Outcomes were the proportion of 'Everyday', 'Occasional' and 'Should Not Be Sold' lunch items purchased, categorized using the state's healthy canteen policy. Linear mixed models were used to analyse study outcomes.

**Findings:** Analysis of the student cohort (Intervention: 4 schools, 656 students; Control: 5 schools, 675 students) found significant between group differences over time favouring the intervention group for the mean percentage of online lunch items per student that were 'Everyday' (+5.5%;  $P < 0.001$ ) and 'Should Not Be Sold' (-4.4%;  $P < 0.001$ ). There were no between group differences over time in the mean percentage of online lunch items that were 'Occasional' (-1.2%;  $P = 0.47$ ).

**Conclusion(s):** These findings suggest a 2-month multi-strategy nudging intervention in an online lunch ordering system can increase the nutritional quality of foods purchased from high school canteens. Such an intervention may be an appealing policy option for stakeholders interested in improving adolescent nutrition. Further research assessing the long-term effect of the intervention may be warranted.

# Smart Indigenous Youth: A Digital Citizen Science Approach to Implement and Evaluate Active Living Interventions

**Dr. Tarun Reddy Katapally<sup>1</sup>, Dr. Jasmin Bhawra<sup>2</sup>, Mr. Eric Kwabia<sup>3</sup>, Ms. Prasanna Kannan<sup>3</sup>**

<sup>1</sup>Western University, London, Canada, <sup>2</sup>Toronto Metropolitan University, Toronto, Canada, <sup>3</sup>University of Regina, Regina, Canada

**SO.1.09 - The Latest Research on Mobile Interventions for Weight-Related Behaviors, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Smart Indigenous Youth (SIY) embeds land-based active living programs into Indigenous school curricula to improve youth mental health, while engaging youth as citizen scientists to implement and evaluate the initiative.

**Methods:** SIY is a mixed-methods 5-year longitudinal community trial set in the Canadian province of Saskatchewan. The initiative started in 2019, with two rural schools that administered separate 4-month (winter term) land-based active living programs specific to their culture, community, geography and language. Before implementation, youth were recruited as citizen scientists to engage with the research team using their own smartphones, before, during, and after the intervention period using a custom-built smartphone app. In year-1 (2019), 93 youth aged 13-18 years reported on their physical activity patterns, land-based activities, mental health, and substance misuse. These data were captured via objective smartphone sensors, subjective validated quantitative and qualitative measures, as well as mixed-methods real-time ecological momentary assessments. In year-2 (2020 [n=37]) and year-3 (2021 [n=20]), SIY was adapted to respond to the Coronavirus disease pandemic to capture the impact of school lockdown policies (2 schools/year) on youth active living and mental health. Analytical approaches include longitudinal regression modeling of quantitative data, thematic analysis of qualitative data, and descriptive and time-series analysis of ecological momentary assessment data.

**Findings:** Year 1 findings depicted an overarching theme of the importance of Indigenous culture, identity, history, and language. Analyses also showed that land-based activities such as canoeing and setting traps played a key role in improved youth mental health by providing them a sense of purpose and identity. Preliminary year 2 and 3 findings show that school lockdown policies had a differential impact on active living across participating schools, with youth belonging to schools with more advanced digital curricula responding more positively towards digital engagement strategies to promote active living.

**Conclusions:** SIY highlights not only the importance of linking active living with culture, but also indicates the potential of leveraging citizen-owned ubiquitous digital tools in implementing interventions in rural communities. More importantly, SIY shows that digital citizen science approaches allow for rapid adaptation of interventions to respond to real-world challenges.

# Examination of whether phone coaching can rescue individuals with poor early weight loss within Internet-delivered weight loss treatment: Results from the Dial Now Trial

**Dr. Jessica Unick<sup>1</sup>**, Dr. Shira Dunsiger<sup>2</sup>, Dr. Christine Pellegrini<sup>3</sup>, Dr. Graham Thomas<sup>1</sup>, Dr. Kathryn Demos<sup>1</sup>, Dr. Dale Bond<sup>4</sup>, Dr. Rena Wing<sup>1</sup>

<sup>1</sup>The Miriam Hospital and Brown University, Providence, USA, <sup>2</sup>Brown University, Providence, USA, <sup>3</sup>University of South Carolina, Columbia, USA, <sup>4</sup>Hartford Hospital, Hartford, USA

**SO.1.09 - The Latest Research on Mobile Interventions for Weight-Related Behaviors, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** D. e- & mHealth

Internet-delivered weight loss (IDWL) programs often produce clinically significant weight loss (WL). However, individuals with the least amount of early WL (i.e., 1 month) are at risk for poorer outcomes and may require additional support.

**Purpose:** To examine whether adding BRIEF (3 calls during weeks 5-7) or EXTENDED (12 calls during weeks 5-16) phone coaching to IDWL treatment for 'early low responders' (1-month WL <2%) and 'early mid responders' (1-month WL 2-4%) improved 4-month WL compared to IDWL alone (CONTROL). Secondary aims compared treatment groups on intervention engagement and assessment of whether 1-month WL moderated the effect of coaching on treatment outcomes.

**Methods:** 452 individuals with overweight/obesity (BMI:  $34.6 \pm 5.0$  kg/m<sup>2</sup>, age:  $50.8 \pm 11.4$  years, 69.7% female) were randomized and received a 4-month, fully-automated, IDWL program consisting of weekly video lessons, daily self-monitoring of caloric intake, exercise minutes, and weight, and weekly automated, tailored feedback. 'Early low responders' and 'early mid responders' in BRIEF and EXTENDED also received individual coaching (first call ~45 minutes, follow-up calls ~10-15 minutes) which consisted of meal planning, goal setting, and problem solving.

**Results:** Across groups, 37.2% were 'early low responders' and 41.2% were 'early mid responders'. Coaching call completion rate and 4-month retention were 94.3% and 90.6% respectively. Four-month WL was significantly greater in BRIEF ( $-6.2 \pm 4.7\%$ ) and EXTENDED ( $-7.0 \pm 5.1\%$ ) versus CONTROL ( $-4.5 \pm 4.7\%$ ;  $p$ 's <0.02). Similarly, the percentage of individuals achieving clinically significant WL ( $\geq 5\%$ ) at 4 months was higher in BRIEF (58.5%) and EXTENDED (65.9%) versus CONTROL (36.5%; Chi-square:  $p < 0.001$ ). One-month WL was a significant moderator such that among 'early low responders', 4-month WL was significantly greater in EXTENDED ( $-4.5 \pm 4.3\%$ ) vs. BRIEF ( $-2.6 \pm 4.0$ ,  $p < .05$ ), but among 'early mid responders' no such effect was observed (EXTENDED:  $-6.9 \pm 3.8\%$  vs. BRIEF:  $-6.8 \pm 4.2\%$ ,  $p > 0.05$ ). Intervention engagement (e.g., video lessons viewed and # of days self-monitored) was greater in BRIEF and EXTENDED vs. CONTROL ( $p$ 's <0.001).

**Conclusions:** Reserving coaching for those with low or mediocre early WL is consistent with a stepped care intervention model and was found to improve program engagement and 4-month WL within Internet-delivered treatment. However, more extended coaching may be necessary for 'early low responders'.

# Effects of a collective family-based mobile health intervention on promoting physical activity and healthy eating – the SMARTFAMILY1.0 trial

**Dr. Janis Fiedler<sup>1</sup>**, Prof. Alexander Woll<sup>1</sup>, Dr. Kathrin Wunsch<sup>1</sup>

<sup>1</sup>Karlsruhe Institute of Technology Institute of Sport and Sport Science, Karlsruhe, Germany

**SO.1.09 - The Latest Research on Mobile Interventions for Weight-Related Behaviors, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Mobile health interventions are promising tools to deliver health behavior change interventions due to their adaptability and wide reach. This study aimed to evaluate the effectiveness of a theory and behavior change techniques (BCTs) based mobile health intervention within families on behavior change for PA and HE.

**Methods:** The study was a cluster-randomized control trial for adults and children who are sharing a common everyday life and live together as a family. The study included a baseline assessment (T0) over one week, followed by a three-week intervention with - among other BCTs - collaborative goalsetting on the application (intervention group) or a no-treatment period (control group). Directly after this period a second assessment over one week (T1) took place and four weeks later a follow-up was assessed using questionnaires only (T2). The main outcomes were self-reported and device-based measured PA, self-reported FVI, and secondary outcomes included intrinsic motivation, self-efficacy, and the family health climate.

**Results** were analyzed using a general linear mixed model with random intercepts which accounted for participants being nested within families. Results/findings: Data from 46 families (intervention group: 25 families with 84 participants; control group: 21 families with 64 participants) were used for the analyses. Results indicated no evidence for a group x time interaction for any PA or FVI measure (all  $p > .014$ ). The secondary outcomes self-efficacy, intrinsic motivation, and family health climate were not associated with the PA outcomes. For FVI, higher self-efficacy and higher intrinsic motivation were associated with higher FVI intake. Exploring the individual development of participants did not reveal responder/non-responder patterns.

**Conclusions:** Overall, our results found no evidence for the effectiveness of the SMARTFAMILY1.0 intervention. Reasons for this could be that the participants were already physically active (more than 8000 steps/day on average) and that the application was rather simplistic in the first version as opposed to the SMARTFAMILY2.0 trial. This research points to the issue, that future interventions should be better tailored to the individual or the respective family to facilitate the strengths of mobile health behavior change interventions.

# Intensity of lifestyle app use as a predictor of postpartum weight loss: The INTER-ACT RCT

**Dr. Femke Geusens**<sup>1,2</sup>, Ms. Hanne Van Uytsel<sup>2</sup>, Dr. Lieveke Ameye<sup>2</sup>, Prof. Roland Devlieger<sup>2,3</sup>, Prof. Annick Bogaerts<sup>2,4</sup>

<sup>1</sup>Department of Women's and Children's Health, Uppsala University, Uppsala, Sweden, <sup>2</sup>REALIFE Research group, Department of Development and Regeneration, KU Leuven, Leuven, Belgium, <sup>3</sup>Department of Obstetrics and Gynecology, University Hospitals Leuven, Leuven, Belgium, <sup>4</sup>Faculty of Medicine and Health Sciences, Center for Research and Innovation in Care, University of Antwerp, Antwerp, Belgium

**SO.1.09 - The Latest Research on Mobile Interventions for Weight-Related Behaviors, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** INTER-ACT is an app-supported lifestyle intervention to enhance optimal weight and a healthy lifestyle in the interpregnancy and pregnancy period. We hypothesize that (1) the more intensively the app is used, the more weight women lose at 6 months postpartum and (2) the weight loss is primarily driven by tracking physical health (i.e., steps and weight).

**Methods:** The INTER-ACT program is a multicentered randomized control trial with an intervention and a control arm. This presentation focuses only on the women in the intervention arm (N = 333). They were given access to a mobile application supported by a Bluetooth-connected weighing scale and pedometer to track their weight, steps and mental health (i.e., mood and tension) with additional face-to-face coaching. Two linear regression models were run, both with the difference in weight between follow-up (6 months postpartum) and intake (6 weeks postpartum) as the outcome variable, and either the sum of the logged measures (steps, weight, mood and tensions,) or the logged measures separately as the independent variables. Due to multicollinearity issues, mood and tension logs had to be combined in one 'mental health' log. We controlled for mother's age, breastfeeding, pregnancy weight gain, weight lost between childbirth and intake, and BMI class before pregnancy.

**Results.** The more intensively women used the app, the more weight they lost between 6 weeks and 6 months postpartum (B(SE)=.01(.002),  $\beta$ =.11,  $t$ =2.26,  $p$ =.02). This weight loss was entirely driven by monitoring their weight using the scale: The more often women weighed themselves, the more weight they lost (B(SE)=.03(.01),  $\beta$ =.24,  $t$ =4.09,  $p$ <.001). Steps and mental health logging were non-significant. Stratification by BMI class indicated that this was only true for overweight women (B(SE)=.05(.01),  $\beta$ =.36,  $t$ =3.85,  $p$ <.01): Women with normal weight or obesity did not lose significantly more weight as they weighed themselves more often.

**Conclusion.** The INTER-ACT RCT is especially effective if women closely monitor their weight: The more often they weigh themselves, the more weight they lose postpartum, especially if they are overweight before pregnancy. Encouraging mothers to track their weight in the first 6 months postpartum can facilitate postpartum weight loss.

# Physical activity, sleep and nutrition in a cohort of Californian pregnant people with overweight and obesity: Findings from the GROWell trial

**Dr. Leigh Ann Simmons<sup>1</sup>**, Dr. Jennifer Phipps<sup>1</sup>, Prof. Siwei Liu<sup>1</sup>

<sup>1</sup>University of California Davis, Davis, USA

**SO.1.09 - The Latest Research on Mobile Interventions for Weight-Related Behaviors, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Overweight and obesity are associated with poor sleep, low quality diet, and inadequate physical activity (PA), all of which have negative impacts on maternal-fetal health. This study aims to determine whether dietary improvements are associated with improved sleep and PA prenatally in the Goals for Reaching Optimal Wellness (*GROWell*) trial.

**Methods:** *GROWell* is an mHealth intervention designed to improve diet quality from early pregnancy to six months postpartum in people who enter pregnancy with overweight or obesity. Prenatally, we collect data at baseline, 26-28 weeks, and 36-38 weeks. We have been conducting a fully remote, randomized control trial of *GROWell* in California. To date N=369 participants have enrolled (target enrollment is 480) and study completion rates are 77%. We conducted preliminary analyses, including descriptives and correlation analyses, and will conduct longitudinal analyses.

**Results:** At baseline 43% of participants have overweight; 32% have class 1 obesity; 25% have class 2/3 obesity. The sample is currently 65% White, 5% Black/African American, 13% Asian, 11% Multiracial, 24% Latinx, and 6% unreported/other. Average age is 34 years and average gestation is 13 weeks. Mean diet quality, PA, and sleep quality were all low. The mean Healthy Eating Index score was 54 (below the US average of 58). Average PA was 384 MET-min/week (below the minimum recommendation of 500-1000 MET-min/week). Sleep quality was 3.5 (range 0-7), indicating poor quality. Correlational analyses showed that increased PA was positively correlated with worse sleep ( $r=0.19$ ,  $p<0.001$ ). To evaluate the relationship of diet to sleep and PA, we will conduct a repeated measures ANOVA to examine whether the intervention and control groups differ in diet quality measured at three time points: baseline, 26-28 weeks gestation, and 36-38 weeks gestation. We will examine the effect of PA and sleep by including them as time-varying predictors in a mixed-effects model to predict diet quality. Missing data will be handled using full information maximum likelihood.

**Conclusions:** *GROWell* may improve diet quality among pregnant people with overweight/obesity. These improvements may improve sleep and support increased PA. *GROWell* may be an evidence-based mHealth tool to improve pregnancy health in high-risk groups.

# Health@NUS: Integrating repeated bursts of Ecological Momentary Assessment within a digital cohort study

**Ms. Xin Hui Chua<sup>1</sup>**, Dr. Sarah Martine Edney<sup>1</sup>, Ms. Claire Marie Jie Lin Goh<sup>1</sup>, Ms. Alicia Low<sup>2</sup>, Ms. Janelle Chia<sup>2</sup>, Ms. Daphne Koek<sup>2</sup>, Dr. Karen Cheong<sup>2</sup>, Prof. Rob Martinus van Dam<sup>1,3</sup>, Assistant Professor Chuen Seng Tan<sup>1</sup>, Dr. Falk Müller-Riemenschneider<sup>1,4,5</sup>

<sup>1</sup>Saw Swee Hock School of Public Health, National University of Singapore and National University Health System, Singapore, Singapore, <sup>2</sup>Health Promotion Board, Singapore, Singapore, <sup>3</sup>Departments of Exercise and Nutrition Sciences and Epidemiology, Milken Institute of Public Health, The George Washington University, Washington, D.C., USA, <sup>4</sup>Yong Loo Lin School of Medicine, National University of Singapore, Singapore, Singapore, <sup>5</sup>Digital Health Center, Berlin Institute of Health, Charité-Universitätsmedizin Berlin, Berlin, Germany

**SO.1.09 - The Latest Research on Mobile Interventions for Weight-Related Behaviors, Clarion Hotel Gillet - Room Akademien, June 15, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Health@NUS is a digital cohort study among university students in Singapore that aims to examine how health behaviours, health and well-being, and their determinants change during the transition from university into working life. In the current study, we examine the response rates to multiple bursts of ecological momentary assessment (EMA) surveys that were embedded within Health@NUS.

**Methods:** Health@NUS integrates biometric assessments, traditional questionnaires, a Fitbit smartwatch, and smartphone-based EMA to continuously collect physical activity, dietary, and sleep data from students over two years. For now, data from the first five bursts of EMA surveys were used (April-May 2021, July-August 2021, October 2021, November-December 2021, and December 2021 to January 2022) that were completed by students who joined the study between October 2020 to April 2021 were included in the analyses. Changes to communication strategies (multiple text messages and in-app notifications instead of emails) were implemented to subsequent bursts following the low response rate in Burst 1. Response rates were calculated based on the percentage of completed surveys per EMA burst and were analysed descriptively.

**Results/findings:** Participants (N=384) were mostly female (60.4%), of Chinese ethnicity (95.3%), with a mean body-mass index of  $22.0 \pm 3.2$  kg/m<sup>2</sup>, and mean age of  $23 \pm 1.3$  years. As compared to EMA Burst 1 (average response rate:  $25.8 \pm 30.1\%$ ), the average response rate was higher in subsequent bursts (Burst 2:  $50.6 \pm 33.6\%$ ), (Burst 3:  $48.3 \pm 33.2\%$ ), (Burst 4:  $40.2 \pm 33.4\%$ ), (Burst 5:  $36.7 \pm 33.4\%$ ), with a downward trend in response rates from Burst 2 to Burst 5. Changes to the communication strategies after EMA Burst 1 may have contributed to the initial rise in response rates. Analysis from 6 additional rounds of EMA bursts will be available in the coming months.

**Conclusion:** Health@NUS is the first digital student cohort study to integrate traditional assessments with continuous smartwatch monitoring and repeated bursts of EMA. Changing communications strategies have led to an initial rise in response rates and were not sustained in subsequent bursts. Examining the response rate to multiple EMA bursts will aid the design of future studies using EMA burst designs and enable the collection of high-intensity longitudinal data.

# Weight stigma in pregnancy and physical activity

**Dr. Taniya Nagpal**<sup>1</sup>, Dr. Rebecca Liu<sup>2</sup>, Dr. Maxine Myre<sup>1</sup>, Dr. Laura Gaudet<sup>3</sup>, Dr. Jocelynn Cook<sup>4</sup>, Dr. Danilo Fernandes<sup>5</sup>, Dr. Kristi Adamo<sup>6</sup>

<sup>1</sup>University of Alberta, Edmonton, Canada, <sup>2</sup>Women's College Hospital, Toronto, Canada, <sup>3</sup>Queen's University, Kingston, Canada, <sup>4</sup>Society of Obstetricians and Gynaecologists of Canada, Ottawa, Canada, <sup>5</sup>Bishop's University, Sherbrooke, Canada, <sup>6</sup>University of Ottawa, Ottawa, Canada

**SO.2.10 - How movement and nutrition behaviors are associated with mental health, UKK - Main Hall (Level 6), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Physical activity during pregnancy has benefits for maternal and infant health, however overall adherence to global recommendations of a 150 minutes of moderate intensity activity is low. Specifically, individuals who have obesity before pregnancy reportedly have low uptake and adherence to prenatal physical activity recommendations; however, can we really attribute physical activity levels to obesity and the pregnant woman alone? This presentation aims to shift the dialogue away from just focusing on the individual's behaviours in pregnancy and obesity, to instead, understanding and challenging larger societal influences such as weight stigma. Weight stigma is defined as negative stereotypes and misconceptions associated with weight, and primarily affects individuals who have obesity. Findings from a qualitative study will be shared that documented lived experiences of weight stigma in pregnancy and implications for engagement in physical activity.

**Methods:** Semi-structured interviews took place with pregnant women in their third trimester who had been diagnosed with obesity. Interview questions were designed to gather their lived experience of obesity in pregnancy, document encounters of weight stigma in physical activity related contexts, and to collect suggestions on how to mitigate weight stigma in pregnancy. A content analysis was performed to assess findings and identify sources of weight stigma in prenatal physical activity contexts.

**Results:** Two sources of weight stigma were identified in relation to physical activity in pregnancy: 1. A lack of visual representation of diverse bodies when promoting physical activity in pregnancy; 2. A lack of recommendations for engaging in physical activity in pregnancy for women who have obesity. The lack of personalized recommendations that took into account comorbidities or other individualized barriers associated with maternal obesity resulted in vague communication and unhelpful advice from healthcare providers for engaging in physical activity.

**Conclusions:** Weight stigma is a pervasive social narrative, that exists in pregnancy and adversely impacts physical activity participation. To improve inclusion in physical activity in pregnancy, public discourse surrounding weight stigma needs to be addressed and changed. To mitigate weight stigma in prenatal physical activity contexts, we require representation of diverse body sizes engaging in physical activity and need to encourage individualized recommendations.

# Family Meal Quality and Quantity: Does one Matter More for Child Health and Emotional Well-being or are they Synergistic?

**Dr. Jerica Berge<sup>1</sup>**

<sup>1</sup>University of Minnesota, Minneapolis, USA

**SO.2.10 - How movement and nutrition behaviors are associated with mental health, UKK - Main Hall (Level 6), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Background and Objectives:** Prior studies show associations between family meal quantity (i.e., frequency) and child health and emotional well-being. Less is known about how family meal quantity and quality (i.e., meal healthfulness and interpersonal quality) is associated with child, parent, and family health and emotional well-being over time. The current study examined longitudinal associations between family meal quantity and quality and child, parent, and family health and emotional well-being. Interactions between family meal quantity and quality were also examined.

**Methods:** Children (n=1307) ages 5-9 years and their parents from six racial/ethnic groups (African American, Hispanic, Hmong, Native American, Somali/Ethiopian, White) were recruited for this study through primary care clinics in Minneapolis/St. Paul, MN. Parents filled out a survey at two time points (2016 and 2019), 18 months apart. Generalized estimating equations with an independence correlation structure were used to examine associations between each family meal characteristic and health or well-being outcome.

**Results:** Family meal quantity was associated with reduced prevalence of obesity, higher diet quality, less food fussiness, lower food responsiveness, and fewer conduct problems in children 18 months later. Family meal quality was associated with higher diet quality for children and parents and lower emotional problems and peer relationship problems in children 18 months later. There was a significant interaction between quantity and interpersonal quality of family meals in relation to children's peer relationship problems.

**Conclusions:** Overall, finding showed that family meal quantity and quality were both independently important for child, parent, and family health and well-being. Health care providers may want to consider focusing on the importance of family meals, both the quantity of meals and the dietary and interpersonal quality of meals, in their anticipatory guidance with parents during well-child visits, given these longitudinal findings showing they may be beneficial for the entire family over time.

# Effects of a long-term physical activity intervention on psychosocial health in adolescents

**SO.2.10 - How movement and nutrition behaviors are associated with mental health, UKK - Main Hall (Level 6), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

Worldwide, around 10-20% of the adolescents suffer from psychosocial health problems which emphasizes the importance of finding effective methods of prevention. Physical activity (PA) has been suggested as a psychosocial health promotion approach, as well as a treatment for psychosocial health problems through beneficial effects on brain structure and function. The purpose of the study was to investigate (1) the effectiveness of a PA intervention in enhancing psychosocial health in healthy adolescents, and (2) the dose-response relationship of dose of moderate-to-vigorous physical activity (MVPA) with psychosocial health. A cluster RCT was conducted during physical education (PE) in 24 classes in the Netherlands, including 297 adolescents (41.8% boys, age=13.4±0.19 years). The intervention group received exercises that were of MVPA intensity and cognitively engaging (14 weeks, two times/week). The control group followed regular PE lessons. Psychosocial health was assessed in three domains: self-concept (Competence Experience Scale for Adolescents), symptoms of depression (Child Depression Inventory), and anxiety (State and Trait Anxiety Inventory). During two PE lessons of the intervention and control group, MVPA was measured with accelerometry (ActiGraph GT3X+). Multilevel analysis was used with pre-intervention measures included as covariates in the models with respectively self-concept, symptoms of depression, state and trait anxiety as outcome measures. Other variables (sex, age, level of maturation, BMI and educational level) were included as covariates using a stepwise backward selection approach. Total dose of MVPA was added to investigate dose-response relationships. The results showed a main intervention effect on depression ( $B=-0.189$ ,  $SE=0.081$ ,  $p=0.019$ ), indicating that symptoms of depression decreased significantly more in the intervention group compared to the control group. Independent of group, a dose-response relationship of MVPA with symptoms of depression ( $B=-0.119$ ,  $SE=0.053$ ,  $p=0.025$ ), state anxiety ( $B=-0.164$ ,  $SE=0.061$ ,  $p=0.008$ ) and self-concept ( $B=0.079$ ,  $SE=0.037$ ,  $p=0.032$ ) was found, indicating that a higher dose of MVPA was associated with less symptoms of depression and state anxiety and better self-concept. In conclusion, the intervention was effective in decreasing symptoms of depression. In addition, our study showed that the dose of MVPA is a crucial aspect in the relationship of PA with psychosocial health.

# Characteristics of 24-hour movement behaviours and their associations with mental health in children and adolescents

**Prof. Stuart J. Fairclough<sup>1</sup>**, Ms. Lauren Clifford<sup>1</sup>, Dr. Richard Tyler<sup>1</sup>

<sup>1</sup>Health Research Institute, and Movement Behaviours, Nutrition, Health, and Wellbeing Research Group, Edge Hill University, Ormskirk, United Kingdom

**SO.2.10 - How movement and nutrition behaviors are associated with mental health, UKK - Main Hall (Level 6), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose** Time-use estimates are typically used to describe 24-hour movement behaviours (24-hMB). However, 24-hMB can additionally be characterised by other easily measured metrics. These include acceleration-based movement metrics (e.g., Intensity Gradient), 24-hour activity rhythmicity (e.g., between-day variability of 24-hour rhythms), and sleep quality (e.g., sleep efficiency). Associations between these characteristics and youth mental health are unclear. This study's aims were to [1] compare youth 24-hMB characteristics by sex and age, and [2] examine associations between 24-hMB characteristics and mental health.

**Methods** Accelerometers were worn by 347 Primary and Secondary-school students for 24-hours/day over 7-days. Externalising and Internalising mental health problems were self-reported using the Strengths and Difficulties Questionnaire. 24-hMB characteristics were categorised as time-use, movement metrics, activity rhythms, and sleep quality. Associations between Externalising and Internalising problems and 24h-MB characteristics were analysed using compositional data analysis (for time-use estimates), and linear mixed models (for the other 24-hMB characteristics categories). Analyses were performed separately for Primary and Secondary students, and adjusted for school-level clustering, sex, socioeconomic status, maturity, and BMI z-score.

**Results** Boys spent significantly more time in moderate ( $p=.009$ ) and vigorous physical activity ( $p=.004$ ) than girls, and Primary students spent longer sleeping than Secondary peers ( $p=.002$ ). For movement metrics, boys were more active than girls according to the Intensity Gradient ( $p=.015$ ), and Primary students had higher Intensity Gradients than Secondary students ( $p=.011$ ). Boys' 24-hour activity rhythm indicators of overall rhythmicity ( $p<.001$ ), activity level during the most active 10-hours ( $p=.03$ ), and the difference in activity between the most active 10-hours and least active 5-hours ( $p=.02$ ) were higher than girls ( $p<.001$ ). Primary students had better sleep regularity ( $p=.02$ ) and earlier sleep onset ( $p=.002$ ) than Secondary peers. Among Primary students, Internalising problems were positively associated with sedentary time ( $p=.02$ ), overall rhythmicity ( $p=.03$ ), and later sleep onset ( $p=.03$ ). Secondary students' Externalising problems were inversely associated with between-day variability of 24-hour rhythms ( $p=.006$ ) and sleep efficiency ( $p=.03$ ).

**Conclusions** Using 24-hMB characteristics may help provide a more complete picture of relationships between youth 24-hMB and mental health, than time-use estimates alone. Understanding relationships between 24-hMB characteristics and health outcomes may inform future intervention content and design.

# Short, frequent physical activity breaks improve working memory in adolescents during prolonged sitting (AbbaH teen study)

**Miss Karin Kjellenberg**<sup>1</sup>, Dr. Emerald Heiland<sup>1,2</sup>, Miss Olga Tarassova<sup>1</sup>, Associate Professor Maria Fernström<sup>1</sup>, Associate Professor Gisela Nyberg<sup>1,3</sup>, Prof. Maria Ekblom<sup>1,4</sup>, Dr. Björg Helgaóttir<sup>1,5</sup>, Prof. Örjan Ekblom<sup>1</sup>

<sup>1</sup>Department of Physical Activity and Health, The Swedish School of Sport and Health Sciences (GIH), Stockholm, Sweden, <sup>2</sup>Department of Surgical Sciences, Medical Epidemiology, Uppsala University, Uppsala, Sweden, <sup>3</sup>Department of Global Public Health, Karolinska Institutet, Stockholm, Sweden, <sup>4</sup>Department of Neuroscience, Karolinska Institutet, Stockholm, Sweden, <sup>5</sup>Department of Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden

**SO.2.10 - How movement and nutrition behaviors are associated with mental health, UKK - Main Hall (Level 6), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Physical activity breaks in schools have been suggested as a promising strategy to acutely improve cognitive performance in children and adolescents. Most previous studies have explored the effects of single physical activity bouts, but they are infeasible in a school setting (e.g. long duration/high-intensity or requiring equipment/space). Further, studies investigating the underlying physiological mechanisms in adolescents are lacking. Therefore, the aim of this study was to investigate the effects of short, frequent physical activity breaks of different intensities on adolescents' working memory (WM) and cerebral blood flow (CBF) during prolonged sitting.

**Methods:** This randomized crossover study was performed in adolescents (13-15 years of age). In 80-minute sessions, one of the following types of breaks was performed four times in three minutes durations on three different days: simple resistance training (SRA), step-up at a pre-determined pace (STEP), or remaining seated (SOCIAL). Before and after each session, WM (accuracy and reaction time during the 1,2,3-back test) were measured, with simultaneous measurement of task-related CBF (assessed by prefrontal oxygenation using functional near-infrared spectroscopy). Analysis of CBF is ongoing and will be presented at the conference.

**Results:** A total of 17 students participated (mean age 13.6 years, 11 girls). In the most demanding task (3-back) the following results were seen: improvement in reaction time following SRA (-30.1,  $p=0.04$ ) and STEP (-34.3 ms,  $p=0.05$ ) and no improvement following prolonged sitting. We also found a moderating effect ( $p < 0.01$ ) of WM performance at baseline (using a mean split), such that students with poor WM significantly improved their accuracy and reaction time following the higher-intensity breaks (STEP) while students with high performance did not.

**Conclusion:** We found that implementing physical activity breaks of both moderate and high intensities was beneficial for WM performance. For students with low WM performance, high-intensity breaks were more beneficial. Implementing physical activity breaks during periods of prolonged sitting, such as long school classes could improve the students' cognitive performance. However, future studies should investigate if these breaks are feasible, acceptable, and beneficial to implement in the school setting.

# Becoming a Healthy Mother: Harnessing the Identity Transformation of Becoming a Mother to Incorporate Sustainable Healthy Eating and Feeding Behaviors

**Miss Elaine Beulick<sup>1</sup>**, Miss Michelle Krach<sup>1</sup>, Miss Kaitlyn Henslee<sup>1</sup>, Miss Grace Moore<sup>1</sup>, Dr. Maria Romo-Palafox<sup>1</sup>

<sup>1</sup>Saint Louis University, Saint Louis, USA

**SO.2.10 - How movement and nutrition behaviors are associated with mental health, UKK - Main Hall (Level 6), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Current theories on maternal identity fail to explore how the change in women's sense of self relates to dietary behaviors. Given that most children in the U.S. are exposed to obesogenic factors before their second birthday, this study explored potential dietary intervention targets that leverage the identity change naturally occurring during the transition to motherhood.

**Methods:** Preliminary thematic analysis was conducted on eleven 60-minute semi-structured interviews (2021-2022) with primiparous mothers in their third trimester or with a child  $\leq 12$  months who shared their experiences with health, diet, breastfeeding, and body image while becoming mothers.

**Results:** Eighteen themes emerged, and three themes presented promising intervention targets: food and diet, breastfeeding, and resources. Mothers described their dietary choices while breastfeeding as "what I consume is what he gets, so [I'm] making sure that I'm getting a good variety of nutrients and vitamins and different types of foods, so that he [infant] gets a healthy diet as well." Mothers described their plans to introduce complementary foods, "I took a mommy and me cooking class and they taught us different things that we can do with introducing food" and "the plan is to do baby-led weaning, so to do solids as opposed to purees." Yet, mothers also commented on turning to social media for nutrition and feeding information, "I follow Instagram accounts of PTs, OTs, registered dietitians . . . so I see that stuff on a regular basis and it's like okay, this is how I think I want to do it." Mothers' desire to provide children with the best nutrition, without receiving formal education (turning to social media), suggests that the postnatal period is an optimal time for dietary interventions. Moreover, prioritizing the child's nutritional status directly increases the mother's motivation to change her dietary habits.

**Conclusions:** This preliminary analysis provides evidence that the postnatal period presents a unique opportunity to optimize the nutritional status of mothers and children. We theorize that integrating habits into one's identity (sense of self) reduces reliance on self-regulation, consequently increasing resilience amidst the stress and fatigue of early motherhood and producing sustainable behavior change.

# Examining the associations between mealtime emotions and eating behaviors in adolescents

**Miss Laurence Vermette**<sup>1</sup>, Prof. Noémie Carbonneau (corresponding author)<sup>1</sup>, Dr. Geneviève Lavigne (corresponding author)<sup>1</sup>

<sup>1</sup>Université du Québec à Trois-Rivières, Trois-Rivières, Canada

**SO.2.10 - How movement and nutrition behaviors are associated with mental health, UKK - Main Hall (Level 6), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

Family meals promote communication, bring family members closer and contribute to their physical, mental, and social well-being. Research suggests that a positive emotional atmosphere during mealtime is related to better nutrition, academic, and psychosocial outcomes in children (Smith et al., 2022). Further, mealtime emotions, especially those related to anxiety, are associated with increased eating psychopathology (White et al., 2015).

**Purpose:** A number of studies have documented the benefits associated with a high frequency of family meals, but more research is needed to better understand the associations between the family mealtime emotional climate and adolescents' eating behaviors. The present study examines the associations between adolescents' mealtime emotions and various dimensions of their eating behaviors while controlling for family meal frequency.

**Methods:** Recruitment is still ongoing. To date, 126 adolescents (114 girls, 12 boys) have been recruited, between the ages of 14 and 17 years ( $M = 15.7$ ;  $SD = 1.1$ ). They completed the Mealtime Emotions Measure for adolescents (White et al., 2015), which assesses the emotions typically experienced during family mealtimes. This measure contains three subscales: anxiety-related, anger-related, and positive mealtime emotions. Participants also completed the Adult Eating Behaviour Questionnaire (Hunot et al., 2016), which assesses eight eating behavior dimensions: hunger, food responsiveness, emotional overeating, enjoyment of food, satiety responsiveness, emotional undereating, food fussiness and slowness in eating.

**Results:** Linear regressions were conducted, controlling for family meal frequency. Preliminary results show that adolescents' anxiety-related mealtime emotions are positively related to emotional undereating ( $\beta = 0.410$ ,  $p < .01$ ) and marginally negatively related to enjoyment of food ( $\beta = -0.256$ ,  $p < .08$ ). Further, positive mealtime emotions are negatively associated with emotional overeating ( $\beta = -0.309$ ,  $p < .01$ ), and positively related to both satiety responsiveness ( $\beta = 0.245$ ,  $p < .05$ ) and enjoyment of food ( $\beta = 0.220$ ,  $p < .07$ ). No significant associations were found between anger-related mealtime emotions and eating behaviors.

**Conclusion:** Overall, the results of this study have important implications for the field of behavioral nutrition because they provide insight into how adolescents' emotional experience during family mealtimes relates to their eating behaviors.

# Empowering Informed Caregiver Decisions Surrounding Use of Pediatric Nutritional Supplement Shakes

**Miss Elaine Beulick<sup>1</sup>**, Dr. Maria Romo-Palafox<sup>1</sup>

<sup>1</sup>Saint Louis University, Saint Louis, USA

**SO.2.10 - How movement and nutrition behaviors are associated with mental health, UKK - Main Hall (Level 6), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Early childhood is a critical period of dietary preference and habit development. A 2017 report found that one pediatric nutritional supplement shake brand accounted for 27% of all spending on food and drink marketing to infants and toddlers. Medically unnecessary use of such shakes may lead to excess calorie consumption and influence sweet taste preferences of healthy children. As childhood obesity rates increase, we recognize the need to help caregivers make an informed decision about when their child needs nutritional support from a supplement shake. Thus, this study tested a countermarketing infographic's ability to reduce purchase intent.

**Methods:** This cross-sectional study consisted of an online survey of U.S. caregivers (n=1,630) of healthy children (6-36 months). Data were collected November through December 2020. Participants were randomly assigned to an experimental group where they viewed either a countermarketing infographic, product website screenshot, or product picture. The infographic included messages targeting the perception of healthfulness and affordability of supplement shakes, organic or non-GMO ingredients, and pediatricians' support for the product. The main outcome measures included perception of healthfulness, willingness to pay, purchase intent, and attitudes.

**Results:** Most (68%) caregivers were between 18 and 34 years. The majority (90%) described their child's body size as healthy weight, and 93% perceived their child's diet as good, very good, or healthy. Due to the rapidly changing diets of children ages 6-36 months, an ANOVA tested the effect of age and image exposure on the main outcomes. Caregivers who saw the infographic had a significantly lower perception of healthfulness ( $p=0.03$ ), purchase intent ( $p=0.08$ ), and attitude ( $p=0.01$ ) for the pediatric supplement shake compared to the other images. Moreover, a significant interaction between child's age and image shows the infographic's effect is different for infant and toddler caregivers.

**Conclusions:** This study provides more evidence that Dietary Guidelines should explicitly discourage pediatric nutritional supplement shakes for healthy children. The infographic developed and tested in this study is a powerful tool that can be easily distributed in pediatric offices and online to inform caregivers about the appropriate use of pediatric nutritional supplement shakes, ultimately reducing misuse in healthy children.

# Weighting and Validation of the Childhood Obesogenic Environment Index in the United States

**Dr. Marilyn Wende<sup>1</sup>**, Dr. Andrew Kaczynski<sup>1</sup>, Dr. Ellen W. Stowe<sup>1</sup>, Dr. Alexander C. McLain<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**SO.2.11 - How Our Surroundings Impact Our Health, UKK - Level 6 Foyer, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Development of a national childhood obesogenic environment index (COEI) in the United States (U.S.) represents a key step for surveillance and intervention, and further validation and weighting of index components would enhance its rigor and utility. This study determined weights for the county-level COEI and assessed the validity of the weighted versus unweighted index.

**Methods:** Data on 10 variables were collected for all U.S. counties (n=3142) from publicly available sources. Six variables were nutrition-focused: percentage of births at facilities supporting breastfeeding and number of grocery/superstores, farmers markets, fast food restaurants, full-service restaurants, and convenience stores per 1000 residents. Four variables were physical activity focused: percentage of population living close to exercise opportunities, percentage of population <1 mile from a school, a walkability index, and number of violent crimes per 1000 residents. Variables supportive of healthful living were reverse-scored. All variables were ranked and assigned a percentile (0-100). A county COEI score was generated by calculating the average percentile for all 10 variables. Because county-level childhood obesity estimates were unavailable, adult obesity estimates served as a proxy measure. Principal components analysis (PCA) identified uncorrelated index components and created a weighted index using eigenvalues once simple structure was achieved. Linear regression validated the PCA-informed index and compared model fit among the weighted and unweighted COEI.

**Results:** Unweighted COEI ranged from 24.5-81.0 (M=50.02,s.d.=9.01) and was associated with adult obesity ( $\beta=0.15, p<.0001$ ). PCA produced simple structure for two factors: 1) access to exercise opportunities, fast food/full-service restaurants, and walkable neighborhoods; 2) access to convenience stores, grocery/super stores, and farmers markets. The PCA-informed weighted COEI ranged from 9.4-54.3 (M=32.0,s.d.=6.0) and was associated with adult obesity ( $\beta=0.18, p<.0001$ ). Compared to unweighted COEI ( $R^2=0.09$ ), the PCA-informed COEI explained slightly less variation in adult obesity ( $R^2=0.06$ ).

**Conclusions:** PCA-informed weighting methods are valuable for index development. While this study showed that the unweighted index explains a larger proportion of variance in adult obesity, researchers can use PCA to better understand index components and their relationships with each other. Moreover, determining the relationship between COEI and obesity provides important guidance for prevention efforts.

# Residents' preferences for neighborhood social, built, and digital environment interventions to promote physical activity

Ms. Esmee Boereboom, Dr. Pauline van den Berg, Dr. Pieter Van Gorp, Dr. Raoul Nuijten, **Dr. Astrid Kemperman**

<sup>1</sup>Eindhoven University of Technology, Eindhoven, Netherlands

**SO.2.11 - How Our Surroundings Impact Our Health, UKK - Level 6 Foyer, June 16, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** H. Policies and environments

Cities are challenged by increases in chronic diseases, obesity, and sedentary lifestyles, and physical inactivity is a major contributor to these problems. Urban planning and design aims to ensure that all people have access to enabling environments and diverse opportunities to be physically active. However, knowledge about the preferences of citizens for interventions supporting physical activity is still limited. This study aims to measure the preferences of residents for new, still-to-be-implemented social, built, or digital environment interventions in their neighborhoods that support physical activity.

First, factors and interventions playing a role in creating active living environments were explored.

Subsequently, an online questionnaire was conducted including a stated-choice experiment to predict preferences for possible (new) interventions to increase physical activity. The experiment asked respondents to choose several times between two packages of interventions, created based on an experimental design. The interventions included personal support and guidance from an exercise broker/sports coach, sports activity sharing via an app, age-appropriate activities in the neighborhood, availability of free public fitness equipment in public space, availability of free public sports facilities, access to a gym, and earning rewards per activity through an app. All interventions were defined at two levels (present vs not present).

325 inhabitants of Venlo, a medium-sized city in the Netherlands (70,000 inhabitants), participated in the survey. A Latent Class model was estimated on the data collected and indicated two segments with different preferences. The 'no preference' segment is more likely to choose no package of interventions and is characterized by inhabitants having more satisfaction with social support, safety, walkability, cycling paths, parks, and sports facilities in their neighborhood compared to the 'preference' segment. This latter segment includes more households with children or one person, and prefers personal support and guidance from an exercise broker or sports coach and the improved availability of free public fitness equipment. Moreover, both segments prefer to have access to a gym with a discount to make physical activity more accessible. Hence, urban planners and policymakers are advised to implement these interventions in the built environment to support a more physical active lifestyle.

# Effects of investment in infrastructure and encouragement of walking and cycling in two small cities

**SO.2.11 - How Our Surroundings Impact Our Health, UKK - Level 6 Foyer, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

Effects of investment in infrastructure and encouragement of walking and cycling in two small cities

**Purpose:** Active transport rates in New Zealand are low and have been falling over recent years. In two small provincial cities, Model Communities Program (MCP) funding was provided to increase active travel by installing walking and cycling infrastructure and running programmes to promote and normalise active travel. We aimed to analyse longer-term effects (five years after baseline measures) along with changes in active travel rates associated with the intervention for Māori (the Indigenous people of New Zealand) and people on lower incomes. We also looked at the effects of the proximity of the new infrastructure to people's homes and estimated differential active trip rates by age group, sex and trip purpose.

**Methods:** Baseline measures were taken in 2011, before the start of the intervention, along with further measures taken in 2012, 2013 and 2016 post-intervention, involving a total of 2,500 people interviewed in person. Some were part of a cohort that was surveyed in more than one of these years regarding their travel behaviours and attitudes to active travel. Respondents from two matched control cities that did not receive the funding provided a comparison group.

**Results/findings:** The MCP was associated with sustained statistically significant increases in active travel rates in the intervention cities compared to the controls. Māori increased active travel rates considerably more than non-Māori, as did members of households with below median income. People living closer to the new infrastructure showed initial larger increases in active travel, but this difference then diminished over time.

**Conclusions:** It is possible that the program elements that benefitted Māori and lower-income households included: engagement with the community and local leaders; provision of infrastructure in lower income areas; engagement with Māori regarding infrastructure that highlighted the cultural significance of the land and its landmarks. The program was successful in addressing some inequities within a car-dominated transport system.

# Spatial accessibility to food retail around the home and school and its relationship with the weight status of children in rural Victoria, Australia.

**Dr. Cindy Needham**<sup>1</sup>, Dr. Ana Horta<sup>2</sup>, Dr. Jane Jacobs<sup>1</sup>, Prof. Liliana Orellana<sup>1</sup>, Prof. Steven Allender<sup>1</sup>, Dr. Gary Sacks<sup>1</sup>, Dr. Miranda Blake<sup>1</sup>, Dr. Claudia Strugnell<sup>1</sup>

<sup>1</sup>Deakin University, Geelong, Australia, <sup>2</sup>Charles Sturt University, Albury-Wodonga, Australia

**SO.2.11 - How Our Surroundings Impact Our Health, UKK - Level 6 Foyer, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Despite disparities in nutrition-related chronic disease between urban, regional and rural populations, the relationships between food environments and childhood obesity in regional and rural (hereafter rural) areas remains unstudied. This study quantified the accessibility and healthiness of food retail environments in Victorian rural communities; and examined the relationship between food retail environment measures and obesity prevalence in primary school children. We also explored whether socioeconomic position (SEP) modified the relationship. We hypothesised that variations in accessibility to food retail around the home and school is associated with health disparities in Victorian rural communities.

**Methods:** Height and weight of 3,002 students (aged 7-12 years) from 94 primary schools located in rural areas of Victoria, Australia were measured by trained researchers in 2019, and used to calculate Body Mass Index (BMI). Food outlet data was collected from local governments in 2019 and classified by a) healthiness (healthy, less healthy, unhealthy) and b) type (Discretionary, Eating out, Fast-food, Fresh produce, Small Goods, Supermarkets, Takeaways). Network analysis was used to determine accessibility to each classification of food retail based on the school's location and 1km and 3km network buffers. Accessibility to food retail in each student's home suburb was estimated as the proportion of the population within 1km, 3.2km and 17km network buffers from each food retail classification. A school-level and area-level (based on the child's home suburb) measure of SEP were used. Linear mixed models were used to estimate associations between children's BMI and food retail measures at the suburb and school level, and to assess whether school SEP or home suburb SEP modified the relationship between the food environment and BMI.

**Results:** Preliminary results indicate the accessibility of unhealthy food retail around primary schools and within children's home suburbs far outweighs accessibility of healthy food retail in rural areas. Results will provide the basis for evidence-based planning of policy and public health interventions to address the widening health inequalities between urban and rural Victorians.

**Conclusions:** The planning system in Australia needs to be strengthened to facilitate health-promoting environments, including in places where children gather.

# An evaluation of the food environment at an Australian university campus

**Dr. Daisy Hannah Coyle**<sup>1,2</sup>, Ms. Laura Sanavio<sup>3</sup>, Dr. Eden Barrett<sup>1,2</sup>, Dr. Liping Huang<sup>1,2</sup>, Ms. Kristy Law<sup>1,2</sup>, Ms. Pabasha Nanayakkara<sup>1,2</sup>, Prof. Jonathan Hodgson<sup>4</sup>, Dr. Merita O'Connell<sup>2</sup>, Ms. Belinda Meggitt<sup>2</sup>, Dr. Carrie Tsai<sup>2</sup>, Prof. Simone Pettigrew<sup>1,2</sup>, Prof. Jason Wu<sup>1,2</sup>

<sup>1</sup>The George Institute for Global Health, Sydney, Australia, <sup>2</sup>University of New South Wales, Sydney, Australia,

<sup>3</sup>University of California, Berkeley, California, Australia, <sup>4</sup>Edith Cowan University, Perth, Australia

**SO.2.11 - How Our Surroundings Impact Our Health, UKK - Level 6 Foyer, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** There is increasing acknowledgment that public institutions, including universities, should provide leadership to ensure that staff, students and visitors are not exposed to unhealthy food environments. Unhealthy food environments at universities are especially concerning because many students are young adults who are vulnerable to poor dietary intakes due to limited cooking skills, low food literacy, lack of disposable income and limited access to kitchen facilities, particularly in shared housing and on-campus accommodations. The aim of this study was to conduct a baseline assessment of the healthiness of the food environment across all food outlets and vending machines ('outlets') at a large university in Australia.

**Methods:** A cross-sectional assessment was conducted (March – July 2022) across 51 food outlets (27 fixed food outlets and 24 vending machines). The healthiness of the on-campus food environment was evaluated using the Healthy Food and Drink in NSW Health Facilities for Staff and Visitors framework ('Framework'). The Framework assesses key food environment parameters including the availability, placement and promotion of 'Everyday' (healthy) and 'Occasional' (less healthy) products. Each parameter was evaluated overall and across each food outlet type (Café, Cafeteria, Convenience store, Kiosk and Vending machine).

**Results:** Across the outlets, Everyday foods and drinks made up 43.9% of all products available. Only two outlets met the Framework's product availability benchmark of ≥75% Everyday foods and drinks. The mean percentage of Everyday products available for sale differed according to the outlet type, ranging from 20.6% for the convenience store up to 64.6% for the cafés. A total of 43 outlets (84.3%) sold sugary drinks as part of their product range. Food outlets generally did not meet the recommendation to avoid displaying Occasional products in prominent positions. Occasional products made up 68.4%, 53.3% and 59.9% of all items for sale at checkout areas, countertops and eye-level shelves, respectively. Finally, 80.0% of meal deals (e.g., buy-one-get-one free) included Occasional products.

**Conclusion:** Consistent with similar prior evaluations at higher education institutions, our findings suggest the need for substantial improvement in the availability, placement and promotion of foods and drinks sold at a major university campus in Australia.

# Food and beverages from street outlets around elementary schools in Mexico

**Dr. Catalina Medina<sup>1</sup>**, Dr. Citlali González<sup>1</sup>, Ms. Uzzi López<sup>1</sup>, Ms. Armando G.-Olvera<sup>1</sup>, Ms. Vanesa Barranco<sup>1</sup>, Ms. Irving Contreras<sup>1</sup>, Prof. Simon Barquera<sup>1</sup>, Ms. Magdiel Barrios<sup>1</sup>

<sup>1</sup>National Institute of Public Health, Mexico, Mexico

SO.2.11 - How Our Surroundings Impact Our Health, UKK - Level 6 Foyer, June 16, 2023, 12:00 PM - 1:15 PM

**SIG - Primary Choice:** H. Policies and environments

**Purpose.** To evaluate the healthfulness of the street food & beverages outlets (SFBO) around primary schools in a neighborhood in Mexico City. We hypothesized that a higher proportion of unhealthy SFBOs and higher non-recommended (NR) products are sold at the SFBO in the nearest buffer to the school (100m) and within the highest marginalized areas.

**Methods.** A neighborhood that contains 5 marginalization levels was selected. From this, a sample of 15 schools was randomly selected. A 500m Euclidean buffer was drawn around the selected schools. All SFBOs found within the buffer were evaluated using a previously validated survey by trained personnel. The survey includes a checklist of traditional food and beverages sold in SFBO, these products were classified as recommended, moderately recommended, and non-recommended (NR) to be consumed daily based on Eat-Lancet guidelines, Mexican food recommendations, and a group of experts. Those outlets that contained 30% or more NR products were classified as unhealthy based on previous studies. Descriptive analysis was used to characterize the sample. The Chi-square test was used to compare the percentage of NR products available within the 100m buffer to the 101-500m buffer. Logistic regression was used to identify the association between the healthfulness of outlets and marginalization levels. Analysis was performed using SPSS.

**Results.** 438 SFBOs were found within the 500m buffer. 90.4% of the SFBOs were classified as unhealthy. The most common products found within the SFBO included sugar-sweetened beverages, deep-fried tacos, candies, simple water, and flavored milk and coffee. A higher proportion of NR products was observed within 100m buffer compared to 101-500m buffer (71.2% vs. 62.2%,  $p=0.012$ ). Those schools located within the lowest marginalized areas were associated with healthier outlets (1.35, CI 95%: 1.67, 8.94;  $p=0.02$ ).

**Conclusions.** Most of the SFBOs around schools were classified as unhealthy. The proportion of NR products is higher within the nearest buffer and the most marginalized areas around schools. Although the results of this study are consistent with other LMIC studies, further studies are needed in other contexts. This study contributes to filling the information gap regarding the informal food environment in the Mexican scholar context.

# Violent Crime and Food Retail in Chicago, IL: Differences in Associations by Neighborhood Socioeconomic Status

**Dr. Chelsea Singleton**<sup>1</sup>, Dr. Fikriyah Winata<sup>2</sup>, Dr. Karen Sheehan<sup>3</sup>, Dr. Diego Rose<sup>1</sup>, Prof. Robin Fretwell Wilson<sup>4</sup>, Dr. Sara McLafferty<sup>4</sup>

<sup>1</sup>Tulane School of Public Health and Tropical Medicine, New Orleans, LA, USA, <sup>2</sup>Mississippi State University, Starkville, MS, USA, <sup>3</sup>Northwestern University, Chicago, IL, USA, <sup>4</sup>University of Illinois at Urbana-Champaign, Champaign, IL, USA

**SO.2.11 - How Our Surroundings Impact Our Health, UKK - Level 6 Foyer, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Violent crime (e.g., homicide, armed robbery, aggravated assault) is a major public health issue in America that disproportionately affects underserved communities. While studies have concluded that certain food retailers may be crime attractors (e.g., liquor stores, fast food restaurants), recent evidence suggests that violent crime may be detrimental to the healthfulness of food retail environments. Unfortunately, there is limited research on this topic. This study aimed to evaluate associations between violent crime occurrence and the availability of food retailers in Chicago, IL. Additionally, this study aimed to determine if associations varied by neighborhood socioeconomic status.

**Methods:** Cross-sectional data representing Chicago's census tracts (N = 798) in 2018 were gathered from the Chicago Data Portal and the U.S. Census Bureau. Violent crime rate for each census tract represented the number of homicides, armed robberies, and aggravated assaults per 1,000 residents. Business license data provided estimates for the availability of supermarkets, dollar stores, liquor stores, and fast food restaurants per 1,000 residents. Stratified regression models were evaluated to test associations between violent crime rate and food retailer availability by neighborhood socioeconomic status. Census tracts were categorized into 3 groups based on the 2018 empirical distribution of median household income in Chicago: "lower income", "medium income", and "higher income".

**Results:** After controlling for key covariates (e.g., % Black, % Hispanic/Latino, population density, etc.), violent crime rate was not associated with supermarket availability. Violent crime rate was positively associated with dollar store availability among all Chicago census tracts ( $p=0.001$ ) and low-income tracts ( $p=0.002$ ). Violent crime rate was positively associated with liquor store availability among all Chicago tracts ( $p<0.001$ ); stratified associations were not statistically significant. Furthermore, violent crime rate was positively associated with fast food restaurant availability among all Chicago census tracts ( $p<0.001$ ), lower income tracts ( $p=0.03$ ) and higher income tracts ( $p<0.001$ ).

**Conclusions:** Violent crime occurrence was associated with greater availability of dollar stores, liquor stores, and fast food restaurants in Chicago with associations varying across neighborhood socioeconomic status. Future studies should explore the influence of violent crime, and other socio-environmental factors, on changes to food retail environments over time.

# Structural Racism and Geographic Access to Food Retailers in the United States: A Scoping Review

**Dr. Chelsea Singleton<sup>1</sup>**, Ms. Laura Wright<sup>1</sup>, Ms. Meredith McDonald<sup>1</sup>, Ms. Isabel Archer<sup>1</sup>, Dr. Caryn Bell<sup>1</sup>, Dr. Gabriella McLoughlin<sup>2</sup>, Dr. Bailey Houghtaling<sup>3</sup>, Dr. Kristen Cooksey Stowers<sup>4</sup>, Dr. Elizabeth Anderson Steeves<sup>3</sup>

<sup>1</sup>Tulane University, New Orleans, LA, USA, <sup>2</sup>Temple University, Philadelphia, PA, USA, <sup>3</sup>Gretchen Swanson Center for Nutrition, Omaha, NE, USA, <sup>4</sup>University of Connecticut, Storrs, CT, USA

**SO.2.11 - How Our Surroundings Impact Our Health, UKK - Level 6 Foyer, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Structural racism is considered the root cause of racial/ethnic inequities in America. In the past, studies have documented associations between neighborhood racial/ethnic composition and geographic access to food retailers. More recent studies have linked manifestations of structural racism (e.g., redlining, gentrification) to disparities in access. This scoping review aimed to summarize findings from US-based literature that 1) identified differences in food retailer access by neighborhood racial/ethnic composition or 2) examined the influence of structural racism on food retailer access. Furthermore, this review aimed to thoroughly describe the measures used to operationalize structural racism.

**Methods:** In 2022, a search of relevant literature was conducted using Covidence software. Seven databases yielded 13,069 citations after removing duplicates. Two reviewers evaluated the titles and abstracts of all citations to identify those that met inclusion criteria. Only studies that featured large or small food retailers that sell groceries were included (e.g., supermarkets, grocery stores, supercenters, convenience stores, dollar stores, pharmacies, and liquor stores). Studies that solely focused on restaurants were not included. The full text of 163 citations were reviewed with 65 studies meeting all inclusion criteria. An additional 5 studies were located via hand searching, which resulted in 70 studies being included in the review.

**Results:** Approximately 20 studies (28.6%) evaluated the influence of structural racism on geographic access to food retailers while 50 (71.4%) solely examined differences in retailer access by neighborhood racial/ethnic composition. All studies that modeled one or more measures of structural racism reported significant findings. However, measures of structural racism varied significantly across studies making it difficult to compare findings. Key examples of measures included mortgage redlining (n = 3), gentrification (n = 3), retailer redlining/decentralization (n = 2), and blockbusting/white flight (n = 2). Sixty percent of studies that featured a measure of structural racism modeled supermarkets, grocery stores, and/or an index measure of healthy food availability as the dependent variable.

**Conclusions:** Many US-based studies have evaluated food retailer access by neighborhood racial/ethnic composition. Moving forward, studies should model measures that reflect structural racism and determine how these measures influence access to large and small food retailers.

# Association of perceived and objective neighborhood walkability with accelerometer measured physical activity and sedentary time in the Maastricht Study

**Mr. Jeffrey A. Chan<sup>1,2</sup>**, Prof. Hans Bosma<sup>1</sup>, Ms. Connie Drosinou<sup>1</sup>, Assistant Professor Erik J. Timmermans<sup>3</sup>, Prof. Hans Savelberg<sup>1</sup>, Prof. Nicolaas Schaper<sup>1</sup>, Associate Professor Miranda T. Schram<sup>1</sup>, Dr. Coen D.A. Stehouwer<sup>1</sup>, Associate Professor Jeroen Lakerveld<sup>4</sup>, Associate Professor Annemarie Koster<sup>1</sup>  
<sup>1</sup>Maastricht University, Maastricht, Netherlands, <sup>2</sup>Northern California VA Healthcare System, Martinez, USA, <sup>3</sup>Utrecht University, Utrecht, Netherlands, <sup>4</sup>Vrije Universiteit Amsterdam, Amsterdam, Netherlands

**SO.2.12 - What have we learned recently on socio-economic inequalities, UKK - Hall B (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** We aim to investigate the association of neighborhood walkability with accelerometer-measured physical activity (PA) and sedentary behavior (SB) levels and examine whether objective and subjective measures of walkability result in similar findings.

**Methods:** PA and SB from the first 7,689 Maastricht Study participants were measured using accelerometers for a period of seven days. Mean daily step count, light intensity PA, moderate to vigorous PA (MVPA), and SB were calculated. Objective walkability was measured by the 7-component Dutch Walkability Index within 500m Euclidian buffers around residential addresses of participants. Subjective walkability was obtained from the Abbreviated Neighborhood Environment Walkability Scale. Linear regression models analyzed the associations of walkability with PA and SB, controlling for potential confounders.

**Results:** Objective walkability was negatively associated with light intensity physical activity in the most walkable quartiles (Q3:  $b = -15.05$ , 95% CI = -21.38, -8.73; Q4:  $b = -14.58$ , 95% CI = -20.94, -8.23). Compared to participants living in the objective, least walkable neighborhoods, those in the most walkable quartiles had statistically significant higher SB levels (Q3:  $b = 13.18$ , 95% CI = 6.53, 19.83; Q4:  $b = 11.64$ , 95% CI = 4.95, 18.32). For subjective walkability, mean daily step count was significantly higher in the most walkable quartiles (Q3:  $b = 378.02$ , 95% CI = 126.76, 629.29; Q4:  $b = 509.60$ , 95% CI = 243.38, 775.81). Higher subjective walkability was positively associated with MVPA (Q3:  $b = 3.56$ , 95% CI = 1.82, 5.29; Q4:  $b = 4.40$ , 95% CI = 2.56, 6.23).

**Conclusion:** Living in a neighborhood with higher objective walkability was associated with lower levels of PA and higher SB levels while higher subjective walkability was associated with higher levels of PA. These results show contrasting findings and thus, the effect of walkability on participant physical activity and sedentary behavior within our sample is to be determined.

# Association between social vulnerability burden and cardiovascular health over adolescence using the novel Life's Essential 8 score

**Mr. Jesús Martínez-Gómez<sup>1</sup>**, Dr. Juan Miguel Fernández-Alvira<sup>1</sup>, Miss Amaya de Cos-Gandoy<sup>1, 2</sup>, Miss Patricia Bodega<sup>1, 2</sup>, Mrs. Mercedes de Miguel<sup>1, 2</sup>, Dr. Anna Tresserra-Rimbau<sup>3, 4</sup>, Dr. Emily Laveriano-Santos<sup>3, 4</sup>, Miss Camila Arancibia-Riveros<sup>3</sup>, Dr. Rosa Casas<sup>5</sup>, Dr. Ramón Estruch<sup>4, 5</sup>, Prof. Rosa María Lamuela-Raventós<sup>3, 4</sup>, Dr. Gloria Santos-Beneit<sup>1, 2, 6</sup>, Dr. Rodrigo Fernández-Jiménez<sup>1, 7, 8</sup>

**SO.2.12 - What have we learned recently on socio-economic inequalities, UKK - Hall B (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose.** The evidence for differences related to social vulnerabilities in cardiovascular health (CVH) in adolescents is not well studied. The main purpose of this study was to explore differences in overall CVH and its individual components in a large cohort of adolescents aged 12 to 16 years in Spain according to the accumulation of social vulnerabilities.

**Methods.** This study collected data from 1297 adolescents at baseline (48.3% girls; 12.5 (0.4) years), 1198 (48.0% girls; 13.9 (0.4) years) at first follow-up and 1090 at second follow-up (48.1% girls; 15.8 (0.4) years) attending 24 secondary schools enrolled in the SI! Program for Secondary Schools trial in Spain. Eight individual metrics (nicotine exposure, diet, physical activity, sleep health, body mass index (BMI), blood glucose, non-high-density lipoprotein cholesterol, and blood pressure) were measured and scored from 0 to 100 points according to the Life's Essential 8 (LE8) criteria established recently by the American Heart Association. A vulnerability score was constructed based on the exposure to the following vulnerabilities: low household income, low parental education, migrant background (at least one parent/caregiver born outside Spain), and parental unemployment (at least one parent unemployed or living on social assistance).

**Results.** At approximately 12 years of age, LE8 CVH score was similar between adolescents exposed to 0, 1, and 2 or more vulnerabilities (77.1, 76.1, and 76.1 points, respectively). However, LE8 CVH score was significantly higher (healthier) in adolescents with 0 vulnerabilities compared to the ones presenting 1 and 2 or more vulnerabilities at 14 and 16 years of age (78.0 vs 76.5/77.5 points, and 77.3 vs. 75.5/74.3 points, respectively). Regarding individual metrics, nicotine exposure and BMI metrics were significantly different between groups at the three time-points, presenting adolescents with 0 vulnerabilities the highest (healthiest) score, and smaller differences in sleep health, blood lipids and blood pressure were also found.

**Conclusions.** Adolescents exposed to social vulnerabilities presented a significantly unhealthier CVH profile, especially at 14 and 16 years of age, mainly due to a higher nicotine exposure and higher BMI. Tailored policy actions are required to tackle CVH inequalities already seen in adolescence.

# Moving in the Margins: A qualitative study into the role of physical activity in marginalised communities

**Miss Ella Creagh<sup>1</sup>**, Dr. Matthew Jenkins<sup>1</sup>, Dr. Paul Skirrow<sup>1</sup>, Associate Professor Mark Huthwaite<sup>1</sup>

<sup>1</sup>Department of Psychological Medicine, University of Otago, Wellington, New Zealand

**SO.2.12 - What have we learned recently on socio-economic inequalities, UKK - Hall B (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

Regular physical activity is essential in maintaining health and well-being, and has been described as a human right. However, people in marginalised communities who experience financial and/or housing insecurity often face significant barriers to physical activity. In Wellington, New Zealand, the charitable organisation Wellington City Mission reduces financial barriers to physical activity by providing their clients with swimming passes, leisure club memberships, and sports equipment. The aim of this study was to investigate the health and well-being outcomes of the clients receiving these physical activity subsidies. Using a qualitative approach, 12 semi-structured one-to-one interviews were conducted with clients of Wellington City Mission. Interview transcript data was analysed using inductive thematic analysis. The overarching theme we identified was that physical activity support resulted in participants actively shaping their health and well-being in four key areas: mental, physical, social, and behavioural health. These results are closely aligned with two established frameworks that describe well-being outcomes. The first of these is Self Determination Theory, which suggests that well-being and ongoing motivation are maximised when an individual's psychological needs of autonomy, competency, and relatedness are met. The second framework is Te Whare Tapa Whā, the Māori (indigenous people of New Zealand) model of health and well-being. This model depicts four aspects of health as being equally important: mental, physical, social, and spiritual health. This research is significant on many levels. For the participants, it allows them to feel seen, heard, and valued. For the wider population, it demonstrates the importance of physical activity in improving the well-being of people in marginalised communities, and the value of organisations like Wellington City Mission in making this possible. It is original in that this is the first time that health and well-being outcomes of physical activity have been investigated in marginalised communities in New Zealand. In terms of impact, the results of this study have been shared with Wellington City Council and they have agreed to supply further funding. Our hope is that other organisations are inspired by this research and develop their own initiatives to improve the social capital, health, and well-being of marginalised people.

# Patterns in postnatal diet and physical activity behaviours among a highly deprived population of women living with obesity in the UK

**Dr. Nicola Heslehurst<sup>1</sup>**, Dr. Angela Flynn<sup>2</sup>, Miss Chloe Briggs<sup>1</sup>, Mr. Lewis Smart<sup>1</sup>, Prof. Judith Rankin<sup>1</sup>, Prof. Elaine McColl<sup>1</sup>, Prof. Falko Sniehotta<sup>1</sup>, Dr. Catherine McParlin<sup>1</sup>

<sup>1</sup>Newcastle University, Newcastle Upon Tyne, United Kingdom, <sup>2</sup>Kings College London, London, United Kingdom

**SO.2.12 - What have we learned recently on socio-economic inequalities, UKK - Hall B (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** Maternal obesity affects 22% of UK pregnancies and is most prevalent among deprived populations. The postnatal period is an important time for healthy maternal diet and physical activity (PA) behaviours for women's health and future pregnancies. There are limited existing data on women's postnatal behaviours. This research aimed to explore maternal postnatal diet and PA among women with obesity, living in an area of high-deprivation.

**Methods:** A pilot cluster RCT cohort study set in four maternity hospitals in Northeast England. Women who had obesity in early pregnancy were invited to complete food frequency and pregnancy PA questionnaires at 3, 6, 9 and 12-months postnatal. Cross sectional descriptive statistics (mean SD; median IQR; n %) explored patterns in diet and PA behaviours at each time-point.

**Results/findings:** There were 24, 22, 12 and 20 questionnaires returned at each time-point. Across time-points, there was minimal difference in the median BMI (range 35.0kg/m<sup>2</sup> [IQR32.9-42.8] to 36.6 kg/m<sup>2</sup> [IQR33.9-39.0]), mean age (29.0 [SD5.4] to 31.2 [SD4.6] years), and 66.6-83.3% resided in the two most deprived quintiles. Median ranges for intake of fruits and vegetables (1.6-2.0 portions/day) and starchy carbohydrates (85g-109g/day) were low. Meat and fish intake (124-169g/day) was primarily from red/processed meats with low oily fish consumption (0-37g/day). Milk intake was 142mL/day and cheese 4-12g/day. Sugary drinks were higher at 3-months postnatal (158mL/day) compared to other time-points (14-80mL/day). Snacks were similar across the time-points (31-61g/day), with higher intakes of sweet than savoury snacks. Median total energy expenditure (TEE) ranged from 213.4-300.7METS/day across time-points. TEE was mainly from light (102.5-145.9METS/day) and moderate (76.6-109.6METS/day) intensity PA, followed by sedentary (17.9METS/day) and limited vigorous intensity PA (0.0-0.8METS/day). TEE was also primarily from the household/care domain (131.9-180.1METS/day), followed by inactive (17.9-29.4METS/day) and transport (13.4-28.0METS/day) domains, with limited TEE from sport (0.5-5.3METS/day).

**Conclusions:** Postnatal diet and PA in this highly deprived population of women with obesity were sub-optimal. Interventions should prioritise supporting women to meet national recommendations for their own health and for future pregnancies. Interventions that tackle wider determinants of health are likely to be required to support women living in deprivation to achieve these goals.

# Effective Recruitment Strategies for Underrepresented Populations in a Community Physical Activity Program

**Dr. Christine Pellegrini<sup>1</sup>**, Dr. Sara Wilcox<sup>1</sup>, Mrs. Krystal Cooper<sup>1</sup>, Ms. Kaitlyn Ramey<sup>1</sup>

<sup>1</sup>University of South Carolina, Columbia, USA

**SO.2.12 - What have we learned recently on socio-economic inequalities, UKK - Hall B (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

Enrollment of underrepresented populations within physical activity programs is challenging. Unique barriers and enablers to participation may exist, necessitating different recruitment strategies to reach various underrepresented populations.

**Purpose:** To examine which recruitment strategies for a community physical activity program were most effective for recruiting Black, low income, older adult populations with arthritis. Second, we compared Black and White populations on baseline characteristics.

**Methods:** Multiple strategies were used to recruit adults with arthritis, lupus, fibromyalgia, or gout for a community telephone-based Walk With Ease (WWE) Program between March 2022 and December 2022. WWE is a 6-week telephone-based walking program that includes one group call and one individual call per week with a WWE leader. The program was adapted from the Arthritis Foundation's in-person WWE program. In addition to obtaining recruitment source and socioeconomic characteristics, objectively measured physical function (Six-minute walk test [6MWT], chair stand test) and pain (visual analog scale) were assessed. Independent t-tests examined differences by race, sociodemographic characteristics, physical function, and pain.

**Results:** Among the 90 participants (93% female) recruited, 71% were Black and 29% White. Black participants were significantly younger ( $62.5 \pm 8.7$  yrs) and had lower objectively measured function (6MWT:  $1204.5 \pm 283.0$  ft;  $8.2 \pm 2.9$  chair stands) than White participants ( $67.1 \pm 10.2$  yrs,  $P < 0.05$ ; 6MWT:  $1378.2 \pm 271.6$  ft,  $P = 0.01$ ;  $9.9 \pm 2.2$  chair stands,  $P < 0.01$ ). There were no differences in BMI ( $35.1 \pm 9.4$  kg/m<sup>2</sup>) or pain ( $38.7 \pm 27.8$  mm). The majority of Black participants were recruited from radio advertisements (48%), university flyers/emails (11%), and community flyers/events (9%). White participants were primarily recruited from university flyers/emails (35%), Facebook (31%), and word of mouth (15%). Recruitment strategies that yielded the most participants with incomes  $< 150\%$  of the poverty line ( $n = 12$ ) or  $< \$54,000$  ( $n = 29$ ) were radio advertisements (12%), university flyers/emails (6%), and community flyer/events (6%). Adults  $\geq 65$  years ( $n = 43$ ) were most successfully recruited from the radio (17%) and university flyers/emails (8%).

**Conclusion:** Radio advertisements, community flyers/events, and university flyers/emails were the most effective recruitment strategies for Black, lower income, and older adults for a community physical activity program. Future physical activity programs looking to increase enrollment of underrepresented populations may want to consider these strategies.

# Refining index to measure physical activity inequality: which group of population is the most vulnerable?

**Associate Professor Piyawat Katewongsa<sup>1</sup>**, Dr. Dyah Anantalia Widyastari<sup>1</sup>, Ms. Aunyarat Khanawapee<sup>2</sup>

<sup>1</sup>Institute for Population and Social Research, Mahidol University, Salaya, Phutthamonthon, Nakhon Pathom, Thailand, <sup>2</sup>Thailand Physical Activity Knowledge Development Centre (TPAK), Salaya, Phutthamonthon, Nakhon Pathom, Thailand

**SO.2.12 - What have we learned recently on socio-economic inequalities, UKK - Hall B (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** There is substantial evidence that inequality – both in access and opportunity – is a predominant factor affecting one's participation in PA. However, the evidence of PA inequality is mostly focused on the disparities in the level (prevalence of sufficiency or cumulative minutes) of MVPA. This study assessed PA inequality by using three parameters to construct an inequality index: (1) Proportion of the population with sufficient MVPA; (2) Cumulative minutes of MVPA; and (3) The Gini coefficient.

**Methods:** Three rounds of data from Thailand's Surveillance on Physical Activity (SPA) 2019–2021 were employed. In each round, over 6,000 individuals aged 18–64 years were selected as nationally-representative samples and were included in the analysis. PA was measured subjectively by using the Global Physical Activity Questionnaire (GPAQ) version 2.0. PA inequality (between- and within-group) was constructed by using three parameters, with a combination of the three as the final measure, to identify the sub-groups of the Thai adults who are most vulnerable: groups with the least MVPA, highest insufficiency, and highest inequality index (Gini).

**Results:** During the Covid-19 epidemic, socioeconomic inequalities in PA was more profound than biologically-driven inequalities (age, sex), indicated by the lowest level of MVPA among socioeconomically deprived population (unemployed). Within group comparison suggested that the gap in the proportion of sufficient MVPA and cumulative minutes MVPA was the largest between those employed in the agricultural sector and the unemployed:  $\Delta$  17.3% vs 15.2%; 275 min vs 199 min in 2020 and 2021, respectively. However, by combining three metrics (the refined index) the five most vulnerable groups during the Covid-19 epidemic were identified as follows: (1) Those with no income; (2) The unemployed; (3) Those who have no access to PA facilities; (4) Older adults aged 60+years; and (5) Those earning <3,500 Baht per month.

**Conclusion:** The use of combined indicators in measuring PA inequality should aid in determining the most vulnerable groups of the population with a refined procedure. This method can be applied in many settings since the baseline data used to assess inequality (i.e., percent sufficient and cumulative minutes of MVPA) are widely available.

# Differences in grocery purchasing behaviours by socioeconomic position during COVID-19 lockdowns in Melbourne, Australia

**Mr. Damian Maganja (corresponding author)<sup>1</sup>**, Dr. Daisy H Coyle<sup>1</sup>, Dr. Liping Huang<sup>1</sup>, Dr. Simone Pettigrew<sup>1</sup>, Ms. Maria Shahid<sup>1</sup>

<sup>1</sup>The George Institute for Global Health, Sydney, Australia

**SO.2.12 - What have we learned recently on socio-economic inequalities, UKK - Hall B (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose** Studies of the impact of COVID-19 on food purchases and dietary patterns have largely relied on self-reporting or aggregated government data. We investigated how household grocery purchasing behaviours, objectively recorded, were impacted by lockdowns in Melbourne, Australia, in 2020, with a focus on differences by socioeconomic position. Increased government support made available at the time may have improved access to healthy foods for some individuals, however it is critical to understand whether this temporary policy change translated into improved dietary patterns at a population level.

**Methods** We used 2019 and 2020 data from the NielsenIQ Homescan Consumer Panel, a large and representative sample of households providing scanned barcode data for all groceries purchased from retail outlets. Households must have provided data in both years to be included. Purchase data was matched to the Australian FoodSwitch database, which contains information for >100,000 products available in Australian supermarkets. Postcode-level data linkage was used to map households to an index of relative socioeconomic position. We assessed mean expenditure on groceries and energy content of grocery purchases per capita, comparing the months in which Melbourne was in lockdown in 2020 to the same months in 2019 (pre-COVID-19).

**Results/findings** A total of 1,413 Melbourne households were included in this study. COVID-19 lockdowns appear to have impacted grocery purchasing behaviours, with average expenditure per capita increasing by 21.2% and average energy purchases per capita increasing by 17.7% between 2019 and 2020. The most disadvantaged households saw the smallest increases in expenditure (12.9%) and energy purchases (9.8%). During lockdowns, these households spent the least on but purchased the most energy from unhealthy sources (A\$108, 109MJ), while the most advantaged households spent the most on but purchased the least energy from unhealthy sources (A\$121, 102MJ).

**Conclusions** Results suggest that temporarily improved social and financial supports were insufficient to positively affect purchasing behaviours, with the most disadvantaged households potentially relying on cheaper but more energy-dense unhealthy products despite spending relatively more on healthy products altogether. These findings have implications for social policy settings in Australia, as well as policy to support healthier dietary patterns during crises.

# How education and income are associated with the consumption of plant-based protein-rich foods and related food choice motives?

**Dr. Elviira Lehto**<sup>1</sup>, Dr. Hanna Konttinen<sup>1</sup>, Prof. Jaakko Nevalainen<sup>2</sup>, Prof. Maijaliisa Erkkola<sup>1</sup>

<sup>1</sup>University of Helsinki, Helsinki, Finland, <sup>2</sup>Tampere University, Tampere, Finland

**SO.2.12 - What have we learned recently on socio-economic inequalities, UKK - Hall B (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose** Since people with low education and income level might face greater obstacles in the transition to a healthier and more sustainable diet, we examined how food choice motives (FCMs) associate with consumption of legumes and processed plant-based meat alternatives (PBMA) and whether education and income moderated these associations.

**Methods** The cross-sectional survey among blue-collar workers and members of the Service Union United was conducted in Finland in 2019 (n=6435). Participants provided information on their FCMs (how important they find health, sustainability, domesticity, convenience, and that they can eat whatever they want) and possible changes in the consumption of legumes and PBMA in the past two years. Information on gender, age, education, and income was received from the population register. Associations between FCMs and food consumption (stable/increased vs. decreased/non-consumption) were examined with logistic regression analyses adjusted for sociodemographic factors using education (low vs. high) and income (lowest quintile vs. higher) levels as moderators.

**Results** Stable/increased consumption of legumes and PBMA were less common among the low-education group (OR 0.47, 95%CI 0.41-0.53,  $p<.001$  and OR 0.51, 95%CI 0.45-0.59,  $p<.001$ , respectively) but no differences were found among income groups ( $p>.05$ ). Stable/increased consumption of legumes and PBMA associated positively with considering health, sustainability, and domesticity important (all  $p<.001$ ) and negatively with finding it very important to be able to eat whatever they want (both  $p<.01$ ). Valuing convenience associated negatively only with legume consumption ( $p<0.01$ ). Education moderated the association between sustainability and legume consumption ( $p=.049$ ) and income the association between convenience and PBMA consumption ( $p=.027$ ). In the stratified analyses, both among highly and less educated stable/increased legume consumption was more likely if they found sustainability very important (OR 5.24, 95%CI 3.46-7.94,  $p<.001$  and OR 3.10, 95%CI 2.61-3.67,  $p<.001$ , respectively). The income-stratified analyses were nonsignificant: in the low-income group the tendency was positive between convenience and PBMA consumption ( $p=.079$ ) whereas in the high-income group the tendency was negative ( $p=.107$ ).

**Conclusions** Barriers to increasing consumption of legumes and PBMA also among those with low education who already value sustainability need more attention. A more varying assortment of inexpensive and convenient PBMA might attract especially low-income consumers.

# Coping strategies of food insecure households with children and adolescents: Insights from Bourdieu's theoretical contributions.

**Mr. Gerónimo Brunet**<sup>1</sup>, Mr. Leandro Machín<sup>1,2</sup>, Ms. Luciana Bonilla<sup>3</sup>, Ms. María Costa<sup>3</sup>, Ms. María Fernanda González<sup>3</sup>, Ms. Silvia Bentancor<sup>3</sup>, Ms. Gabriela Fajardo<sup>4</sup>, Ms. Alejandra Girona<sup>1,4</sup>, Ms. Sofía Verdier<sup>3</sup>, Ms. María Rosa Curutchet<sup>3</sup>, Mr. Gastón Ares<sup>1,5</sup>

<sup>1</sup>Núcleo Interdisciplinario Alimentación y Bienestar, Espacio Interdisciplinario, Universidad de la República, Montevideo, Uruguay, <sup>2</sup>Centro de Investigación Básica en Psicología, Facultad de Psicología, Universidad de la República, Montevideo, Uruguay, <sup>3</sup>Instituto Nacional de Alimentación, Ministerio de Desarrollo Social, Montevideo, Uruguay, <sup>4</sup>Escuela de Nutrición, Universidad de la República, Montevideo, Uruguay, <sup>5</sup>Sensometrics & Consumer Science, Instituto Polo Tecnológico de Pando, Facultad de Química, Universidad de la República, Montevideo, Uruguay

**SO.2.12 - What have we learned recently on socio-economic inequalities, UKK - Hall B (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

## **SIG - Primary Choice:** I. Socio-economic inequalities

**Purpose:** The effect of food insecurity on health strongly depends on the behavioral strategies individuals use to cope with food access difficulties. The aim of this work was to gain an in-depth understanding of the coping strategies of food insecure households with children and adolescents in Uruguay, a high income Latin American country.

**Methods:** The study adopted a qualitative approach. Semi-structured interviews with adults and adolescents who lived in beneficiary households of food-related interventions provided by the state or civil society organizations were conducted in four cities between August and December 2022. Deductive-inductive content analysis of interview transcripts was conducted based on Bourdieu's theoretical concepts of fields, habitus, capitals, and practices.

**Results/findings:** Several food and non-food based coping strategies to acquire foods were identified among food insecure households based on the usage, combination and/or consideration of their accumulated cultural, economic, social and symbolic capital. These mainly included changes in household expenditure and consumption patterns, asking food from relatives/friends, searching for jobs, formal or informal credit requests, application to cash-transfer assistance programs, and/or attendance at community pots or public kitchens. A group of distinctive practices were found, such as drinking stimulant beverages, begging or rummaging for food on the street. We argue that reliance on these coping strategies respond to the combination of capitals (not) accumulated in the households and to food-related habitus.

**Conclusions:** Findings contribute to expand current knowledge about coping strategies in food insecure households, providing new theoretical and interdisciplinary insights, and stimulating new research lines. Results provide insights to the development of strategies and policies to reduce food insecurity.

# Understanding the categorization and moralization of food and eating behavior

**Dr. Alexandra Jackson<sup>1</sup>**, Dr. Hyun Jeong Min<sup>1</sup>, Ms. Anaderi Iniguez<sup>2</sup>, Ms. Megan Strickland<sup>3</sup>, Dr. Jane Lanigan<sup>3</sup>

<sup>1</sup>Pacific University, Forest Grove, USA, <sup>2</sup>Washington State University, Pullman, USA, <sup>3</sup>Washington State University, Vancouver, USA

**SO.2.13 - The Latest Research on Motivation and Emotion Studies, UKK - Hall C (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Intuitive eating emphasizes eating in response to physiological cues of hunger and satiety and is associated with multiple positive health outcomes. Unconditional permission to eat (UPE), a domain of intuitive eating, promotes removing food classifications and permission to eat all foods. This is based on the premise that not allowing foods can lead to preoccupation, guilt, or disordered behavior, whereas permission to eat all foods reduces emotional responses to food and supports consumption based on internal cues. However, people frequently categorize food items to simplify decision making. Foods are often categorized by characteristics of the food (e.g., nutrient value, convenience, context) as well as the moral aspects of healthy eating (e.g., clean, good, bad, junk). To promote UPE, we were interested in understanding how Americans categorize food and how categorizations that moralize foods were associated with UPE.

**Methods:** We recruited 48 adults 18 years and older living in the United States to complete a parallel mixed methods study including an online survey followed by an interview. The survey included demographic data and assessed UPE via the intuitive eating scale (IES-2). The interview explored what and how participants eat, and their thoughts and feelings about their body. To understand how foods are categorized, we used inductive and deductive coding. Next, we divided each code into two categories: moralizing and non-moralizing. We then used thematic analysis to describe how foods were moralized. Lastly, among participants who moralized foods, we conducted an exploratory case analysis assessing the frequency and content of moralizing codes with UPE scores.

**Results:** Participants were primarily White (77%) and female (68%) yet ranged from 18-76 years old. While analyses are in progress, we anticipate the rich description of food categorization including how the moralization of foods is associated with UPE scores will inform the promotion of intuitive eating.

**Conclusions:** Describing the categorization and moralization of foods and their association with eating behavior can help to better understand how to promote intuitive eating, positive health outcomes, and the development of nutrition messaging to promote diet quality while preventing disordered eating behaviors and reducing eating disorder risk.

# Body image satisfaction and food intake in adolescents from the SI! Program for Health Promotion in Secondary Schools

**Ms. Patricia Bodega**<sup>1,2</sup>, Dr. Juan Miguel Fernández-Alvira<sup>2</sup>, Miss Amaya de Cos-Gandoy<sup>1,2</sup>, Dr. Luis A Moreno<sup>3,4</sup>, Miss Mercedes de Miguel<sup>1,2</sup>, Miss Carla Rodríguez<sup>1</sup>, Dr. Anna Tresserra-Rimbau<sup>4,5</sup>, Miss Jesús Martínez-Gómez<sup>2</sup>, Miss Sonia Ramírez-Garza<sup>5</sup>, Dr. Emily P Laveriano-Santos<sup>5</sup>, Dr. Ramón Estruch<sup>4,6</sup>, Dr. Rosa M Lamuela-Raventós<sup>4,5</sup>, Dr. Rodrigo Fernández-Jiménez<sup>2,7,8</sup>, Dr. Gloria Santos-Beneit<sup>1,9</sup>

Wiener Cardiovascular Institute, Icahn School of Medicine at Mount Sinai, New York, USA

**SO.2.13 - The Latest Research on Motivation and Emotion Studies, UKK - Hall C (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Background:** Adolescence is a period in which body image satisfaction (BIS) gains relevance and influences dietary habits among other behaviors.

**Purpose:** To evaluate the relationship between BIS and food intake over adolescence.

**Methods:** 1315 adolescents from the SI! Program for Secondary Schools trial were assessed at baseline (12.5 [±0.4] years, 48.2% girls), first follow-up (1-FU) (13.9 [±0.4] years, 47.6% girls), and second follow-up (2-FU) (15.8 [±0.4] years, 48.4% girls). Adolescents self-reported their BIS and food intake through the Stunkard's figure rating scale and a validated food frequency questionnaire, respectively. Associations were estimated using linear and logistic mixed models stratified by gender, and adjusted for age, nutritional status, educational level, migrant background, and randomization group as fixed effects, and region and schools as random effects.

**Results:** In general, adolescents who desired to gain weight consumed more frequently unhealthier foods (e.g. fast-food, sweets, and processed meat). Compared to body-satisfied participants, boys willing to gain weight were more likely to be in the highest consumption group of sweets in 1-FU (OR: 2.39 [95%CI: 1.46;3.92]) and fast-food in 2-FU (OR: 2.97 [95%CI: 1.51;5.87]), while girls who desired to gain weight were more likely to be in the highest consumption group of sweets at baseline (OR: 1.99 [95%CI: 1.14;3.48]). In contrast, boys with a drive for thinness were less likely to be in the highest sweet beverages (baseline OR: 0.57 [95%CI: 0.34;0.96]; 1-FU OR: 0.57 [95%CI: 0.35;0.93]; 2-FU OR: 0.59 [95%CI: 0.35;1.00]), and sweets (baseline OR: 0.59 [95%CI: 0.36;0.98]; 2-FU: 0.49 [95%CI: 0.29;0.83]) consumption groups as compared to body-satisfied boys, while girls who desired to lose weight were less likely to be in the highest fruits and vegetables (OR: 0.64 [95%CI: 0.41;1.00]) and snacks (OR: 0.54 [95%CI: 0.3;0.99]) consumption groups at 1-FU.

**Conclusion:** BIS was consistently related to food intake during adolescence, with adolescents who desired to gain weight presenting an unhealthier dietary profile, especially boys. Health promotion programs on adolescent dietary habits should include a gender perspective and emphasize the overall health-related aspects of nutrition beyond weight status.

# Effects of combining physical activity with mindfulness on mental health and wellbeing: A systematic review

**Miss Masha Remskar<sup>1</sup>**, Dr. Max J. Western<sup>1</sup>, Miss Emma L. Osborne<sup>1</sup>, Dr. Olivia Maynard<sup>2</sup>, Dr. Ben Ainsworth<sup>3</sup>

<sup>1</sup>University of Bath, Bath, United Kingdom, <sup>2</sup>University of Bristol, Bristol, United Kingdom, <sup>3</sup>University of Southampton, Southampton, United Kingdom

**SO.2.13 - The Latest Research on Motivation and Emotion Studies, UKK - Hall C (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Physical activity and mindfulness practice both have established psychological benefits. However, relatively little is understood about how combining them may impact these effects, and whether there are additional benefits to a combined approach. This pre-registered review systematically identified, synthesised, and evaluated the existing literature on interventions combining physical activity and mindfulness, with a focus on mental health and wellbeing outcomes. Potential mechanisms of action and effects on physical activity engagement were explored as secondary aims.

**Methods:** Six databases (PubMed, Scopus, EMBASE, PsychINFO, Web of Science, The Cochrane Library) were searched for trials published up to June 2022. Eligible studies reported combined behaviour change interventions with 1) physical activity and mindfulness as the only or main treatments, 2) any type of control condition present, 3) adult samples with any or no medical condition(s), and 4) at least one wellbeing or mental health outcome. Study screening, data extraction and quality assessment (using the Cochrane Risk of Bias 2 tool) were performed by two separate reviewers. Findings are presented as a narrative synthesis due to clinical and methodological heterogeneity of included interventions.

**Results:** Out of 6389 original search results, 25 trials reported in 27 publications met the inclusion criteria. Most were pilot or feasibility studies (14 trials) or had small sample sizes ( $N_{median} = 47$ ), which limited our ability to draw firm conclusions regarding intervention effectiveness. Combining physical activity with mindfulness was deemed feasible and well-received by clinical and non-clinical samples alike. Combined interventions improved mental health and wellbeing outcomes relative to inactive controls (9/13 trials), with mixed results when compared to active control conditions (5/14 trials favoured combination). Effects on engagement in physical activity were also mixed, where measured.

**Conclusions:** Interventions combining physical activity with mindfulness are feasible and can be promising for improving mental health and wellbeing. Further research, particularly full-scale randomised controlled trials, is required to determine effectiveness, optimal intervention duration, dose and delivery type of either component. Assessing possible mediators or qualitatively exploring mechanisms of change would further advance the current understanding of the effects of combined interventions on mental health, wellbeing and their potential for behaviour change.

# How competitive high school sport influences boys' and girls' food habits: A gendered role for body shape.

**Miss Alysha L Deslippe<sup>1,2</sup>**, Miss Coralie Bergeron<sup>1,2</sup>, Dr. Tamara Cohen<sup>1,2</sup>

<sup>1</sup>Faculty of Land and Food Systems, The University of British Columbia, Vancouver, Canada, <sup>2</sup>Healthy Starts, BC Children's Hospital Research Institute, Vancouver, Canada

**SO.2.13 - The Latest Research on Motivation and Emotion Studies, UKK - Hall C (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Adolescents (13-18 years) who play competitive sports experience performance-related pressures like body shape that influence food habits and vary by gender. Most research exploring gender and food habits is conducted in elite sport settings (i.e., collegiate or high-performance teams) with limited work exploring athletes in competitive high school sports. Therefore, this study explored how adolescents in high school sports perceive the role of gender, sports and body shape over their food habits.

**Methods:** Semi-structured one-on-one interviews with high school students involved in competitive sports were conducted in Spring 2022 (n=27). All participants were purposefully recruited based on biological sex and high school sport participation. Interviewers were trained to probe for the perceived impact of sports, gender and social influences on participants' food habits. The interview guide was developed using previous literature and Bronfenbrenner's Social-Ecological Model. A brief online demographic question was also completed. Thematic analysis using inductive methods on 10 analyzed interviews (n=5 boys, n=5 girls) is reported here.

**Results:** All adolescents suggested that eating a healthy, balanced diet, staying hydrated and timing meals was critical for athletic performance. Majority of sport nutrition knowledge was learned from coaches or trainers, though girls also mentioned social media. In particular, adolescents highlighted the role of dietary protein on achieving performance goals. Within this, boys reported consuming more function protein sources (i.e., bars and shakes) compared to girls (i.e., shakes only). With regard to body shape, boys emphasized a desire to be fit and tall whereas girls stressed wanting to be thin. Among girls, these body-related pressures were more prominently stated to guide eating. Girls discussed feeling pressure to look a certain way to avoid judgement on their self-worth outside of sport in uniforms from coaches or teammates. In contrast, boys only discussed potential benefits for sport performance as a motivator for altering body shape.

**Conclusions:** Greater research is needed to understand how body-related pressures impact adolescents in high school sports food habits. Findings from these preliminary analyses suggest that gender specific messaging is needed to support adolescents' understanding that all bodies belong in sport.

# Cross-lagged effect of self-compassion on physical activity: The longitudinal mediation of barrier self-efficacy

**Dr. Shuge Zhang**, Prof. Andy Pringle, Dr. Clare Roscoe

<sup>1</sup>University of Derby, Derby, United Kingdom

**SO.2.13 - The Latest Research on Motivation and Emotion Studies, UKK - Hall C (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Overcoming barriers to engaging in regular physical activity is not an easy task but challenging to most people if not all. Self-compassion that involves one's disposition to approach distress, suffering, or unpleasant feelings and experience with an accepting and gentle mindset, is an important psychological quality and resource for an individual to overcome obstacles, recuperate from a setback or exercise lapse, and reengage in regular physical activity. Building on the limited, existing research on self-compassion and physical activity, the present research was the first to apply a longitudinal design and to examine the cross-lagged effect of self-compassion on physical activity. Moreover, the study also tested the longitudinal mediation of barrier self-efficacy that underlies the potential causal influence of self-compassion on one's physical activity levels.

**Methods:** We recruited a sample of 654 UK adults (Mean age = 40.83, SD = 13.58; 328 males) and followed them over three time points across seven months. At each time point, participants completed an online survey via Qualtrics, which assessed their levels of self-compassion, barrier self-efficacy, and physical activity (PA) levels. Cross-lagged panel analysis and longitudinal mediation analysis were performed.

**Results:** Self-compassion manifested a stable, significant cross-lagged effect from Time 1 to Time 2 and from Time 2 to Time 3 on increased MVPA and light PA. Time 2 Barrier self-efficacy mediated the effect of Time 1 self-compassion on increased MVPA and light PA at Time 3. All these observed effects were controlled for autoregressive effects across time (e.g., the effect of Time 1 MVPA on Time 2 MVPA) and synchronous correlations at each time point (e.g., the correlation of Time 1 MVPA and Time 1 self-compassion). Self-compassion did not demonstrate a meaningful effect on reducing time spent in sedentary behaviour.

**Conclusions:** Adopting a self-compassionate mind can help an individual engage in physical activity. The benefit of self-compassion is greater for MVPA than light PA but seems not useful for addressing sedentary behaviours. Future PA intervention should consider compassion-focused training to explore new ways to tackle physical activity and sedentary behaviour.

# Gratitude is associated with a healthier and more sustainable diet in the NutriNet-Santé Study

Dr. Margaux Robert<sup>1</sup>, Prof. Rebecca Shankland<sup>2</sup>, Dr. Mélanie Deschasaux-Tanguy<sup>1</sup>, Dr. Emmanuelle Kesse-Guyot<sup>1</sup>, Dr. Julia Baudry<sup>1</sup>, Dr. Alice Bellicha<sup>1</sup>, Dr. Bernard Srour<sup>1</sup>, Miss Marion Van Beekum<sup>1</sup>, Dr. Christophe Leys<sup>3</sup>, Prof. Serge Hercberg<sup>1,4</sup>, Dr. Mathilde Touvier<sup>1</sup>, Dr. Benjamin Allès<sup>1</sup>, **Dr. Sandrine Péneau<sup>1</sup>**

<sup>1</sup>Université Sorbonne Paris Nord, Inserm U1153, Inrae U1125, Cnam, Equipe de recherche en Epidémiologie Nutritionnelle (EREN), Centre de Recherche en Epidémiologie et Statistiques – Université de Paris (CRESS), Bobigny, France, <sup>2</sup>Laboratoire DIPHE (Développement, Individu, Processus, Handicap, Education), Université Lumière Lyon 2, Lyon, France, <sup>3</sup>Université Libre de Bruxelles, Service d'analyse des données (SAD), Bruxelles, Belgium, <sup>4</sup>Département de Santé Publique, Avicenne Hospital, Bobigny, France

**SO.2.13 - The Latest Research on Motivation and Emotion Studies, UKK - Hall C (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Gratitude has been associated with positive health outcomes, such as better cardiovascular health, less anxiety and depression or less dysfunctional eating. Grateful individuals have also been shown to be more compliant with medical recommendations, including diet recommendations suggesting that more grateful individuals could also have a better overall diet quality. However, data are lacking. This cross-sectional study aimed to investigate the associations between gratitude and food intake and in particular diet quality, food group and ultra-processed food (UPF) consumption and the contribution of organic and plant-foods to the diet.

**Methods:** In 2017, 20,190 participants of the NutriNet-Santé study completed the Gratitude Questionnaire-6 (GQ-6) and at least three self-administered 24-h dietary records. Adherence to dietary guidelines were assessed with the French National Nutrition and Health Program-Guideline Score (mPNNS-GS). Foods consumed were categorized according to their degree of processing by the NOVA classification. Organic food consumption was measured through an organic food frequency questionnaire. Contribution of plant-based foods to the diet was assessed with the plant-based diet index (PDI). Logistic and linear regressions were used to analyze associations between gratitude and diet quality, stratified on sex and considering socio-demographic and lifestyle characteristics.

**Results:** In both men and women, higher gratitude was associated with a better adherence to the dietary guidelines ( $\beta=0.08$ ; 95% CI = 0.05, 0.011) higher intakes of fruits and vegetables and whole-grain products, non-salted oleaginous fruit and lower intakes of meat and poultry, dairy and cheese and milk-based desserts. In women, gratitude was also associated with higher intake of healthy (legumes) and unhealthy (alcoholic and sugary drinks, fast-food and appetizers) food groups. Higher gratitude was also associated with lower intake of UPFs and a greater contribution of organic and plant-based foods to the diet in both men and women.

**Conclusions:** Gratitude was associated with a healthier and more sustainable diet overall. Potential impact of gratitude on the diet should be further investigated in intervention studies. These findings suggest that gratitude could be helpful in the promotion of healthy and sustainable dietary behaviors.

# A Randomized Controlled Trial on the Social Diffusion of Eating Behavior

**Associate Professor Nicklas Neuman**<sup>1</sup>, Ms. Ansung Kim<sup>2</sup>, Dr. Carolin Zorell<sup>2</sup>

<sup>1</sup>Uppsala University, Uppsala, Sweden, <sup>2</sup>Örebro University, Örebro, Sweden

**SO.2.13 - The Latest Research on Motivation and Emotion Studies, UKK - Hall C (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** This is an innovative method utilizing a mobile application both as a dietary assessment instrument and as an instrument for exposure to test effects on food behavior. We ask the important question: *are behaviors affected by what we are told to do or what our group members do?* More precisely: *does social reinforcement affect self-reported intakes of plant or animal foods within artificial social networks, and if so, under what conditions?*

**Method:** This is a 4-month randomized controlled trial conducted in Sweden. Participants were contacted via a variety of online and offline channels and directed to a questionnaire form. 328 eligible participants were invited to the app and randomized to one of three groups: (1) a factual information group (n=110); (2) a social information group (n=110); and (3) a no information group (control) (n=108). All participants were given the possibility to interact by posting pictures as well as commenting on and “liking” the activity of others. Throughout the study, groups 1 and 2 received weekly messages: (1) focused on facts about diet and health or environmental impact (mainly advice from the Swedish Food Agency); or (2) about the reported food intake of others in the group. Messages were mostly about plant or animal foods, but not only, since we did not want to make the study purpose too obvious. All three groups received reminders twice per week, asking participants to report at least two days’ total intake per week.

**Results:** Of all invited individuals, 190 reported at least one meal (n=62 [1]; n=65 [2]; n=63 [3]), with large variations in activity over the 4 months. Main outcome: proportions of plant:animal foods in the three groups across the 4 months. In addition, network dynamics, demographic associations (e.g. gender and education), patterns of specific foods, and the patterns of reporting (itself a behavior) are examples of secondary outcomes analyzed exploratively.

**Discussion:** The innovativeness of the method can inspire further behavior-change research to test the effects of different forms of social influence. The results have relevance for advancing behavioral nutrition knowledge and, in the long run, construct effective policy.

# Overcoming barriers to engage in physical activity: The role of self-compassion

**Associate Professor Clare Roscoe<sup>1</sup>**, Prof. Andy Pringle<sup>1</sup>, Dr. Shuge Zhang<sup>1</sup>

<sup>1</sup>University of Derby, Derby, United Kingdom

SO.2.13 - The Latest Research on Motivation and Emotion Studies, UKK - Hall C (Level 3), June 16, 2023, 12:00 PM - 1:15 PM

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Self-compassion involves being open to one's own suffering, generating the desire to heal oneself or acknowledging suffering as part of normal, human experience; it is likely to be a driver for physical activity. Existing studies examining the relationship between self-compassion and physical activity have insufficient statistical power or lack the sensitivity to detect a true effect. Therefore, the present study aimed to test the association between self-compassion and physical activity in a large, well-powered sample. We hypothesised that self-compassion exerts positive influences on one's active health behaviour (increases physical activity levels/reduces sedentary behaviour) via alleviated psychological distress (greater emotion and coping resources) and subsequently enhanced barrier self-efficacy (greater confidence and motivation).

**Methods:** In a sample of 569 UK adults (mean age = 41.92 years, SD  $\pm$  13.70; 47.8% female), participants consented and completed online surveys. We assessed self-compassion using the 12-item Self-Compassion Scale – Short, psychological distress using the 6-item Psychological Distress Scale, barrier self-efficacy using the 5-item Self-Efficacy Inventory and physical activity using the 7-item International Physical Activity Questionnaire – Short Form. We examined the effects of self-compassion on average daily time spent in sedentary behaviour, light and moderate-to-vigorous physical activity, whilst testing psychological distress and barrier self-efficacy as underpinning mediating factors. We also examined the effects of self-compassion on barrier self-efficacy, with psychological distress being the hypothesised mediator.

**Results:** Self-compassion demonstrated a significant, positive indirect effect on MVPA via increased barrier self-efficacy ( $\beta = .15$ ,  $p = .01$ , 95% CI [.04, .27]; standardised indirect effect = .06,  $p = .01$ , 95% CI [.01, .11]). The serial mediation path of self-compassion on MVPA via decreased psychological distress ( $\beta = -.75$ ,  $p = .00$ , 95% CI [-.78, -.71]) and subsequently increased barrier self-efficacy ( $\beta = -.11$ ,  $p = .06$ , 95% CI [-.23, .01]) was marginally significant and positive (standardised indirect effect = .03,  $p = .07$ , 95% CI [.00, .07]).

**Conclusions:** Self-compassion is a good source to overcome challenges and obstacles in the context of physical activity. Self-compassion contributes more strongly to moderate and vigorous physical activity levels and future interventions could consider incorporating self-compassion for physical activity adoption and maintenance.

# Exploring the Meanings and Perceptions of an Identity Towards Physical Activity in Early Cancer Survivorship

**Miss Allyson Tabaczynski<sup>1</sup>**, Miss Jada Roach<sup>1</sup>, Dr. Linda Trinh<sup>1</sup>

<sup>1</sup>Faculty of Kinesiology and Physical Education, University of Toronto, Toronto, Canada

**SO.2.14 - Lifestyle factors and cancer survivorship: Evidence from cross-sectional to intervention studies, UKK - Hall D (Level 2 - main floor), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Physical activity (PA) behaviour change efforts for cancer survivors continue to be thwarted by a lack of understanding and application of the determinants for PA maintenance. PA identity has been theorized to be both an antecedent and product of sustained PA participation, with some support for a strong association between PA identity and behaviours among cancer populations. Cancer survivors often report cancer-related barriers (e.g., fatigue, poorer physical functioning) as an impediment to PA participation following diagnosis. However, there is little understanding of how cancer-related sequela can impact existing PA identities of cancer survivors or the development of new PA identities. Therefore, the purpose of this study is to explore the meaning and perceptions of PA identity among cancer survivors within early survivorship.

**Methods:** Purposeful sampling will be used to reach adult cancer survivors within the early survivorship period ( $\leq 5$  years post-treatment) who have an identity surrounding PA (i.e.,  $\geq 5$  points on each role-identity item on the Exercise Identity Scale). Using a constructivist approach, semi-structured interviews include items seeking to understand the meaning of their PA identity, perceptions of how it formed, and how their cancer journey has interacted with this identity. Online interviews will be transcribed verbatim and analyzed using the methods outlined in Braun and Clarke's thematic analysis. Data collection will continue until saturation has been reached.

**Results:** Data collection is currently ongoing, and results have not been generated. Complete results will be presented at the ISBNPA 2023 annual meeting.

**Discussion:** PA identity is becoming more explicitly targeted in PA interventions for cancer survivors given its growing support as an important predictor of behaviour. Application of such identity formation strategies may, however, be limited by a lack of understanding of this construct as it applies specifically to cancer populations. The current study will provide insight into the perspectives cancer survivors hold towards PA identity within the context of their individual experiences following their cancer diagnosis. Such exploration can be used to tailor identity formation strategies within PA interventions for cancer survivors.

# Self-efficacy, motivation, and habits: psychological correlates of exercise among women with breast cancer.

**Dr. Tamara Jones**<sup>1</sup>, Dr. Lara Edbrooke<sup>1,2</sup>, Dr. Jonathan Rawstorn<sup>3</sup>, Prof. Sandra Hayes<sup>4</sup>, Prof. Ralph Maddison<sup>3</sup>, Prof. Linda Denehy<sup>1,2</sup>, Associate Professor Camille Short<sup>1</sup>

<sup>1</sup>The University of Melbourne, Melbourne, Australia, <sup>2</sup>The Peter MacCallum Cancer Centre, Melbourne, Australia, <sup>3</sup>Deakin University, Melbourne, Australia, <sup>4</sup>Griffith University, Brisbane, Australia

**SO.2.14 - Lifestyle factors and cancer survivorship: Evidence from cross-sectional to intervention studies, UKK - Hall D (Level 2 - main floor), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Designing effective programs that support breast cancer survivors to adopt and maintain regular exercise requires an understanding of characteristics that influence exercise behaviour. Psychological factors in particular are considered manipulable through behaviour change intervention. The purpose of this analysis was to inform future theory-based interventions by exploring associations between exercise behaviour and behavioural constructs from distinct theories: self-efficacy, motivation, and habits.

**Methods:** Breast cancer survivors (n=204) completed a cross-sectional survey collecting demographic and disease characteristics, exercise levels (Godin Leisure Time Exercise Questionnaire [GLTEQ] and a purpose-built resistance training item), and self-efficacy (Multidimensional Self-Efficacy for Exercise Scale), motivation (Behavioral Regulation in Exercise Questionnaire V2), and habit scores (Self-Report Habit Index). Multivariable linear regression models were used to identify psychological correlates of Total Activity (QLTEQ Score) and Resistance Training (sessions/week).

**Results:** Participants had a mean age of 57(11) years and most were diagnosed with early-stage disease (72%) and engaged in sufficient levels of exercise (GLTEQ Score  $\geq 24$ ; 94%), though only 44% completed two or more resistance training sessions/week. Identified motivation ( $\beta$ [95%CI]=7.58[3.91-11.24];  $p < 0.01$ ) and habits ( $\beta$ [95%CI] =4.43[1.48-7.38];  $p < 0.01$ ) were found to be significant correlates of Total Activity, whilst identified motivation ( $\beta$ [95%CI]=0.62[0.32-0.91];  $p < 0.01$ ) and coping self-efficacy ( $\beta$ [95%CI]=0.02[<0.01-0.03];  $p < 0.01$ ) were significant correlates of Resistance Training.

**Conclusions:** Although preliminary, these results may support the application of integrated theory-based interventions for improving exercise behaviour among breast cancer survivors and provide insight into how intervention techniques from distinct theories may be best integrated. Future research should explore these findings longitudinally to examine correlates of exercise maintenance and in a less active sample.

# Adherence to the WCRF/AICR cancer prevention recommendations and risk of recurrence after non-muscle invasive bladder cancer

Dr. Moniek van Zutphen<sup>1</sup>, Mr. Jasper Hof<sup>1</sup>, Dr. Katja Aben<sup>3</sup>, Prof. Ellen Kampman<sup>2</sup>, Prof. Alfred Witjes<sup>1</sup>, Prof. Lambertus Kiemeny<sup>1</sup>, **Dr. Alina Vrieling<sup>1</sup>**

<sup>1</sup>Radboud University Medical Center, Nijmegen, Netherlands, <sup>2</sup>Wageningen University & Research, Wageningen, Netherlands, <sup>3</sup>Netherlands Comprehensive Cancer Organisation, Utrecht, Netherlands

**SO.2.14 - Lifestyle factors and cancer survivorship: Evidence from cross-sectional to intervention studies, UKK - Hall D (Level 2 - main floor), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Patients with non-muscle invasive bladder cancer (NMIBC) are at high risk of tumor recurrence. It has not been previously investigated if adherence to cancer prevention recommendations lowers risk of recurrence. We examined whether the standardized lifestyle score measuring adherence to the 2018 World Cancer Research Fund/American Institute for Cancer Research (WCRF/AICR) cancer prevention recommendations was associated with risk of recurrence and progression among patients with NMIBC.

**Methods:** The study population included patients diagnosed with primary NMIBC between 2014 and 2017 from the prospective cohort UroLife. Lifestyle was assessed at baseline (n=979; reflecting the prediagnosis period) and 3-months postdiagnosis (n=885). The standardized 2018 WCRF/AICR score was constructed based on recommendations for body weight, physical activity, diet, and alcohol intake. We computed multivariable-adjusted hazard ratios (HRs) and 95% confidence intervals (CIs) using Cox proportional hazard regression models.

**Results:** During a median follow-up time of 3.7 years, 320 patients developed  $\geq 1$  recurrence(s) and 49 experienced progression. Patients in the highest versus lowest tertile of postdiagnosis WCRF/AICR scores had a lower risk of first bladder cancer recurrence (HR, 0.74; 95%CI: 0.56, 0.98). No associations were observed for multiple recurrences (HR, 0.90; 95%CI 0.70, 1.15) or for the baseline score with either first (HR, 1.07; 95%CI 0.82, 1.40) or multiple recurrences (HR, 1.04; 95%CI: 0.82, 1.31). Improving lifestyle after diagnosis (per 1-point increase) was not significantly associated with risk of first or multiple recurrence(s) (HR, 0.87; 95% CI: 0.74, 1.02 and HR, 0.93; 95%CI: 0.80, 1.08, respectively). No associations were observed for bladder cancer progression, but power was limited.

**Conclusions:** Better adherence to the WCRF/AICR cancer prevention recommendations 3-months after NMIBC diagnosis, but not before diagnosis, is associated with a decreased risk of first bladder cancer recurrence. More studies evaluating postdiagnosis lifestyle are needed to provide solid support for lifestyle recommendations for cancer survivors.

# “I'm hooked on e-cycling, I can finally be active again”: Perceptions of e-cycling as a physical activity intervention during breast cancer treatment.

Ms. Kirsty Way<sup>1</sup>, Dr. Jessica Bourne<sup>1</sup>, Ms. Chloe Forte<sup>1</sup>, **Dr. Miranda Armstrong<sup>1</sup>**

<sup>1</sup>Exercise, Nutrition and Health Sciences, School for Policy Studies, University of Bristol, Bristol, United Kingdom

**SO.2.14 - Lifestyle factors and cancer survivorship: Evidence from cross-sectional to intervention studies, UKK - Hall D (Level 2 - main floor), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Electrically-assisted bicycles (e-bikes) are a means through which to increase individual physical activity (PA) and overcome some commonly reported barriers to engaging in conventional cycling. Fatigue is a common side effect to breast cancer treatment, and the rate of PA engagement drops significantly following a breast cancer diagnosis. The use of e-bikes as a means of increasing PA in this population has yet to be explored. Therefore, the primary aim of this research was to examine perceptions of e-cycling amongst individuals who have had a breast cancer diagnosis. Changes in perceptions of e-cycling were examined following completion of an e-bike taster session. A secondary aim was to understand when, during the treatment process, using an e-bike may be the most beneficial as a means of increasing PA.

**Methods:** Twenty-four participants (Mean age =57.5 (SD 10.2), 100% female) who had had a breast cancer diagnosis, completed two semi-structured interviews via Zoom. One interview was conducted prior to an e-bike taster session and a second, after the session. Taster sessions were conducted by certified cycling instructors in the community. Interviews were conducted between December 2021 and May 2022. Data were transcribed verbatim and analysed thematically using NVivo 12 software. An inductive and deductive approach to analysis was adopted whereby initial coding was inductive.

**Results/findings:** Five themes were generated: Perceived role of e-bikes during treatment; Overcoming fatigue; Cancer-specific considerations; Is e-cycling 'enough'? and Optimising intervention. Negative perceptions of e-bikes noted before the taster session were often altered following a trial on the e-bike. E-cycling was appealing to participants due to its multiple levels of assistance which made e-cycling more manageable, thereby enabling individuals to re-introduce cycling habits. An optimal time to implement an e-bike intervention during the cancer journey was difficult to discern; however, immediately post-diagnosis was deemed least convenient.

**Conclusions:** E-cycling may be a suitable option to increase PA behaviour amongst individuals being treated for breast cancer with the potential to overcome many of the barriers of conventional cycling. Enabling this population to trial an e-bike elicits positive physical and psychological responses that may help to promote future engagement.

# Physical activity and sedentary behaviour as predictors of health-related quality of life among women treated for breast cancer through Connect 4 Exercise intervention: A multi-level model analysis

**Miss Delaney Thibodeau<sup>1</sup>**, Dr. Ross Murray<sup>1</sup>, Dr. Madison Vani<sup>1</sup>, Dr. Catherine Sabiston<sup>1</sup>

<sup>1</sup>University of Toronto, Toronto, Canada

**SO.2.14 - Lifestyle factors and cancer survivorship: Evidence from cross-sectional to intervention studies, UKK - Hall D (Level 2 - main floor), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Health-related quality of life (HRQOL) is a key indicator of health and well-being, particularly among individuals diagnosed with cancer. Physical activity (PA) is positively associated with HRQOL, and there is sparse insight on the association with sedentary behaviour (SB). This study aimed to explore associations between changes in PA and SB and HRQOL among women treated for breast cancer involved in a 10-week partner-focused remote-delivered PA intervention. It was hypothesized that positive changes in PA and SB would be related to higher HRQOL from pre- to post-intervention, and that the effects would be stronger for the intervention group.

**Methods:** Women treated for breast cancer ( $N = 108$ ,  $M_{\text{age}} = 50.84$ ) were matched with a partner and randomly assigned to either engage in PA with their partner (ActiveMatch; AM group), or to attend PA sessions led by a qualified exercise professional (QEP group). Fitbit watches measured PA and SB and the Short Form Health Survey was used for physical- and mental HRQOL at baseline and post-intervention. The data were analysed using multi-level models to test longitudinal changes in PA and SB as predictors of HRQOL, accounting for the participants' age, dyad, intervention group, and baseline HRQOL.

**Results:** PA and SB both increased during the intervention, but these changes were not significant. There was a significant interaction of intervention condition and SB changes on post-intervention PQOL (CI: [0.00-0.03],  $p < .05$ ). Among AM participants, SB changes were associated with more negative changes in physical HRQOL; however, SB changes were not associated with physical HRQOL among QEP participants. Effects of PA were null in both groups. Changes in PA and SB were not associated with mental HRQOL ( $p > .05$ ) for AM or QEP.

**Conclusions:** Results suggest a protective effect of the PA intervention for the physical HRQOL domain. There is a specific benefit of being matched with a partner and a QEP to protect from poor changes in SB which connect to HRQOL. These findings implicate a potential benefit of supervised PA interventions for women treated for breast cancer who experience challenges to their quality of life resulting from treatment.

# Longitudinal associations of adherence to lifestyle recommendations and health-related quality of life in patients with non-muscle invasive bladder cancer

Dr. Nikoletta Vidra<sup>1</sup>, **Ms. Ivy Beeren**<sup>1</sup>, Dr. Moniek van Zutphen<sup>1,3</sup>, Dr. Katja KH Aben<sup>1,2</sup>, Prof. Ellen Kampman<sup>3</sup>, Prof. J Alfred Witjes<sup>1</sup>, Dr. Antoine G van der Heijden<sup>1</sup>, Prof. Lambertus ALM Kiemeny<sup>1</sup>, Assistant Professor Alina Vrieling<sup>1</sup>

<sup>1</sup>Radboud University Medical Center, Nijmegen, Netherlands, <sup>2</sup>Netherlands Comprehensive Cancer Organisation, Utrecht, Netherlands, <sup>3</sup>Wageningen University & Research, Wageningen, Netherlands

**SO.2.14 - Lifestyle factors and cancer survivorship: Evidence from cross-sectional to intervention studies, UKK - Hall D (Level 2 - main floor), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Although the role of lifestyle in health-related quality of life (HRQoL) outcomes has been increasingly recognized for various types of cancer, evidence in patients with non-muscle invasive bladder cancer (NMIBC) is very limited. Therefore, we aimed to evaluate the longitudinal association between adherence to the 2018 World Cancer Research Fund/American Institute for Cancer Research (WCRF/AICR) lifestyle recommendations and HRQoL in patients with NMIBC.

**Methods:** This study included 1,029 patients diagnosed with NMIBC between May 2014 and April 2017 from the Dutch multi-centre prospective cohort study UroLife. Self-reported lifestyle and HRQoL data were collected at six weeks (baseline), three months, and fifteen months after diagnosis. Information on body mass index (BMI), physical activity, diet (including intakes of fruit and vegetables, dietary fibre, ultra-processed foods, red and processed meat, and sugary drinks), and alcohol was used to compute the standardized 2018 WCRF/AICR adherence score (range 0-7). HRQoL outcomes were evaluated by the EORTC QLQ-C30. Linear mixed models were used to assess longitudinal confounder-adjusted associations between the WCRF/AICR adherence score and HRQoL outcomes.

**Results:** The mean WCRF/AICR adherence score was  $3.3 \pm 0.9$  at baseline. Adherence to each additional WCRF/AICR recommendation was associated with better global quality of life ( $\beta$ : 2.00, 95% CI: 1.15, 2.84), physical ( $\beta$ : 1.36, 95% CI: 0.74, 1.98), role ( $\beta$ : 1.92, 95% CI: 0.76, 3.09), and social ( $\beta$ : 1.21, 95% CI: 0.29, 2.13) functioning, and less fatigue ( $\beta$ : -1.33, 95% CI: -2.28, -0.39). We found stronger inter-individual than intra-individual associations, suggesting that associations were mainly driven by between-subject differences. Higher adherence to the BMI, physical activity, and dietary recommendations was associated with better scores for most HRQoL outcomes, while adherence to the alcohol recommendation (i.e. non-consumption) was associated with worse HRQoL.

**Conclusions:** Higher adherence to the overall 2018 WCRF/AICR lifestyle recommendations was associated with better HRQoL outcomes in patients with NMIBC. A reverse association was observed for alcohol consumption. Overall, following a healthy lifestyle may improve HRQoL in this patient group. Well-designed intervention studies are required to obtain further insight into the relationship between lifestyle and HRQoL.

# Lifestyle intervention during Colorectal Cancer Screening: a pilot study in France

**Miss Aline Al Nahas**<sup>1</sup>, Dr. Nathalie Kliemann<sup>1</sup>, Mrs. Aurelia Maire<sup>2</sup>, Dr. Emmanuel Forte<sup>3</sup>, Dr. Anne Anne Cattey-Javouhey<sup>2</sup>, Dr. Nicolas Benech<sup>3</sup>, Mrs. Olivia Pérol<sup>2</sup>, Mrs. Tracy Wootton<sup>1</sup>, Dr. Inarie Jacobs<sup>1</sup>, Dr. Julien Carretier<sup>2</sup>, Prof. Jean-Christophe Saurin<sup>3</sup>, Associate Professor Beatrice Fervers<sup>2</sup>, Dr. Marc J. Gunter<sup>1</sup>, Dr. Inge Huybrechts<sup>1</sup>

<sup>1</sup>International Agency for Research on Cancer, CEDEX 08, Lyon , France, <sup>2</sup>Centre Léon Bérard, Lyon, France,

<sup>3</sup>Service d'Hépatogastroentérologie, Hôpital Edouard Herriot, Hospices Civils de Lyon, , Lyon, France

**SO.2.14 - Lifestyle factors and cancer survivorship: Evidence from cross-sectional to intervention studies, UKK - Hall D (Level 2 - main floor), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** This pilot study aims to test the feasibility of a lifestyle intervention in French hospital settings to optimize fieldwork procedures for the large-scale randomized control trial LIFE-SCREEN (registered with clinicaltrials.gov: Record PP201907-26). The aim of the intervention is to provide evidence-based diet and lifestyle advice for cancer prevention at a teachable moment, namely at colorectal cancer screening.

**Methods:** the pilot study is ongoing and anticipates a final number of 40 patients recruited at two hospitals, Centre Léon Bérard and l'hôpital Edward Herriot in Lyon, France . The intervention material was administered to each patient and comprises WCRF recommendations, recipes, nutrition and physical activity tips, behavioural change section, and a logbook to help them in goal setting, tracking and achievement. Patients receive the intervention material in colonoscopy visit and are asked to complete questionnaires at baseline and after at least one month of using the material. They also receive a pedometer. Biospecimens collections (venous blood at hospital and self-administered urine, feces, capillary blood collections) were optional to enable patients to participate while refusing one or more biospecimens. Focus group meetings were organised with patients and then with hospital staff to give an understanding of their perspective on the intervention.

**Results/findings:** The first 10 patients who have been recruited accepted to give all the biospecimens (except from two patients); they rated the collection at home and the sending of the collected samples as acceptable. Patients participating in the focus group (2 men; 2 women) were impressed by the quality of the intervention material and found the monitoring sheets useful to help them reach their goals. Hospital staff suggested to simplify the material while referring to more detailed online information to reduce the time needed to explain the intervention material to the patient during the visit.

**Conclusions:** A simplification of the material and providing access to supplementary resources online (including short video's) are suggested modifications to improve efficacy and to meet the diverse needs of the patients while reducing the burden on hospital staff. Self-administered biospecimens collections are acceptable by the patients and posting them proved to be cost effective and practical.

# Prevalence and change in circadian rhythm disrupting sleep and eating behaviours in women after breast cancer.

**Ms. Kelly D'cunha**<sup>1</sup>, Dr. Yikyung Park<sup>2</sup>, Dr. Rebecca M. Leech<sup>3</sup>, Dr. Melinda M. Protani<sup>1</sup>, Dr. Louise Marquart-Wilson<sup>1</sup>, Prof. Marina M. Reeves<sup>1</sup>

<sup>3</sup>Faculty of Health, Institute for Physical Activity and Nutrition (IPAN), Deakin University, Geelong, Australia

**SO.2.14 - Lifestyle factors and cancer survivorship: Evidence from cross-sectional to intervention studies, UKK - Hall D (Level 2 - main floor), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** C. Cancer prevention and management

**Purpose:** Circadian rhythm disrupting lifestyle factors, such as sleep patterns and eating behaviours, may influence cancer outcomes in women following a breast cancer diagnosis. However, little is known about the prevalence of these behaviours in breast cancer survivors. This study examined the prevalence of sleep and eating behaviours within a sample of breast cancer survivors and changes in these behaviours following a weight loss (diet and physical activity) intervention.

**Methods:** 159 female breast cancer survivors (18-75 years; 25-45 kg/m<sup>2</sup>; stage I-III) were recruited to participate in a randomised controlled trial of a 12-month weight loss intervention versus usual care. Data were collected at baseline, 6-, 12-, and 18-months (80.5% retention at 18-months). Participants completed two non-consecutive 24-hour dietary recalls and sleep logs for seven days. Sleep duration, eating occasions, proportion of calories consumed in the evening, night-time eating, and nightly fasting duration were estimated and categorised based on existing evidence into desirable/undesirable behaviours. Prevalence of sleep and eating behaviours at baseline are described, and prevalence of eating behaviours were compared to an age- and BMI-matched national sample of women without cancer from the Australian Health Survey (2011-2013). Mixed-effects logistic regression models were used to examine the effects of the weight loss intervention on these behaviours.

**Results:** At baseline (mean 11 months post-diagnosis), 62% of breast cancer survivors had >6 eating occasions (versus 38% in women without cancer), 82% consumed ≥30% of caloric intake after 5pm (versus 79%), 67% consumed ≥25kcal after 8pm (versus 52%), 86% fasted for less than 13 hours overnight (versus 73%), and 24% slept <8 hours while 30% slept >9 hours per night. For breast cancer survivors, there were no statistically significant or meaningful (Cohen's effect sizes [d] all <0.3) differences between the intervention and usual care groups for changes in sleep or eating behaviours over the 18 months.

**Conclusions:** Circadian rhythm disrupting eating behaviours are highly prevalent in breast cancer survivors. These behaviours were not modified following a standard weight loss intervention. Future diet and health behaviour interventions should focus not only on diet quality but also on timing of eating in breast cancer survivors.

# The UNiversity students LIFEstyle behaviors and Mental health problems (UNILIFE-M) prospective cohort

Prof. Felipe Schuch<sup>1</sup>, **Associate Prof. Susan Torres**, Other On behalf of the UNILIFE-M consortium

<sup>1</sup>Federal University of Santa Maria , Santa Maria, Brazil

**SO.2.15 - Hot topics in young adults nutrition and physical activity, UKK - K1 (+K2) (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Emerging adulthood is a peak period for the onset of mental health problems. This period – in which many young people go to college – is also marked by a shift in multiple lifestyle behaviors, including increased time spent in sedentary behavior and physical inactivity, poorer dietary habits, sleep quality, and increased substance use. Lifestyle behaviors do not occur in isolation, there is a high level of interdependence between them, and thus, changes in one behavior may trigger changes in other behaviors. Robust evidence demonstrates that some lifestyle behaviors are independent risk factors for mental health outcomes. However, there is a paucity of evidence investigating the role of multiple lifestyle behaviors with incident mental health problems in university students. The present project portrays an international prospective multicenter cohort in over 60 universities in 24 countries, aiming to investigate the relationships between lifestyle behaviors and incident mental health problems in university students.

**Methods:** The prospective study will gather self-reported data on lifestyle behaviors (diet, physical activity, substance use, stress management, social support, restorative sleep, and screen exposure), using the Short Multidimensional Inventory Lifestyle Evaluation (SMILE) scale. Mental health problems (symptoms of depression, anxiety, mania, sleep problems, substance abuse, inattention/hyperactivity, and obsessive/compulsive thoughts/behaviors) will be assessed using a two-level approach. All students will answer the DSM-5 Level 1 Cross-Cutting Symptom Measure in level one. Further, the participants that screen positive for a problem will fill up the level two instrument for that problem(s). The level 2 questionnaires are the Patient Health Questionnaire (PHQ-9), the Generalized Anxiety Disorder (GAD-7), the Hypomania CheckList (HCL-16), the Alcohol, Smoking and Substance Involvement Screening Test, *Adult Self-Report Scale* for the symptoms of attention-deficit disorder (ASRS), the Pittsburg Sleep Quality Index (PSQI), and the obsessive-compulsive inventory-revised (OCI-R).

**Results:** A total of 300 first-year students will be assessed at baseline (the first semester of the 2023 academic year), and followed up for 1, 2, and 3.5 years.

**Conclusions:** The study will advance the field by comprehensively investigating how multiple lifestyle behaviors cluster to predict the most prevalent mental health problems in university students during their college years.

# Lifestyle behaviours clustering and their association with cardiorespiratory fitness and muscular strength in university students

**Mrs. Ximena Palma-Leal<sup>1,2</sup>**, Dr. José Francisco López-Gil<sup>3</sup>, Dr. Fernando Rodríguez-Rodríguez<sup>2</sup>, Dr. Daniel Camiletti-Moirón<sup>4,5</sup>, Dr. Palma Chillón<sup>1</sup>

<sup>1</sup>PROFITH Research Group, Department of Physical Education and Sports, Faculty of Sport Sciences, Sport and Health University Research Institute (iMUDS), University of Granada, Granada, Spain, <sup>2</sup>IRyS Group, School of Physical Education, Pontificia Universidad Católica de Valparaíso, Viña del Mar, Chile, <sup>3</sup>Health and Social Research Center, Universidad de Castilla-La Mancha, Cuenca, Spain, <sup>4</sup>GALENO Research Group, Department of Physical Education, Faculty of Education Sciences, University of Cádiz, Avenida República Saharaui, s/n, Puerto Real, Cádiz, Spain, <sup>5</sup>Instituto de Investigación e Innovación Biomédica de Cádiz (INiBICA), Cádiz, Spain

**SO.2.15 - Hot topics in young adults nutrition and physical activity, UKK - K1 (+K2) (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** J. Young Adults

**Background:** There is a prevalence of unhealthy lifestyles, especially among university students, which could have a negative impact on their short-and long-term health.

**Purpose:** The aim of this study was two-fold: 1) to identify different lifestyle behaviours patterns in Chilean and Spanish university students, according to their sleep duration, breakfast status, moderate-to-vigorous physical activity (MVPA), sitting time, and mode of commuting; and 2) to determine the odds of reporting high cardiorespiratory fitness and muscular strength among the different lifestyle behaviours patterns established.

**Methods:** In this cross-sectional design, a total of 2269 university students (52.9% women) participated in this study (26.8 ± 6.0 years old). Self-reported questionnaires were used to measure sleep duration, breakfast status, MVPA, sitting time, mode of commuting and physical fitness components (i.e., cardiorespiratory fitness and muscular strength). To examine the different lifestyle behaviours patterns, a two-step cluster analysis was performed. Logistic regression models were used to determine the odds of reporting high physical fitness among the different lifestyle behaviours patterns established.

**Results/findings:** Three different lifestyle patterns were identified: Cluster 1 (less sleep duration + skipping breakfast + low MVPA + medium sitting time), Cluster 2 (medium sleep duration + daily breakfast + high MVPA + less sitting time + passive commuting), and Cluster 3 (more sleep duration + daily breakfast + high MVPA + more sitting time + active commuting). Students in Cluster 2 and Cluster 3 were more likely to report higher cardiorespiratory fitness (Odd Ratio [OR]: 1.35, Confident Interval [CI] 95%: 1.06-1.74; OR: 1.37; CI95%: 1.01-1.86, respectively), and muscular strength (only significant for Cluster 2, OR: 1.29; CI95%: 1.01-1.64) compared to students in Cluster 1. Additionally, Cluster 2 had significant odds of reporting both high cardiorespiratory fitness and muscular strength (OR: 1.54; CI95%: 1.13-2.09) compared to students in Cluster 1.

**Conclusions:** Having a lifestyle behaviour pattern that includes more sleep duration, daily breakfast, high MVPA, and less sitting time was associated with reporting a high cardiorespiratory fitness and muscular strength among Spanish and Chilean university students. This finding could be clinically relevant, as both components of physical fitness are powerful markers of health.

# Diet quality, diet-related factors, and disability status among male young adults in the United States

**Dr. Andrea Deierlein**<sup>1</sup>, Ms. Jackie Litvak<sup>1</sup>, Ms. Chang Liu<sup>1</sup>, Dr. Cheryl Stein<sup>2</sup>

<sup>1</sup>School of Global Public Health at New York University, New York, USA, <sup>2</sup>New York University Grossman School of Medicine, New York, USA

**SO.2.15 - Hot topics in young adults nutrition and physical activity, UKK - K1 (+K2) (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Diet during adolescence and early adulthood greatly influences overall physical and mental health and chronic disease development throughout the life course. Persons with disabilities report poorer health status and higher rates of chronic health conditions compared to their counterparts without disabilities. There are numerous contributors to these health disparities, including socioeconomic status, lifestyle behaviors, healthcare access, and receipt of preventive healthcare services. Additionally, an increased risk of household food insecurity is consistently associated with disability status. However, there remains limited investigation of dietary intakes and other diet-related factors among persons with disabilities. We aimed to address this gap in the literature by examining these factors among male young adults with and without disabilities in the United States.

**Methods:** Cross-sectional data were from the National Health and Nutrition Examination Surveys, 2013–2018. Disability was reported as serious difficulty hearing, seeing, concentrating, walking, dressing, and/or running errands due to physical, mental, or emotional conditions. Diet quality was assessed by the Healthy Eating Index (HEI)-2015 and diet-related factors included self-rated diet healthfulness, food security, and food assistance programs. Multivariable linear regression estimated differences in HEI-2015 scores. Multivariable Poisson regression estimated adjusted prevalence ratios (aPR) and 95% confidence intervals (CI) for diet-related factors.

**Results/Findings:** There were 3,249 male young adults, 18–44 years; of whom, 441 (13.4%) reported disabilities. Compared to males without disabilities, those with disabilities had a 2.69-point (95% CI:-4.18,-1.20) lower mean total HEI-2015 score and approximately one third to half of a point lower HEI-2015 component scores for greens and beans, total protein foods, seafood and plant proteins, fatty acids, and added sugars. Males with any disabilities were more likely to have low food security (aPR=1.57; 95% CI:1.28, 2.92); household participation in food assistance programs (aPR=1.61; 95% CI:1.34, 1.93); and consume fast food meals during the previous week (1–3 meals: aPR=1.11; 95% CI: 1.01–1.21 and 4 or more meals: aPR=1.18; 95% CI: 1.01–1.38) compared to males with no disabilities.

**Conclusions:** Factors affecting diet and other modifiable health behaviors among male young adults with disabilities require further investigation. Health promotion strategies that are adaptive to diverse populations within the disability community are needed.

# Health behavioural and psychosocial characteristics of physical activity patterns: a cohort study from adolescence to young adulthood

**SO.2.15 - Hot topics in young adults nutrition and physical activity, UKK - K1 (+K2) (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose** The decline in physical activity (PA) during adolescence is well-established. However, while some subgroups of adolescents follow the general pattern of decreased activity, others increase or maintain high or low activity. Correlates and determinants of different PA patterns may vary and are valuable information for targeted health promotion. The aim of this study was to examine how psychosocial factors, health behaviours, and PA domains are associated with longitudinal PA patterns from adolescence to young adulthood.

**Methods** This prospective study encompassed 254 participants measured at mean age 15 and 19. Device-measured moderate-to-vigorous PA was grouped into five patterns (*activity maintainers*, *inactivity maintainers*, *decreasers from moderate to low PA*, *decreasers from high to moderate PA*, *increasers*) via a data-driven method (K-means for longitudinal data). Multinomial logistic regression was used to analyse the associations between health behaviours, psychosocial factors, PA domains (all assessed via a survey), and different longitudinal PA patterns.

**Results** A lack of sports club participation characterised *inactivity maintainers* throughout adolescence, as modelled via (1) baseline determinants: Odds Ratio (OR) 4.6, Confidence Interval (CI) 2.2–9.6; (2) follow-up correlates: OR 6.4, CI 2.6–14.7; and using the combined group of activity maintainers and increasers as a reference. Difficulties in communicating with one's father at age 15 were associated with higher odds of belonging to *inactivity maintainers* (OR 2.4, CI 1.1–5.1) and to *decreasers from moderate to low PA* (OR 3.3, CI 1.6–7.1). Lower fruit and vegetable consumption at age 19 was also related to increased odds of belonging to the groups of *inactivity maintainers* (OR 0.8, CI 0.7–0.9) and *decreasers from moderate to low PA* (OR 0.9, CI 0.8–0.97). Smoking at age 19 was associated with being a *decreaser from moderate to low PA* (OR 3.0, CI 1.005–8.8).

**Conclusions** Multilevel factors characterise longitudinal PA patterns over the transition to young adulthood. Sports club participation contributes to maintained PA. Moreover, a father-adolescent relationship that supports open communication may be one determinant for sustained PA during adolescence. A healthier diet and non-smoking as a young adult are associated with more favourable PA development.

# Child maltreatment and psychological adaptation in adolescents: what if organized sports could help?

**Dr. Christopher Rodrigue<sup>1,2</sup>**, Prof. Martine Hébert<sup>3</sup>, Prof. Daniel Lalande<sup>1</sup>, Prof. Sylvie Parent<sup>2</sup>, Dr. Marie-Ève Blackburn<sup>1</sup>, Prof. Linda Paquette<sup>1</sup>, Prof. Jacinthe Dion<sup>1</sup>

<sup>1</sup>Université du Québec à Chicoutimi, Chicoutimi, Canada, <sup>2</sup>Université Laval, Québec, Canada, <sup>3</sup>Université du Québec à Montréal, Québec, Canada

**SO.2.15 - Hot topics in young adults nutrition and physical activity, UKK - K1 (+K2) (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** J. Young Adults

Many adults worldwide report maltreatment during childhood, including physical (23%) and emotional abuse (36%), sexual abuse (13%), and physical neglect (16%)(Stoltenborgh et al., 2014). Child maltreatment is associated with a greater risk of dealing with serious physical and psychological issues in adulthood (e.g., addiction, depression, obesity)(WHO, 2019). In addition to preventing child maltreatment, it is essential to identify potential factors to help promote resilience in victims. A huge body of literature supports the benefits of sports on physical and psychological health. However, the role of organized sports participation (OSP) (i.e., being part of a sports club or federation) as a potential factor sustaining positive adaptation despite adversity, has been understudied. Thus, the present study aimed to investigate the interaction of OSP on the association between child maltreatment and psychological adaptation. To do so, 1,802 adolescents aged 14-18 (Mean=14.74;  $SD=0.84$ ) were recruited in six Canadian high schools. Participants completed self-reported questionnaires on OSP, psychological adaptation (body satisfaction, disordered eating, self-esteem, life satisfaction, internalized and externalized symptoms), and child maltreatment. Moderation analyses were performed using the *Mplus* software, with 95% confidence intervals and 10,000 bootstraps, to assess the interaction effects of OSP on the relationships between child maltreatment and psychological adaptation outcomes, separately. They revealed that OSP significantly moderated the relationships between child maltreatment and life satisfaction [ $B=0.095$ , 95% C.I. (0.155,0.997),  $p<.05$ ], self-esteem [ $B=.076$ , 95% C.I. (0.01,0.429),  $p<.05$ ], and body satisfaction [ $B=0.105$ , 95% C.I. (0.094,0.467),  $p<.05$ ]. The negative relationships between child maltreatment and all three outcomes were more pronounced in adolescents who did not report OSP. Moreover, a chi-square test of independence showed that adolescents with an experience of child maltreatment were significantly less likely to report OSP ( $\chi^2(1) = 13.14$ ,  $p < .001$ ). In conclusion, our results showed that OSP could represent a resilience factor in individuals with a history of child maltreatment, to facilitate a better psychological adaptation. However, they also showed that adolescents with a past child maltreatment experience are less involved in those activities. The present results highlight the need to better understand barriers for those adolescents, to facilitate their participation in organized sports.

# Body weight perceptions among youth from six countries: Findings from the International Food Policy Study

**Ms. Karen Hock (corresponding author)**<sup>1</sup>, Dr. Lana Vanderlee<sup>2</sup>, Ms. Christine M. White<sup>1</sup>, Dr. David Hammond<sup>1</sup>

<sup>1</sup>University of Waterloo, Waterloo, Canada, <sup>2</sup>Université Laval, Quebec City, Canada

**SO.2.15 - Hot topics in young adults nutrition and physical activity, UKK - K1 (+K2) (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Body dissatisfaction is associated with poor psychological and physical health, particularly among young people. However, limited data exist on body size perceptions across countries and factors associated with body dissatisfaction. The current study examined prevalence of body dissatisfaction, and its association with sociodemographics and lifestyle correlates among youth in six countries. The study had three primary hypotheses: over one-third of youth will report body dissatisfaction across countries, and dissatisfaction for being larger than ideal will be associated with weight loss efforts and social media use.

**Methods:** National online surveys were conducted as part of the 2019 and 2020 waves of the International Food Policy Study Youth Survey, a cross-sectional sample of 21,277 youth aged 10-17 from six countries: Australia, Canada, Chile, Mexico, the United Kingdom, and the United States. Figural drawing scales assessed self-perceived and ideal body images, with the difference between scales representing body dissatisfaction. Multinomial logistic regression models examined differences in body dissatisfaction by country, and associations with sociodemographics, weight loss efforts, and either time spent on screens browsing social media (social media screen time) or social media platforms used.

**Results:** Overall, approximately 45% of youth reported matching perceived and ideal body sizes, while more than half reported dissatisfaction: 35% reported their body size was larger than ideal (from 33% in Canada and Australia to 42% in Chile), whereas 20% reported being thinner than ideal (15% in Chile to 22% in Mexico). Compared to youth with the intention of 'doing nothing/staying the same weight', youth reporting efforts to gain or lose weight were more likely to report dissatisfaction for being thinner or larger than ideal, respectively ( $p \leq 0.010$  for both contrasts). Greater social media screen time was associated with a higher likelihood of dissatisfaction for being larger than ideal ( $p < 0.001$ ), with greater dissatisfaction among users of YouTube and Snapchat ( $p \leq 0.005$  for both contrasts).

**Conclusions:** Body dissatisfaction for being both larger and thinner than a perceived ideal is prevalent among youth across diverse countries, and is associated with weight-related behaviours and social media use. These findings highlight the need to promote healthy body image among youth worldwide.

# Daily physical activity patterns among students in different vocational education and training programs

**Miss Yingyi Wu**<sup>1</sup>, Associate Professor Pascal Van Gerven<sup>1</sup>, Prof. Renate de Groot<sup>2</sup>, Prof. Bert O Eijnde<sup>3</sup>, Associate Professor Bjorn Winkens<sup>1</sup>, Prof. Hans Saveberg<sup>1</sup>

<sup>1</sup>Maastricht University, Maastricht, Netherlands, <sup>2</sup>Open University, Heerlen, Netherlands, <sup>3</sup>Hasselt University, Hasselt, Belgium

**SO.2.15 - Hot topics in young adults nutrition and physical activity, UKK - K1 (+K2) (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Students' total physical activity levels vary in vocational education and training (VET) programs. It remains unknown how students' physical activity behavior (PAB) in diverse VET programs change over the day during study and leisure time. We examined students' daily PAB patterns on weekdays and weekends and compare the hourly differences between four different VET programs: administrative, hairdressing nursing, and sports.

**Methods:** In this cross-sectional study, 155 students (66% women, mean age  $\pm$  SD = 19.2  $\pm$  3.4, mean BMI  $\pm$  SD = 23.5  $\pm$  4.1) wore ActivPAL accelerometers continuously for a week. Outcomes were sedentary time, activity score, sit-to-stand transitions, and number of steps per hour. Linear mixed models assessed hourly and group variation.

**Results:** VET students in different programs had different PAB patterns during the weekdays. On weekdays, from 9:00 to 19:00, administrative students sat the most with the least sit-to-stand transitions. Sports students sat about 30 minutes per hour with one physically active time period (10:00-14:00). Hairdressing students sat least. Nursing students sat for about 25 minutes per hour with more sit-to-stand transitions. Only sports students continued being physically active into the evening hours (19:00-22:00). On weekend days, VET students' sedentary behavior patterns did not differ by program. Their sitting time gradually increased during the day, reaching a peak during the evening (17:00-21:00). While sports students continued being physically active into the weekend with a peak in the afternoon (13:00-17:00) than other groups.

**Conclusions:** VET students who are required to be sedentary during school time (administrative > nurse > hairdresser), are also sedentary (i.e., do not compensate for sedentary behavior with increased physical activity) during non-study hours, including evening hours on workdays and leisure time on weekend days. Only sports students extended their active behavior beyond courses. These results warrant interventions reducing sedentary behavior during both study and leisure time among VET students.

# Physical activity and sedentary behaviour prior and subsequent to mood sampling

**Dr. Bronwyn Clark<sup>1</sup>**, Dr. Fiona Maccallum<sup>1</sup>, Dr. Eric Vanman<sup>1</sup>, Dr. Elisabeth Winkler<sup>1</sup>

<sup>1</sup>The University of Queensland, Brisbane, Australia

**SO.2.15 - Hot topics in young adults nutrition and physical activity, UKK - K1 (+K2) (Level 3), June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** J. Young Adults

**Purpose:** Physical activity and sedentary behaviour have been associated with following mood reported by ecological momentary assessment (EMA). Mood may also have an effect on subsequent behaviours. Identifying targets to improve mood requires an understanding of the timing of active and sedentary behaviour around mood dimensions.

**Methods:** Mixed models (n=1850 observations, 349 days, 75 participants) evaluated associations with six EMA reported mood dimensions (0-100) of thigh worn Movisens accelerometer derived sedentary and prolonged sedentary time (%) and step counts in time windows (1 5 10 15 20 30 60 90 120 minutes) beforehand and afterwards, adjusting for age, sex, education, ethnicity, work or study hours, and day of the week. Significance was set at  $p < 0.05$ .

**Results:** Participants (83% female) were aged  $20.1 \pm \text{SD } 3.3$  years. Bayes Information Criteria (BIC) showed no consistent preference for time window. For all time windows, lower previous and subsequent % of time spent sedentary and prolonged sedentary and higher previous and subsequent step counts were significantly associated with higher levels of feeling 'energetic' and 'awake'. Higher previous and subsequent % sedentary and prolonged sedentary and lower step counts were both associated with greater feeling 'calm' but reached statistical significance for some time windows only. Higher prior % sedentary and % prolonged sedentary and subsequent % sedentary but not step counts were associated with lower levels of feeling 'content' with significance reached in only some windows and BIC favoured prior behaviour over subsequent. Significantly greater feeling 'well' was seen with less % sedentary and prolonged sedentary and more step counts prior to mood but not subsequent behaviours. There was no large or significant association between prior or subsequent sedentary behaviour or step counts and feeling 'relaxed'.

**Conclusion:** This study showed less sedentary behaviour and more stepping were significantly associated with feeling more 'energetic', 'awake' and less 'calm' both beforehand and afterwards, while less sedentary behaviour and sometimes more step counts was significantly associated with subsequently feeling 'well' and 'content'. While not definitive, results suggest feeling 'well' and less 'content' follows the behaviours while feeling 'energetic', 'awake' and less 'calm' both follow and precede them.

# The process of co-creating an intervention focusing on parenting practices to optimize 24-hour movement behaviors in children with overweight

**Mrs. Marga Decraene<sup>1</sup>**, Dr. Vera Verbestel<sup>1</sup>, Prof. Greet Cardon<sup>1</sup>, Assistant Prof. Marieke De Craemer<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium

**SO.2.16 - Parenting and health in young children, UKK - K3+4 (Level 3), June 16, 2023, 12:00 - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose** Approximately 10% of European children comply with the guidelines for physical activity, sedentary behavior and sleep, the so-called 24-hour movement behaviors. Children with overweight are less likely to comply with such health behavior guidelines and are more at risk to develop non-communicable diseases later in life compared to children with normal weight. Parents have a major influence on the health behaviors of children. Active involvement of parents combining co-creation and Intervention Mapping (IM) may improve implementation and effectiveness of interventions. This study aims to describe the development process of an intervention focusing on parenting practices to optimize 24-hour movement behaviors in children with overweight combining co-creation and IM.

**Methods** Two groups of parents of children between 2,5 to 10 years were recruited through a hospital and a school. In the hospital group, all parents had children with overweight (n=10). The school group included parents of children with (n=5) and without overweight (n=5). The groups had seven (hospital group) and five (school group) co-creation sessions with an academic facilitator guided by IM. The process was evaluated through a reflection questionnaire and interview at the end of each session. The sessions were recorded, transcribed and thematically analyzed in Nvivo.

**Results** Throughout the sessions, the groups went through the first four steps of IM: (1)needs assessment, (2)program objectives, (3)methods and applications, (4)program development. On the one hand, participants reported they liked the sessions, learned a lot from the experiences from others and felt supported by sharing parenting struggles with regard to the behaviors. On the other hand, they perceived the process as intensive, they reported that it was not always clear what the purpose of each session was until the last two sessions and they struggled to be present in each session.

**Conclusions** Co-creating an intervention is an innovative and intensive process for both participants and researchers that has its strengths (e.g. empowerment of the participants) and pitfalls (e.g. making decisions for intervention components out of endless options). To evaluate whether this intervention optimizes 24-hour movement behaviors in children with overweight, a randomized-controlled trial of the co-created intervention will be conducted.

# Breastfeeding practices and reasons for cessation and associated maternal, infant and pregnancy characteristics: a cross-sectional study

**Dr. Jenna Hollis**<sup>1,2,3</sup>, Ms. Renee Reynolds<sup>1,2,3</sup>, Dr. Justine Daly<sup>1,2,3</sup>, Ms. Milly Licata<sup>1,3</sup>, Ms. Belinda Tully<sup>1,4</sup>, Ms. Emma Doherty<sup>1,2,3</sup>, Ms. Eva Farragher<sup>1,2,3</sup>, Ms. Clare Desmet<sup>1,3</sup>, Mr. Christophe Lecathelinais<sup>1</sup>, Ms. Julianne McKie<sup>5</sup>, Ms. Melanie Williams<sup>5</sup>, Prof. John Wiggers<sup>1,2,3</sup>, Dr. Melanie Kingsland<sup>1,2,3</sup>

<sup>1</sup>Population Health, Hunter New England Local Health District, Newcastle, Australia, <sup>2</sup>School of Medicine and Public Health, College of Health, Medicine and Wellbeing, The University of Newcastle, Newcastle, Australia,

<sup>3</sup>Hunter Medical Research Institute, Newcastle, Australia, <sup>4</sup>Gomerioi Nation, New South Wales, Australia,

<sup>5</sup>Hunter New England Area Health Service and Midwifery Services, Newcastle, Australia

**SO.2.16 - Parenting and health in young children, UKK - K3+4 (Level 3), June 16, 2023, 12:00 - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Global rates of exclusive breastfeeding (EBF) for the first six months of life are suboptimal in many countries, including Australia (15.4%). There is limited evidence regarding whether reasons for EBF cessation are associated with maternal, infant and pregnancy characteristics. This study aimed to describe women's intention to breastfeed, breastfeeding practices and reasons for breastfeeding cessation prior to an infant reaching six months of age; and examine the associations between these factors and maternal, infant and pregnancy characteristics.

**Methods:** Telephone and online surveys were conducted between October 2019 and April 2020 with women who had given birth in the previous 8-21 weeks at four public maternity services in Australia. Multivariable and simple logistic regression models identified associations between all characteristics and whether women were EBF and reasons for breastfeeding cessation at the time of survey completion.

**Results/findings:** 536 women completed the survey. Most women intended to (94%), and initiated (95%) breastfeeding. At the time of the survey, 57% of women were EBF, 16% were mixed feeding and 27% of women were not breastfeeding. Adjusting for other characteristics, women who completed high school or less or TAFE certificate/diploma (OR=0.40; 95%CI: 0.22; 0.72; OR=0.46; 95%CI: 0.28; 0.76), had a pre-pregnancy BMI in the overweight or obesity range (OR=0.50; 95%CI: 0.30, 0.86; OR=0.30; 95%CI: 0.18, 0.50), and smoked tobacco at the time of the survey (OR=0.09; 95%CI: 0.02, 0.33) had lower odds of EBF at survey completion. Common self-reported reasons for breastfeeding cessation were breastfeeding challenges (47%) and perceived insufficient milk supply (40%). Women had greater odds of reporting breastfeeding cessation due to perceived insufficient milk supply if they were aged 26-35 years (OR=2.92, 95%CI: 1.11, 7.66) and 36+ years (OR=5.57, 95%CI: 1.70, 18.29) compared to women aged 18-25 years, or had completed University-level education compared to women who completed high school or less (OR=1.59; 95%CI: 0.63, 3.85) or TAFE certificate/diploma (OR=3.57; 95%CI: 1.37, 9.09).

**Conclusions:** The findings highlight the importance of supporting all women to EBF. The most common reasons for breastfeeding cessation may be modifiable through support in the early postpartum period. Women's age and education may influence the support needed.

# The needs and wishes of parents of 0-2-year-olds regarding sleep education in Youth Health Care.

**Ms. Marijn van de Sande<sup>1</sup>**, Ms. Lisa Verspeek<sup>2</sup>, Assistant Professor Sanne Gerards<sup>1</sup>, Associate Professor Ree Meertens<sup>1</sup>

<sup>1</sup>Department of Health Promotion, NUTRIM School of Nutrition and Translational Research in Metabolism, Maastricht University, Maastricht, Netherlands, <sup>2</sup>Department of Health Promotion, Maastricht University, Maastricht, Netherlands

**SO.2.16 - Parenting and health in young children, UKK - K3+4 (Level 3), June 16, 2023, 12:00 - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Infant sleep problems are reported by a quarter of parents with children under 3 years of age. This can have a serious negative impact on the child as well as the parents. In the Netherlands, the Youth Health Care (YHC) services offer primary healthcare to all children, from birth until the age of 18 years. Therefore, this setting provides the opportunity to address and prevent infant sleep problems. The current study assesses parents' needs, wishes and experiences regarding sleep education in YHC, and parents' help-seeking behaviour regarding infant sleep.

**Methods:** A qualitative needs-assessment study was designed. Eight semi-structured interviews with first-time parents of 0-2 year-old infants living in the south of the Netherlands were conducted. The interviews were audio recorded, transcribed and analysed by inductive coding using Nvivo software. Data analysis was based on behavioural theories, including the Theory of Planned Behaviour, the Health Belief Model and Social Cognitive Theory.

**Results:** Parents were 30 to 34 years of age and children's age ranged from 4 to 27 months. Parents' education levels included low, medium and high level. All participants reported their infant's sleep to be of low quantity at least once post-partum. Parents often sought help on the internet or in their social network and less via the YHC. Most parents indicated that they did not receive adequate sleep advice from YHC-professionals. Parents wished to receive information in the first weeks after birth or even antenatal. Parents wanted more in-depth and tailored information from the YHC-professionals. Regarding methods to manage infant sleep problems, parents experienced difficulties with the extinction methods.

**Conclusion:** The current YHC services regarding sleep education do not meet the needs of first-time parents. This highlights the need for revision of the current YHC sleep education practices as well as the timing and content of sleep advice provided. We suggest to develop interventions optimizing sleep education in YHC to prevent infant sleep problems.

# Examination of how distinct food parenting approaches vary by parent, by meal and by day: A Cluster Analysis Study

**Dr. Katie Loth**<sup>1</sup>, Mr. Zuofu Huang<sup>1</sup>, Dr. Julian Wolfson<sup>1</sup>, Dr. Jerica Berge<sup>1</sup>, Dr. Dianne Neumark-Sztainer<sup>1</sup>, Dr. Jayne Fulkerson<sup>1</sup>, Dr. Jennifer Fisher<sup>2</sup>

<sup>1</sup>University of Minnesota, Minneapolis, USA, <sup>2</sup>Temple University, Philadelphia, USA

**SO.2.16 - Parenting and health in young children, UKK - K3+4 (Level 3), June 16, 2023, 12:00 - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

Recent research shows most parents of young children use a variety of theoretically supportive (structure, autonomy support) and unsupportive (coercive control, indulgent) food parenting practices on a given day, challenging previously held assumptions that parents use one approach. This study's aim was to identify distinct food parenting approaches and examine how these approaches vary by meal and by day. Parents (n=98) reported food parenting practices, categorized within four higher-order domains (structure, autonomy support, coercive control, indulgent), used at each eating occasion [n=3382 total; 33.93 (SD: 13.93) per dyad] they shared with their preschooler over multiple days [Mean: 12.56 days (SD:4.63)]. Agglomerative hierarchical clustering was used to identify different clusters in food parenting approach by person, by meal, and by day. By person, three distinct clusters emerged: Cluster 1 parents (n=86) used low indulgent, coercive control and structure, moderate autonomy support; Cluster 2 parents (n=10) used moderate structure, autonomy support and indulgence, low coercive control; and Cluster 3 parents (n=2) used high levels across all four practice domains. By day, three distinct clusters emerged: Cluster 1 days (n=710) had low levels across all four practice domains; Cluster 2 days (n=470) had low indulgence and coercive control and moderate-to-high structure and autonomy support; Cluster 3 days (n=51) had high levels across all four practice domains. By meal, six distinct clusters emerged: Cluster 1 meals (n=985) were low across all four practice domains; Cluster 2 meals (n=1915) were similar, but with moderate autonomy support practices; Cluster 3 meals (n=132) were high in indulgent, structure and autonomy support, but low in coercive control; Cluster 4 meals (n=234) were high across all four practice domains; Cluster 5 meals (n=14) were high/very high in coercive control, indulgent and structure and low in autonomy support, and Cluster 6 meals (n=45) were high in indulgent, moderate in structure, and low in coercive control and autonomy support. Importantly, parents were found to transition between clusters meal-to-meal and day-to-day, supporting evidence that food parenting approaches are responsive to context and circumstance. Future research should examine the longitudinal impact of within-and between-day fluctuations in food parenting on child outcomes.

# Infant eating behaviour profiles and their associations with infant rapid weight gain and parent feeding practices.

**Dr. Alissa Burnett<sup>1</sup>**, Dr. Georgie Russell<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition, School of Exercise and Nutrition Sciences, Deakin University, Melbourne, Australia

**SO.2.16 - Parenting and health in young children, UKK - K3+4 (Level 3), June 16, 2023, 12:00 - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** A range of child eating behaviours has been shown to individually associated with child weight status and parent feeding practices. Emerging research has shown that eating behaviours are latent constructs, however it is still unknown if eating behaviour profiles develop in infancy. Therefore, the aims of this study are to classify and describe groups of infants according to their eating behaviours, and examine associations between these groups of infants and infant rapid weight gain (RWG) and parent feeding practices.

**Methods:** A online survey of parents ( $n = 1474$ ) of infants aged less than 4 months was conducted via Qualtrics. Parents were recruited using paid advertisements on Facebook. The parents reported their feeding practices (using the FPSQ for infants and toddlers), infant eating behaviours (using the BEBQ) and infant weight and length at two timepoints (birth and <4 months). Latent profile analysis was used to identify distinct groups of infants who shared similar eating behaviours. Logistic and linear regression models were fitted to examine associations between the eating behaviour profiles and infant rapid weight gain (from birth to <4 months) and parent feeding practices.

**Results:** Three eating behaviour profiles were identified. Profile 1 (17%) was identified as food avoidant, profile 2 (59%) was identified as balanced, and profile 3 (24% of infants) was identified as food approach. There was an association between profile 1 and higher use of persuasive feeding and parent led feeding, when compared to profile 2. There was an association between profile 2 and higher use of persuasive feeding and using food to calm, when compared to profile 2. In total, 16% of infants experienced RWG from birth to <4 months. No association was found between the eating behaviour profiles and RWG from birth to <4 months of age.

**Conclusion:** This study provides evidence that three types of eating behaviour profiles develop very early in life and are associated with parent feeding practices. Because parents are known to use feeding practices in response to child eating behaviours, identifying infant eating profiles early allows for anticipatory tailored guidance to be provided to parents to support infant healthy eating.

# Feeding practices and their associations with infant rapid weight gain, and the moderating effects of infant eating behaviours on these associations.

**Dr. Alissa Burnett<sup>1</sup>**, Dr. Georgie Russell<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition, School of Exercise and Nutrition Sciences, Deakin University, Melbourne, Australia

**SO.2.16 - Parenting and health in young children, UKK - K3+4 (Level 3), June 16, 2023, 12:00 - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Parent feeding practices are associated with child weight status, yet the impact of these feeding practices is dependent on child eating behaviours. However, it is unknown if eating behaviours moderate these associations from infancy. Therefore, the aims of this study are to examine the relationships between parent feeding practices and infant rapid weight gain (RWG) and whether infant's eating behaviours moderate these relationships.

**Methods:** A online survey of parents ( $n = 1474$ ) of infants aged less than 4 months was conducted via Qualtrics. Parents were recruited using paid advertisements on Facebook. The parents reported their feeding practices (using the FPSQ for infants and toddlers), infant eating behaviours (using the BEBQ) and infant weight and length at two timepoints; birth and <4 months. The parents will be followed up when the infants are 4 months, 6 months, 9 months and 12 months of age. Logistic regression assessed associations between feeding practices and infant RWG, including interactions between feeding practices and infant eating behaviours.

**Results:** If higher levels of persuasive feeding were used, the infant was at higher odds (0.77) of experiencing RWG from birth to <4 months. Additionally, if higher levels of parent led feeding were used, the infant was at higher odds (0.52) of experiencing RWG from birth to <4 months. The associations between parent led feeding and RWG were moderated by infant slowness in eating, satiety responsiveness, and general appetite. However, the associations between persuasive feeding and infant RWG were not moderated by infant eating behaviours. The results for associations between parent feeding practices and RWG beyond 4 months will be presented at the conference.

**Conclusion:** This study showed that non-responsive feeding practices are associated with rapid weight gain in infancy, and that some of these associations are moderated by infant eating behaviours. This study advances the knowledge regarding the influence of parent feeding practices on child weight gain. Previous studies have assumed that parent feeding practices influence all children in the same way, however this study shows that it is important to consider their individual eating behaviours when developing interventions targeting child overweight and obesity.

# Neighbourhood environments and physical activity in the early years: examining the moderating role of parent perceptions

Dr. Andrea Nathan<sup>1,2</sup>, Prof. Jasper Schipperijn<sup>3</sup>, Mrs. Trina Robinson<sup>1</sup>, **Ms. Phoebe George<sup>1,2</sup>**, Associate Professor Bryan Boruff<sup>2</sup>, Prof. Stewart Trost<sup>4</sup>, Associate Prof. Hayley Christian<sup>1,2</sup>

<sup>1</sup>Telethon Kids Institute, Perth, Australia, <sup>2</sup>The University of Western Australia, Perth, Australia, <sup>3</sup>University of Southern Denmark, Odense, Denmark, <sup>4</sup>University of Queensland, Brisbane, Australia

**SO.2.16 - Parenting and health in young children, UKK - K3+4 (Level 3), June 16, 2023, 12:00 - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Parents act as gatekeepers to young children's early exposure to local neighbourhood environments. How parents perceive attributes of these neighbourhood environment may subsequently facilitate or hinder their young child's physical activity behaviour. We examined the moderating effects of parent perceptions on associations between objectively measured neighbourhood environment attributes and physical activity among young children.

**Methods:** We utilised data from the PLAY Spaces and Environments for Children's Physical Activity (PLAYCE) study conducted in Perth, Western Australia with 2-5 year olds recruited via childcare centres (n=1,038 children). Parent survey items modified from NEWS-Y assessed parent perceptions of six neighbourhood environment sub-scales. Objective GIS measures included count of pocket parks, local parks, neighbourhood parks, cul-de-sacs, street connectivity and low traffic exposure within 500m and 1600m service areas. Children wore GT3X+ accelerometers for seven days. Raw tri-axial acceleration signals were processed using an age-specific random forest physical activity classification model. Adjusted linear regression models estimated interaction effects of objectively measured neighbourhood environment attributes by parent perceptions on daily minutes of total physical activity and energetic play.

**Results/findings:** The mean age of children was 3.3 years (SD 0.8) and almost half were female (49.5%). Most parents completing the parent survey were female (91.8%). Average time spent in energetic play was 39.4 minutes per day (SD 14.3). We found the number of neighbourhood parks within a 500m service area was positively associated with daily minutes of energetic play, only when parents perceived land use mix-access to be above average (B=1.88; 95% CI 0.04, 3.72; p=0.045). Objective street connectivity within a 1600m service area was associated with fewer daily minutes of energetic play, only when parents perceived pedestrian and traffic safety to be below average (B=-0.02; 95% CI -0.03, 0.00; p=0.034).

**Conclusions:** We found some evidence of the important role played by parent perceptions on young children's physical activity levels. Greater understanding of how young children interact with their neighbourhood environment and the role of parents (in facilitating or negating their children's use of and interaction with environments), using age-appropriate, conceptually relevant measures of neighbourhood environments specific to the early years is needed.

# Exposure to the digital environment and cognitive functioning in children and adolescents – findings from the I.Family study

**SO.2.16 - Parenting and health in young children, UKK - K3+4 (Level 3), June 16, 2023, 12:00 - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Digital media (DM) have penetrated all aspects of children's lives, but little is known about how DM exposure is related to their cognitive functioning. This study aims to investigate the association of daily duration and type of DM exposure with cognitive functioning in European children and adolescents, being the first study to examine the aforementioned associations in free-living participants.

**Methods:** This study examines data from children aged 8-18 years that participated in the pan-European I.Family study (2013-2014). Participants reported information on DM use (hours/day) for television viewing (TV), computer/game console (PC), smartphone, and internet. Media multitasking (MTT) was self-reported and defined as using PC with another DM simultaneously. Measures of cognitive functioning, namely decision-making ability (making advantageous vs. disadvantageous choices) and cognitive inflexibility (continued erroneous responses following a rule switch) were assessed via computerized tests. Latent class analyses were conducted to identify underlying patterns of DM use, based on the duration of individual media use in categories (low: 0-1 h/day, medium: 1-2 h/day, high: >2 h/day). Generalized linear mixed regressions adjusting for potential confounders, including weight status and psychosocial well-being were used to calculate regression coefficients ( $\beta$ ) and 99.8% confidence intervals (CI – these limits were chosen to adjust for multiple testing based on the Sidak method).

**Results/findings:** Respectively, 4046 and 3441 children provided data for decision-making ability (mean age/SD=11.6/1.9) and cognitive inflexibility (11.7/2.0), where 50% were girls and 26% were classified with overweight/obesity. The adjusted models showed that one additional hour of smartphone exposure and engaging in one additional MMT activity were positively associated with cognitive inflexibility ( $\beta_{\text{smartphone}}=0.32$ ; 99.8%CI=-0.001,64;  $\beta_{\text{MMT}}=0.39$ , 99.8%CI=0.03,0.75) and negatively associated with the decision-making ability of children ( $\beta_{\text{smartphone}}=-0.47$ ; 99.8%CI=-1.44,0.48;  $\beta_{\text{MMT}}=-0.70$ ; 99.8%CI=-1.75,0.34). The latent class analyses identified four patterns of DM use. Children with high smartphone/internet use, but medium TV/low PC use were more likely to have higher cognitive inflexibility, but lower decision-making ability, compared to children with low use of all media.

**Conclusion:** Prolonged DM exposure is unfavorably associated with the cognitive functioning of children and adolescents. These findings shed light on an underlying mechanism by which DM environment may impact cognitive development during childhood.

# Measuring and Improving all Dimensions of Food Security among Low-Income Families with Children aged 0-5 years – An Australian and American Collaboration

**Dr. Rebecca Lindberg<sup>1</sup>**, Dr. Courtney Parks<sup>2</sup>, Dr. Amber Bastian<sup>1</sup>, Associate Professor Fiona McKay<sup>1</sup>, Dr. Paige van der Pligt<sup>1</sup>, Ms. Julia Zinga<sup>1</sup>, Prof. Sarah McNaughton<sup>1</sup>, Prof. Amy Yaroch<sup>2</sup>  
<sup>1</sup>Deakin University, Geelong, Australia, <sup>2</sup>Gretchen Swanson Center for Nutrition, Omaha, USA

**SO.2.16 - Parenting and health in young children, UKK - K3+4 (Level 3), June 16, 2023, 12:00 - 1:15 PM**

**SIG - Primary Choice:** G. Children and families

**Purpose** The prevalence of food insecurity was estimated to have doubled during the COVID-19 pandemic. Our international collaborative conducted mixed methods studies in 2020-22, to gain an understanding of differences and similarities between the USA and Australia in terms of food systems, food assistance, and food insecurity in families with children aged 0-5 years. Our objectives were to strengthen food security for families through a two-country collaboration.

**Methods** A policy and program review established the dominant solutions and disciplinary approaches in both nations, and a scoping review investigated constructs of food insecurity pertinent to young families. Semi-structured interviews with pregnant women and mothers were conducted in 2020 in Melbourne, Australia (n=22) and Omaha, U.S.A (n=19), to investigate the six dimensions of food security.

**Results** Our findings indicate both countries have inconsistent and limited measurement of five of the six dimensions of food security. Similar factors affect low-income families in both cities and there's a paucity of effective multi-faceted programmatic and policy responses. Of particular concern is the impact of food insecurity on young children: infants have greater odds of having poor health, being nutrient deficient, experiencing developmental challenges, and being hospitalized. Lived experience of this phenomena suggests particularly for the access, availability, utilization and agency dimensions of food security, the pandemic had substantial impacts. Whilst localized strategies, including less austere social safety nets were mobilized during the crisis, these were not sufficient to overcome the barriers to food security experienced; many of which were present prior to the pandemic.

**Conclusions** In measuring and responding to food insecurity, all dimensions should be considered. Our collaboration has attempted to spotlight the need for joined up efforts and future studies can build upon this foundational work, examining the factors identified across food insecure populations in these two high-income countries.

# Testing the Public Health 12 framework using community-based systems thinking case studies

**Dr. Kristy Bolton**<sup>1</sup>, Mrs. Penny Fraser<sup>2</sup>, Prof. Colin Bell<sup>2</sup>, Mr. Andrew Brown<sup>2</sup>, **Dr. Jillian Whelan**<sup>2,3</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition, Deakin University, , Geelong, Australia, <sup>2</sup>Global Centre for Preventive Health and Nutrition, Institute for Health Transformation, , Geelong, Australia, <sup>3</sup>Telethon Kids Institute, Perth, Australia

**SO.2.17 - Experience from implementation research in various settings, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Participatory community-based systems approaches (for example, group model building), allow community stakeholders to create a shared systems map reflecting their understanding of the drivers of a complex issue in their community, such as childhood obesity. Community stakeholders then develop and implement actions to influence these drivers. To date there has been limited guidance regarding the best places to act to maximise impact. Recently, the Meadows 12 places to act in a system was translated into language familiar to public health practitioners, termed Public Health 12 (PH12); where level 1 is most impactful; and level 12 the least impactful.

The aim of this study was to test the PH12 using documented actions from community-driven systems approaches to childhood obesity prevention in rural and regional areas of Australia.

**Methods:** Communities documented more than 250 implemented actions that arose from their group model building workshops and ongoing planning activities. This documentation was examined by an external reviewer with public health expertise and coded to one of the PH12 levels. Blinded double coding was conducted by a co-author of PH12, where required consensus was reached in consultation with the wider research team. Descriptive statistics were used to describe the system levels most targeted.

**Results:** To date, the majority of actions were coded in levels 8-12. In one Victorian case study, of the 106 actions registered between 2015-2017, 16% were level 8, 25% level 10, 4% level 11 and 55% level 12. A further 96 actions were implemented during 2018-2019, 1% were level 4, 5% level 8, 30% level 10, 7% level 11 and 56% level 12. Coding of actions from other case studies in 2020-2022 is ongoing.

**Conclusion:** Coding community actions revealed a gap in action in levels 1 to 7 - the leverage points which have been suggested to be more effective at achieving and sustaining change in a system. In the future, PH12 can be used to guide action planning and help stakeholders identify gaps in planning, prioritising and implementing actions and has potential to guide thinking to higher leverage points.

# Feasibility and acceptability of CHARMING: a school-based physical activity intervention

**Dr. Kelly Morgan**<sup>1</sup>, Mr. Jordan Godwin<sup>1</sup>, Dr. Rebecca Cannings-John<sup>1</sup>, Dr. Rachel Granger<sup>3</sup>, Dr. Britt Hallingberg<sup>2</sup>, Prof. Graham Moore<sup>1</sup>, Ms. Bethan Pell<sup>1</sup>, Dr. Esther van Sluijs<sup>4</sup>, Prof. Rhiannon Tudor Edwards<sup>3</sup>, Dr. Holly Whiteley<sup>3</sup>, Dr. Jemma Hawkins<sup>1</sup>

<sup>1</sup>Cardiff University, Cardiff, United Kingdom, <sup>2</sup>Cardiff Metropolitan University, Cardiff, United Kingdom, <sup>3</sup>Bangor University, Bangor, United Kingdom, <sup>4</sup>University of Cambridge School of Clinical Medicine, Cambridge, United Kingdom

**SO.2.17 - Experience from implementation research in various settings, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The CHARMING (**CH**oosing **A**ctive **R**ole **M**odels to **IN**spire **G**irls) intervention was co-designed and theory-informed (integrating self-determination theory and the socio-ecological model) to increase and sustain physical activity levels among 9–10-year-old girls. The intervention is delivered on primary school premises, with different 1-hour weekly activity taster sessions led by community role models. Peer role models (pupils from linked secondary schools) participate in sessions alongside the primary school-aged girls. This study aimed to examine the feasibility and acceptability of the CHARMING intervention and future evaluation trial design.

**Methods:** This feasibility study used a cluster randomised controlled trial including embedded process and health economic evaluations. In South Wales, United Kingdom, secondary schools were recruited, followed by their adjoining primary schools to recruit Year 5 girls (aged 9-10-years). A survey and accelerometer were administered at baseline and at 12-months. Following baseline, primary schools were randomly allocated to intervention (6-week programme) or control (usual practice) on a 2:1 basis. Observation and attendance data were collected for intervention sessions. Focus groups (N=13) and interviews (N=22) were conducted post-intervention to explore evaluation and intervention acceptability, feasibility, and fidelity. Analyses were intention to treat, and qualitative data were analysed thematically (deductive and inductive).

**Results/findings:** One hundred and fifty-six girls from six primary schools (four intervention: two control) were eligible to participate. Of these, 96 (62%) and 97 (62%) Year 5 girls participated in the survey and accelerometer measures respectively, with 78 (81%) and 77 (79%) participating at 12-month follow-up. Despite the COVID-19 pandemic, three of five criteria for progressing to a full-scale evaluation were met. Process evaluation data provided understandings of why two criteria were not met. Data suggested that acceptability and feasibility of the intervention were high, and the intervention was broadly delivered as intended. Alterations to study measures and the intervention were suggested to increase programme acceptability and feasibility, including extending the length of delivery in line with original intentions (12-weeks).

**Conclusions:** The novel role model intervention, CHARMING, and study design are shown to be acceptable and feasible. Future work will seek to optimise the intervention and evaluation design prior to a full-scale effectiveness trial.

# Nutritional assessment of plant-based milk alternatives in the Swedish market

**Dr. Hanieh Moshtaghian<sup>1</sup>**, Dr. Elinor Hallström<sup>2</sup>, Dr. Marta Bianchi<sup>1</sup>, Dr. Susanne Bryngelsson<sup>2</sup>

<sup>1</sup>Department of Agriculture and Food, Research Institutes of Sweden (RISE), Gothenburg, Sweden,

<sup>2</sup>Department of Agriculture and Food, Research Institutes of Sweden (RISE), Lund, Sweden

**SO.2.17 - Experience from implementation research in various settings, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** One of the strategies for promoting diet sustainability is the replacement of animal-based products with plant-based alternatives. However, the nutritional quality of these products should be assessed to ensure their nutritional adequacy. This study aims to evaluate the nutritional quality of plant-based milk alternatives in the Swedish market.

**Methods:** The main dairy alternative manufacturers were identified through the Swedish supermarkets' websites. Energy and nutrient data per 100 g of unflavoured plant-based milk alternatives (UPBMAs) were collected from the manufacturer's website. The International Choices criteria (saturated fat  $\leq 1.1$  g, sodium  $\leq 100$  mg, total sugars  $\leq 5$  g and energy  $\leq 40$  kcal) were used for the nutritional assessment of these products. Furthermore, their energy, macronutrients and key micronutrients (vitamin D, B12 and calcium) were compared to Sweden's most commonly consumed milk product (1.5% fat).

**Results:** Sixty-four UPBMAs were identified. Of these, 50 products were fortified, and 13 were organic. Regarding International Choices criteria, the proportion of UPBMAs meeting the saturated fat, total sugars, sodium and energy criteria was 94%, 89%, 98% and 53%, respectively. In terms of comparison with milk, 32%, 42%, 2%, 44%, 10% and 26% of fortified products had higher energy, fat, saturated fat, carbohydrate, total sugars and sodium compared to milk, respectively. Furthermore, 98% of fortified UPBMAs had less protein and vitamin B12, and 59% and 100% had less vitamin D and calcium than milk, respectively. Likewise, 79% of unfortified products had less protein and 100% had less vitamin D, B12 and calcium compared to milk. Among organic UPBMAs, 23%, 38%, 15%, 31%, 8% and 38% had higher energy, fat, saturated fat, carbohydrate, total sugars and sodium than milk, respectively. However, 85% had less protein and 100% had less vitamin B12 and calcium compared to milk. Only three organic products were fortified with vitamin D, similar to milk.

**Conclusions:** Most UPBMAs can be considered healthy in terms of meeting the International Choices criteria. However, their protein content is less than milk and most products provide less vitamin D, B12 and calcium compared to milk despite fortification. Similarly, the nutritional quality of organic UPBMs appears inferior to milk.

# Effectiveness of a Whole-of-School Intervention to Improve Physical Activity for Children: Evidence from Cohort Study in Primary Schools in Thailand

**Dr. Dyah Anantalia Widyastari<sup>1</sup>**, Associate Professor Piyawat Katewongsa<sup>1</sup>, Mr. Panya Choolers<sup>2</sup>

<sup>1</sup>Institute for Population and Social Research, Mahidol University, Salaya, Phutthamonthon, Nakhon Pathom, Thailand, <sup>2</sup>Thailand Physical Activity Knowledge Development Centre (TPAK), Salaya, Phutthamonthon, Nakhon Pathom, Thailand

**SO.2.17 - Experience from implementation research in various settings, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** This study employed a whole-of-school approach as the health promotion strategy to improve physical activity (PA) of children. We developed the 4PC model (Active Policy, Active People, Active Program, Active Place and Active Classroom) as the prototype model of PA promotion. This study aimed to examine the effectiveness of 4PC model in improving PA and reducing sedentary behavior (SB) of school children in Thailand.

**Methods:** A quasi-experimental cohort design involved fourth graders of primary schools and followed for 2-years (2017-2019). Participants for both the intervention and control schools were matched and randomly selected based on their characteristics (i.e., school size, grade, and sex). A total of 119 of 184 students in the intervention group, and 173 of 254 students in the control group were present in all five rounds of data collection and included in the analysis. All students in the intervention schools were exposed to the 4PC model, whereas those in the control schools performed their regular program. In every round, PA and SB was measured objectively using the Feel-fit accelerometer, which was attached to the students' waist for a period of 7 hr. for five consecutive days (Monday–Friday). The independent t-test was employed to compare PA and SB between intervention and control groups, whereas the paired t-test was used to compare the mean difference of the two behavioral outcomes.

**Results:** Compared to students in the control group without the 4PC exposure, students in the intervention group accumulated an additional 19–25 min of PA ( $t = 15.539$ ,  $p = .000$ ) and experienced a 31-min reduction in sedentary time ( $t = -13.999$ ,  $p = .000$ ). The effectiveness of 4PC in improving the PA level of students can also be seen by the consistent increase of PA throughout the four rounds of data collection during the intervention (Round 2–5).

**Conclusion:** As a whole-of-school intervention, the 4PC model was effective in increasing PA and reducing SB by providing opportunities and support system for children. The prototype model 4PC is now being scale-up to be implemented in primary schools across Thailand.

# Schools Working to Improve Staff Health (SWISH): A health promotion program targeting the physical activity and nutrition of school staff

**Dr. Alix Hall<sup>1</sup>**, Dr. Beatrice Murawski<sup>1</sup>, Prof. Luke Wolfenden<sup>1,2</sup>, Dr. Rachel Sutherland<sup>1,2</sup>, Mr. Christophe Lecathelinais<sup>2</sup>, Mrs. Nicole McCarthy<sup>2</sup>, Mr. Adam Shoesmith<sup>1</sup>, Dr. Cassandra Lane<sup>1</sup>, Associate Professor Serene Yoong<sup>1,2,3</sup>, Dr. Kathryn Reilly<sup>2</sup>, Dr. Kirsty Hope<sup>2</sup>, Dr. Rebecca Hodder<sup>1,2</sup>, Dr. Nicole Nathan<sup>1,2</sup>

<sup>1</sup>University of Newcastle, Newcastle, Australia, <sup>2</sup>Hunter New England Population Health, Wallsend, Australia,

<sup>3</sup>Deakin University, Melbourne, Australia

**SO.2.17 - Experience from implementation research in various settings, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The workplace is a recommended setting for targeting key health behaviours, including physical activity and nutrition. There are numerous, existing, school-based physical activity and healthy eating programs that are delivered to students in an attempt to improve their health behaviours. Encouraging school staff to take part in these existing student-focused programs is a potentially simple way to improve staff physical activity and health eating.

**Methods:** We developed and evaluated the feasibility, acceptability and potential impact of the Schools Working to Improve Staff Health (SWISH) program in a pilot trial. A cluster randomised controlled design was used. Eighteen primary schools from one Local Health District in New South Wales Australia completed baseline, and were then randomised to receive SWISH (n=9), or to a waitlist control (n=9). The SWISH program is a multi-component intervention consisting of five main strategies designed to support school staff participation in existing, student-focused, healthy eating and physical activity school-based programs. Quantitative data was collected via accelerometers (to assess physical activity) and surveys (to assess fruit and vegetable consumption, and acceptability). Qualitative data were also collected to further explore staff views of SWISH. Descriptive and qualitative data were used to assess acceptability. Generalised linear mixed models were used to assess differences in staff physical activity and diet outcomes.

**Results:** Surveys were completed by 276 staff and valid accelerometer data was provided by 289 staff. Staff who received SWISH had greater odds of consuming vegetables (OR: 1.77; 95% CI: 0.16, 19.07) and fruit (OR: 1.04; 95% CI: 0.09, 11.76) consistent with guidelines; as well as participating in student-directed classroom physical activity (OR: 1.78; 95% CI: 0.20, 15.77) and fruit and veg breaks (OR: 2.89; 95% CI: 0.28, 29.60). Although these results were not statistically significant. There was minimal impact on physical activity outcomes. Acceptability was high, with more than 50% of staff rated the SWISH resources as useful.

**Conclusions:** SWISH is a feasible and acceptable intervention for addressing school staff physical activity and nutrition. A large randomised controlled trial is warranted to further explore the effect of SWISH on staff outcomes.

# Implementation and scale-up of the Daughters and Dads Active and Empowered Program: A case study of adaptations.

**Dr. Anna Rayward**<sup>1,2</sup>, Dr. Emma Pollock<sup>4</sup>, Dr. Myles Young<sup>2,5</sup>, Associate Professor Narelle Eather<sup>1,2</sup>, Prof. David Lubans<sup>1,2</sup>, Dr. Alyce Barnes<sup>1,2</sup>, Dr. Rachel Sutherland<sup>2,3,4</sup>, Dr. Lee Ashton<sup>1,2,6</sup>, Ms. Stevie-Lee Kennedy<sup>1</sup>, Prof. Philip Morgan<sup>1,2</sup>

<sup>1</sup>School of Education, University of Newcastle, Callaghan, Australia, <sup>2</sup>Hunter Medical Research Institute, New Lambton, Australia, <sup>3</sup>School of Medicine and Public Health, University of Newcastle, Callaghan, Australia, <sup>4</sup>Hunter New England Population Health, Wallsend, Australia, <sup>5</sup>School of Psychological Sciences, University of Newcastle, Callaghan, Australia, <sup>6</sup>School of Health Sciences, University of Newcastle, Callaghan, Australia

**SO.2.17 - Experience from implementation research in various settings, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose** Tailored adaptation of evidence-based programs is often required during scale-up to ensure an appropriate fit for different contexts, populations and providers whilst ensuring reasonable fidelity with the original intervention. However, the adaptation process is infrequently systematically monitored and/or reported. The Daughters And Dads Active and Empowered program (DADAE) is an evidence-based, education program targeting fathers/father-figures to improve their daughters' physical activity levels, sport skills and social-emotional wellbeing. The aim of this study is to document the reasoning, process and nature of adaptations of DADAE during scale-up across NSW, Australia in partnership with the NSW Office of Sport (NSW OoS).

**Methods** We used the Framework for Reporting Adaptations and Modifications to Evidence-based interventions-Expanded (FRAME) to guide adaptations of DADAE associated with context, training, resources, cost, and settings. We used an iterative process and collaborated with stakeholders involved in the program scale-up at multiple levels within the NSW OoS, as well as program participants. Program modifications were made in response to organisational, provider and participant barriers identified through consultation with, and feedback from, stakeholder groups using a variety of methods including advisory panel meetings, semi-structured interviews, and surveys. FRAME was used to track the process and reasons for making adaptations whilst ensuring preservation of core program elements.

**Results** Prior to implementation, a new condensed 'Weekender' version was developed (based on the original 9-week, 90-minute/session program) to capitalise on the unique setting of NSW OoS Sport and Recreation Centres and to best utilise the available workforce (highly-skilled program officers) located at these centres. During implementation, reactive modifications included 1) redesign of the program structure; 2) redesign of the participant handbook 3) reduction of fitness content in the 'Weekender' program; 4) redesign of facilitator training and 5) redesign of implementation protocols/guidance. Subsequent program fidelity checks indicated good program fidelity. Adaptations led to improved ease of delivery, decreased infrastructure requirements, and reduced workforce and participant burden and costs, whilst maintaining core program elements.

**Conclusion** Our stakeholder-engaged adaptation process augurs well for minimising voltage-drop, fostering program sustainability and informing the adaptation for scale-up of Daughters and Dads sport-specific program variants.

# Identifying the role of contextual factors in the relationship between physical activity and cognition: a systematic review and meta-analysis

Dr. Myrto Mavilidi<sup>1</sup>, **Prof. David Lubans<sup>2,3</sup>**, Prof. Anthony D. Okely<sup>1</sup>, Associate Professor Spyridoula Vazou<sup>4</sup>, Dr. Valentin Benzing<sup>5</sup>, Mrs. Sofia Anzeneder<sup>5</sup>, Mrs. Katie Robinson<sup>2</sup>, Dr. George Thomas<sup>6</sup>, Mr. Andrew Woods<sup>1</sup>, Associate Professor Caterina Pesce<sup>7</sup>

<sup>1</sup>University of Wollongong, Wollongong, Australia, <sup>2</sup>University of Newcastle, Newcastle, Australia, <sup>3</sup>University of Jyväskylä, Jyväskylä, Finland, <sup>4</sup>Michigan State University, Michigan, USA, <sup>5</sup>University of Bern, Bern, Switzerland, <sup>6</sup>Curtin University, Perth, Australia, <sup>7</sup>University of Rome "Foro Italico", Rome, Italy

**SO.2.17 - Experience from implementation research in various settings, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** A large number of systematic reviews and meta-analyses have focused on the effects of physical activity interventions on cognitive outcomes. However, the contextual mechanisms that may moderate intervention effects or trigger different mechanisms underlying these effects are largely neglected. This study aimed at quantifying the evidence on what mechanisms work under what contextual conditions, considering potential task-level moderators that may jointly influence the effects of physical activity interventions on cognitive outcomes in children, adolescents and adults.

**Methods:** We conducted a search of experimental studies using five electronic databases to October 2022. Grey literature and published studies conducted with typical populations in English, German, and Italian were included. Cognitive outcomes involved executive function, memory, academic achievement, creativity, intelligence, and metacognition.

Studies were coded and analysed based on the following characteristics: physical activity type (e.g., resistance exercise, exergame), cognitive demand (low, moderate, high), intervention delivery mode (face-to-face, remote), style (theory-/evidence-based, atheoretical), domain (e.g., school, leisure) and setting (e.g., in-/outdoors, virtual), and social environment (individual, group). Using a multilevel structural equation modelling approach, a series of meta-regressions will examine the interaction between context-level (e.g., cognitive demand, setting) with individual (e.g., age) and task-level (e.g., physical activity type) moderators of physical activity on cognition. Effect sizes will be calculated using post-test mean values and standard deviations from control and intervention groups.

**Results:** Out of 10,769 outputs found, 7,209 titles and abstracts, and 655 full-texts were screened. 233 studies were included in the systematic review. Preliminary descriptives from a subsample of 36,543 children and adolescents in 56 studies, showed that most studies involved face-to-face, school-based interventions (51). Twenty-nine studies looked at the chronic effects of physical activity on cognition. Only five studies were conducted outdoors, while the majority was classroom-based (23). Aerobic exercise was the most predominant type (26), with mixed cognitive demand (17 high and 21 low). Forty studies reported positive cognitive outcomes of intervention compared to the control groups.

**Conclusions:** Our quantitative review will inform the development of future physical activity interventions based on relevant contextual characteristics that should be considered along with individual- and task-level factors to reap largest cognitive benefits.

# Translation and feasibility of an efficacious school-based resistance training intervention

Ms. Caroline R. Hartmann<sup>1,2</sup>, **Associate Professor Lars B. Christiansen<sup>1,2</sup>**

<sup>1</sup>Department of Sports Science and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark, <sup>2</sup>Research and Implementation Centre for Human Movement and Learning, Odense, Denmark

**SO.2.17 - Experience from implementation research in various settings, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose** WHO recommend strengthening physical activities three times per week, but few adolescents' meet systematic and motivating resistance training (RT) in school. The aim of this mixed method feasibility study was to adapt and evaluate the Australian school-based intervention, Resistance Training for Teens (RT4T), in Danish upper secondary schools. The evaluation included effect analyses of pupils' muscle strength, motivation, and experienced competency for RT as well as analyses of acceptability and feasibility in the Danish context.

**Methods** RT4T is developed and thoroughly tested by a research group at University of Newcastle, Australia. The aim of RT4T is to give pupils competencies and motivation to do RT. Translation and adaptation were conducted based on the PRACTIS-guide by Koorts et al. and involved interviews with physical education (PE) teachers. Three 7<sup>th</sup>-grade classes and three 9<sup>th</sup>-grade classes were recruited for the study. All six classes followed the RT4T concept over 8 weeks. Before and after the intervention the pupils completed a push-up test, a standing long jump test, and a beep test for measuring muscle strength and endurance. In addition, they answered an adapted survey about motivation and competencies and completed a RT Skill Battery. Four qualitative interviews were performed with pupils and PE teachers.

**Results** A total of 69 pupils completed the physical tests and answered the survey. Statistical analyses were conducted in STATA and using t-tests to compare the results before and after the intervention. A significant intervention effect for Self-efficacy (0,23 95% (CI) 0,08-0,39) and beep-test (202,2 meters 95% CI 75,2-329,6) was found. Qualitative data were analyzed based on central aspect for implementation: acceptability, reach, dose, fidelity, adaptation, and resources. The pupils expressed a need for variation and were motivated by games, challenges and to follow the progress in the physical tests in the program. Teachers found difficulties advising all pupils about technical aspects of the program and observed a decline in motivation and concentration during the 8 weeks.

**Conclusion** Overall, the RT4T was acceptable and feasible to implement in upper secondary schools in Denmark, but adjustment can be made to increase the reach and effect of the program.

# Measuring implementation indicators of school and university nutrition programs: a systematic review

**Ms. Ana Mitchell<sup>1</sup>**, Ms. Shelly Palmer<sup>1</sup>, Dr. Femke van Nassau<sup>2</sup>, Dr. Melissa Pflugh Prescott<sup>1</sup>

<sup>1</sup>University of Illinois Urbana-Champaign, Urbana, USA, <sup>2</sup>Amsterdam University Medical Center, Amsterdam, Netherlands

**SO.2.17 - Experience from implementation research in various settings, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Addressing the research-to-practice gap is a significant public health priority, especially in school settings where the opportunity for scale-up is possible. No reviews have assessed the use of implementation indicators in the evaluation of school programs aimed to improve student dietary quality. To move the field forward, a systematic review was conducted to determine 1) what implementation indicators were evaluated and 2) how and to what extent the indicators were assessed in relation to program outcomes.

**Methods:** Studies published between January 2010 and March 2021 were selected from a systematic search of six bibliographic databases. Studies quantitatively measuring implementation indicators were included if they focused on improving student dietary quality in a school or University setting and if the intervention was implemented by school staff as part of standard operation. Data extraction was performed to determine the program characteristics and how implementation indicators were measured. The quality of each indicator was scored and then rated as high (>75%), moderate (50-75%), or low (<50%).

**Results/findings:** A total of 12,340 articles were retrieved and 50 articles representing 44 studies were included. Most studies took place in the US (n=24), in K-12 schools (n=41) and a third were conducted with low-income populations. Most studies had a physical activity component (n=27), measured 1 or 2 implementation indicators (n=26), and did not report an evaluation framework (n=27). In total, 118 indicators were measured: fidelity (n=29), reach (n=15), acceptability (n=12), adoption (n=10), sustainability (n=9), dose (n=9), feasibility (n=7), satisfaction (n=7), self-efficacy (n=6), and (n≤5) appropriateness, cost, context, adaptability, complexity, and culture. The indicators were primarily measured at the provider level (64%) using questionnaires (66%) and rated low in quality (72% and mean quality was 40.6%). Only 16% of indicators were related to program outcomes—most were fidelity and dose.

**Conclusions:** More research is needed to strengthen methods for all indicators, especially for adaptability, culture, complexity, and context. The use of an implementation theory or framework and relating implementation indicators to program outcomes needs to be prioritized. A core set of indicators would allow comparisons to be made between studies.

# Key elements across systems frameworks for childhood obesity prevention: a scoping review

**Ms. Laura Belmon<sup>1</sup>**, Ms. Alejandra Sotomayor Sainz<sup>1,3</sup>, Dr. Heide Busse<sup>2</sup>, Ms. Irma Huiberts<sup>4</sup>, Dr. Stefanie Vandevijvere<sup>5</sup>, Ms. Lara Christianson<sup>2</sup>, Prof. Wolfgang Ahrens<sup>2</sup>, Prof. Stefaan De Henauw<sup>3</sup>, Dr. Teatske Altenburg<sup>1</sup>

<sup>1</sup>Amsterdam UMC, Department of Public and Occupational Health, Amsterdam, Netherlands, <sup>2</sup>Leibniz Institute for Prevention Research and Epidemiology - BIPS, Bremen, Germany, <sup>3</sup>Ghent University, Department of Public Health and Primary Care, Ghent, Belgium, <sup>4</sup>Mulier Instituut, Utrecht, Netherlands, <sup>5</sup>Sciencono, Department of Epidemiology and Public Health, Brussel, Belgium

**SO.2.17 - Experience from implementation research in various settings, Clarion Hotel Gillet - Room Gillesalen, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose** Childhood obesity is a complex problem. A systems approach takes into account this complexity by considering nonlinear relationships, accumulations, feedback loops, effects of time and delays in systems and unintended consequences that emerge. To date, it is unclear how a systems approach can best be implemented. Therefore, this scoping review aimed to summarize existing systems frameworks focused on childhood obesity prevention, and with that provide insight into the key elements of systems approaches.

**Methods** Studies were identified from searches in Medline, PsycINFO, Web of Science, CINAHL, and Sociological Abstracts, until October 2022, and from hand-searches for grey literature in five languages (i.e. English, French, Spanish, German, and Dutch). Systems frameworks were included if they focused on childhood obesity prevention and were informed by systems science or complexity theory. Data extracted from the frameworks were information regarding the goal, key elements, definition(s) of systems/complexity theory, development process, and the (boundaries of the) system wherein the framework was developed. To extract the key elements across included frameworks, a thematic content analysis was performed.

**Results/findings** We identified 16 systems frameworks for childhood obesity prevention. Twelve key elements were derived from these frameworks: (1) Understanding the local system; (2) Underpin with theory and evidence; (3) Adaptive and dynamic action development; (4) Continuous, adaptive and sustainable implementation of actions; (5) Continuous and adaptive monitoring and evaluation; (6) Upscaling of program actions; (7) Social marketing and communication; (8) Systematic program planning and organization; (9) Supporting leadership for whole system coordination; (10) Community partnership development; (11) Supporting political environment; and (12) Program outcomes of a systems approach, e.g. specific behavioural- and environmental factors on different system levels. Elements 1 and 10 were mentioned most often across frameworks.

**Conclusions** A systems approach for childhood obesity prevention requires long-term multi-sectoral collaboration to understand the local context and to adaptively develop, implement and evaluate coordinated actions together with actors aimed at changing the complex system. These key elements from systems frameworks provide guidance for research, policy and practice on how to effectively implement a systems approach for preventing childhood obesity.

# (In)voluntary telework and 24-h physical behaviors: A cross sectional analysis of white-collar workers in Sweden

Dr. Leticia B Januario<sup>1</sup>, Prof. Marina Heiden<sup>1</sup>, Prof. Svend Erik Mathiassen<sup>1</sup>, Prof. Gunnar Bergström<sup>1</sup>,  
**Associate Professor David M Hallman<sup>1</sup>**

<sup>1</sup>University of Gävle, Gävle, Sweden

**SO.2.18 - From cohort studies to interventions, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** To investigate associations between the extent and voluntariness of telework and 24-h physical behaviors on working days during the COVID-19 pandemic.

**Methods:** We included 298 white-collar workers, working  $\geq 50\%$  of full time. They were asked about the extent and voluntariness of telework (categorized into low or high), and physical activity was assessed for 7 days in terms of time spent sedentary (sitting, lying), standing, and moving (walking, running, cycling) using a thigh-worn accelerometer. Work, leisure, and sleep were identified using a diary. Data were transformed to isometric log ratios (ILRs) using compositional data analysis. We ran multivariate analysis of variance to estimate the effects of voluntariness and extent of telework on physical behaviors adjusting for age, gender, and BMI.

**Results/findings:** We found that a high extent of telework was associated with more sleep relative to time awake ( $F=15.33$ ;  $p<0.01$ ;  $\eta^2=0.06$ ), less work relative to leisure ( $F=12.22$ ;  $p<0.01$ ;  $\eta^2=0.05$ ), and more sedentariness relative to active behaviors at work ( $F=15.56$ ;  $p<0.01$ ;  $\eta^2=0.06$ ). The interaction between telework extent and voluntariness was significant ( $F=3.24$ ;  $p<0.01$ ;  $\eta^2=0.07$ ) indicating that the effects of telework extent on physical behaviors were more pronounced among those with low voluntariness.

**Conclusions:** Our findings suggest that the association between the extent of telework and 24-h physical behaviors depends on the individual's possibility to choose whether to telework or not. Workers who remained at the office during the pandemic, with limited possibility to choose to telework, spent less time in sleep relative to awake, more time at work relative to leisure, and less time in sedentary relative to active behaviors at work. The results can have implications for how to implement telework in post-pandemic workplaces.

# Weight bias in adults from the NutriNet-Santé study: associations with weight status, socioeconomic position and demographic characteristics

Ms. Olivia Branche<sup>1</sup>, Dr. Camille Buscail<sup>1</sup>, Dr. Sandrine Péneau<sup>1</sup>, Dr. Julia Baudry<sup>1</sup>, Prof. Christine Poitou<sup>3,4</sup>, Prof. Jean-Michel Oppert<sup>1,3</sup>, Prof. Sébastien Czernichow<sup>5</sup>, Dr. Emmanuelle Kesse-Guyot<sup>1</sup>, Dr. Mathilde Touvier<sup>1</sup>, Prof. Chantal Julia<sup>1,2</sup>, **Dr. Alice Bellicha<sup>1</sup>**

<sup>1</sup>Sorbonne Paris Nord University, Inserm U1153, INRAE U1125, CNAM, Nutritional Epidemiology Research Team (EREN), Epidemiology and Statistics Research Center – University Paris Cité (CRESS), Bobigny, France, <sup>2</sup>Public Health Department, GHU Paris Seine-Saint-Denis, Assistance Publique-Hôpitaux de Paris (APHP), Bobigny, France, <sup>3</sup>Department of Nutrition, Pitié-Salpêtrière Hospital, Assistance Publique-Hôpitaux de Paris (APHP), Sorbonne University, CRNH-Ile de France, Paris, France, <sup>4</sup>Inserm, Nutrition and Obesity: Systemic Approaches (NutriOmics) Team, Sorbonne University, Paris, France, <sup>5</sup>Department of Nutrition, Hôpital Européen Georges Pompidou, Assistance Publique-Hôpitaux de Paris (APHP), Université Paris Cité, Paris, France

**SO.2.18 - From cohort studies to interventions, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Weight stigma experienced by people living with obesity has been well described but the degree of explicit weight bias (EWB) among the general population received less attention. We aimed to assess EWB in French adults and to explore associations with individual characteristics.

**Methods:** French adults from the NutriNet-Santé study (n=33 948, 52% women after weighting procedures) completed the validated Anti-Fat Attitudes Questionnaire assessing three EWB subscales: *Dislike* (antipathy towards people with obesity), *Fear of fat* (concerns about body weight) and *Willpower* (belief in weight controllability). Responses were rated on a 9-point Likert scale (0 to 8), a higher score indicating greater levels of EWB. Cross-sectional associations between weight status, socioeconomic position, demographic characteristics and EWB were examined using gender-stratified multi-variable ANCOVA models. Pairwise post-hoc testing corrected for multiple comparisons was performed.

**Results:** *Fear of fat* was higher among women (mean [SD]: 4.3 (1.7) in women, 3.6 (2.7) in men,  $P<0.0001$ ), while *Dislike* and *Willpower* scores were higher among men (*Dislike*: 1.7 (1.0) in women and 2.2 (1.8) in men; *Willpower*: 3.0 (1.4) in women and 3.7 (2.3) in men; all  $P<0.0001$ ). People with obesity reported greater *Fear of fat* scores compared to those with normal weight ( $P<0.0001$ , mean difference, MD, [95% CI]: 0.3 [0.2;0.4] in women and 0.3 [0.1;0.5] in men), lower *Dislike* scores (MD [95% CI]: -0.4 [-0.4;-0.3] in women and -0.4 [-0.5;-0.2] in men) and lower *Willpower* scores (MD [95% CI]: -1.0 [-0.1;-0.9] in women and -0.3 [-0.5;-0.2] in men). In both genders, lower income was associated with lower *Dislike*, *Fear of fat* and *Willpower* scores (all  $P<0.0001$ ), and low education with greater *Fear of fat* and *Willpower* scores (all  $P<0.0001$ ).

**Conclusions:** EWB was widespread in this large sample of French adults and largely driven by the fear of gaining weight in women and the belief in weight controllability in men. Our findings show that dimensions of EWB are differentially associated with individual characteristics and provides new insights into which population subgroups should preferably be targeted by future interventions.

# Dietary outcomes in youth with intellectual disabilities who participated in a family-based weight loss intervention

**Dr. Linda Bandini**<sup>1</sup>, Dr. Misha Eliasziw<sup>2</sup>, Ms. Gail Rogers<sup>3</sup>, Dr. Carol Curtin<sup>1</sup>, Dr. Gretchen Dittrich<sup>4</sup>, Dr. Richard Fleming<sup>5</sup>, Ms. Katherine Rancaño<sup>2</sup>, Dr. Aviva Must<sup>2</sup>

<sup>1</sup>University of Massachusetts Chan Medical School, Worcester, USA, <sup>2</sup>Tufts University School of Medicine, Boston, USA, <sup>3</sup>Jean Mayer USDA Human Nutrition Research Center on Aging, Boston, USA, <sup>4</sup>Simmons University, Boston, USA, <sup>5</sup>University of Massachusetts, Boston, USA

**SO.2.18 - From cohort studies to interventions, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** To assess whether youth with intellectual disabilities (ID) enrolled in a family-based multi-component behavioral weight loss intervention: 1) adhered to their healthy eating plan (HEP); 2) experienced changes in parent-offered treat foods; 3) increased the variety of foods eaten; and/or 4) showed an improvement in their Healthy Eating Index (HEI) score.

**Methods:** This is a sub-analysis of dietary data from our intervention (Bandini, Pediatric Obesity, 2021). Individualized HEPs were tailored to youth's estimated energy needs with a modest energy deficit to promote weight loss. The HEP is a visual tool that depicts the recommended daily servings from six food groups and allocates 400 calories weekly (allotted as 8 'coins') to 'spend' on treats (e.g., cookies, chips, soda). Parents attended a pre-intervention orientation and were provided a food guide to assist with HEP implementation. Three-day food records were collected at baseline and at the end of the 6-month intervention. Data were entered into the Nutrition Data System for Research. Linear mixed models estimated adherence, using an intraclass correlation coefficient (ICC), and assessed changes.

**Results/Findings:** Twenty-four participants were enrolled (mean age 17.9 years, 66.7% female). HEP adherence improved significantly, from slight to moderate (ICC=0.17 vs. 0.43,  $p=0.004$ ). The largest change in consumption observed was a decrease of 'coin' foods, from a daily average of 7.2 to 3.0 ( $p<0.001$ ). Only small changes were observed among the other food groups. Parent-offered treat foods decreased by 21.9% ( $p=0.002$ ). Of 97 food items considered, youth ate 9.6 different foods on average at 6 months that they had not consumed at baseline ( $p<0.001$ ). The average total HEI score improved from 56.8 to 67.3 ( $p<0.001$ ).

**Conclusions:** The HEP represents a novel approach to promote healthy eating in youth with ID. Despite observing only small changes in servings consumed in the various food groups, the decrease in treats consumed and offered by parents, as well as the increase in dietary variety, may have contributed to the improved HEI score. The observed changes suggest a successful implementation of the HEP and a positive impact of the nutrition sessions and the behavioral components of the intervention.

# Examining the mediating effects of sleep variables on mental health in older adolescents: Findings from the Burn 2 Learn randomized controlled trial

**Dr. Angus Leahy**<sup>1,2</sup>, Dr. Thierno Diallo<sup>3</sup>, Associate Professor Narelle Eather<sup>1,2</sup>, Associate Professor Mitch Duncan<sup>1,2</sup>, Dr. Jordan Smith<sup>1,2</sup>, Prof. David Lubans<sup>1,2,4</sup>

<sup>1</sup>University of Newcastle, Callaghan, Australia, <sup>2</sup>Hunter Medical Research Institute, New Lambton Heights, Australia, <sup>3</sup>Western Sydney University, Penrith, Australia, <sup>4</sup>University of Jyväskylä, Jyväskylä, Finland

**SO.2.18 - From cohort studies to interventions, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** This study explored the mediating effect of sleep-related outcomes on older adolescents' mental health in the context a school-based physical activity intervention.

**Methods:** The Burn 2 Learn (B2L) physical activity intervention was evaluated using a cluster randomized controlled trial, which was conducted in two cohorts. The current investigation is a sub study that involved participants from cohort 2. Study participants ( $n = 292$ ) were older adolescents (mean age = 16.0 [0.5]) from 10 secondary schools in New South Wales, Australia. Participants were randomised at the school level to the B2L intervention ( $n = 146$ ) or a wait-list control condition ( $n = 146$ ). Two teachers from intervention schools were recruited as school champions to deliver high-intensity activity breaks (approximately 15 mins) to students during academic lessons. Teachers received training, resources, and support to deliver two high-intensity activity breaks per week for 16 weeks. Older adolescents completed measures of mental health (i.e., perceived stress, and internalizing symptoms) and hypothesized mediators (i.e., sleep duration, sleep latency, awakenings, and daytime sleepiness) via questionnaires at baseline (February-April 2019) and post-intervention (August-September 2019). Separate single mediation analyses were conducted to explore the potential mediating effects of sleep variables on mental health outcomes using a product-of-coefficient test.

**Results:** No significant mediated effects were found for mental health outcomes. We did observe a small significant effect for perceived stress ( $\beta = -0.11$ ,  $SE = 0.034$ ,  $p = 0.002$ ), but not for internalizing symptoms ( $\beta = 0.02$ ,  $SE = 0.051$ ,  $p = 0.760$ ). There were no statistically significant effects of the intervention on measures of sleep variables. Several significant associations were observed for changes in sleep-related outcomes and mental health in the hypothesized direction.

**Conclusion:** The B2L intervention had a small beneficial effect on older adolescents' perceived stress, however, changes in sleep were not responsible for mediating these effects. Changes in markers of sleep were associated with changes in mental health, highlighting the importance of sleep for good psychological health. Despite recognized links between regular physical activity in improved sleep parameters, short duration high-intensity activity may not be the most useful exercise modality for influencing adolescents' sleep.

# The mediating effect of maternal adiposity on diet and physical activity interventions in pregnancy for prevention of gestational diabetes

**Miss Anna Boath<sup>1</sup>**, Dr. Louise Hayes<sup>1</sup>, Prof. Luke Vale<sup>1</sup>, Dr. John Allotey<sup>2</sup>, Dr. Nicola Heslehurst<sup>1</sup>

<sup>1</sup>Newcastle University, Newcastle-Upon-Tyne, United Kingdom, <sup>2</sup>University of Birmingham, Birmingham, United Kingdom

**SO.2.18 - From cohort studies to interventions, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Weight management interventions in pregnancy, comprising of diet and/or physical activity components, aim to reduce adverse pregnancy outcomes (e.g. gestational diabetes; GDM). Interventions are typically targeted by body mass index (BMI); however, this does not adequately identify all women who develop GDM. Therefore, exploring novel ways of targeting interventions, by alternative adiposity measures (e.g. waist circumference) may better predict GDM risk. This study aimed to estimate the relative performance of alternative measures of adiposity as predictors of GDM.

**Methods:** The International Weight Management in Pregnancy (i-WIP) collaboration has a living database of Individual Participant Data (IPD) from RCTs of weight management interventions in pregnancy. IPD from trials that collected data on adiposity were available from 9 trials (n=6089). A two-stage random effects IPD meta-analysis assessed overall intervention effectiveness for GDM prevention. The IPD meta-analytical framework was extended to explore treatment-covariate interactions, to investigate the mediating effect of adiposity measures on intervention effectiveness.

**Results:** Of the 9 trials, 2 recruited women with a BMI >18.5kg/m<sup>2</sup>, 3 recruited women with overweight, and 4 recruited women with obesity. Meta-analysis showed no evidence of effect of weight management interventions, compared to standard care, on GDM risk (OR: 0.99 95% CI: 0.79, 1.25). Treatment-covariate interactions did not identify any adiposity measures that were significantly associated with intervention effectiveness for GDM prevention (BMI: Interaction effect (IE): 0.000, 95% CI: -0.003, 0.003; waist circumference: IE: -0.002, 95% CI: -0.005, 0.002; Hip circumference IE: -0.001, 95% CI: -0.005, 0.002; Mid-upper arm circumference IE: 0.001 95% CI: -0.004, 0.007; Bicep skinfold: IE: -0.002, 95% CI: -0.006, 0.001; Tricep skinfold: IE: 0.001 95% CI: -0.002, 0.005; Subscapular skinfold: IE 0.001, 95% CI -0.002, 0.004; Suprailiac skinfold: IE 0.002, 95% CI -0.009, 0.013).

**Conclusions:** 7 of the 9 trials recruited women with overweight/obesity, limiting exploration of adiposity effect as the population may be skewed towards high adiposity. Development of a larger, more diverse, dataset that would allow for the exploration of adiposity across different maternal weights, the effect of characteristics associated with adiposity (e.g ethnicity), and effect of mode of interventions (e.g. diet/physical activity/combined), which was not possible due to limited data.

# Active Mums and Bumps: A mixed-method study into the feasibility and effectiveness of an online programme to increase physical activity levels in pregnant and postnatal women

Dr. Gaynor Creaby<sup>1,2</sup>, Dr. Laura Britten<sup>1</sup>, **Dr. Camilla Nykjaer<sup>1</sup>**

<sup>1</sup>School of Biomedical Sciences, Faculty of Biological Sciences, University of Leeds, Leeds, United Kingdom,

<sup>2</sup>Harrogate and District NHS Foundation Trust, Harrogate, United Kingdom

**SO.2.18 - From cohort studies to interventions, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Few pregnant or postnatal women meet physical activity (PA) recommendations, despite the known health benefits. COVID-19 exacerbated this, but also created a stimulus for innovation and opportunity. This study aimed to determine the feasibility of a 12-week online PA intervention tailored towards pregnant and postnatal women.

**Methods:** A mixed method approach was used. Women aged 18+ years, 12-20 weeks pregnant or 6-52 weeks postnatal with no contraindications to PA were recruited via social media in December 2020. The intervention, which coincided with the start of the third National UK COVID-19 lockdown, consisted of two weekly free midwife-led 45 minutes exercise classes (N=15) delivered via Zoom. Data were collected via online surveys at baseline, 6 and 12 weeks. Feasibility was assessed through acceptability, demand, practicality, and limited efficacy. Adherence was calculated as percentage of classes attended out of the number of classes available at each follow-up. Changes in self-reported PA (MET-minutes/week) and sitting time (hours/day), assessed using the IPAQ-SF, were explored using the Friedman test and Wilcoxon signed-rank tests. Qualitative outcomes were explored using a focus group (N=7) and thematic analysis.

**Results/findings:** Eighty-six eligible women expressed interest, of which 48 were invited to participate. Thirty-three signed up to the intervention, and 27 (age:  $34.8 \pm 4.3$  years) pregnant (n=9,  $18.1 \pm 3.0$  weeks gestation) and postnatal (n=18,  $17.7 \pm 7.5$  weeks since birth) women completed the surveys and attended at least one class. Mean adherence decreased from 67.5% to 54.3%, with postnatal women reporting a greater adherence at both time points. There was a statistically significant increase in median PA (MET-minutes/week) from baseline (912.0, IQR: 594.0, 1332.8) to 6 weeks (1173.0, IQR: 844.5, 1786.5,  $p=0.001$ ) as well as a statistically significant reduction in median sitting time (hours/day) from baseline (8.5, IQR: 6.0, 11.3) to 12 weeks (6.5, IQR: 5.0, 8.5,  $p=0.004$ ). Thematic analysis found four themes: 'accessibility', 'personalised', 'me time' and 'instructor qualities'.

**Conclusions:** There was a high demand for this intervention and findings indicate it as a feasible way of increasing PA and decreasing sitting time. A larger randomised-controlled trial with a control group is required to test this intervention further.

# Hidden hunger: Patterns of diet quality among slum-dwelling pregnant women in India

**Ms. Swapna Deshpande<sup>1,2</sup>**, Dr. Rubina Mandlik<sup>1</sup>, Dr. Anuradha Khadilkar<sup>1</sup>, Dr. Tarun Reddy Katapally<sup>3</sup>, Dr. Jasmin Bhawra<sup>4</sup>, Dr. Tarja I Kinnunen<sup>2</sup>

<sup>1</sup>Hirabai Cowasji Jehangir Medical Research Institute, Pune, India, <sup>2</sup>Tampere University, Tampere, Finland,

<sup>3</sup>Western University, Ontario, Canada, <sup>4</sup>Toronto Metropolitan University, Toronto, Canada

**SO.2.18 - From cohort studies to interventions, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Presently, 17% (65 million) of the urban Indian population resides in slums, which are socioeconomically backward neighbourhoods in urban areas. Given the dearth of nutrition studies on slum-dwelling Indians, this study aims to identify the determinants of dietary adequacy among slum-dwelling pregnant women in India.

**Methods:** This prospective observational study was conducted with slum-dwelling pregnant women (N=238) in the Western Indian city of Pune. Participants were between 18 to 40 years, recruited <12 weeks into pregnancy and followed till delivery. Data on socio-demographic characteristics, anthropometrics, and diet (3-day, 24hr recall at 21-25 weeks) were collected using interviewer-administered questionnaires. Nutrient Adequacy Ratio and Mean Adequacy Ratio for 9 micronutrients (calcium, iron, zinc, vitamins A, C, B1, B2, B3, folic acid) were calculated using the Estimated Average Requirement (EAR) for Indians. Principal component analysis and linear regression analysis were performed to identify nutrient intake patterns and their sociodemographic determinants.

**Results:** Mean age of the sample was 24.4±4.5 years, with 46% completing ≥12 years of formal education (higher secondary). Approximately 60% women were nulliparous, and over 85% were homemakers. Further, 25% of women were underweight, while 26% were overweight and 10% obese. Mean daily energy intake was 1912±540 kcal (EAR – 2010 kcal), where energy obtained from carbohydrates, proteins, and fats was 63%, 10%, and 26%, respectively. Approximately 42% of women exceeded the suggested energy intake from carbohydrates, whereas all participants' protein intake was within the recommended value. Mean Adequacy Ratio was 52%, implying that the diet was devoid of most micronutrients, particularly folic acid. Broadly, two nutrient intake patterns were identified: 1) Group 1: High macro and micronutrient intake (66%); 2. Group 2: High intake of vitamins (A, C, Folic Acid) (9%). Obtaining >12 years of formal education ( $\beta=0.63$ ,  $p=0.020$ ) was significantly associated with pattern 1 after adjusting for other demographic and anthropometric covariates. Overall, higher education was associated with better diet quality.

**Conclusion:** On average, the diets of Indian slum-dwelling pregnant women had sufficient macronutrient, but inadequate micronutrient composition, indicating hidden hunger. Given the long-term impacts of diet quality on maternal and child health, nutritional literacy programs should be prioritized.

# A Christmas themed physical activity intervention to increase participation in physical activity during Advent: pilot randomised controlled trial

**Dr. Gregory Biddle**<sup>1</sup>, Dr. James Sanders<sup>1</sup>, Dr. Kajal Gokal<sup>1</sup>, Dr. Claire Madigan<sup>1</sup>, Mr. Jonah Thomas<sup>1</sup>, Ms. Alexandra Pyle<sup>1</sup>, Dr. Andrea Roalfe<sup>1</sup>, Prof. Amanda Daley

<sup>1</sup>Loughborough University, Loughborough, United Kingdom

**SO.2.18 - From cohort studies to interventions, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** To examine the recruitment, retention, and preliminary effects of a Christmas themed physical activity intervention designed to increase participation in physical activity and decrease sedentary behaviour in inactive adults.

**Methods:** A pilot randomised controlled trial recruited inactive adults and randomised them 2:1 to the intervention or the comparator group. The intervention group received an email each day of Advent (1-24 December 2021), containing a Christmas themed physical activity idea to be completed that day. Each physical activity idea was presented in three intensity formats, including Easy Elf (light intensity), Moderate Mrs Claus (moderate intensity), and Strenuous Santa (vigorous intensity). The comparator group received a leaflet about healthy living on the 1 December. Primary outcomes were recruitment rate, retention, and weekly minutes of participation in self-reported moderate-to-vigorous intensity physical activity (MVPA) using the exercise vital signs questionnaire. Primary analysis used repeated measures linear modelling to compare minutes of moderate-to-vigorous intensity physical activity between groups at one, two-, and three-weeks follow-up. Secondary outcomes were muscle strengthening physical activity (days per week), accelerometer measured MVPA and sedentary time (minutes per day), and enjoyment of and adherence to the intervention.

**Results:** 323 individuals expressed an interest in the trial and 107 were randomly assigned to the intervention (n=71) or the comparator (n=36) group. The recruitment target (n=105) was reached within 19 days of starting recruitment. 23 (21%) of 107 participants were lost to follow-up. At three weeks, the adjusted mean difference between groups was 20.6 minutes of participation in moderate-to-vigorous intensity physical activity per week (95% CI -29.7 to 70.9) in favour of the intervention group. Accelerometer data showed that the intervention group spent fewer minutes sedentary per day than comparators (-58.6 (-113.5 to -3.8)). Overall, 70% participants reported that they liked the intervention and 69% reported that they completed the activity ideas each day.

**Conclusions:** The public were interested in a Christmas themed physical activity intervention during Advent, which might increase physical activity and reduce time sedentary. Enjoyment of, and adherence to the intervention shows the potential benefit that Christmas themed physical activity campaigns/initiatives might have for improving public health.

# Preferred Physical Activity Type and Relationship with meeting Physical Activity Guidelines by Urban-Rural Residence among Adults in the US, 2019

**Dr. Christiaan Abildso**<sup>1</sup>, Dr. Eugene Fitzhugh<sup>2</sup>

<sup>1</sup>West Virginia University School of Public Health, Morgantown, USA, <sup>2</sup>University of Tennessee, Knoxville, Knoxville, USA

**SO.2.18 - From cohort studies to interventions, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** The purpose of this study was to compare urban- and rural-residing US adults' participation in specific types of leisure-time (LT) physical activity (PA), and the relationship of LT PA types with the prevalence of meeting aerobic, muscle strengthening, and combined PA guidelines.

**Methods:** 2019 Behavior Risk Factor Surveillance System data from adults (N=396,261) were analyzed. Respondents that indicated they engaged in any LT PA in the previous month could report up to two LT PAs they engaged in the most from among 75 options, including "other." These were condensed to 13 categories using the Compendium of PAs. Age-adjusted prevalence of engaging in specific LT PAs and the overarching activity categories were compared by urban/rural county of residence using the 2013 NCHS Urban/Rural Classification Scheme. The relationship of PA categories with meeting aerobic, muscle strengthening, and the combined PA guidelines, stratified by urban/rural status was analyzed using chi-square analyses with  $p \leq 0.004$  adjusted for multiple comparisons.

**Results/findings:** For all adults, walking (44.1%), running (11.7%), weightlifting (10.7%), and gardening (5.8%) were the four most commonly reported LT PAs. Running and weightlifting were reported more often by urban (12.2% and 11.2%, respectively) than rural adults (8.9% and 7.8%, respectively) ( $p < .0001$ ); gardening more often by rural than urban adults (6.9% v 5.7%) ( $p < .0001$ ). "Recreational" LT PA categories (e.g., walking/hiking, cycling, conditioning, sports, running/jogging) were more prevalent among urban residents whereas "purposeful" LT activities (e.g., household activities, lawn/garden) were more prevalent among rural residents. Interestingly, individuals reporting walking (44.1%) had the highest rate of not meeting the combined PA guidelines (22.2% urban, 22.4% rural). Categories of LT PA associated with the highest rates of meeting the combined PA guidelines (all > 40%) were dancing/aerobics, conditioning, running/jogging, and "other" activities.

**Conclusions:** The results highlight uniqueness between rural and urban US adults in the LT PA types that they engage in and those that are associated with PA guidelines. These analyses are innovative and important for addressing the significant rural/urban PA disparities that exist in the US by developing our understanding of which activities may or may not appeal to specific populations.

# Associations between dietary patterns with objective and subjective sleep duration and quality in the Rotterdam study

**Ms. Auke J.C.F. Verkaar<sup>1</sup>**, Associate Professor Renate M. Winkels<sup>1</sup>, Prof. Ellen Kampman<sup>1</sup>, Assistant Professor Annemarie I. Luik<sup>2</sup>, Associate Professor Trudy Voortman<sup>2</sup>

<sup>1</sup>Division of Human Nutrition and Health, Wageningen University & Research, Wageningen, Netherlands,

<sup>2</sup>Department of Epidemiology, Erasmus MC, University Medical Center Rotterdam, Rotterdam, Netherlands

**SO.2.18 - From cohort studies to interventions, Clarion Hotel Gillet - Room Akademien, June 16, 2023, 12:00 PM - 1:15 PM**

**SIG - Primary Choice:** N. Other

**Purpose:** Healthier dietary patterns have been associated with better sleep quality and longer sleep duration. Most studies however have relied on self-reported sleep measurements which reflect the experience of sleep. Associations of dietary patterns with sleep consequently might differ when sleep is assessed objectively. We therefore comprehensively examined associations of different types of dietary patterns with both actigraphy-estimated and self-reported sleep duration and quality in a population-based sample of middle-aged and elderly persons.

**Methods:** In 2,589 participants (median age 56.9 years, IQR: 52.5-60.3; 58% female) of the Rotterdam study, an ongoing prospective cohort, dietary intake was assessed with a 389-item food frequency questionnaire. Five different dietary patterns were defined: two pre-defined scores developed to measure adherence to the Dutch dietary guidelines and Mediterranean diet, and three previously derived data-driven scores indicating a prudent, unhealthy, and typical Dutch diet. Self-rated sleep quality was assessed with the Pittsburgh Sleep Quality Index. In 533 participants (median age 56.2 years, IQR: 51.3-59.5; 61% female), we used actigraphy for an average of 6.8 days (SD: 0.7) to estimate total sleep time, sleep onset latency, wake after sleep onset, and sleep efficiency. Multiple linear regression was used to assess associations between dietary patterns and sleep outcomes, adjusting for multiple confounders. Stratified analyses were performed by sex, age and BMI categories.

**Results/findings:** No statistically significant associations were observed between the different dietary patterns and objective sleep outcomes or subjective sleep quality. Stratified analyses did not reveal meaningful differences between groups.

**Conclusions:** No associations between dietary patterns with subjective sleep quality or objective sleep outcomes were observed in this population-based sample of middle-aged and elderly persons. This suggests that overall dietary patterns are not associated with sleep in a general population. Potentially, more specific aspects of dietary intake may affect sleep or dietary intake might be more relevant in relation to sleep for specific groups.

# An online tool to support pediatric providers and parents in addressing child weight management

**Assistant Professor Marlyn Allicock<sup>1</sup>**, Mr. Joshua Yudkin<sup>1</sup>, Miss Victoria Nelson<sup>3</sup>, Dr. Sarah Barlow<sup>2,3</sup>

<sup>1</sup>The University of Texas Health Science Center at Houston, Dallas, USA, <sup>2</sup>University of Texas Southwestern Medical Center, Dallas, USA, <sup>3</sup>Children's Medical Center of Dallas, Dallas, USA

**SO.3.19 - What we know about weight management from children and families studies, UKK - Main Hall (Level 6), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Systemic, structural, and social factors have contributed to a high burden of overweight and obesity among African American and Latino children in the United States, but weight management programs are scarce. Pediatric providers have opportunities to address weight management with children in healthcare settings, but they have limited time to implement interventions. This study created an eHealth solution to extend the abilities of pediatric providers to support parents in child weight management. Dynamo Kids/¡Niños Dinámicos! is a novel online tool (in English and Spanish) to assist pediatric providers in counseling parents of children with overweight or obese.

**Methods:** Families with children (6-12 years), with BMI  $\geq$  85<sup>th</sup> percentile, and receiving pediatric primary healthcare at three safety-net clinics in Dallas, TX were recruited by pediatric providers via EHR alerts. Dynamo Kids/¡Niños Dinámicos! focused on positive behavior changes for sugar-sweetened beverages (SSB), physical activity, and MyPlate (nutrition) over the 3-month intervention, plus behavior tracking, text messages, provider endorsement, and self-pacing to encourage parental engagement. Parent-use information was sent to the patient's EHR so that providers could assess progress and provide counseling during scheduled follow-up visits. Providers received a brief motivational-interviewing training to model clinical conversations and a guide with questions and talking points to support counseling. Parents completed baseline and follow-up surveys that evaluated behavior change including the Family Nutrition and Physical Activity Assessment (FNPA) and parent BMI. Postintervention interviews with parents and providers offered insight into engagement, intervention design, and fit/need.

**Results:** 73 families enrolled, majority Latino (87%), and 63% used the program. Improvements in FNPA 3.0 (6.3),  $p=0.01$  and parent BMI = -0.69 (1.76),  $p=0.04$  were observed. 61% started with SSB and spent an average 109 minutes over 21 days. Experiences with engagement and lessons learned from providers and parents regarding implementation, content, and engagement will be discussed.

**Conclusions:** Promising evidence in parent-related behaviors demonstrates that an eHealth platform may be valuable for delivering parent education and a tool for providers to collaboratively engage with parents for weight management.

# Designing a communication strategy to promote the use of warning labels among Mexican children and adolescents

**Dr. Alejandra Jáuregui<sup>1</sup>**, Mrs. Selene Pacheco-Miranda<sup>1</sup>, Miss Yatziri Ayvar-Gama<sup>1</sup>, Mr. Nelson Alejandro-Torres<sup>1</sup>, Mrs. Amalia Cuno<sup>2</sup>, Dr. Anabelle Bonvecchio-Arenas<sup>1</sup>, Dr. Simón Barquera-Cervera<sup>1</sup>

<sup>1</sup>Instituto Nacional de Salud Pública, Cuernavaca, Mexico, <sup>2</sup>Instituto Politécnico Nacional, Mexico City, Mexico

**SO.3.19 - What we know about weight management from children and families studies, UKK - Main Hall (Level 6), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Background:** The health and economic burdens due to childhood obesity and poor dietary habits among the youth are key pressing matters in Mexico. In October 2020 front-of-package warning labels were implemented in Mexico to improve the food environment and guide consumers to select healthier foods. We aimed to describe the process used to design a communication strategy aimed at promoting the use of warning labels and choosing healthy foods among Mexican children and adolescents.

**Methods.** Between June a December 2021, we conducted a mixed-methods study among youth (6-18 years) and their caretakers with low- and high-income backgrounds from urban and rural settings in Morelos, Mexico. The study consisted of four phases: 1) Formative research (18 focus groups, n=179); Co-creation workshops with children and adolescents (n=33); 3) Design of the communication strategy, and 4) Pilot-testing of the proposed strategy (6 focus groups, n=52). The COM-B model and the conceptual model of front-of-package nutrition label influence guided all the phases of the study.

**Results.** We identified key priorities to be addressed by the communication strategy: 1) Improve the understanding of how warning labels work, 2) Explain the link between key ingredients (calories, saturated fat, trans fat, sodium, sweeteners, and caffeine), and disease; 3) Remind that not all processed products are healthy, 4) Highlight the negative effects of the excessive consumption of foods with warning labels, 5) Highlight the other benefits of healthy eating beyond health (academic achievement and feeling lively and more energized), 6) Empower youth to promote healthy eating within their families, 7) Encourage youth and their caretakers to speak up and demand the food industry to produce healthier food products, 8) Highlight that natural foods are cheaper and of better quality than foods with warning labels, and 9) Provide options of healthy and attractive food preparations with natural foods.

**Conclusion.** Formative research and the participation of children and adolescents in creating the strategy were essential for designing a culturally relevant strategy with impact potential, which was later implemented at the national level in June 2022. The process and results of this study may inform efforts in contexts similar to Mexico.

# Geographical location matters: Differences in dietary behaviours of children living with obesity who participate in Shapedown-BC, a Provincially funded weight management program in British Columbia, Canada (2015-2019)

Ms. Alexandra J. Heidl<sup>1</sup>, **Dr. Ana Carolina B. Leme<sup>2</sup>**, Ms. Judith de Niet<sup>3</sup>, Ms. Thumri Waliwitiya<sup>4</sup>, Ms. Madelaine Gierc<sup>3</sup>, Ms. Kiran Kalkat<sup>3</sup>, Ms. Arlene Cristall<sup>3</sup>, Associate Professor Eli Puterman<sup>3,5</sup>, Assistant Professor Tamara Cohen<sup>2,3</sup>

<sup>1</sup>School of Nutrition, McGill University, Sainte-Anne-De-Bellevue, Canada, <sup>2</sup>Faculty of Land and Food Systems, The University of British Columbia, Vancouver, Canada, <sup>3</sup>British Columbia Children's Hospital, Vancouver, Canada, <sup>4</sup>Faculty of Medicine, The University of British Columbia, Vancouver, Canada, <sup>5</sup>School of Kinesiology, The University of British Columbia, Vancouver, Canada

**SO.3.19 - What we know about weight management from children and families studies, UKK - Main Hall (Level 6), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Population health is known to vary between rural versus urban population centres. Shapedown BC is a provincially funded weight-management program in British Columbia, Canada, that provides support to families of children (9-11y) and adolescents (12-18 y) living with obesity throughout the province. The purpose of this study was to examine the associations between geographic locations within British Columbia and differences in dietary behaviours of those enrolled in the program.

**Methods:** This study reports on a cross-sectional analysis of data from participants enrolled in Shapedown BC from 2015-2019 (n=1,079, BMI z-score  $2.77 \pm 0.67$ , mean age  $14.0 \pm 1.7$  years). Parent-proxy frequencies of vegetables and sugar-sweetened beverages intake were reported for children <11 years and child self-report frequencies for children >12 years. Statistics Canada definitions of geographic locations were used: rural ( $\leq 1,000$  inhabitants), small (1,000 to 29,999 inhabitants), medium (30 to 99,999 inhabitants), and large ( $\geq 100,000$  inhabitants). Due to a small number of children living in rural areas (n=3), data for rural and small centres were merged to one category (n= 3). Descriptive statistics and logistic regression with generalized estimating equations were used to calculate the association between geographic location and dietary behaviours.

**Results:** Most of the children were living in urban centres (66.2%) followed by medium (30.8%) and rural/small (3.1%) centres. Those residing in medium centres consumed more salads/greens (OR: 0.42; 95%CI 0.14, 0.70), fewer sugar-sweetened beverages (OR: -0.36; 95%CI -0.64, -0.09), and fewer family meals (OR: -0.30; 95%CI -0.57, -0.03) compared to large populations, but not compared to rural and small centres. However, children residing in rural and small locations were found to eat more at fast-food restaurants (OR: 1.19; 95%CI 0.25, 2.12) compared to large populations.

**Conclusion:** Study results provide insight into the dietary behaviours of Canadian children living with obesity across different geographic locations in British Columbia. Those living in medium centres present with healthier eating patterns compared to those residing in rural and large centres. These findings have important implications for understanding how geographic locations might affect dietary behaviours in children living with obesity.

# Cross-sectional and longitudinal associations of vigorous and moderate-to-vigorous physical activity with cardiovascular disease risk factors in children from 4 to 9 years of age

Dr. Christine Delisle-Nyström<sup>1</sup>, **Dr. Jairo H. Migueles**<sup>1</sup>, Dr. Pontus Henriksson<sup>2</sup>, Prof. Marie Löff<sup>1,2</sup>

<sup>1</sup>Karolinska Institutet, Huddinge, Sweden, <sup>2</sup>Linköping University, Linköping, Sweden

**SO.3.19 - What we know about weight management from children and families studies, UKK - Main Hall (Level 6), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Although physical activity guidelines for children encourage moderate-to-vigorous intensity activities (MVPA), some studies have found that only vigorous intensity activities (VPA) might promote health benefits in young children. To investigate the longitudinal associations of VPA and MVPA with cardiovascular risk factors measured at 4 and 9 years of age.

**Methods:** This study pooled data from three cohorts under the umbrella of SPINACH. Of the 632 children originally measured, 411 children participated in the follow-up measurements at 9 years of age. Movement behaviours (i.e., physical activity, sedentary behaviour, and sleep) were measured with accelerometers. Cardiovascular disease risk factors included blood pressure (BP), high- and low-density lipoprotein cholesterol (HDL, LDL), triglycerides, insulin, glucose, the Homeostatic model assessment of insulin resistance (HOMA-IR), and waist circumference. A normalized metabolic syndrome risk score (MetS-score) was derived from these indicators. Cross-sectional and longitudinal linear regression models were built using compositional data analysis standards.

**Results:** Reallocating time to VPA from lower-intensity behaviours at 9 years was associated with a lower waist circumference ( $B = -3.219$ ,  $P = 0.002$ ), diastolic BP ( $B = -1.836$ ,  $P = 0.036$ ), triglycerides ( $B = -0.214$ ,  $P < 0.001$ ), glucose ( $B = -0.189$ ,  $P = 0.033$ ), insulin ( $B = -2.997$ ,  $P < 0.001$ ), and HOMA-IR ( $B = -0.778$ ,  $P < 0.001$ ) measured at 9 years of age. Similarly, reallocating time to VPA at 4 years was associated with MetS-score ( $B = -0.831$ ,  $P = 0.049$ ), waist circumference ( $B = -4.211$ ,  $P = 0.015$ ), systolic BP ( $B = -5.572$ ,  $P = 0.015$ ), diastolic BP ( $B = -2.931$ ,  $P = 0.044$ ), triglycerides ( $B = -0.229$ ,  $P = 0.034$ ), glucose ( $B = -0.325$ ,  $P = 0.032$ ), insulin ( $B = -5.114$ ,  $P = 0.001$ ), and HOMA-IR ( $B = -0.673$ ,  $P = 0.001$ ) at 9 years of age. Reallocations of time to MVPA were not associated with cardiovascular disease risk factors, neither at 4 nor 9 years of age.

**Conclusion:** Allocating more time to VPA was associated with cardiovascular health in children both cross-sectionally and longitudinally. Interestingly, MVPA seemed not to be a stimulus of enough intensity to trigger these potential cardiometabolic benefits in apparently healthy children.

# Energy intake mediates the association between evening food consumption and adiposity among children

Miss Jenna Rahkola<sup>1</sup>, Mr. Aku-Ville Lehtimäki<sup>1</sup>, Dr. Henna Vepsäläinen<sup>2</sup>, Dr. Ilona Merikanto<sup>3</sup>, Prof. Eva Roos<sup>1</sup>, **Dr. Reetta Lehto<sup>1,2</sup>**

<sup>1</sup>Folkhälsan Research Center, Helsinki, Finland, <sup>2</sup>Department of Food and Nutrition, University of Helsinki, Helsinki, Finland, <sup>3</sup>Faculty of Medicine, University of Helsinki, Helsinki, Finland

**SO.3.19 - What we know about weight management from children and families studies, UKK - Main Hall (Level 6), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Timing of eating has recently gained special interest as it has been found to impact metabolism and relate to obesity in adults. Among young children, some studies have shown an association between late eating and adiposity. The role of energy intake as a possible mediator in such association is unclear. We studied whether late timing of eating associates with adiposity among young children and whether the association is mediated by energy intake.

**Methods:** We used cross-sectional data of 577 Finnish preschoolers (aged 3-6 years) from the DAGIS survey. Children's 3-day food records and at least 3 days' Actigraph-derived sleep data on the same days were used. Children's weight, height and waist circumference (WC) were measured by research staff. Following mean variables were calculated and used as exposure variables: time of last eating occasion, elapsed time between last eating occasion and sleep onset (evening latency), and % of daily energy intake within two hours prior to sleep onset. Mean daily energy intake (MJ) was used as the mediator and WC (log<sub>10</sub>-transformed) and BMI z-score as outcome variables. Age, gender, height (only with WC), parental education level, sleep duration, moderate-to-vigorous physical activity, and sleep midpoint were used as confounders.

**Results:** There were negative indirect (estimate -6.74e-04, 95% CI -1.49e-03, -7.78e-05, p 0.01), direct (estimate -5.02e-03, 95% CI -8.78e-03, 1.16e-03, p. 0.008) and total (estimate -5.693x10<sup>-3</sup> 95% CI -9.47e-03, 1.80e-03 p. 0.004) effects of evening latency to WC via energy intake. Also, no direct, but positive indirect (estimate 5.86e-05, 95% CI 1.44e-05, 1.20e-04, p. 0.002), and total (estimate 3.28e-04, 95% CI 7.14e-05, 6.18e-04, p. 0.02) effects of % of evening energy intake to WC via energy intake was found. Similar, but fewer effects were found to BMI z-score. Time of last eating occasion had no mediation or direct effects to either WC or BMI z-score.

**Conclusions:** Eating close to sleep onset and higher proportional energy intake in the evening associated with higher adiposity among preschool-aged children and the effects were mediated by energy intake. Further, preferably longitudinal studies confirming these preliminary results are needed.

# Environmental impacts of current diet and two healthy and sustainable scenario diets among young children in Norway

**Ms. Ellen Cecilie Wright<sup>1</sup>**, Mr. Bob van Oort<sup>2</sup>, Ms. Marie Michaelsen Bjøntegaard<sup>1</sup>, Associate Professor Monica Hauger Carlsen<sup>1</sup>, Prof. Lene Frost Andersen<sup>1</sup>

<sup>1</sup>University of Oslo, Oslo, Norway, <sup>2</sup>CICERO Centre for International Climate Research, Oslo, Norway

**SO.3.19 - What we know about weight management from children and families studies, UKK - Main Hall (Level 6), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose** The study aimed to estimate environmental impacts and nutritional adequacy of the current diet among 2-year-olds in Norway and compare this with two alternative healthy and environmentally sustainable scenario diets.

**Methods** The current diet was estimated based on a national dietary survey among 2-year-olds in Norway (food frequency questionnaire, n= 1413). Two scenario diets were constructed based on the Norwegian Food-Based Dietary Guidelines (FBDGs) and the EAT-Lancet Planetary Health Diet using culturally acceptable foods for this age group. The nutritional content and environmental impacts of diets were calculated using the food and nutrient calculation system Kostberegningssystem (KBS) at the Department of Nutrition, University of Oslo. Indicators for environmental impacts were based on a newly developed database including life cycle assessments for foods on the Norwegian market with system boundaries from cradle to fork. Impact categories include global warming potential (GWP), marine and freshwater eutrophication (ME and FE), terrestrial acidification (TA), water consumption (WC) and land use (LU/LUC).

**Results/Findings** All diets were nutritionally adequate for young children 2-5 years of age. However, the current diet among 2-year-olds included lower amounts of vegetables, legumes, nuts, and whole grains, and more dairy and processed meat products than the scenario diets. For four of the six impact categories (GWP, FE, TA, and WC), the analysis showed a decreasing gradient from the current diet to the EAT-Lancet scenario, with impacts from the FBDGs scenario falling in between the two. For the current diet, high consumption of dairy and dairy products was responsible for the majority of contributions to these impact categories. Meanwhile, the EAT-Lancet scenario diet had a higher ME impact than the two other diets, mainly due to a higher content of legumes and vegetable oils. The impacts from LU/LUC were similar for all diets.

**Conclusion** In conclusion, environmental impacts from diets among 2-year-olds in Norway could be reduced by shifting to a diet more in line with the Norwegian FBDGs, and further reduced by transitioning to a diet following EAT-Lancet Planetary Health Diet guidelines. This shift would involve the inclusion of more vegetables and legumes, and a reduction in total dairy consumption.

# What are young people's views and understanding of physical activity calorie equivalent (PACE) food labelling? A mixed methods study

**Ms. Natalia Iris<sup>1</sup>**, Prof. Fehmidah Munir<sup>2</sup>, Prof. Amanda Daley<sup>1</sup>

<sup>1</sup>Centre for Lifestyle Medicine and Behaviour, School of Sport, Exercise and Health Sciences, Loughborough University, Loughborough, United Kingdom, <sup>2</sup>School of Sport, Exercise and Health Sciences, Loughborough University, Loughborough, United Kingdom

**SO.3.19 - What we know about weight management from children and families studies, UKK - Main Hall (Level 6), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Childhood obesity is a public health challenge. Food labelling may help children make healthier food choices but current approaches (i.e. traffic light labelling) are complex to understand. PACE food labelling may be easier for children to understand/more appealing because it contextualises the energy content of food/drinks. The mixed methods study aimed to examine the views/understanding of PACE food labelling.

**Methods:** An online questionnaire was completed by 808 young people aged 12-18 years in England. The questionnaire explored their views and understanding of traffic light and PACE food labels. Analyses assessed associations between variables and tested differences in the proportions of views about food labels. A sub-sample (n=17) of questionnaire responders participated in an online semi-structured interview to explore their perceptions of PACE labelling in more depth. Interview transcripts were analysed using the framework method.

**Results/findings:** More participants reported PACE labels were easier to understand than traffic light labels (69% vs 31%,  $p < 0.001$ ). Forty-two percent reported they would look at PACE labels often/always if they were implemented. The most common reason why participants never/would never look at food labels was because they are not interested in making healthy food choices. Fifty-two percent said PACE labels would make it easier for them to choose healthy food/drinks. Half of participants reported PACE labels would encourage them to be physically active. Interview findings revealed the acceptability and perceived usefulness of PACE labels was generally high because of the potential to help participants choose healthier food/drinks and encourage physical activity. It was felt that PACE labelling could have negative impacts on some people such as feeling pressure to do physical activity. PACE labels would be particularly useful in 'grab and go' contexts/where quick decisions are made (e.g. convenience stores and fast food outlets).

**Conclusions:** Young people generally had positive views about PACE labelling. PACE labelling may help young people choose healthier food/drinks and encourage physical activity, although consideration must be given to the concerns raised about the potential negative effects it may have. Research is needed to understand the impact of PACE labelling on food choice among young people in real settings.

# Transforming obesity prevention for children through collaboration and innovative methods

Ms. Kylie Hunter<sup>1,2</sup>, **Dr. Brittany Johnson<sup>1,3</sup>**, Mr. Mason Aberoumand<sup>1,2</sup>, Dr. Jonathan Williams<sup>1,2</sup>, Prof. Rebecca Golley<sup>1,3</sup>, Dr. Sol Libesman<sup>1,2</sup>, Ms. Angie Barba<sup>1,2</sup>, Prof. Louise Baur<sup>1,4</sup>, Dr. Anna Lene Seidler<sup>1,2</sup>

<sup>1</sup>Transforming Obesity Prevention for CHILDren (TOPCHILD) Collaboration, Sydney, Australia, <sup>2</sup>NHMRC Clinical Trials Centre, University of Sydney, Sydney, Australia, <sup>3</sup>Caring Futures Institute, Flinders University, Adelaide, Australia, <sup>4</sup>Sydney Medical School, University of Sydney, Sydney, Australia

**SO.3.19 - What we know about weight management from children and families studies, UKK - Main Hall (Level 6), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** It is imperative to intervene early if childhood obesity and associated lifelong health risks are to be prevented. Yet, whilst there is convincing evidence that early interventions can be effective, there are major gaps in the evidence base on which elements of interventions are effective and for whom. To address this, we brought together researchers around the world in an international collaboration.

**Methods:** We conducted systematic searches of medical databases and clinical trial registries to identify randomised controlled trials of parent-focused behavioural interventions aimed at preventing childhood obesity that started antenatally or within the first year of life. All eligible trials were invited to join the Transforming Obesity Prevention for CHILDren (TOPCHILD) Collaboration and asked to share their intervention materials and individual participant data upon completion. We mapped characteristics of all completed trials that have joined TOPCHILD to date, including their location, delivery features, target behaviours and effectiveness.

**Results:** We identified 78 eligible trials (55 completed, 23 ongoing) with a total of >60,000 infant-parent dyads (participants). To date, 50 (64%) of these trials, including ~40,000 (65%) eligible participants have joined the TOPCHILD Collaboration. Thirty-five of these trials (including a total of 41 active intervention arms) are complete; these are set in 15 countries, including 4 middle and 11 high income countries. Reported effectiveness varied among published trials, with 7 out of 26 (27%) reporting a statistically significant difference for an infant weight-related outcome. Many included trials alone were statistically underpowered to detect potential differences in weight-related outcomes. The 41 intervention arms of completed TOPCHILD trials varied in content and delivery features, and targeted a range of behaviours, with 31 (76%) targeting infant feeding practices, 36 (88%) food provision feeding practices, 24 (59%) movement practices, and 7 (17%) sleep health practices.

**Conclusions:** No individual trial or simple meta-analysis alone can solve the complex issue of early childhood obesity prevention. The TOPCHILD Collaboration is using innovative collaborative and meta-analytic methodologies to compare a broad range of interventions delivered to diverse populations. This will enable us to develop effective and targeted approaches that lead to sustainable behaviour change in at-risk populations.

# Evaluation of Universal Free School Meals

**SO.3.20 - School-related studies on behavioral nutrition and physical activity, UKK - Level 6 Foyer, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Universal School Meal (USM) policies can increase access to healthy foods for millions of children. During the COVID-19 pandemic, the United States implemented a UFSM policy, but this ended in Fall 2022. However, several states (e.g., California and Maine) have adopted policies to continue USM. Therefore it is essential to examine the challenges and strategies for successful continuation of USM policies (including differences by school characteristics), along with studying pandemic-related challenges that are likely to persist in schools.

**Methods:** In Spring 2022, all school food authorities (SFAs) in California (n=1116) and Maine (n=121) were invited to complete an online survey (developed in collaboration with the School Nutrition Association, Center for Science in the Public Interest, and California Department of Education). Descriptive statistics, ANOVA, and logistic regression were used to examine differences by school demographic characteristics (urbanicity, school size, and school poverty levels [e.g., percent of students eligible for free or reduced-price meals [FRPM]]).

**Results:** A total of 581 SFAs in California and 43 SFAs in Maine completed the survey (response rate of 52% and 36%, respectively). The majority of SFAs in California and Maine reported benefits of USM including increased student meal participation (79% and 75%, respectively) and reduced stigma (40% and 51%, respectively). The top challenge for implementing USM was staffing (77% and 69%, respectively). Nearly all SFAs reported pandemic-related challenges procuring the necessary types and amounts of foods and non-food supplies/equipment. Additionally, over 40% of SFAs in both California and Maine reported that federal reimbursements were insufficient to cover costs. When examining differences by school demographics, rural schools reported significantly more challenges compared with urban and suburban schools. Additionally, SFAs with lower poverty levels (<40% of students eligible for FRPM) and/or higher student enrollment reported more current challenges and future concerns than those with ≥40% FRPMs and lower student enrollment. The top resources requested to implement state-level USM policies included additional facilities/equipment, communications/marketing, increasing meal participation, and financial management.

**Conclusions.** USM may have multiple important benefits for students and schools, and state and federal resources should consider urbanicity, student enrollment, and poverty for successful implementation.

# Differences between adolescents' and their parents' perceived benefits and barriers to actively commute to school: PACO y PACA Project

Mr. Iván Pinilla Quintana<sup>1</sup>, Miss Evelyn Martin-Moraleda<sup>1</sup>, Dr. Alberto Dorado<sup>1</sup>, Dr. Virginia García-Coll<sup>1</sup>, Mr. Fabio Jimenez-Zazo<sup>1</sup>, Dr. Esther Cabanillas-Cruz<sup>1</sup>, Dr. Cristina Romero-Blanco<sup>2</sup>, Dr. Ana Queralt<sup>3</sup>, Dr. Manuel Herrador-Comenero<sup>4</sup>, **Prof. Susana Aznar<sup>1</sup>**

<sup>1</sup>PAFS Research Group, Faculty of Sports Science, University of Castilla-La Mancha, Toledo, Spain, <sup>2</sup>PAFS Research Group, Faculty of Nursing, University of Castilla-La Mancha, Toledo, Spain, <sup>3</sup>AFIPS Research Group, Faculty of Nursing, University of Valencia, Valencia, Spain, <sup>4</sup>PROFITH Research Group, Faculty of Sport Sciences, University of Granada, Granada, Spain

**SO.3.20 - School-related studies on behavioral nutrition and physical activity, UKK - Level 6 Foyer, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Active commuting to and from school (ACS) plays an important role in the physical activity recommendations achievement. There are several factors perceived by parents and their adolescents that affect the way adolescents commute to school. The aim of this study is to (1) describe the benefits and barriers to walk to school perceived by parents and adolescents, (2) analyze the differences between parents' and adolescents' perceived benefits and barriers, and (3) analyze those perceptions according to the means of transport to school.

**Method:** A sample of 464 adolescents (age Mean=14.86 years; SD=0.51) from four cities in Spain (Toledo, Sevilla, Granada, and Valencia) and their parents (n=499, age M=48.0; SD=5.42) participated in the study. Adolescents were asked about the way they commute to school. Both, parents and adolescents reported their perceived benefits and barriers to walking to school. Data was analyzed using paired samples t-test and Wilcoxon test.

**Results:** Adolescents actively commuting to school represented a 46.1% of the sample. Adverse weather was seen as an important barrier for both study groups. Parents were mainly concerned about additional planning and traffic safety, while for adolescents, the time they saved with motorized transport, was especially important. Adolescents who walked to school perceived significantly ( $p<0.01$ ) less barriers than the ones who commuted by motorized transport (Mean= 2.75; SD=0.72 vs Mean= 4.08; SD=0.57). In contrast, there were only one significant difference in the benefits perceptions to walk to school between parents whose children actively commute to school vs the ones who did not, in "walking to school gives the opportunity to socialize" (Mean=4.58 (0.81) vs Mean=4.26 (1.14)  $p>0.01$ )

**Conclusions:** Benefits were perceived as important for both parents and adolescents. The means of transport seem to be associated with the barriers' perception for adolescents who reported more barriers to walk to school when they commuted by motorized transport. The opportunity of socializing when walking to school was considered a benefit only for parents whose children actively commuted to school.

# Nutrition Quality of Elementary School Meals in the United States During the COVID-19 Pandemic

**Dr. Leah Chapman**<sup>1,2</sup>, Dr. Scott Richardson<sup>2</sup>, Mr. Colin Schwartz<sup>3</sup>, Ms. Meghan Maroney<sup>3</sup>, Dr. Juliana Cohen<sup>1,2</sup>

<sup>1</sup>Center for Health Inclusion, Research, and Practice (CHIRP) & Department of Public Health and Nutrition, Merrimack College, North Andover, USA, <sup>2</sup>Department of Nutrition, Harvard T.H. Chan School of Public Health, Boston, USA, <sup>3</sup>Center for Science in the Public Interest, Washington, D.C., USA

**SO.3.20 - School-related studies on behavioral nutrition and physical activity, UKK - Level 6 Foyer, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** In the United States (U.S.), roughly 30 million children receive school meals daily from the U.S. Department of Agriculture's (USDA) federal school lunch and breakfast programs. Given this large reach, setting strict nutrition standards for school meals may significantly improve diet quality among school-aged children in the U.S. However, various federal policies have weakened school meal nutrition standards, including nutrition waivers for school meals during the COVID-19 pandemic. The impact of these waivers on the nutritional quality of school meals is currently unknown. This study therefore examined school meal quality during COVID-19 compared with prior to the pandemic, as well as differences by region and urbanicity, among a nationally representative sample of schools.

**Methods:** This study used publicly available school menu and nutrient data from a nationally representative sample of 128 elementary schools to examine differences in nutrients (average calories, total fat, saturated fat, sodium, total sugar, and fiber) and alignment with USDA sodium targets in 2019 (pre-pandemic) and in 2022 (post-pandemic). Data were analyzed using analysis of variance accounting for repeated measures within school districts, adjusting for geographic region and urbanicity.

**Results/findings:** Overall, only small differences in the nutrient content for breakfast and lunch were observed between 2019 and 2022. Despite the meal pattern waivers and impact of COVID-19, sodium levels decreased by 10.2% for breakfast and 5.0% for lunch between the two time points. Most weeks (>92%) met the USDA sodium Targets 1 and 1A for breakfast and lunch, although this lowered slightly when condiments were included. Additionally, total sugar levels in meals were high, with breakfast and lunch providing on average 57g of total sugar. Differences by region and urbanicity were observed; in particular, rural schools served meals with higher sodium, total sugar, and fiber levels.

**Conclusions:** Despite the exigencies of the COVID-19 pandemic and USDA waivers, school meal standards were largely maintained in the U.S. during the pandemic. Simple strategies, such as offering lower sodium condiments, can support efforts to further reduce sodium in school meals. Additionally, the total sugar levels observed highlight the need for limits on added sugars in school meals.

# Top sources of energy, sodium, sugar and saturated fat consumed by Canadian children at school: results from the 2015 Canadian Community Health Survey – Nutrition

**Ms. Emily Ziraldo<sup>1</sup>**, Dr. Mavra Ahmed<sup>1</sup>, Ms. Chelsea McPherson<sup>1</sup>, Prof. Daniel W Sellen<sup>1</sup>, Prof. Mary L'Abbé<sup>1</sup>

<sup>1</sup>University of Toronto, Toronto, Canada

**SO.3.20 - School-related studies on behavioral nutrition and physical activity, UKK - Level 6 Foyer,  
June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** The diets of Canadian children do not meet Canadian dietary guidelines and a significant portion of children's daily dietary intakes are consumed at school. Understanding the foods and beverages that children consume at school can help inform the development of school-based nutrition interventions and a national school food policy; a recently announced federal priority. Therefore, the objective was to identify the top dietary sources of energy and three nutrients of concern (i.e., sugar, sodium and saturated fat) consumed by children at school.

**Methods:** The 2015 Canadian Community Health Survey – Nutrition first day 24hr recall was used to assess top sources of energy and nutrients of concern for children 1-18 years old (n=1,977). Only foods and beverages consumed at schools were included. Foods and beverages were grouped into 58 mutually exclusive categories (e.g., Fresh and frozen fruit, Canned and bottled fruit, Fruit juice and drinks). The top 10 categories contributing to intake of energy, sugar, sodium and saturated fat based on total consumption were identified overall and by Dietary Reference Intake age and sex group. For each category, the proportion consumed and the proportion of consumers were also evaluated.

**Results/findings:** Overall, Sandwiches and submarines were the top contributors to children's energy, sodium and saturated fat intakes at school. For sugar, Frozen fruit and Fruit juice and fruit drinks were the top contributors to children's sugar intakes accounting for 20.0% and 19.4% of sugar consumed at school. Sandwiches and submarines and Cookies were in the top 10 contributors for energy and all three nutrients. Five categories were in the top 10 contributors for 3 of energy, sugar, sodium and saturated fat, namely, Pasta and pasta dishes, Meat and poultry dishes, Pizza, Granola bars and Other bakery products (breads, flatbreads, crackers, rolls, bannock, bagels, English muffins).

**Conclusions:** Results highlight categories that are top contributors to children's intakes of energy and nutrients of concern at schools. These categories should be prioritized by policymakers as targets for improvements in nutritional quality when developing school food policies or interventions such as a national school food program.

# Corporate food sponsorship agreements are associated with higher frequency of food and beverage marketing in recreation and sport facilities in Canada

**Dr. Rachel Prowse<sup>1</sup>**, Dr. Erin Hobin<sup>2</sup>, Dr. Sara Kirk<sup>3</sup>, Dr. Dana Lee Olstad<sup>4</sup>, Dr. Hassan Vatanparast<sup>5</sup>, Dr. Kim Raine<sup>6</sup>

<sup>1</sup>Memorial University of Newfoundland, St. John's, Canada, <sup>2</sup>Public Health Ontario, Toronto, Canada,

<sup>3</sup>Dalhousie University, Halifax, Canada, <sup>4</sup>University of Calgary, Calgary, Canada, <sup>5</sup>University of Saskatchewan, Saskatoon, Canada, <sup>6</sup>University of Alberta, Edmonton, Canada

**SO.3.20 - School-related studies on behavioral nutrition and physical activity, UKK - Level 6 Foyer, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** This study examined associations between the presence of corporate food sponsorship agreements and the frequency of food and beverage marketing in recreation and sport facilities in Canada.

**Methods:** 135 recreation and sport facilities that offered hockey, soccer, or swimming for children under 18 years were randomly selected from an open-source list of facilities in Canada, supplemented by researchers through google searches. An observational audit and survey was conducted in each facility to count instances of food and beverage marketing (including alcohol) using the validated Food and beverage Marketing Assessment Tool for Settings (FoodMATS). Facility managers/directors reported the number of corporate sponsors of their facility from the previous fiscal year and listed sponsors' names and their type (food and non-alcoholic beverage, alcohol, other). We examined associations between the presence of sponsorship agreements and the number of food and beverage marketing instances using Mann-Whitney U tests, due to non-normal distributions and unequal variances.

**Results:** Full data were available for 78 facilities. The median (25<sup>th</sup> percentile, 75<sup>th</sup> percentile) count of food and beverage marketing was 16.0 (6.5, 34.0) per facility. A total of 333 non-unique sponsors were named: food and non-alcoholic beverage sponsors (n=70) made up 21% of all sponsors; alcohol sponsors (n=4) were rare. Coca-Cola and Pepsi accounted for 16% of all food and beverage sponsors, and contributed to 60% of food and beverage marketing instances recorded in the FoodMATS that we could link to corporate sponsors named in facility surveys. Food marketing was more frequent in facilities with food sponsorship agreements (26.5 [13.0, 56.75], n=28) than facilities without food sponsorship agreements (12.5 [3.0, 21.5], n=58) (U=1179.5, z=3.390, p<0.001).

**Conclusions:** This is the first nation-wide study in Canada to assess associations between corporate food sponsorship agreements and the frequency of food and beverage marketing in recreation and sport facilities. Recreation and sport facilities with food sponsorship agreements displayed more than twice the number of food and beverage marketing instances than facilities with no food sponsorship agreements. Children's exposure to food and beverage marketing in Canada could be mitigated through restricting or regulating food sponsorship agreements in recreation and sport.

# Youth's self-reported location of exposure to sugary drink advertisements across the COVID-19 pandemic in six countries: implications for public health

**Miss Élisabeth Demers-Potvin**<sup>1,2</sup>, Prof. Simone Lemieux<sup>1,2</sup>, Dr. Rachel Acton<sup>3</sup>, Dr. Tarra Penney<sup>4</sup>, Dr. Gary Sacks<sup>5</sup>, Ms. Christine White<sup>3</sup>, Dr. David Hammond<sup>3</sup>, Dr. Lana Vanderlee<sup>1,2</sup>

<sup>1</sup>Centre de recherche Nutrition, Santé et Société (NUTRISS), Université Laval, Québec, Canada, <sup>2</sup>Institut sur la nutrition et les aliments fonctionnels, Québec, Canada, <sup>3</sup>School of Public Health Sciences, University of Waterloo, Ontario, Waterloo, Canada, <sup>4</sup>Faculty of Health - School of Kinesiology & Health Science, York University, Toronto, Canada, <sup>5</sup>School of Health & Social Development, Deakin University, Melbourne, Australia

**SO.3.20 - School-related studies on behavioral nutrition and physical activity, UKK - Level 6 Foyer, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** COVID-19 pandemic-related lockdowns and reductions in social activities may have impacted youth's exposure to sugary drink (SD) marketing. This study aimed to explore youth's self-reported location of exposure to SD advertising at three timepoints during the COVID-19 pandemic in six countries.

**Methods:** Data are from the International Food Policy Study Youth Surveys (November/December 2019/2020/2021), repeat cross-sectional web-based surveys conducted in Australia, Canada, Chile, Mexico, the United Kingdom (UK) and the United States (US) among youth ages 10-17 (N=33,598). The outcome of interest was location of exposure (TV, digital, retail settings) to advertising for major soft drink (cola), energy drink and fruit juice brands. Weighted logistic regression models stratified by country examined differences in reported exposure to SD advertisements for each advertising location by year, adjusting for socio-demographics and total screen time. Differences in exposure between students in online-only or in-school classes were explored.

**Results/findings:** The percentage of participants who self-reported exposure to SD advertisements was highest for TV (range 38-70% between countries), followed by digital (range 24-54%) and retail settings (range 16-54%). Compared to 2019, youth in 2020 were more likely to report exposure to SD advertisements on digital media in Australia and the US ( $p < 0.005$  for both) and less likely to report exposure in retail settings in Canada, Chile, Mexico and the US ( $p < 0.001$  for all). Compared to 2020, youth in 2021 were less likely to report exposure to advertisements on TV in Canada and Australia ( $p < 0.002$  for both), more likely to report exposure in retail settings in the US ( $p = 0.008$ ) and less likely to report exposure in retail settings in Mexico ( $p = 0.003$ ). In separate models for 2020/2021, youth completing only online classes were more likely to report exposure to SD advertisements on digital media in Canada, Australia and the UK ( $p < 0.003$  for all), compared to youth attending all classes in-person.

**Conclusions:** Lockdowns due to the COVID-19 pandemic likely contributed to increase likelihood of youth being exposed to digital advertising for SD. As digital media use shifts among youth, comprehensive restrictive marketing policies may protect youth from negative influences of marketing on dietary behaviours.

# Reliability and Validity of a Tool to Assess Kids' Menu Compliance with Healthy Default Beverage Policies on Restaurant Websites and Mobile Applications in the United States

**Miss Carolyn Bresnahan**<sup>1</sup>, Mr. Hayden Hayes<sup>1</sup>, Dr. Attia Goheer<sup>1</sup>, Dr. Alyssa Moran<sup>1</sup>, Dr. Angie Cradock<sup>2</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA, <sup>2</sup>Harvard T.H. Chan School of Public Health, Boston, USA

**SO.3.20 - School-related studies on behavioral nutrition and physical activity, UKK - Level 6 Foyer, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** In the United States, more than a dozen jurisdictions have enacted healthy default beverage policies, which require that restaurants serve healthy beverages (water, milk or 100% juice) as the “default” option with kids’ meals. No prior policy has addressed implementation in online settings. This study developed and tested a tool to assess kids’ menu compliance with healthy default beverage policies on online ordering platforms.

**Methods:** We randomly selected ten locations of ten top-grossing fast-food and full-service restaurant chains in California, where a healthy default beverage law was enacted in 2018 (n=100 locations). Kids’ menus were audited, when available, on the following platforms: restaurants’ websites/mobile application, GrubHub, UberEats, and DoorDash (n=263 menus). A tool was developed to capture the ways in which the “default” beverage could be defined on online kids’ menus and the types of beverages offered under these definitions. In 2021, two coders coded all kids’ menus and captured screenshots. We calculated Gwet’s agreement coefficient (GAC), descriptive statistics, and mean percent agreement across restaurants within each chain and across platforms within each restaurant.

**Results:** Inter-rater reliability was excellent for most measures (87%, GAC>0.9). Most menus (96%) offered a kids’ meal with a drink. The most common beverage available with the kids’ meal without an upcharge was milk (90%) followed by sugary drinks (68%). When a drink was listed in the kids’ meal description (n=207; 82%), it was most often described as a fountain/kids’ drink (78%), but when a drink was pictured with the meal (n=158; 63%) it was most often milk (78%). On some menus, the customer could select a beverage from a list (n=231; 92%), with milk (41%) or sugary drinks (34%) typically listed first. When the ordering platform automatically selected a drink (n=50; 22%), either milk (80%) or a fountain/kids’ drinks (20%) were pre-selected. Data on variability across restaurants and platforms is forthcoming.

**Conclusion:** Restaurant compliance with healthy default beverage policies on online kids’ menus is highly dependent on how the online “default” is defined. Governments and decision-makers should consider policy language that is inclusive of this new food environment to maximize public health impact.

# School Environments in Jamaica – in urgent need of Healthy Food Policies

**Dr. Suzanne Soares-Wynter (Corresponding Author)**<sup>1</sup>, Mr. Maxime Bercholz<sup>2</sup>, Mrs. Annalee Gray Brown<sup>1</sup>, Dr. Shu Wen Ng<sup>3</sup>

<sup>1</sup>Caribbean Institute for Health Research, The University of the West Indies, Kingston, Jamaica, <sup>2</sup>Carolina Population Center, The University of North Carolina at Chapel Hill, Chapel Hill, USA, <sup>3</sup>Department of Nutrition, Gillings School of Global Public Health, The University of North Carolina at Chapel Hill, Chapel Hill, USA

**SO.3.20 - School-related studies on behavioral nutrition and physical activity, UKK - Level 6 Foyer, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Obesity among Jamaican children has doubled in recent years and school-based interventions are among the strategies being considered to improve children's consumption patterns. An audit of the school environment was conducted to support development of a national school nutrition policy.

**Methods:** A cross-sectional, multi-level study of food and built environments and health initiatives in a random sample of 60 schools located in Kingston, Jamaica was conducted in 2018. The sample comprised 50 public funded and 10 independently funded (private) schools. Interviews with school administrators and street vendors provided details on existing meal initiatives, food availability and marketing practices to supplement audit findings. To describe the school environment, information about food and beverage exposures and the built environment were summarized into median scores and interquartile ranges (IQR) with comparisons using Wilcoxon's rank sum tests ( $p < 0.05$ ). Scores were created for each category (e.g. food and beverage presence) by summing the total possible number of elements.

**Results/Finding:** Unsweetened beverage options (excluding water) and fresh fruits were available in only 19 (32%) and 15 (25%) of schools respectively. When compared with private schools, public schools had significantly higher median (IQR) scores for sweetened beverage availability (7 (4) vs. 3.5 (2)), unhealthy food and beverage marketing (12 (7) vs. 7 (3)) and sponsorships and donations from food industry (4 (5) vs. 1.5 (4)). Built environments and resources related to food preparation were similar; however, private schools had significantly lower student:teacher ratios (14:1 vs 21:1) and more resources for physical activity (score 4.5 (2) vs 3 (1)) and safety features (score 3 (1) vs 2 (2)). Street vendors sold mostly pre-packaged processed foods, and were primarily located near public schools. A third of schools reported healthy food initiatives.

**Conclusions:** Children have high exposure to unhealthy foods and beverages in Jamaican schools. Curtailing the availability of high-sugar drinks and unhealthy snack foods, while promoting healthier options should be a priority intervention. Policies must consider the role of street vendors as they are integral to lower-income school communities. A comprehensive school nutrition policy is needed to regulate school food environments and for monitoring existing school meal programs.

# Could it ever be too late to adopt an active lifestyle? Longitudinal patterns of physical activity and health-related quality of life in a cohort of middle-aged Australian women

**Dr. Binh Nguyen**<sup>1,2</sup>, Dr. Philip Clare<sup>1,2,3</sup>, Prof. Wendy Brown<sup>4</sup>, Dr. Gregore Mielke<sup>5</sup>, Associate Professor Melody Ding<sup>1,2</sup>

<sup>1</sup>Prevention Research Collaboration, Sydney School of Public Health, Faculty of Medicine and Health, The University of Sydney, Camperdown, Australia, <sup>2</sup>Charles Perkins Centre, The University of Sydney, Camperdown, Australia, <sup>3</sup>National Drug and Alcohol Research Centre, UNSW Sydney, Australia, <sup>4</sup>School of Human Movement and Nutrition Sciences, Faculty of Health and Behavioural Sciences, University of Queensland, Brisbane, Australia, <sup>5</sup>School of Public Health, Faculty of Medicine, University of Queensland, Brisbane, Australia

**SO.3.21 - The Latest Research on Disease Prevention and Management, UKK - Hall B (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** To examine the associations between longitudinal patterns of physical activity (PA) over 12 years and health-related quality of life (HRQoL) among middle-aged Australian women. We hypothesized that consistent adherence to PA guidelines over time would lead to improved HRQoL. Few longitudinal studies have assessed PA at multiple time points, over the long-term.

**Methods:** We analysed data collected at 3-year intervals from 1998 to 2019 from 11,937 participants in the Australian Longitudinal Study on Women's Health (cohort born in 1946-51). Women whose physical functioning was in the lowest 5th percentile in 1998 were excluded. Primary outcomes were the physical health component (PCS) and mental health component (MCS) summary scores, derived from the 36-item Short Form Survey subscales. We analysed associations between meeting the WHO PA guidelines (150 min/week of moderate-to-vigorous PA) in 2001-2016 and outcomes in 2019. Analysis was based on a counterfactual framework, using models to construct expected mean outcomes, had everyone in the sample experienced those particular patterns of exposure. Using causal inference modelling, we evaluated the counterfactual effect of 1) meeting or not meeting PA guidelines at all surveys and 2) meeting PA guidelines upon reaching a particular age but not prior to that, with a range of age thresholds considered (50, 55, 60, and 65 years). Analyses were adjusted for a range of sociodemographic and health variables.

**Results:** Women who did not meet PA guidelines in any wave (PCS: 42.10 [95% CI: 40.98, 43.22]), or first started to meet guidelines at ages 60 (PCS: 42.92 [95% CI: 41.66, 44.19]) or 65 (PCS: 42.03 [95% CI: 40.85, 43.20]) had significantly lower expected mean PCS scores in 2019 than women who started to meet guidelines at ages 50 (PCS: 45.85 [95% CI: 45.23, 46.47]) or 55 (PCS: 46.05 [95% CI: 44.76, 47.34]) and those who met guidelines in all surveys (PCS: 45.98 [95% CI: 45.37, 46.58]). The age of starting to meet guidelines was not associated with MCS scores.

**Conclusions:** Middle-aged women should be encouraged to be physically active for as long as they can, to gain the most benefits for future HRQoL.

# A health and wellbeing profile of Nordic Walking participants in the United Kingdom

**Dr. Clare Stevinson<sup>1</sup>**, Mr. Charley Brown<sup>1</sup>

<sup>1</sup>Loughborough University , Loughborough , United Kingdom

**SO.3.21 - The Latest Research on Disease Prevention and Management, UKK - Hall B (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Nordic Walking is a popular form of all-body exercise with the use of poles making it a suitable activity for individuals with musculoskeletal problems or other conditions that restrict weight-bearing exercise. Furthermore, elements integral to Nordic Walking such as group interaction and exposure to outdoor natural environments are recognised contributors to psychological wellbeing. This study examined the health and wellbeing profile of Nordic Walkers in the United Kingdom and explored factors associated with wellbeing.

**Methods:** A health and wellbeing questionnaire was distributed via British Nordic Walking communication channels to adult Nordic Walkers in the United Kingdom. Self-report measures included health, disability and pain status (based on the UK Census), wellbeing (Warwick Edinburgh Mental Wellbeing Scale), group cohesion (Group Cohesiveness Scale) and nature connectedness (Nature Relatedness Scale). Descriptive statistics were used to create a profile of participant health and wellbeing and linear regression was used to examine variables associated with wellbeing.

**Results:** Among the sample of 411 participants (mean age  $61.1 \pm 9.9$  years; 84.4% female), the proportion reporting a limiting disability/illness (25%) was higher than documented in national statistics for the general adult population (18%), as was the percentage reporting chronic pain (47% versus 34% in the general population). Nonetheless overall wellbeing scores were higher among Nordic Walkers (53.1) than the general population (50.1). Three factors had small independent associations with wellbeing scores. Group cohesion ( $\beta = 0.18$ ;  $p = 0.001$ ) and nature relatedness ( $\beta = 0.13$ ;  $p = 0.011$ ) were positively related to wellbeing and pain scores ( $\beta = -0.15$ ;  $p = 0.003$ ) were negatively related.

**Conclusion:** Nordic Walking is a suitable activity for individuals with limiting disabilities or chronic pain and is associated with high levels of psychological wellbeing. The associations of group cohesion and nature relatedness with wellbeing point to the value of joining Nordic Walking groups to benefit from social support and exposure to natural environments.

# Genetic susceptibility to type 2 diabetes, screen-based sedentary activities, and risk of cardiovascular disease: the UK Biobank study

**Ms. Mengyao Wang<sup>1</sup>**, Miss Zhu Liduzi Jiesisibieke<sup>1</sup>, Ms. Haeyoon Jang<sup>1</sup>, Dr. Shan Luo<sup>1</sup>, Dr. Shiu Lun Au Yeung<sup>1</sup>, Dr. Youngwon Kim<sup>1,2</sup>

<sup>1</sup>School of Public Health, The University of Hong Kong Li Ka Shing Faculty of Medicine, Hong Kong, Hong Kong, <sup>2</sup>University of Cambridge School of Clinical Medicine, Cambridge, United Kingdom

**SO.3.21 - The Latest Research on Disease Prevention and Management, UKK - Hall B (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Type 2 diabetes (T2D) is a major risk factor for cardiovascular disease (CVD). Little is currently known about to what extent the risk of CVD associated with high genetic risk of T2D can be offset through less time spent in screen-based sedentary activities. This study examined the prospective associations of genetic susceptibility to T2D and two prevalent screen-based sedentary activities (TV viewing, computer use) with incident CVD.

**Methods:** This study included 352,369 white British individuals from the UK Biobank. Weighted polygenic risk score for T2D (PRS-T2D), an indicator of individual's genetic risk for T2D, was calculated based on 89 genetic variants associated with T2D. Time spent in TV viewing and leisure-time computer use was categorized into three groups:  $\leq 1$ h/day, 2-3h/day, and  $\geq 4$  h/day. Incident CVD ( $n=15,890$  during a median 12.6-year follow-up) was defined as the first occurrence of coronary heart disease or stroke.

**Results:** Compared with low genetic susceptibility to T2D, high and medium genetic susceptibility had 12% (95%CI: 1.06-1.17) and 6% (95%CI: 1.01-1.10) higher hazards of CVD, respectively. Watching TV for  $\leq 1$ h/day and 2-3h/day was associated with 14% (95%CI: 0.82-0.90) and 4% (95%CI: 0.92-0.99) lower hazards of CVD, respectively, compared with watching TV for  $\geq 4$ h/day after adjusting for PRS-T2D. The joint association analyses using a combined category of low genetic risk and  $\leq 1$ h/day of TV viewing as the reference revealed no increased risk of CVD in individuals at high or medium genetic risk for T2D but watching TV for  $\leq 1$ h/day, while  $\geq 2$ h/day of TV viewing combined with high genetic risk were associated with higher CVD hazards. Estimated 12-year absolute risk of CVD was lower for watching TV for  $\leq 1$ h/day at high genetic risk (2.01%) than for watching TV for  $\geq 4$ h/day at low (2.66%) or medium (2.77%) genetic risk.

**Conclusion:** Watching TV for  $\leq 1$ h/day has the potential to offset the risk of developing cardiovascular events associated with high genetic susceptibility to T2D. Individuals who have high genetic risk for T2D but watch TV for  $\leq 1$ h/day may have a lower risk of developing CVD, compared with those who have low or medium genetic risk but watch TV for  $\geq 4$ h/day.

# Associations between different intensities of physical activity and magnitude of ICAM-1 changes in response to acute psychological stress

**Dr. Nicola Paine**<sup>1,2</sup>, Dr. Aiden Chauntry<sup>1</sup>, Ms. Victoria Linsley<sup>1,2</sup>, Dr. Andrew Kingsnorth<sup>3</sup>, Prof. Mark Hamer<sup>4</sup>, Prof. Nicolette Bishop<sup>1,2</sup>

<sup>1</sup>School of Sport, Exercise and Health Sciences, National Centre for Sport and Exercise Medicine, Loughborough University, Loughborough, United Kingdom, <sup>2</sup>National Institute for Health Research (NIHR) Leicester Biomedical Research Centre, University Hospitals of Leicester NHS Trust and the University of Leicester, Leicester, United Kingdom, <sup>3</sup>Diabetes Research Centre, University of Leicester, Leicester, United Kingdom, <sup>4</sup>The Institute of Sport, Exercise and Health, Division of Surgery & Interventional Science, University College London, London, United Kingdom

**SO.3.21 - The Latest Research on Disease Prevention and Management, UKK - Hall B (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** M. Disease prevention and management

**Background:** Physical activity (PA), psychological stress and intracellular adhesion molecule-1 (ICAM-1) are risk factors for cardiovascular disease (CVD). ICAM-1 mediates vascular adhesion, is indicative of vascular endothelial cell activation/damage and can increase under acute psychological stress. PA can buffer against exaggerated cardiovascular reactivity to acute psychological stress, but the potential impact of PA and ICAM-1 changes under psychological stress is yet to be elucidated.

**Purpose:** To investigate the associations between different PA intensities and changes in ICAM-1 in response to acute psychological stress.

**Methods:** Healthy adults (n=61, mean (SD) age = 25.69 (8.86) years, 52.5% female, BMI = 24.38 (4.20) kg/m<sup>2</sup>) undertook seven days of device-based (wrist-worn ActiGraph) measurement of habitual levels of movement behaviours, including moderate-to-vigorous physical activity (MVPA) and light (LPA) physical activity. Participants then underwent stress reactivity testing (20-minute rest, 8-minute mental arithmetic stress task, 45-minute recovery), where ICAM-1 was assessed as a marker of vascular inflammation.

**Results:** Relationships between physical activity and ICAM-1 changes were seen immediately post-stress (MVPA: B= -1.672, 95% CI= -3.017 – -0.328,  $p = .015$ ; LPA: B= 0.672, 95% CI= 0.071 – 1.273,  $p = .028$ ). Similar direction of associations was evident for changes at 45 minutes post-stress (MVPA: B= -12.402, 95% CI= -20.472 – -4.332,  $p = .003$ ; LPA: B= 5.196, 95% CI= 2.524 – 7.867,  $p < .001$ ) were apparent. No relationship was observed between resting levels of ICAM-1 and any intensity of physical activity.

**Conclusion:** This is the first analysis of the potential impact of PA on ICAM-1 changes under stress. Future interventions are needed to determine the impact of PA on ICAM-1, including whether increases in PA benefit ICAM-1 responses and longer-term if this impacts on potential CVD risk via stress-induced mechanisms

# Mental Health Promotion in Australian Sporting Clubs

**Dr. Jasmine Petersen**<sup>1</sup>, Prof. Murray Drummond<sup>1</sup>, Associate Professor Ivanka Prichard<sup>1</sup>, Associate Professor Sam Elliott<sup>1</sup>, Associate Professor Claire Drummond<sup>1</sup>, Prof. James Smith<sup>1</sup>, Prof. Ben Wadham<sup>1</sup>

<sup>1</sup>Flinders University, Adelaide, Australia

**SO.3.21 - The Latest Research on Disease Prevention and Management, UKK - Hall B (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Organised sports are increasingly recognised as an important setting to improve the provision of mental health support. There is, however, limited knowledge pertaining to the promotion of mental health in organised sporting contexts. Thus, this study aimed to examine the initiatives implemented in Australian sporting clubs to promote mental health. We also sought to examine preferences for mental health promotion in sport settings, important to informing the implementation of initiatives that will be acceptable, feasible and broadly scalable in future.

**Methods:** The study used a cross-sectional design. An online survey assessed the implementation of mental health initiatives in sporting clubs and preferences for such initiatives in future. Data were summarised using descriptive statistics.

**Results:** The sample comprised 246 stakeholders (e.g., sport participant, president, coach, committee member) of sporting clubs in Australia (aged 18-81 years,  $M_{\text{age}} = 40.3 \pm 16.0$  years, 56.5% female). Few stakeholders (25.0%) were satisfied with the current level of mental health support provided by their club. Over half of stakeholders (54%) reported that their sporting club has implemented initiatives to support mental health. The most commonly implemented initiatives were mental health days/ rounds (25.3%), provision of educational information and resources (23.0%), and promotion of mental health services and supports (19.0%). The prominent barriers to clubs supporting mental health included insufficient funding, lack of human resources (e.g., volunteers), and inadequate mental health knowledge. The findings further indicate that the provision of access to mental health first aid training is perceived as the most important (and preferred) way in which sporting clubs can support mental health in future.

**Conclusions:** The landscape of mental health promotion in Australian sporting clubs is currently “each club to its own”, and there is little guidance for clubs in how best to support mental health. This approach does not appear adequate with few stakeholders satisfied with the current level of mental health support provided by their club. The development of a gold standard or best practice for clubs in “how to” support mental health will pave the way to creating psychologically safe, inclusive, and mentally healthy environments across all sporting codes.

# A Cross-Sectional Nationwide Study of Australians' Health: are there differences in health-related behaviours among Teachers?

**Ms. Lucy Corbett<sup>1</sup>**, Mr. Joseph Van Buskirk<sup>1</sup>, Prof. Philayrath Phongsavan<sup>1</sup>, Prof. Adrian Bauman<sup>1</sup>

<sup>1</sup>University of Sydney, Sydney, Australia

SO.3.21 - The Latest Research on Disease Prevention and Management, UKK - Hall B (Level 3), June 17, 2023, 9:40 AM - 10:55 AM

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** The health-related behaviour of teachers is important both for their own health and because teachers play an important role in the communication of public health messages to students. Teachers in Australia have high current rates of burnout and leaving the profession. This study aims to [1] determine levels of psychological wellbeing and health-related behaviours among Australian teachers and other non-teacher professions, and [2] identify any differences that exist between Australian teachers and other professions across these domains.

**Methods:** We used data from the interview-based nationally-representative Australian National Health Survey (NHS). Employed adults aged 20-64years from the 2014/15 (n=8455), 2017/18 (n=9130) and 2020/21 (n=5753) waves of the NHS were analysed. Adjusting for demographics, we used logistic regression to compare eight indicators of health-related behaviours and psychosocial wellbeing (physical activity, fruit intake, vegetable intake, alcohol consumption, smoking status, body mass index, psychological wellbeing, and general health) between teachers (~4% of sample/wave) and two comparison groups: other managerial/non-teacher professional (NTP) occupations (~26% of sample/wave) and other general occupations (~69% of sample/wave).

**Results/findings:** In 2020/21, 9% of teachers met vegetable, 46% met fruit, 26% met physical activity, and 52% met alcohol guidelines. Additionally, 4% of teachers were smokers, 56% reported overweight or obesity, 67% had excellent/very good self-rated health and 22% had high or very high levels of psychological distress. After adjusting for demographics and survey wave, non-teacher professionals had similar odds of meeting physical activity (OR:1.12[0.90–1.41]), vegetable intake (OR:0.72[0.52-1.00]), and alcohol consumption (1.01[0.83-1.22]) guidelines compared to teachers. Teachers and NTPs reported similar general health (OR:1.05[0.86-1.27]) and smoking rates (OR:1.34[0.92-1.95]). However, compared with NTPs teachers were more likely to have high or very high levels of psychological distress (OR: 1.35[1.01-1.75]).

**Conclusions:** Our results suggest that in comparison to NTPs, teachers were either comparable or better off in all domains health-related behaviours except psychological distress. Higher levels of psychological distress among teacher may contribute to high rates of burnout in the profession. Issues around the aetiology of teacher stress and burnout need to be explored in more detail.

# Pain Management and Patient Education for Physical Activity in Intermittent Claudication (PrEPAID): Feasibility Randomised Controlled Trial

Dr. Christopher Seenan<sup>1</sup>, Dr. Ukachukwu Abaraogu<sup>1</sup>, **Dr. Philippa Dall<sup>1</sup>**, Mr. Andrew Elders<sup>1</sup>, Mr. Wesley Stuart<sup>2</sup>, Prof. Garry Tew<sup>3</sup>, Prof. Julie Brittenden<sup>2,4</sup>

<sup>1</sup>Glasgow Caledonian University, Glasgow, United Kingdom, <sup>2</sup>Vascular Services, NHS Greater Glasgow & Clyde, Glasgow, United Kingdom, <sup>3</sup>York St John University, York, United Kingdom, <sup>4</sup>University of Glasgow, Glasgow, United Kingdom

**SO.3.21 - The Latest Research on Disease Prevention and Management, UKK - Hall B (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** Current guidelines for peripheral arterial disease with intermittent claudication (PAD/IC) recommend increased physical activity, but barriers of patient understanding of the condition and pain management are rarely addressed. This study tested the feasibility of conducting a trial of pain management (Transcutaneous Electrical Nerve Stimulation (TENS)) and patient-centred education to increase physical activity in people with PAD/IC.

**Methods:** Participants diagnosed with PAD/IC were recruited from NHS Greater Glasgow & Clyde vascular service. The double-blind feasibility randomised controlled trial had four intervention arms: TENS; placebo TENS; Education +TENS; Education +placebo TENS. Education was a three-hour workshop aiming to modify patients' illness beliefs and perceptions, plus three follow-up phone calls. The TENS machine was worn during walking (TENS: 120 Hz, 200µs, intensity 'strong but comfortable'; placebo TENS: intensity below sensation). The primary outcome measure was absolute claudication distance (ACD; Gardner treadmill protocol). Secondary outcomes included physical activity behaviour, quality of life and pain. Assessment was at baseline (with second treadmill test for screening), post intervention (6 weeks) and follow-up (3 months). Participant experience of the intervention was explored with semi-structured interviews (3 months). Feasibility was assessed by recruitment, retention, intervention uptake and adherence, and outcome completion.

**Results:** Ninety-five potential participants completed baseline screening (1030 reviewed records; 267 eligible individuals). Individuals excluded during screening (n=38) had >20% variability in treadmill ACD. All randomised participants (n=56) received their allocated intervention, and outcome completion was 91% (6 weeks) and 80% (3 months). Attendance at the group education session was high (96%) with 63% taking follow-up phone calls. Compliance with TENS (>=30 min/day, >=3 days/week, >=3weeks) was 70% according to participant-completed logs, but only 28% using TENS machine records. Interviewed participants (n=9) were generally positive about the interventions and trial procedures, however experience of TENS use was mixed. Some participants were dissatisfied with the size and cables of the TENS machine.

**Conclusions:** The PrEPAID trial was feasible to run, however 40% of potential participants were excluded at screening due to issues of research fidelity and not participant suitability or willingness to participate. Future work should consider a revised primary outcome measure and smaller wireless TENS machines.

# Diet quality during pregnancy: associations with psychological distress and personality traits.

**Miss Marianne Gagnon**<sup>1,2,3</sup>, Miss Claudia-Béatrice Ratté<sup>4,6</sup>, Miss Marianne Rochette<sup>1,2,3</sup>, Mrs. Anne-Sophie Plante<sup>1,3</sup>, Prof. Simone Lemieux<sup>1,2</sup>, Prof. Julie Robitaille<sup>1,2</sup>, Prof. Catherine Bégin<sup>4</sup>, Prof. Andréanne Michaud<sup>1,2,5</sup>, Prof. Anne-Sophie Morisset<sup>1,2,3</sup>

<sup>1</sup>Centre Nutrition, santé et société (NUTRISS), Institut sur la nutrition et les aliments fonctionnels (INAF), Université Laval, Québec, Canada, <sup>2</sup>École de nutrition, Université Laval, Québec, Canada, <sup>3</sup>Axe Endocrinologie et Néphrologie, centre de recherche du CHU de Québec-Université Laval, Québec, Canada, <sup>4</sup>École de Psychologie, Université Laval, Québec, Canada, <sup>5</sup>Institut universitaire de cardiologie et de pneumologie de Québec (IUCPQ), Québec, Canada, <sup>6</sup>Axe Santé des populations et pratique optimales en santé, centre de recherche du CHU de Québec-Université Laval, Québec, Canada

**SO.3.21 - The Latest Research on Disease Prevention and Management, UKK - Hall B (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** M. Disease prevention and management

**Purpose:** We aimed to 1) compare diet quality between individuals with and without high levels of anxiety and depression during pregnancy and 2) examine associations between personality traits and diet quality during pregnancy.

**Methods:** In their 1<sup>st</sup> trimester, 29 participants completed the anxiety and depression portion of the Psychiatric Symptom Index (PSI) and the NEO five-factor inventory (NEO-FFI). Pregnant individuals were divided into two groups characterized by a clinically relevant threshold of low (PSI ≤20) or high (PSI >20) anxiety or depression. Three Web-based 24h dietary recalls were completed at each trimester, from which nutrient intakes and the Healthy Eating Food Index (HEFI-2019), a global diet quality score, was calculated.

**Results:** In this sample, 41.2% and 62.1% had clinically significant levels of anxiety and depression, respectively. Participants with high anxiety levels had higher daily intakes of free sugars in the first, second and third trimesters compared to individuals with low anxiety levels (77.2g ± 6.6 vs. 53.6g ± 5.6; 96.8g ± 10.2 vs. 59.0g ± 8.5; 106.4g ± 10.0 vs. 54.8g ± 8.4,  $p \leq 0.01$ ). Accordingly, HEFI-2019 subscores for free sugars intakes (/10 points; allocated according to the proportion of total energy intakes) were lower for participants with high anxiety levels in all trimesters (6.23 ± 0.90 vs. 8.95 ± 0.38, 5.45 ± 1.14 vs. 8.60 ± 0.54, 4.01 ± 3.42 vs. 9.13 ± 0.39,  $p < 0.05$ ). Participants with high depression levels had higher daily intakes of total sugars in the first trimester compared to individuals with low depression levels (70.7g ± 5.7 vs. 51.4g ± 7.2,  $p = 0.045$ ). Openness was positively associated with total HEFI-2019 scores in the 2<sup>nd</sup> and 3<sup>rd</sup> trimesters ( $r = 0.47$ ,  $p = 0.01$  and  $r = 0.38$ ,  $p = 0.04$ ), while neuroticism was positively associated with total sugar intakes in the 1<sup>st</sup> and 2<sup>nd</sup> trimesters ( $r = 0.39$ ,  $p = 0.04$  and  $r = 0.42$ ,  $p = 0.02$ ).

**Conclusions:** Psychological distress is prevalent and associated with components of a suboptimal diet quality during pregnancy. Furthermore, personality traits such as neuroticism and openness are associated with a poorer and better diet quality, respectively. While this remains to be confirmed in a larger sample, psychological variables should be further considered in antenatal care.

# Just Like That: Development of the Exercise & Depression Professional Training Program

**Dr. Madelaine Gierc<sup>1</sup>**, Prof. Guy Faulkner<sup>1</sup>

<sup>1</sup>University of British Columbia, Vancouver, Canada

**SO.3.21 - The Latest Research on Disease Prevention and Management, UKK - Hall B (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** M. Disease prevention and management

**Introduction:** Major depressive disorder is a chronic health condition characterized by low mood, sadness, and anhedonia. In 2016, the Canadian Network for Mood and Anxiety Treatments recognized exercise as a first-line monotherapy for mild-moderate depression, and an adjunctive therapy for moderate-severe depression. There is additional benefit if patients receive supervised and structured support. Though exercise providers are well-positioned to offer such programming, Canadian kinesiology programs do not typically include education on depression or cognitive-behavioural strategies.

**Objective:** To develop a continuing education program in exercise-based treatment for depression for exercise providers.

**Process:** Program development followed a three-stage process. In Stage One, an environmental scan was conducted to gauge training needs. Canadian undergraduate kinesiology programs were reviewed for coursework in psychology, mental health, and behaviour change. A search was conducted for pre-existing mental health training programs, and the mental health literature was consulted to develop an understanding of training standards. In Stage Two, a tentative curriculum was developed and presented to an international expert panel of researchers, clinicians, and patients. Stage Three involved content development, consultation with pedagogical experts, and peer review.

**Product:** A two-part continuing education program was developed. Part One is a 10-hour mental health literacy training program for exercise providers of all training backgrounds. Part Two is a 40-hour specialization on exercise-based treatment for depression for clinical exercise physiologists. Parts One and Two are available to Canadian exercise providers via the Canadian Society for Exercise Physiology.

**Next Steps:** The program is currently undergoing evaluation, and there are plans to revise the training modules based on user feedback and empirical developments. Dissemination activities are ongoing with Canadian and international partners, including in educational, research, and public health settings.

**Summary:** The Exercise & Depression Training Program is an evidence-based continuing education resource that aims to address knowledge gaps in exercise providers' (i) mental health literacy and (ii) capacity to deliver safe and effective interventions to people experiencing depression.

# Implementation and preliminary outcomes of a cooking intervention to supplement the Diabetes Prevention Program (DPP Cooks study): a pilot randomized controlled trial

**Dr. Julia Wolfson<sup>1</sup>**, Dr. Caroline Richardson<sup>2</sup>, Dr. Nisa Maruthur<sup>3</sup>

<sup>1</sup>Johns Hopkins Bloomberg School of Public Health, Baltimore, USA, <sup>2</sup>Brown University School of Medicine, Providence, USA, <sup>3</sup>Johns Hopkins University School of Medicine, Baltimore, USA

**SO.3.22 - The Latest Research on Behavior Change Studies, UKK - Hall C (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** The Diabetes Prevention Program (DPP) is a widely implemented, 12-month behavioral weight loss program for adults with pre-diabetes. However, the DPP does not include hands-on cooking instruction as part of the intervention. Lack of cooking skills can be a barrier to improving dietary quality and preventing type-2 diabetes. Therefore, we designed a new intervention, the DPP Cooks, to supplement the DPP and are testing it in a randomized controlled pilot trial.

**Methods:** The DPP Cooks intervention was informed by formative research with 13 former DPP participants and input from a Community Advisory Committee. In February-September 2022, in collaboration with community-based DPP providers, we randomized 45 adults in Baltimore, MD, USA with pre-diabetes to the DPP (Control) or DPP plus a 6-session cooking skills intervention (DPP Cooks). The primary outcome is weight loss as reported during DPP sessions. At baseline and at 4-months follow-up, we assessed dietary intake/quality by using the Remote Food Photography Method (RFPM) in which participants take photographs of all food and beverages they consume for 3 days. We also assessed food agency, cooking attitudes, behaviors, self-efficacy, and food security status at baseline, 4-month and 12-month follow-up. Preliminary changes in outcomes from baseline to 4-month follow-up were assessed using paired t-tests. Photographs taken for the RFPM diet quality assessment were also qualitatively coded and analyzed to assess pre/post changes.

**Results:** Thirty-nine (87%) of the 45 randomized participants attended Session 1 of the intervention; 82% of participants identified as Black and 87% identified as female. The presentation will focus on lessons learned during implementation and preliminary results of the intervention for primary and secondary outcomes. We will also highlight insights gleaned from qualitative analyses of the RFPM data. Initial results from participants who have completed 4-month follow-up indicate that participants in the DPP Cooks group lost more weight and gained more cooking confidence compared to participants in the control group.

**Conclusions:** Preliminary results from the DPP Cooks randomized controlled pilot trial indicate that adding hands-on cooking skills education to the DPP helps participants achieve greater weight loss and can improve participant engagement and behavioral outcomes.

# A randomised controlled trial to investigate the feasibility and acceptability of a small change approach to prevent weight gain

**Miss Henrietta Graham**<sup>1</sup>, Dr. Claire Madigan<sup>1</sup>, Prof. Amanda Daley<sup>1</sup>

<sup>1</sup>Loughborough University, Loughborough, United Kingdom

SO.3.22 - The Latest Research on Behavior Change Studies, UKK - Hall C (Level 3), June 17, 2023, 9:40 AM - 10:55 AM

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** A small change approach, which asks people to decrease their energy intake and/or increase their energy expenditure by 100-200 kcal each day, has shown merit, but research has only considered the effectiveness of this approach when delivered in intensive lifestyle/behavioural change interventions involving multiple contacts over time. The aim of this study was to investigate whether a small change approach might still be feasible and acceptable to participants for weight gain prevention when delivered within an intervention that is delivered remotely and potentially deliverable at scale.

**Methods:** This randomised controlled feasibility and acceptability trial allocated 122 participants to the small change weight gain prevention intervention (targeting dietary and/or physical activity behaviours) or a comparator using 2:1 randomisation for 12 weeks. The primary outcome was the feasibility (number of participants recruited each month & retention of participants at follow-up) and acceptability (adherence) of a small change approach intervention, assessed using three traffic light stop-go criteria. Secondary outcomes included weight change at follow-up.

**Results:** The traffic light stop-go criteria results were green for recruitment (11 participants randomised per month) and retention (91%) and red for intervention adherence (<60% of participants made at least seven small changes each week). Sixty-two percent of participants found a small change approach helpful/very helpful. The difference in weight between the trial groups at follow-up was -1.1kg (95% CI -1.7, -0.4), favouring the intervention group.

**Conclusion:** Although adherence to the small change approach intervention was lower than expected, this trial provides evidence that the public find a small change approach helpful/very helpful in preventing weight gain, and they gained less weight than comparators. A small change approach might be an effective strategy for reducing weight gain in the population and, with increased consideration of how to improve adherence, progress to an effectiveness trial is recommended.

# Modeled substitution of isocaloric foods for increased adherence to a Mediterranean style diet pattern in U.S. Adults

**Dr. Ambria Crusan<sup>1</sup>**, Dr. Francine Overcash<sup>2</sup>

<sup>1</sup>St. Catherine University, St. Paul, USA, <sup>2</sup>University of Minnesota, St. Paul, USA

SO.3.22 - The Latest Research on Behavior Change Studies, UKK - Hall C (Level 3), June 17, 2023, 9:40 AM - 10:55 AM

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Studies suggest Americans could benefit from greater adherence to a Mediterranean Diet (MedD) pattern for chronic disease management. A study assessing adherence to dietary prescriptions noted participants were more likely to continue substituting nutrient-dense options 6-months post intervention than to follow diet prescriptions. The purpose of this study is to provide targeted intervention data supporting simple isocaloric food substitutions for Americans to help increase adherence to a MedD pattern.

**Methods:** A validated scoring index for non-Mediterranean populations determined alignment to a MedD pattern in 19,978 adults from the National Health and Nutrition Examination Survey (2007–2018). The study population was divided into two groups based on their score: top quartile (TQ) vs. lower quartiles (LQ). Differentiation in adherence guided foods most predictive of improved alignment, optimizing the substitutions. Isocaloric food substitution modeling via multiple regression identified key dietary swaps to improve MedD alignment. Targeted intervention groups were determined via highest substitution frequency.

**Results:** The mean MedD score was significantly different in the LQ ( $7.1 \pm 0.05$ ) than the TQ ( $16.5 \pm 0.09$ ) ( $p < 0.0001$ ). Four individual food substitutions increased LQ and TQ MedD score independently: olive oil from no use to partial use, leafy greens for starchy vegetables, whole grains for refined grains, or whole fruit in place of fruit juice (all substitutions  $p < 0.0001$ ); however, a synergistic effect was seen as the mean MedD score increased to  $10.5 \pm 0.05$  in the LQ and  $20.5 \pm 0.09$  in the TQ when all substitutions were added to the model (within-group t-test p-values all  $< 0.0001$ ). The dietary substitutions for fruit, olive oil, and whole grains applied to a greater proportion of 30-49 year olds, females, individuals identifying as white, individuals that are obese, or those with some college education. Leafy greens showed similar demographic data, however, males or those in the age range of 50-59 were more likely to receive the dietary substitution.

**Conclusions:** Using foods that are already part of the average American diet underscores wide-spread acceptability to elicit behavior change. Simple dietary substitutions can help Americans more closely align with a MedD pattern to reduce chronic disease risk.

# Does boys' and girls' motivation behind their food habits differ? A systematic review of the underlying factors impacting eating in adolescents.

<sup>1</sup>Faculty of Land and Food Systems, The University of British Columbia, Vancouver, Canada, <sup>2</sup>Healthy Starts, BC Children's Hospital Research Institute, Vancouver, Canada

**SO.3.22 - The Latest Research on Behavior Change Studies, UKK - Hall C (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Boys' and girls' food habits begin to diverge during adolescence (13-18 years). For example, greater reports of food restriction among girls versus higher consumption of high caloric foods among boys have been reported. These differences may contribute to unequal risk of certain health outcomes in adulthood. At present, there is no consensus of how gender impacts adolescents' food habits. Therefore, this study aimed to consolidate gender trends in adolescents' rationale behind eating.

**Methods:** A systematic review following PRISMA guidelines (Medline Ovid, Embase, Web of Science, CINAHL) was conducted using qualitative studies. To be eligible, studies had to report at least one unique gender theme. Quality appraisals were conducted using the Critical Appraisal Skills Programme checklist and a thematic analysis of themes was performed from all studies.

**Results:** Of the original 1706 articles returned, 34 met eligibility. Three themes emerged regardless of gender to explain adolescents' rationale behind their food habits: 1) *looking ahead*; 2) *eating in the moment*; and 3) *logistics*. *Looking ahead* encompassed adolescents' discussion of how long-term benefits like health outcomes, forming their identities, or controlling appearance influenced their food habits. Specifically, girls' food habits were influenced by a desire to be thin, control aesthetics or manage their health through weight. In contrast, boys emphasised the role of athletic performance, building muscle and the quantity of foods. Adolescents also mentioned how immediate gratification through physical feelings (e.g., avoiding feeling sick or giving into cravings) and socialization further played a role by *eating in the moment*. In this theme, girls highlighted using food to appear attractive to boys and eating healthier with their friends whereas boys did not. Finally, adolescents recognized that regardless of their motivation, their food habits were confined by *logistics* outside of their control (e.g., parent's rules, food availability or cost). No gender differences arose in this theme.

**Conclusions:** Boys' and girls' food habits are not motivated by the same factors. To create more effective interventions that address food habits, researchers should consider the unique factors important to different gender groups and include them in their designs.

# LOFIT: Lifestyle front Office For Integrating lifestyle medicine in the Treatment of patients. A novel care-model towards community-based options for lifestyle change – study protocol.

**SO.3.22 - The Latest Research on Behavior Change Studies, UKK - Hall C (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

## **SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** A healthy lifestyle is indispensable for the prevention of non-communicable diseases. However, lifestyle medicine is hampered by time constraints and competing priorities of treating physicians. A dedicated lifestyle front office (LFO) in secondary/tertiary care may provide an important contribution to optimize patient-centered lifestyle care and connect to lifestyle initiatives from the community. The LOFIT study aims to gain insight into the (cost-)effectiveness of the LFO.

**Methods:** Two parallel pragmatic randomized controlled trials will be conducted for (cardio)vascular disorders (i.e. (at risk of) (cardio)vascular disease, diabetes) and musculoskeletal disorders (i.e. osteoarthritis, hip or knee prosthesis). Patients from three outpatient clinics in the Netherlands will be invited to participate in the study. Inclusion criteria are body mass index (BMI)  $\geq 25$  (kg/m<sup>2</sup>) and/or smoking. Participants will be randomly allocated to either the intervention group or a usual care control group. In total, we aim to include 552 patients, 276 in each trial divided over both treatment arms. Patients allocated to the intervention group will participate in a face-to-face motivational interviewing (MI) coaching session with a so called lifestyle broker. The patient will be supported and guided towards suitable community-based lifestyle initiatives. A network communication platform will be used to communicate between the lifestyle broker, patient, referred community-based lifestyle initiative and/or other relevant stakeholders (e.g. general practitioner). The primary outcome measure is the adapted-Fuster-BEWAT, a composite health risk and lifestyle score consisting of resting systolic and diastolic blood pressure, objectively measured physical activity and sitting time, BMI, fruit and vegetable consumption and smoking behaviour. Secondary outcomes include cardiometabolic markers, anthropometrics, health behaviours, psychological factors, patient reported outcome measures (PROMs), cost-effectiveness measures and a mixed-method process evaluation. Data collection will be conducted at baseline, 3, 6, 9 and 12 months follow-up.

**Discussion:** This study will gain insight into the (cost-)effectiveness of a novel care-model in which patients under treatment in secondary or tertiary care are referred to community-based lifestyle initiatives to change their lifestyle.

# The mediating effects of self-efficacy on psychological well-being – findings from the Burn to Learn cluster randomised controlled trial

**Dr. Levi Wade**<sup>1,2</sup>, Dr. Thierno M.O. Diallo<sup>3</sup>, Dr. Michael Noetel<sup>4</sup>, Prof. Chris Lonsdale<sup>5</sup>, Associate Professor Narelle Eather<sup>1,2</sup>, Dr. Jordan J. Smith<sup>1,2</sup>, Prof. Ronald Plotnikoff<sup>1,2</sup>, Prof. David R. Lubans<sup>1,2,6</sup>

<sup>1</sup>Centre for Active Living and Learning, College of Human and Social Futures, University of Newcastle, Callaghan, Australia, <sup>2</sup>Active Living Program, Hunter Medical Research Institute, New Lambton, Australia, <sup>3</sup>School of Social Sciences, Western Sydney University, Sydney, Australia, <sup>4</sup>School of Psychology, University of Queensland, Brisbane, Australia, <sup>5</sup>Institute for Positive Psychology and Education, Australian Catholic University, North Sydney, Australia, <sup>6</sup>Faculty of Sport and Health Sciences, University of Jyväskylä, Jyväskylä, Finland

**SO.3.22 - The Latest Research on Behavior Change Studies, UKK - Hall C (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Engagement in physical activity is known to benefit multiple markers of mental health in adolescence, including improvements in psychological well-being. However, there remains a gap in knowledge on the mechanisms responsible for these effects. The aim of this study is to examine the potentially mediating role of self-efficacy on psychological well-being in a sample of adolescents participating in a school-based high-intensity interval training (HIIT) program.

**Methods:** The current study uses data collected from 378 school students (mean age = 16.02, SD = 0.38) who participated in the first year of the Burn to Learn cluster randomised controlled trial. Teachers in the intervention schools were trained to deliver at least two HIIT sessions per week during academic lessons across two school terms. HIIT self-efficacy was assessed using the HIIT-SQ, and well-being was assessed using the 7-item Warwick-Edinburgh Mental Well-being Scale. A product-of-coefficient mediation analysis was conducted to assess the potentially mediating effect of HIIT self-efficacy at 6-months post intervention on well-being 12-months post intervention.

**Results:** After adjusting for baseline values, age, sex, BMI, and SES, the intervention did not have a significant effect on well-being (estimate [SE] = -0.648 [0.566], 95%CI = -1.545 to 0.339,  $p = 0.25$ ). However, there was a significant effect of the intervention on HIIT self-efficacy at 6-months (estimate [SE] = 0.994 [0.251], 95%CI = 0.581 to 1.403,  $p < 0.01$ ), and a significant mediated effect of HIIT self-efficacy on well-being at 12-months (estimate [SE] = 0.371 [0.162], 95%CI = 0.090 to 0.618,  $p = 0.02$ ).

**Conclusions:** The findings suggest that improving adolescents' HIIT self-efficacy has a sustained positive influence on their psychological well-being. Accordingly, targeting improvements in physical activity self-efficacy may be an effective strategy for improving well-being in adolescents in future trials.

# Shaping a personalized lifestyle program for colorectal cancer survivors experiencing cancer-related fatigue (the SoFiT program): identification and application of behavioural and environmental determinants, and behaviour change techniques

**Ms. Judith de Vries - ten Have<sup>1,2</sup>**, Associate Professor Renate M. Winkels<sup>1</sup>, Prof. Ellen Kampman<sup>1</sup>, Dr. Laura H.H. Winkens<sup>2</sup>

<sup>1</sup>Division of Human Nutrition and Health, Nutrition and Disease Chair Group, Wageningen University and Research, Wageningen, Netherlands, <sup>2</sup>Consumption and Healthy Lifestyles Chair Group, Wageningen University and Research, Wageningen, Netherlands

**SO.3.22 - The Latest Research on Behavior Change Studies, UKK - Hall C (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Cancer-related fatigue (CRF) is a severe long-term problem in colorectal (CRC) survivors. Some interventions suggest beneficial effects of healthy eating and/or physical activity or exercise on CRF in cancer survivors. Other interventions did not find beneficial effects on CRF, possibly because they did not achieve substantial behaviour change. Identifying behavioural and environmental determinants is an important step in the design of effective behaviour change interventions, so that they can be targeted by matching behaviour change techniques (BCTs). In the design of the SoFiT study we sought to identify behavioural and environmental determinants of health behaviours among CRC survivors and matched those with BCTs.

**Methods:** We conducted a mixed-method study, including a systematic literature review, focus groups, and interviews to identify behavioural and environmental determinants of healthy lifestyle behaviours among CRC survivors. Thematic content analysis was performed to identify themes in the focus groups and interviews. In a second systematic review, we summarized the literature on applied and promising BCTs in lifestyle interventions targeting CRF among cancer survivors. The BCT taxonomy was used to code BCTs in those interventions. We used our reviews and the BCT tool to connect BCTs to the identified determinants and decided on practical applications of this combination to design the SoFiT intervention.

**Results/findings:** We identified knowledge, motivation, beliefs, social surroundings, self-efficacy and disease-related effects and barriers as the most important determinants of healthy lifestyle behaviours in the mixed method study. In the second systematic review, the most frequently applied BCTs were Goal setting (behaviour), Instruction on how to perform the behaviour, Demonstration of the behaviour, Behavioural practice/rehearsal, and Credible Source. The BCT 'Generalisation of the target behaviour' was identified as promising to increase effectiveness of the intervention. An example of a practical application in SoFiT is that the skills needed for increasing the intake of vegetables, can be improved by giving instructions on how to cook with more vegetables and let the participant practice with this.

**Conclusions:** We used a systematic approach to design our SoFiT intervention, in which we match the most promising BCTs to personal and environmental determinants of CRC survivors with CRF.

# Tension and dynamics of weight management: A fresh theoretical perspective based on qualitative investigation of experiences of success and relapse in weight management.

Dr. Samantha van Beurden<sup>2</sup>, Dr. Sarah Morgan-Trimmer<sup>2</sup>, Dr. Leon Poltawski<sup>2</sup>, **Prof. Colin Greaves<sup>1</sup>**

<sup>1</sup>University of Birmingham, Birmingham, United Kingdom, <sup>2</sup>University of Exeter, Exeter, United Kingdom

**SO.3.22 - The Latest Research on Behavior Change Studies, UKK - Hall C (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** B. Motivation and behavior change

**Background:** People often lose weight successfully. However, few are able to keep the weight off in the long term. To investigate the reasons for this and build on emerging theoretical perspectives around "Tension Theory", we conducted an exploration of the psychological dynamics of weight management.

**Methods:** This qualitative study was conducted within a feasibility study of the Skills for weight loss and Maintenance (SkiM) intervention. Thirty-six participants were interviewed about their weight management journey before, immediately after and a year after the six-month intervention. Data were analysed thematically. We compared the accounts of those who were more and less successful in longer-term weight loss (12 months post-intervention) and key themes were linked in a conceptual model.

**Results:** Five interpretative themes were generated: encountering and managing key situations; impact of emotion; source of control; personal values; and acquiring knowledge and skills. These themes were linked through a model of decision-making during key situations in which decisions in weight management are taken. Behavioural decisions (conscious and non-conscious) emerge from a dynamic interplay between several drivers: emotional state and psychosocial needs that drive or motivate obesogenic behaviour, perceived control, personal values, the individual's knowledge and skills, and their existing habits. Individual's responses in key situations may generate experiential learning which in turn can influence the dynamics of decision-making in future situations. It is these decisional dynamics that appeared to differ between participants who were more successful and those who were less successful in weight management.

**Conclusions and implications:** Our model of the dynamics and fundamental drivers of decision-making in weight loss and weight loss maintenance has implications for the development and delivery of behavioural weight management interventions. By helping people to identify the core drivers of their decisions in key situations, interventions will be more likely to be able to equip them appropriately to manage these drivers and so optimise longer term intervention effectiveness.

# Compositional Data Analysis Behaviors in the 24-hr Period and their Association with Gestational Weight Gain in Pregnant Women with Overweight or Obesity

**Dr. Krista Leonard**, Dr. Abigail Pauley, Dr. Daniel Rivera, Dr. Jennifer Savage, Dr. Danielle Symons Downs  
<sup>1</sup>Arizona State University, Phoenix, USA

SO.3.22 - The Latest Research on Behavior Change Studies, UKK - Hall C (Level 3), June 17, 2023, 9:40 AM - 10:55 AM

**SIG - Primary Choice:** B. Motivation and behavior change

**Purpose:** Regulating gestational weight gain (GWG) lowers risks for maternal morbidity/mortality. Behaviors across the 24-hour (24hr) period (physical activity, sedentary behaviors, sleep) are modifiable factors that predict GWG. However, most studies have overlooked that these behaviors are mutually exclusive (i.e., time spent in one displaces time in another), potentially leading to inaccurate estimates of their association with GWG. This secondary analysis examined whether these behaviors, across pregnancy, and how they individually and in combination explained GWG.

**Methods:** Pregnant women with overweight/obesity (PW-OW/OB;  $N=19$ ) from a randomized feasibility trial to adapt intervention dosages to regulate GWG, wore a Jawbone daily from ~8-36 weeks gestation to obtain time spent in sleep, inactivity, and activity (light and MVPA), averaged for trimesters 1, 2, and 3. Women weighed themselves daily (Aria Wi-Fi scale); GWG was calculated as weight at ~36-weeks gestation minus pre-pregnancy weight. Compositional data analysis and descriptives were used to examine changes in sleep, inactivity and activity; linear regression was used to examine whether the composition of the behaviors in the 24hr period predicted GWG.

**Results:** On average, all women spent the majority of the 24hr period as sleeping (42-47%; 6.7-8.2hrs) or inactive (47-52%; 7.8-8.3hrs) and little time as active (5-7%; 0.9-1.2hrs), with minimal change in these behaviors across the trimesters. The behaviors in the 24hr period did not significantly predict GWG.

**Conclusion:** Women allocated most of their 24hr period to inactivity and sleep, and minimally to activity. The composition of this sample of PW-OW/OB did not predict GWG. Further research is needed to examine if other compositions (e.g., higher activity, lower inactivity, appropriate sleep) and/or changes in compositions over time may better explain GWG. Nevertheless, given the minimal activity time, identifying strategies to educate women on how to best reallocate their time to activity are warranted; for example, promoting small reallocations from sedentary behaviors such as standing to break up sitting, or 10-minute walks after meals. Further, implementing strategies in early pregnancy may be beneficial given women maintained behaviors over the course of pregnancy.

# Goldilocks and the Rail Drivers: Can physical behaviours at work be health-enhancing?

**Dr. Stephanie Chappel<sup>1</sup>**, Associate Professor Janine Chapman<sup>1,2</sup>, Prof. Corneel Vandelanotte<sup>3</sup>, Prof. Andreas Holtermann<sup>4</sup>, Prof. Leon Straker<sup>5</sup>, Prof. Anjum Naweed<sup>1</sup>

<sup>1</sup>Central Queensland University, Appleton Institute, Adelaide, Australia, <sup>2</sup>Flinders University, Adelaide, Australia, <sup>3</sup>Central Queensland University, Physical Activity Research Group, Appleton Institute, Queensland, Australia, <sup>4</sup>National Research Centre for the Working Environment, Copenhagen, Denmark, <sup>5</sup>Curtin University, Perth, Australia

**SO.3.23 - Working with participatory research designs in mental health, UKK - Hall D (Level 2 - main floor), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** The purpose of this presentation is to outline the Goldilocks in Rail project along with the initial findings and next steps. The aim of the project is to develop a 'just right job design' model through three key objectives; 1) identify the movement profiles of rail drivers, 2) explore how movement is accumulated within work, and 3) determine potential opportunities to apply the Goldilocks Work approach to redesigning rail driving.

**Methods** Tram, train, and freight organisations were recruited across Australia and New Zealand to participate in several phases. In Phase 1, the physical behaviours of drivers at work and away from work are monitored for eight days using thigh-worn Axivity devices. In Phase 2, detailed descriptions of the tasks drivers perform are created based on researchers directly observing drivers across an entire shift. Data from Phases 1 and 2 are used to create a physical behaviours-based description of rail driving tasks. Phase 3 involves rail drivers and management identifying potential job (re)designs to enhance health-promoting physical behaviours using a 'just right job design' conceptual model.

**Results** Data from 31 rail drivers show that on average across any shift, 79% was spent sitting, 10% was spent standing, and 11% was spent moving. On non-workdays, 63% of time was spent sitting, 18% was spent standing, and 19% was spent moving. Interestingly, tram drivers appear to be more sedentary at work, whilst train drivers were more sedentary during leisure time. According to the task analysis, the majority of rail drivers sitting time occurs when driving the tram/train, and the potential opportunities to introduce movement into the job appear to be limited by current timetables and roster designs.

**Conclusions** This is the first time the 'just right job design' model has been explored, with a focus on rail driving. Unsurprisingly rail driving is a highly sedentary occupation, and the opportunities for redesigns appear limited due to the complex nature of the rail environment. Using the Phases 1 and 2 findings, Phase 3 explores through a participatory approach possible job redesigns through implementation simulations.

# The development and evaluation of a physical activity promotion intervention for adolescents and young adults with intellectual disabilities: the Move it, Move ID! project

**Miss Laura Maenhout**<sup>1,2</sup>, Prof. Greet Cardon<sup>1</sup>, Prof. Geert Crombez<sup>1</sup>, Prof. Geert Van Hove<sup>1</sup>, Dr. Sofie Compernelle<sup>1,2</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Research Foundation Flanders, Brussels, Belgium

**SO.3.23 - Working with participatory research designs in mental health, UKK - Hall D (Level 2 - main floor), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Evidence shows that people with intellectual disabilities (ID) face more health problems than their peers without ID. One suggestion to narrow these health inequalities, is to focus on supporting a healthy lifestyle in young people with ID, such as the promotion of physical activity (PA). Currently, adolescents and young adults with ID are considerably less physically active than their typically developing peers. Despite this need to find ways to promote PA in adolescents with ID, they are a neglected population in PA research. The aim of the present study is to describe the development and evaluation of the “Move it, Move ID!” intervention.

**Methods:** The Behaviour Change Wheel (BCW) was used as the framework to ensure a scientific and systematic intervention development, in combination with a co-creational approach (n=23). The project will investigate the effects of the intervention on total volume of PA among young people (16-22y) with mild to moderate ID using a single case multiple baseline design over an intervention period of max 10 weeks (February-May 2023).

**Results:** The application of the different steps of the BCW resulted in the formulation of ten intervention goals, which were linked to the COM-B components. The ultimate intervention consists of a buddy component and supporting app. It was indicated that a stand-alone app would not motivate adolescents with ID to be more physically active, instead it needs to be embedded in a larger PA promotion programme. Participants with ID will be paired with a buddy without ID (same age range) to do physical activities together in (the vicinity of) Ghent, Belgium. A range of activities will be proposed in the app, where also specific arrangements can be made using the chat and the agenda. Preliminary results on the participants' PA pattern will be available at the time of the conference.

**Conclusions:** This study will increase our understanding on whether a theory-based, co-created lifestyle intervention focusing on young people with ID can improve their PA behaviour and has important implications for future research and health policy.

# Community-Based Participatory Research Methodologies are an Effective way to Create Relevant Programming to Support Physical and Mental Health in Perinatal Individuals

**Ms. Leigh Neptune<sup>1</sup>**, Ms. Kayla Parsons<sup>1</sup>, Ms. Amelia Sullivan<sup>1</sup>, Ms. Emalee Harrington<sup>1</sup>, Ms. Kayla Raymond<sup>1</sup>, Dr. Jade McNamara<sup>1</sup>

<sup>1</sup>University of Maine, Orono, USA

**SO.3.23 - Working with participatory research designs in mental health, UKK - Hall D (Level 2 - main floor), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** This study aimed to examine the experiences of Community Advisory Board (CAB) members during the creation of a unique program to support physical and mental health during the perinatal period using a Community-Based Participatory Research (CBPR) approach.

**Methods** In this qualitative study, one-on-one interviews were conducted with CAB members (N=9) to examine their experiences participating in the CAB. Interviewees included recently postpartum individuals (n=4), registered dietitians (n=3), a community nutrition professional (n=1), and a research assistant (n=1). Interviews were transcribed and independently coded by three coders for primary and secondary themes using a grounded theory approach and basic thematic analysis.

**Results/Findings** Five primary themes emerged across interviews. The first was “collaboration,” with CAB members highlighting collaboration among researchers, professionals, and community members as a critical component of their experience with creating the program. Members felt the process was inclusive and that their input was valued. The second theme was “learning.” Participants revealed their primary motivator for participating in the CAB was the opportunity to learn about perinatal health and the research process. Members frequently reflected on what they learned from hearing diverse perspectives. The third theme was “community.” Interviewees stated they felt supported, connected to other members, and involved in the research process. Community and support were also described as primary needs for perinatal individuals. The fourth theme was “addressing a need.” Interviewees consistently identified their belief that the final program would result in a reliable resource that addresses the needs of perinatal individuals and that using CBPR methodologies was an innovative way to create relevant resources. The fifth and final theme was “CAB expansion.” Participants frequently mentioned involving more perspectives and offering alternate times to ensure adequate participation when asked what could be done to improve the process.

**Conclusions** CAB members from community and professional backgrounds highlighted collaboration, learning, and a sense of community as primary positive components of their experiences. This study highlights CBPR as an effective tool for bringing researchers and community members together in creating programming relevant to the needs of perinatal individuals.

# Connecting with Cultural Foods: Co-designing data collection methods with community members with lived refugee experiences

**Ms. Tina Gingell<sup>1</sup>**, Associate Professor Kate Murray<sup>1</sup>, Dr. Ignacio Correa-Velez<sup>1</sup>, Prof. Danielle Gallegos<sup>1</sup>  
<sup>1</sup>Queensland University of Technology, Brisbane, Australia

**SO.3.23 - Working with participatory research designs in mental health, UKK - Hall D (Level 2 - main floor), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Co-design is increasingly being used in research to design project outcomes with people with lived experience, to ensure those outcomes are tailored to the unique needs of the target population. However, co-design may also be used to design the project plan and tools to ensure the research is conducted in a trauma informed, strengths-based, and culturally appropriate manner. Connecting with Cultural Foods is an innovative research project that aims to improve food security for people from refugee backgrounds, by using a co-designed research plan.

**Methods:** Four workshops were conducted with community members to co-design data collection methods. Participants were recruited using convenience and purposive sampling. Workshop one utilised journey mapping to capture the lived experience of accessing food and identify key community roles that facilitate that access to food. Workshop two involved creating personas of key community roles to identify culturally appropriate communication methods, and consequently, data collection methods. Workshop three employed group discussions to collaboratively design data collection tools. Workshop four involved experiential learning to train participants on data collection methods and ethics.

**Results:** Workshops were held in Brisbane, Australia, between January and April 2022 with eight community members participating. Five key community roles were identified that facilitate access to food for people from refugee backgrounds: grocery store owner, market stall owner, restaurant owner, farmer, and community leader. Face-to-face interviews were determined as appropriate communication methods for all community roles. An interview guide was collaboratively designed with culturally appropriate language, and included trauma informed methods, such as monitoring the interviewee for signs of distress. Seven (88%) participants agreed to become research assistants and were trained to conduct interviews.

**Conclusions:** Co-designing data collection methods with community members that had a lived experience, ensured the research was trauma informed, culturally appropriate, and incorporated consideration of aspects that would not have been otherwise included, for example, showing respect when speaking to community leaders. This method may lead to new insights into the experience of accessing food in Brisbane, and create outcomes that produce a higher likelihood of behaviour change to improve food security for people from refugee backgrounds.

# Co-production of Move Well, Feel Good: a school-based motor competence and mental health intervention.

**Ms. Lauren Clifford**<sup>1</sup>, Dr. Richard Tyler<sup>1</sup>, Prof. Zoe Knowles<sup>2</sup>, Dr. Emma Ashworth<sup>2</sup>, Prof. Lynne Boddy<sup>2</sup>, Dr. Lawrence Fowweather<sup>2</sup>, Prof. Stuart Fairclough<sup>1</sup>

<sup>1</sup>Edge Hill University, Liverpool, United Kingdom, <sup>2</sup>Liverpool John Moores, Liverpool, United Kingdom

**SO.3.23 - Working with participatory research designs in mental health, UKK - Hall D (Level 2 - main floor), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Children from low-income families are disproportionately affected by poor mental health. Mental health problems such as anxiety and depression are associated with low motor competence (MC) and inhibited psychosocial development. These relationships may be mediated by social support and personal resources such as perceived competence. Improving children's MC through school-based physical activity interventions emphasising psychosocial development may therefore be a mechanism for promoting positive mental health. Shared stakeholder ownership in intervention development provides a context-sensitive basis for acceptable interventions with increased likelihood of them being effectively implemented. This study describes the co-production of 'Move Well Feel Good', a primary school physical activity intervention to improve children's MC and mental health.

**Methods:** Five primary schools from a low-income community of northwest England were recruited. Stakeholder groups consisting of class teachers, school leaders, physical activity specialists, and children (aged 8-9 years) participated in a series of co-production workshops. During these, participants worked in single and multiple stakeholder groups through a 6-stage process. Stakeholders' knowledge and experiences were integrated with existing research evidence using creative methods (e.g., post-it note tasks, worksheets, and drawings) to facilitate discussion. Audio recordings and field notes were also used to capture the events of the workshops. The co-production process culminated in stakeholder consensus voting for one of three proposed intervention ideas to decide which intervention would be implemented as a subsequent feasibility trial.

**Results:** Children cited physical and mental health benefits, enjoyment with friends, and high perceived competence as motives for being physically active. Opportunities to develop MC across the different segments of the school day were identified by adult stakeholders, who perceived the barriers to intervention implementation as children's lack of resilience, an overloaded curriculum, and poor parental support for physical activity. Stakeholders agreed that a fully resourced programme that could be embedded across the curriculum was essential for intervention feasibility and acceptability. The chosen intervention idea received 6 out of a possible 12 votes.

**Conclusions:** This study reinforces the complex nature of school-based intervention development and highlights the value of engaging with stakeholders in co-production processes.

# Community Capacity Building for Improving Capabilities for Physical Activity in Men 50 plus

**Prof. Susanne Tittlbach**<sup>1</sup>, Mr. Sebastian Kindig<sup>1</sup>, Prof. Anne Herrmann-Johns<sup>2</sup>, Mrs. Christine Bernardi<sup>2</sup>, Dr. Julia von Somogy<sup>2</sup>, Prof. Julika Loss<sup>3</sup>, Dr. Helmut Strobl<sup>1</sup>

<sup>1</sup>University of Bayreuth, Bayreuth, Germany, <sup>2</sup>University of Regensburg, Regensburg, Germany, <sup>3</sup>Robert-Koch-Institute, Berlin, Germany

**SO.3.23 - Working with participatory research designs in mental health, UKK - Hall D (Level 2 - main floor), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** Participation of men 50 plus in programs to promote health-enhancing physical activity (HEPA) is low. Due to socially constructed roles and expectations, men 50 plus are more likely to deny engagement in those programs, to prove adherence to the construct of masculine “toughness” or strength. Improving social and environmental conversion factors by working with rather than against sociocultural influences on behaviour is a promising way to increase participation rates of men in HEPA. However, there is a lack of capacity in many communities to conceptualize and implement corresponding programs. For that reason, ACTION for men (A4M) aims to (a) develop capacities for gender-sensitized HEPA promotion addressing men 50 plus by a participatory approach in two rural communities in Germany, and (b) scale up good-practice models.

**Methods** We implemented participatory stakeholder groups in each community. These groups were motivated to develop and implement gender-sensitized measures for HEPA promotion for men 50 plus. For measuring capacity building processes a semi-standardized monitoring protocol was used to document all group meetings (23 protocols) and 13 semi-standardized interviews with group participants and drop-outs were conducted. All documents were analysed using thematic analysis along relevant dimensions of capacity building suggested in literature (e.g., problem solving, resource mobilization, leadership).

**Results** We successfully established stakeholder groups that conceptualized and implemented a range of local measures meant to increase HEPA among men 50 plus (e.g. new gender-sensitized HEPA programs with a low-threshold access). Capacity building was successful to a certain degree (e.g., regarding participation, problem assessment, and resource mobilization). Capacity building processes differed between communities in terms of leadership, sustainability and critical awareness. Two good-practice models turned out: The SportCard, as a trial offer for men-specific courses of different sports club courses, and a standardized men-specific HEPA program. These measures have been scaled up to other municipalities and umbrella sports organisations.

**Conclusions** A successful capacity building approach can result in improved social and environmental conversion factors regarding physical activity for men 50 plus. Success of the approach mainly depends on the composition of stakeholder groups and inherent power relations.

# Movement Matters: A co-produced physical activity and motor competence intervention for children with intellectual disabilities.

**Dr. Sarah Taylor**<sup>1</sup>, Prof. Lynne Boddy<sup>1</sup>, Dr. Samantha Downs<sup>1</sup>, Dr. Arlene McGarty<sup>2</sup>, Dr. Bronagh McGrane<sup>3</sup>, Dr. James Rudd<sup>4</sup>, Dr. Benjamin Buckley<sup>1,5</sup>, Dr. Lawrence Fowweather<sup>1</sup>

<sup>1</sup>Liverpool John Moores University, Liverpool, United Kingdom, <sup>2</sup>University of Glasgow, Glasgow, United Kingdom, <sup>3</sup>Dundalk Institute of Technology, Dundalk, Ireland, <sup>4</sup>Norwegian School of Sport Sciences, Oslo, Norway, <sup>5</sup>University of Liverpool, Liverpool, United Kingdom

**SO.3.23 - Working with participatory research designs in mental health, UKK - Hall D (Level 2 - main floor), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose** The purpose of this study was to co-produce and trial the feasibility of an intervention aimed at improving physical activity (PA) and motor competence (MC) levels of children with intellectual disabilities (ID) aged 8-10 years. Interventions targeting both these outcomes in children with ID are scarce. Co-production has been suggested as a more appropriate approach to intervention development as it uses stakeholder knowledge, understanding, and lived experiences to produce context-sensitive, effective, and sustainable strategies.

**Methods** Across the Liverpool city region (UK), 49 individuals representing education, sport, charities, health, and parents/families were invited to participate in the co-production. Local Special Educational Needs Schools were invited to participate in a 5-week feasibility trial. Feasibility outcomes included, eligibility and recruitment of schools, training satisfaction, dose delivered, programme satisfaction, completed outcome measures of The Bruininks-Oseretsky Test of Motor Proficiency-2, accelerometry-assessed PA and anthropometrics, and attrition from baseline to follow up.

**Results** Twelve individuals participated in four co-production workshops. Stakeholder groups included, professionals, relatives of an adult/child with ID, parents of an adult/child with ID, adults/children with ID. Additional co-production discussions were held outside of these workshops with parents at charity group meetings and children in schools. Stakeholders co-produced six programme ideas: 1) Teacher/coach training. 2) School-based PA. 3) Family co-participation. 4) Parental education. 5) School multi-skill event. 6) Role models. For the feasibility trial, two schools were recruited (recruitment rate of 13%). Completion rate of the outcome measures with 25 participants was 67.0% at baseline and 40.5% at follow up. One participating school was not able to complete the fulfilments of the MM programme, meaning 12 participants were lost from baseline to follow up. The training course was not completed in full by any school staff, with time cited as a reason for two participating staff. One school reported successfully implementing the remaining strategies as recommended.

**Conclusions** To proceed to pilot, changes to eligibility/recruitment criteria, school commitment enhancement strategies, and adjustments to the training component are required. Learnings from this study, such as workshop tasks and techniques used to engage the public in intervention design can be used and adapted for future research.

# The current and potential role of physical activity within holistic health support for people living with severe mental illness.

**Dr. Ilaria Pina**<sup>1</sup>, Ms. Sue Webster<sup>5</sup>, Dr. Vanessa Pinfold<sup>5</sup>, Dr. Emily Henderson<sup>4</sup>, Prof. Tammi Walker<sup>3</sup>, Prof. Kate Walters<sup>2</sup>, Prof. David Osborn<sup>2</sup>, Prof. Emily Oliver<sup>1,3</sup>

<sup>1</sup>Newcastle University, Newcastle upon Tyne, United Kingdom, <sup>2</sup>University College London, London, United Kingdom, <sup>3</sup>Durham University, Durham, United Kingdom, <sup>4</sup>Northumbria University, Newcastle upon Tyne, United Kingdom, <sup>5</sup>The McPin Foundation, London, United Kingdom

**SO.3.23 - Working with participatory research designs in mental health, UKK - Hall D (Level 2 - main floor), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** People living with severe mental illness (SMI) are over three times more likely to have a physical health condition, and die on average 15-20 years earlier, than others in the general population. One determinant of these premature deaths is modifiable health-related behaviour, with high levels of physical inactivity and sedentary behaviour overlapping with other behavioural and social risk factors. Although effective health promotion services exist, provision is mixed and engagement relatively poor. Here, we explored the perspectives of people with SMI on existing and potential holistic health support services, with a particular focus on the role of physical activity, to better inform implementation and service planning.

**Methods:** Qualitative data were collected using future workshops and semi-structured interviews with adult experts by experience, defined as people living with SMI and/or carers and close family members. These were conducted online and in-person, and analysed using reflexive thematic analysis with a lens provided by the Consolidated Framework for Implementation Research. Analyses were further informed by a lived experience advisory panel and peer researcher engagement.

**Results/findings:** People with SMI advocated for a more holistic health approach in healthcare, and experienced fragmentation and neglect of their physical health needs: *"I'll often say that I feel like I'm just a piece of a part of the body, but nobody looks at it like the whole, like the impact as a whole."* Physical activity was experienced as a context of holistic health- and life-enhancing experiences, with creative, community-based and immersive experiences particularly valued. While disconnection between healthcare and physical activity services was experienced as frustrating and impaired access, participants were keen that community-based physical activity provision did not become 'overmedicalised' and risk losing some of its effective characteristics (e.g., community spirit, joy).

**Conclusions:** Physical activity experiences, especially in community settings, were advocated by people living with SMI as a contributor to their holistic health and 'living well'. For effective integration in, or partnerships with, more formal health support services, enhanced cross-sector communication, information-sharing, and wider referral and entry pathways are required. Without these, implementation settings will remain challenging.

# Exploring the Needs of People with Low Health Literacy for Lifestyle Counselling: A Qualitative Study

**Ms. Eclair Hietbrink<sup>1,2</sup>**, Dr. Anouk Middelweerd<sup>1</sup>, Ms. Marlin Meulman<sup>3</sup>, Ms. Anouk Logtenberg<sup>3</sup>, Ms. Lara Schemkes, Ms. Manou Hijink<sup>3</sup>, Ms. Petra Welmers<sup>3</sup>, Ms. Eline Droppers<sup>3</sup>, Ms. Dorthe Brands<sup>3</sup>, Mr. Arie Koster<sup>3</sup>  
<sup>1</sup>University of Twente, Enschede, Netherlands, <sup>2</sup>Ziekenhuisgroep Twente (ZGT), Almelo, Netherlands, <sup>3</sup>Saxion University of Applied Sciences, Enschede, Netherlands

**SO.3.23 - Working with participatory research designs in mental health, UKK - Hall D (Level 2 - main floor), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** K. Participatory Research in Health Promotion

**Purpose:** Health literacy forms the basis of a healthy lifestyle. Almost thirty percent of the Dutch population has low health literacy (LHL), which means that they have difficulty obtaining, understanding, and applying health-related information. Therefore, this group has more difficulty maintaining a healthy lifestyle. Many existing lifestyle counselling interventions are not accessible to people with LHL because those are not tailored to their needs. This study explored the needs of people with LHL regarding physical activity and dietary counselling.

**Methods:** From 3 October to 11 November 2022, 13 semi-structured interviews were conducted among 8 people with LHL and 5 healthcare professionals familiar with the target group. Participants were recruited through interest groups for people with LHL. Interview topics included adherence to a healthy lifestyle, comprehensibility of current lifestyle counselling, and needs regarding lifestyle counselling. All interviews were audio-recorded, transcribed non-verbatim, and coded applying inductive thematic analysis.

**Findings:** Five main themes emerged: (1) challenges in adhering to lifestyle advice, (2) problems with comprehensibility of lifestyle counselling, (3) mode of delivery, (4) understandability of the information, (5) applicability of the information. Participants often did not follow lifestyle advice because they did not know how to apply the advice in daily life. Current lifestyle guidance through consultations with healthcare professionals and leaflets were often misunderstood due to the use of long sentences with difficult terminology and numbers. Participants found existing apps for lifestyle guidance too difficult to use. Participants preferred blended lifestyle counseling in which guidance from a healthcare provider is complemented with daily guidance. They would prefer to receive daily guidance via a simple app or paper workbooks. To provide comprehensible lifestyle counselling, it is important to consider the choice of words and style, the structure, the use of numbers, and the use of images. To make lifestyle advice applicable, it is important that the advice encourages concrete actions with an explicit step-by-step plan.

**Conclusions:** The findings provide concrete starting points for developing interventions to support a healthy lifestyle in people with LHL. The insights will be used to develop a physical activity and dietary intervention through co-creation with the target group.

# Availability of Healthy and Unhealthy Foods in Supermarkets in Urban Ireland

**Ms. Sinead O'Mahony**<sup>1,2</sup>, Miss Aideen McCann<sup>1</sup>, Mrs. Nuala Collins<sup>1</sup>, Prof. Gerardine Doyle<sup>2</sup>, Dr. Kevin Burke<sup>3</sup>, Prof. Adrian Moore<sup>4</sup>, Prof. Eileen Gibney<sup>2</sup>

<sup>1</sup>Food Safety Authority of Ireland, Dublin, Ireland, <sup>2</sup>University College Dublin, Dublin, Ireland, <sup>3</sup>University of Limerick, Limerick, Ireland, <sup>4</sup>University of Ulster, Coleraine, United Kingdom

**SO.3.24 - Studies on food and drink consumption, accessibility, and purchasing behavior, UKK - K1 (+K2) (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Sugar and saturated fat in Irish adult diets are in excess of the World Health Organisation (WHO) recommended intakes. Supermarkets account for 91% of food purchased from grocery retailers by consumers in Ireland. Despite the importance of supermarkets in consumer food choice, to date there has been no research on the availability of healthy and unhealthy foods sold in Irish supermarkets. The aim of this study was to measure shelf space allocation to healthy and unhealthy foods in supermarkets in Dublin, Ireland in areas of high and low socio-economic deprivation.

**Methods:** Three of the five large grocery retailers in Ireland participated in the study, accounting for approximately 50% of market share. Supermarkets in Dublin, Ireland were mapped by area level socio-economic deprivation and sampled representatively. The INFORMAS Food Retail Module: Food Availability in Supermarkets Protocol was applied in 36 supermarket stores between October 2021 – February 2022. Shelf space (height (cm) x length (cm)) was measured for seven food categories, representative of healthy and unhealthy food offerings, using a five-metre measuring tape. Available shelf space (cm<sup>2</sup>) for healthy and unhealthy foods was calculated as defined by the protocol.

**Results:** The study found for every 100cm<sup>2</sup> of shelf space, 69cm<sup>2</sup> was allocated to unhealthy foods and 31cm<sup>2</sup> was allocated to healthy foods. There was little difference between area level socio-economic deprivation. In areas of low socio-economic deprivation (affluent and marginally above average) for every 100cm<sup>2</sup> of shelf space, 69cm<sup>2</sup> was allocated to unhealthy foods and 31cm<sup>2</sup> was allocated to healthy foods. In areas of high socio-economic deprivation (disadvantaged and marginally below average) for every 100cm<sup>2</sup> of shelf space, 70cm<sup>2</sup> was allocated to unhealthy foods and 30cm<sup>2</sup> was allocated to healthy foods.

**Conclusion:** This study found more shelf space allocated to unhealthy than healthy foods in supermarkets in Dublin, Ireland. Allocation of shelf space to healthy and unhealthy food does not differ by area level socio-economic deprivation, in this urban context. Findings indicate an opportunity to improve the allocation of shelf space to healthy foods in Irish supermarkets to support healthier food choice by consumers.

# “It seems as though there are healthy options but still the bad options too”: Staff and visitor satisfaction with food and drinks in New Zealand healthcare facilities

**Miss Magda Rosin<sup>1</sup>**, Dr. Sarah Gerritsen<sup>1</sup>, Dr. Yannan Jiang<sup>2</sup>, Mr. Bruce Kidd<sup>2</sup>, Miss Stephanie Shen<sup>2</sup>, Mrs. Elaine Umali<sup>2</sup>, Dr. Sally Mackay<sup>1</sup>, Associate Professor Lisa Te Morenga<sup>3</sup>, Prof. Cliona Ni Mhurchu<sup>2</sup>

<sup>1</sup>School of Population Health, Faculty of Medical and Health Sciences, The University of Auckland, Auckland, New Zealand, <sup>2</sup>National Institute for Health Innovation, The University of Auckland, Auckland, New Zealand, <sup>3</sup>Research Centre for Hauora and Health, Massey University, Mt Cook, Wellington, New Zealand

**SO.3.24 - Studies on food and drink consumption, accessibility, and purchasing behavior, UKK - K1 (+K2) (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** A voluntary National Healthy Food and Drink Policy was released in New Zealand in 2016 to encourage public sector organizations to provide healthier food/drink options for staff and visitors in line with national dietary guidelines. However, staff and visitor satisfaction with the available food/drink options has not been assessed. This study aimed to collect feedback on the current food environment in healthcare facilities and any perceived changes resulting from the implementation of the Policy.

**Methods:** Electronic and paper-based surveys were undertaken from June 2021 to August 2022 in 18 (out of 20 total) District Health Boards (regional healthcare facilities) and one central government agency. Participants were invited to complete the surveys via in-person recruitment onsite, paper flyers and posters in healthcare facilities, organizational staff email lists, and social media platforms. Quantitative data were analyzed using SAS v.9.4©, with the primary outcome measure being staff and visitors' satisfaction with the food/drink available. Free-text data were analyzed using a qualitative general inductive approach.

**Results/findings:** Surveys were completed by 2,526 hospital staff and 261 visitors. Most staff participants were nurses (27.9%), administration staff (23.2%), allied health workers (21.9%), and doctors (8.7%). Staff were more aware of the healthy food/drink policy (79.3%) than visitors (56.3%). Both groups generally supported having organizational guidelines (62.7% staff and 76.9% visitors). Staff noticed changes in the food/drink healthiness in the period following policy implementation, but indicated healthy options were not more affordable. The mean satisfaction score of the available food/drink on a scale of 1 (very dissatisfied) to 10 (very satisfied) was 4.7 (SD 2.3) for staff and 6.5 (SD 2.5) for visitors. Preliminary qualitative analysis indicates that variety, cost, quality and taste of food/drinks, and perception of freedom of choice, are important to staff and visitors in healthcare facilities.

**Conclusion:** Hospital staff and visitors are reasonably satisfied with the available food/drink options and noticed an improvement in healthy food/drink availability, but not affordability, following the introduction of a voluntary national food policy. Survey respondents provided valuable suggestions for further improving current food environments.

# Exploring socioeconomic patterning of online food outlet accessibility through online food delivery services in seven European countries

**Dr. Jody Hoenink**<sup>1</sup>, Ms. Yuru Huang<sup>1</sup>, Mr. Matthew Keeble<sup>1</sup>, Assistant Professor Joreintje Mackenbach<sup>2</sup>, Dr. Gabriela Matias de Pinho<sup>3</sup>, Dr. Thomas Burgoine<sup>1</sup>, Prof. Jean Adams<sup>1</sup>

<sup>1</sup>University of Cambridge, Cambridge, United Kingdom, <sup>2</sup>Amsterdam UMC, Amsterdam, Netherlands, <sup>3</sup>Utrecht University, Utrecht, Netherlands

**SO.3.24 - Studies on food and drink consumption, accessibility, and purchasing behavior, UKK - K1 (+K2) (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Use of online food delivery services (OFDS) has increased in recent years. This trend is concerning given that most food sold by OFDS is 'unhealthy'. Furthermore, dietary consumption and diet-related morbidity is socioeconomically patterned. Online food outlet access and its socioeconomic patterning has rarely been studied at a national or international scale. We explored access to food outlets through the most popular OFDS across seven purposively selected European countries to maximise variation in income and OFDS usage. We also investigated how online food outlet access varies by area-level socioeconomic position (SEP) in each country.

**Methods:** In this cross-sectional study, we automated collection of data on all food outlets registered with the leading OFDS (e.g. Just Eat Takeaway.com) in 2022 in England, Italy, Luxembourg, the Netherlands, Portugal, Spain and Switzerland. For each country, we linked area-level online food outlet access to socio-demographic information (i.e. area size, number of residents, income and social assistance rate as available) using a geographic information system. We used negative binomial regression models to investigate associations between area-level SEP quintiles and online food outlet access adjusted for population density.

**Results:** Median number of food outlets accessible online per 1000 residents was highest in England (14 food outlets online (IQR 4-31)) and lowest in Italy, Portugal and Spain (0 food outlets online (IQR 0-1)). In Italy, Luxembourg, Portugal and Spain, more socioeconomically advantaged areas had greater online food outlet access (e.g. Italy Q4 vs Q1 IRR= 5.8, 95%CI= 4.7; 7.1) compared with less socioeconomically advantaged areas. The reverse was seen in Switzerland, where more socioeconomically advantaged areas had less online food outlet access (e.g. Q4 vs Q1 IRR= 0.7, 95%CI= 0.6; 0.8). In the Netherlands and England, socioeconomic patterning was U-shaped; the most socioeconomically advantages areas had the greatest online food outlet access, and those in the second least advantaged areas had the least access.

**Conclusion:** National context appears to contribute to the socioeconomic patterning of online food outlet access. Further work is needed to understand drivers of disparities in online food outlet access by country, as well as possible implications for public health.

# Evaluation of the updated Nutri-Score algorithm in a Norwegian setting

**Dr. Bente Øvrebo<sup>1</sup>**, Dr. Marianne Hope Abel<sup>1</sup>, Dr. Anne Lise Brantsæter<sup>1</sup>, Prof. Lene Frost Andersen<sup>2</sup>

<sup>1</sup>Norwegian Institute of Public Health, Oslo, Norway, <sup>2</sup>University of Oslo, Oslo, Norway

**SO.3.24 - Studies on food and drink consumption, accessibility, and purchasing behavior, UKK - K1 (+K2) (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** The Nutri-Score is a candidate for a harmonized mandatory front-of-pack nutrition label enabling consumers in the EU to make healthier food choices. We aim to evaluate the updated Nutri-Score algorithm (2022) in a Norwegian setting by exploring its ability to discriminate the nutritional quality of foods, with emphasis on challenges previously cited by the Nordic countries such as the scoring of fish and oils. Additionally, we assess its agreement with food-based dietary guidelines (FBDG). To our knowledge, we are the first to evaluate the updated Nutri-Score algorithm independent of the Nutri-Score Scientific Committee.

**Methods** The updated Nutri-Score has been calculated for a) general foods and b) fats, oils, nuts and seeds in a Norwegian food database containing 1,631 foods and will be calculated for all foods in a national database for branded foods sold in grocery stores (n~40,000).

The discriminatory ability of the algorithm is considered by exploring the distribution of Nutri-Score in overall food categories and in subcategories using boxplots and frequency tables. Agreement with FBDG is assessed by exploring scores for different foods with specific recommendations, expecting higher scores for foods we should increase intake of, and opposite for foods we should limit.

**Results/findings** In general, preliminary findings indicate that the updated Nutri-Score algorithm discriminates nutritional quality of foods within and between food categories. The updated algorithm also aligns better with Norwegian FBDG, particularly related to fish and fats with different fat quality and content, which are previously cited challenges. Limitations might remain as the algorithm may not capture small, but perhaps important, differences in nutritional composition in some food categories which could be important for health, such as by fat content in cheese.

**Conclusions** Overall, the updated Nutri-Score algorithm shows promising results on its ability to discriminate the nutritional quality of foods, and it appears to have improved previously cited limitations. This is important for Nutri-Score's trustworthiness and potential of use. To fully assess the performance of the updated Nutri-Score algorithm in a Norwegian setting, a more thorough evaluation is currently conducted using a database containing all branded foods sold in Norwegian grocery stores.

# The evolution of online food delivery service: recommended industry actions to support healthier out-of-home food consumption

**Assistant Professor Lana Vanderlee**<sup>1,2</sup>, Prof. Gary Sacks<sup>3</sup>

<sup>1</sup>Université Laval, Quebec, Canada, <sup>2</sup>Centre NUTRISS, Quebec, Canada, <sup>3</sup>Deakin University, Melbourne, Australia

SO.3.24 - Studies on food and drink consumption, accessibility, and purchasing behavior, UKK - K1 (+K2) (Level 3), June 17, 2023, 9:40 AM - 10:55 AM

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Food ordered using online food delivery (OFD) services represents an increasingly large proportion of out-of-home food purchases. This study aimed to create an evaluation framework for assessing OFD company policies, commitments and actions to create healthier food environments and support efforts to improve population diets.

**Methods:** Drawing upon the Business Impact Assessment—Obesity and Population-Level Nutrition (BIA-Obesity) framework developed as part of INFORMAS, evidence from peer-reviewed and grey literature was synthesized and expert opinion was sought to identify recommended industry actions that OFD aggregators (e.g., UberEats, JustEat) could undertake across six domains: *corporate strategy*; *external relationships*; *nutrition labelling*; *promotions and pricing*; *product and outlet availability*; and *product formulation*.

**Results/findings:** In the domains of *corporate strategy* and *external relationships*, recommended industry actions were consistent with those for other food industry sectors, including targeted corporate commitments to nutrition and health with transparent reporting. In *nutrition labelling*, recommended actions included the labelling of nutrition and/or energy information in ways that are consistent and easy to access and understand, with transparency on mechanisms used to identify 'healthier' products/outlets. In *promotions and pricing*, recommended actions included measures to reduce children's exposure to unhealthy products and brands. These measures included commitments to not sponsor sporting, cultural or other activities popular with children and/or in settings where children gather, and to not use celebrities or animated characters that appeal to children. Recommended actions to restrict promotions for unhealthy products/brands included avoiding premium offers, price promotions or loyalty benefits for unhealthy products/brands. In *product and outlet availability*, recommended actions included mechanisms to ensure greater availability of healthier food items and healthier outlets, including opportunities for consumers to prioritize access to healthier food items. No actions were identified for *product formulation*; however, the recommended actions in other domains are likely to promote reformulation from food service companies.

**Conclusions:** OFD companies have the opportunity to contribute to efforts to improve population diets, particularly through their large reach and function as an aggregator, and their potential influence over food service companies. Monitoring the policies and actions of OFD companies may help improve their accountability for creating health-promoting food environments.

# Household purchases of sugar-sweetened, artificially sweetened, and unsweetened beverages: A five-year time trend analysis using New Zealand NielsenIQ Homescan market research data

**Dr. Helen Eyles<sup>1</sup>**, Ms. Sah Dodd<sup>1</sup>, Dr. Kelly Garton<sup>1</sup>, Dr. Yannan Jiang<sup>1</sup>, Dr. Teresa Castro<sup>1</sup>

<sup>1</sup>University of Auckland, Auckland, New Zealand

**SO.3.24 - Studies on food and drink consumption, accessibility, and purchasing behavior, UKK - K1 (+K2) (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Sugar-sweetened beverages (SSBs) are a significant source of dietary free sugars, thus providing a suitable target for nutrition-related policies and interventions. However, in Aotearoa New Zealand (NZ), no such strategy has been implemented, and data on the consumption of SSBs and their less sugary counterparts are lacking. Our aims were to assess (1) recent annual household purchase volumes and percentages of SSBs, artificially sweetened beverages (AFSBs), and unsweetened beverages (USBs), (2) differences in purchase volumes of beverages by household composition and income, and (3) changes in purchase volumes of beverages over time (2015 to 2019).

**Methods:** We used annual household purchasing data from NielsenIQ Homescan, a geographically and demographically representative consumer panel of ~ 1,800 NZ households per year. The sugar content of beverages was acquired from a NZ supermarket food composition database (Nutritrack). Beverages were classified based on sweetener type and amount. The outcome of interest was total annual household purchase volume (in litres) of all eligible non-alcoholic beverages. Analysis of variance (ANOVA) was used to compare household purchase volumes between household characteristics and years.

**Results:** In 2019, mean (SD) annual household purchase volumes for SSBs were 72.3 (93.0) L (33%), AFSBs were 32.5 (79.3) L (15%), and USBs were 112.5 (100.9) L (52%). Households with more adults or children generally purchased more of all beverages, except AFSBs. Households earning < \$NZ 30,000 generally purchased fewer of all beverages, except SSBs. Household purchases of SSBs dropped from 78.2 (91.5) L in 2015 to 72.3 (93.0) L in 2019, and AFSBs increased from 27.2 (72.7) L to 32.5 (79.3) L, respectively (both  $p=0.03$ ). No changes over time were observed for total or USBs.

**Conclusions:** Most beverages purchased by NZ households were AFSBs or USBs, and household SSB purchases dropped from 2015 to 2019. However, the reduction in SSBs was small and thus unlikely to improve health. Further, equal spending on SSBs by household income suggests greater relative spending for those on lower incomes. Findings support the need for policies and interventions to reduce SSB consumption in NZ and highlight that such strategies must focus on reducing inequities.

# Benchmarking the online fast food supply against the NSW Menu Labelling Scheme

**Miss Sophia Cassano**<sup>1</sup>, **Miss Anna Jia**<sup>1</sup>, Dr. Stephanie Partridge<sup>1</sup>, Dr. Alice Gibson<sup>1</sup>, Prof. Margaret Allman-Farinelli<sup>1</sup>, Miss Sisi Jia<sup>1</sup>

<sup>1</sup>University of Sydney, Sydney, Australia

**SO.3.24 - Studies on food and drink consumption, accessibility, and purchasing behavior, UKK - K1 (+K2) (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** In New South Wales (NSW), Australia, it is mandatory for large food outlets (>20 locations) to display kilojoule (kJ) labelling at point-of-sale under the Menu Labelling Scheme. It is unknown how well this scheme is implemented on Meal Delivery Applications (MDAs) which sell food via an online platform. Additionally, mid-sized food outlets that escape the scheme criteria, are potentially providing foods which may also warrant kJ labelling. This study aimed to examine the prevalence of kJ labelling on the menus of large food outlets on franchise-owned (single large food outlet app) and third-party (aggregated food outlets app such as Uber Eats, Menulog, Deliveroo) MDAs in Sydney, Australia. A secondary aim was to evaluate the nutritional quality of menu items from mid-sized food outlets.

**Methods:** Cross-sectional observational study. Ten suburbs across Sydney were randomly selected to represent all deciles of the SEIFA Index of Relative Socioeconomic Disadvantage. Large food outlets were identified as those that had >20 locations in NSW, mid-sized food outlets had between 5-20 locations. From 24<sup>th</sup> August to 14<sup>th</sup> September 2022, publicly available data was extracted. The prevalence of kJ labelling on online menus of large food outlets was assessed. Using the Australian Dietary Guidelines, the proportion of 'discretionary' menu items from mid-sized outlets that are energy-dense, nutrient-poor was calculated.

**Results/findings:** On franchise-owned MDAs, 91% (21/23) of large food outlets had some form of kJ labelling, and 35% (7/23) had complete kJ labelling. In comparison, only 4.8% (2/42), 5.3% (2/38) and 3.6% (1/28) of large outlets on Uber Eats, Menulog and Deliveroo had complete kJ labelling, respectively. Kilojoule labelling was also inconsistent between outlet locations across MDAs. Of the 452 menu items from mid-sized outlets, 76.3% (345/452) were classified as 'discretionary.'

**Conclusions:** Kilojoule labelling was absent or incomplete on a high proportion of online menus, predominately on third-party MDAs. Mid-sized outlets also offered a large proportion of discretionary choices which highlights a need to broaden the criteria for outlets subject to the Menu Labelling Scheme. The findings combined with the increasing popularity of MDAs show nutrition policies must be updated to include online forms of food retail.

# The quality and accuracy of nutrition information on Instagram

**Ms. Emily Denniss<sup>1</sup>**, Dr. Rebecca Lindberg<sup>1</sup>, Prof. Sarah McNaughton<sup>1</sup>

<sup>1</sup>Institute for Physical Activity and Nutrition, School of Exercise and Nutrition Sciences, Deakin University, Melbourne, Australia

**SO.3.24 - Studies on food and drink consumption, accessibility, and purchasing behavior, UKK - K1 (+K2) (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose:** Online health misinformation is a major issue. Social media has become a popular source of nutrition information and can influence eating behaviours. Thus far, no studies have examined the quality and accuracy of nutrition information on Instagram. Therefore, the aim of this study was to evaluate the quality and accuracy of nutrition information posted by popular Australian Instagram accounts.

**Methods:** Australian Instagram accounts with over 100,000 followers, that primarily posted about nutrition were identified, and all posts containing nutrition information from a 12-month period were identified (n = 10,964 posts). A random subsample of these posts was analysed for the present study. The quality of posts was evaluated using the PRinciples for Health Information on Social Media (PHRISM) tool. Posts were assessed with an overall quality score (0-100, where a higher score indicated higher quality). The accuracy of information was evaluated against the Australian Dietary Guidelines, Practice-based Evidence in Nutrition database and the Metafact fact-checking platform. Descriptive statistics and significance of overall difference in quality and accuracy scores between Instagram account categories and Instagram post topics using one-way ANOVA will be calculated in Stata. Post hoc significance tests will be calculated using the Tukey-Kramer method. Pearson's correlation coefficient will be used to determine correlation between quality and accuracy.

**Results/findings:** A total of 715 posts were included in the final sample. Preliminary results of quality evaluations reveal 35% of posts were poor, 61% mediocre, 11% good and 0% excellent quality. The average quality score was 31/100. The majority of posts (57%) contained inaccuracies and 43% of posts were completely accurate.

**Conclusions:** Findings from this study indicate that the quality and accuracy of nutrition information posted by Australian influencer accounts is suboptimal, suggesting that the public are at risk of exposure to unreliable nutrition information. More work is needed to understand the role of social media on food literacy, to understand the role of credible nutrition experts on social media and to improve the public's e-health literacy. Improved policies to regulate harmful health misinformation on social media and greater monitoring of health information are also needed.

# The nutrient composition and Health Star Rating of packaged foods manufactured by major New Zealand food and beverage companies: 2015 to 2019: a trend analysis

**Dr. Leanne Young<sup>1</sup>**, Mr. Bruce Kidd<sup>1</sup>, Ms. Stephanie Shen<sup>1</sup>, Dr. Yannan Jiang<sup>1</sup>, Prof. Cliona Ni Mhurchu<sup>1</sup>

<sup>1</sup>The University of Auckland, Auckland, New Zealand

**SO.3.24 - Studies on food and drink consumption, accessibility, and purchasing behavior, UKK - K1 (+K2) (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** H. Policies and environments

**Purpose** We aimed to evaluate the healthiness and nutrient composition of packaged foods manufactured by major New Zealand food and beverage companies over time (2015-2019). This analysis is part of a larger randomised trial evaluating structured engagement with food companies as a method to improve nutrition-related policies and actions.

**Methods** The largest food and beverage companies operating in New Zealand (n=36) were identified based on sales revenue and market share data sourced from the Euromonitor 2019 database. All relevant brands and products from the companies were selected from the Nutrtrack database, and their composition over five years (2015-2019) was examined. The primary outcome was the product health star rating (HSR) estimated using Nutrition Information Panel and food ingredient information. Healthiness was defined as a minimum of 3.5 stars (out of a maximum of 5). Secondary outcomes included the product sodium (mg per 100g or 100mL), total sugar (g per 100g or 100mL) and saturated fat (g per 100g or 100mL) contents.

All outcomes were summarised overall, by company, by major food category, and over time. Change over time was tested using linear mixed models, adjusting for company and major food categories. Model-adjusted mean differences between years were estimated with 95% confidence intervals.

**Results/findings** The category sales revenue of the 36 identified companies ranged from 15-229 million GBP for beverages and 18-744 million GBP for packaged foods. Category market share for beverages ranged from 28-41% and packaged food from 0.1-12% (2019). The total number of products included in this analysis across the five years was ~18,000 which accounts for approximately one-quarter of products each year in Nutrtrack. Detailed findings on change over time in HSR and nutrient content will be presented.

**Conclusions** Comprehensive, independent monitoring of the composition of packaged foods and beverages is important to understand if government-led reformulation programmes and nutrition labelling policies incentivise the packaged food industry to reformulate and produce healthier foods.

# Can parenting practices predict adolescents' 24-hour movement behaviours? A compositional data approach based on accelerometer data.

**Mrs. Vera Verbestel**<sup>1</sup>, Miss Iris willems<sup>1,2</sup>, Miss Marga Decraene<sup>1</sup>, Prof. Marieke De Craemer<sup>1</sup>

<sup>1</sup>Ghent University, Ghent, Belgium, <sup>2</sup>Research Foundation Flanders, Brussels, Belgium

SO.3.25 - How can parenting support healthy behaviours in children and adolescents?, UKK - K3+4 (Level 3), June 17, 2023, 9:40 AM - 10:55 AM

**SIG - Primary Choice:** G. Children and families

**Purpose:** Optimal compositions of 24-hour movement behaviours (24-HMBs; i.e., sufficient sleep, low levels of sedentary time (ST), high levels of physical activity (PA)) are associated with positive health outcomes in adolescents. Adolescence is typically characterized by an increasing need for independence but parents remain important actors in developing and changing their children's behaviours. However, evidence is lacking on how parenting practices are related to adolescents' 24-HMB compositions. Getting insight in these associations can provide direction for interventions aiming to optimize 24-HMB compositions in adolescents. The aim of this study was therefore to investigate if parenting practices were associated with adolescents' 24-HMB compositions.

**Methods:** Valid 24-HMB data (i.e., sleep, ST, light and moderate-to-vigorous PA) were obtained from the ActiGraph GT3X in 72 Belgian adolescents (mean age: 14.82±1.73 years; 80% girls). An online questionnaire measured adolescents' socio-demographics and perceived parenting practices. Parenting practices were conceptualized within the self-determination theory and reflected the parental support provided to fulfil adolescents' psychologic needs of autonomy, competence, and relatedness (i.e., need-supportive parenting practices). To account for the intrinsic co-dependency of 24-HMBs, a compositional data approach was applied, followed by isometric log-ratio transformations on the compositional data. To investigate the association between parenting practices and 24-HMB compositions, linear regression models were used. Prediction models were applied to assess if 24-HMBs compositions changed with varying levels of parenting practices.

**Results:** Adolescents' daily composition consisted for 35% of sleep (505.34 min/day), 47% of ST (674.31 min/day), 18% of light PA (260.33 min/day) and 0.0014% of moderate-to-vigorous PA (0.02 min/day). Need-supportive parenting practices were not significantly associated with adolescents' 24-HMB compositions (relatedness:  $p=0.123$ , competence:  $p=0.824$ , autonomy:  $p=0.553$ ). When plotting prediction models, ST decreased whereas light PA and sleep increased with increasing need-supportive parenting practices. No substantial changes were observed in moderate-to-vigorous PA.

**Conclusions:** Given the dramatically low levels of moderate-to-vigorous PA and high levels of ST, findings of this study call for action to optimize 24-HMB compositions in adolescents. Increasing parental support to fulfil adolescents' needs for autonomy, competence, and relatedness might be a promising strategy to optimize adolescents' ST, light PA and sleep duration but more research is warranted.

# Weeknight Supper Savers: Family-based intervention to reduce household food waste

**Associate Professor Jess Haines<sup>1</sup>**, Mr. Amar Laila<sup>1</sup>, Dr. Kate Parizeau<sup>1</sup>, Dr. Michael von Massow<sup>1</sup>

<sup>1</sup>University of Guelph, Guelph, Canada

**SO.3.25 - How can parenting support healthy behaviours in children and adolescents?, UKK - K3+4 (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** To assess the feasibility, acceptability, and preliminary impact of Weeknight Supper Savers, a family-based food waste intervention.

**Methods:** Nineteen families with at least one child between 9-12 years of age and with no prior nutrition or food training participated in a pre/post design pilot study. Families completed a 4-week intervention, which was based on Theory of Planned Behaviour, and included: a) a chef-led online cooking class; b) a food waste toolkit that provided families with tips, kitchen tools, and recipes to reduce food waste, and c) tips to reduce food waste delivered via 4 text messages/week. The primary outcome was feasibility and acceptability of the intervention. Secondary outcomes were pre/post intervention changes in quantity of household food waste, and level of food literacy and waste-related knowledge, attitudes, and behaviours of parents and children.

**Results:** Of the 19 families who completed the baseline assessment, 18 families attended their scheduled cooking class. All parents (17 mothers; 12 fathers) and 17 of the 22 children who completed the post-intervention process survey reported being satisfied with the program. Compared to baseline, household avoidable fruit and vegetable waste and unavoidable other food waste significantly decreased by 37% and 53%, respectively. At post-intervention more parents reported being confident in reducing food waste and more children correctly interpreted “best before” dates as compared to baseline.

**Conclusion:** The Weeknight Supper Savers intervention was well-received and may decrease both avoidable and unavoidable household food waste. A full-scale randomized controlled trial with a larger sample is warranted.

# Perceptions and feeding experiences of Australian fathers of young children while living with disadvantage

**Mr. Tsz Hei Jeffrey So (corresponding author)**<sup>1</sup>, Dr. Kimberley A Baxter<sup>1</sup>, Dr. Rebecca Byrne<sup>1,2</sup>, Dr. Smita Nambiar-Mann<sup>1,2</sup>, Prof. Danielle Gallegos<sup>1</sup>

<sup>1</sup>Woolworths Centre for Childhood Nutrition Research, Faculty of Health, Queensland University of Technology, Brisbane, Australia, <sup>2</sup>School of Exercise and Nutrition Sciences, Faculty of Health, Queensland University of Technology, Brisbane, Australia

**SO.3.25 - How can parenting support healthy behaviours in children and adolescents?, UKK - K3+4 (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Fathers influence children's nutrition and development in a unique way. Research examining fathers' role in child feeding is gaining interest, however, paternal feeding practices in the context of disadvantage is limited. Family socioeconomic factors are associated with the physical and psychosocial development of children and can also impact caregivers' ability to feed responsively. The aim of this research was to explore the perceptions and experiences of feeding in fathers experiencing hardship.

**Methods:** This qualitative study employed a constructionist approach and symbolic interactionism lens to interpret meanings for behaviours. Fathers (n=25) of children aged between 6 months and 5 years who experienced financial hardship participated in semi-structured interviews across Australia. Interviews were analysed using reflexive thematic analysis.

**Results:** Five themes were constructed from the data: (i) disrupting normative gendered roles: from tension to acceptance, (ii) responsibilities for food work are based on strengths, opportunities and values, (iii) prioritising feeding children: managing adversities, (iv) contextual factors facilitate or hinder feeding practices, and (v) seeking out help: dads are "brushed to the side". Fathers embraced involved fatherhood norms. Their responsibilities for food work varied depending on family structure and capacity, employment, maternal gatekeeping, and intergenerational, cultural and gender norms around food provision. Economic, emotional and environmental stressors contribute to financial and mental strain, and food insecurity. Fathers described resource management strategies to maintain normality and protect children's food access at the expense of caregivers. Food parenting practices are driven by value, adversity and emotions. Challenging child behaviours coupled with limited resources and mental capacity triggered adjustment of feeding strategies to align with reality, such as tailoring to child food preferences and allowing screentime to avoid power struggles. Fathers reported feeling unsupported by health services and therefore sought information elsewhere, such as internet and social networks

**Conclusions:** Fathers are involved in feeding but faced personal and systemic barriers. It is crucial for health services to review their practices to include fathers and support their unique needs. The values that underpin father-child mealtime interactions and coping mechanisms amidst adversities can be leveraged to inform child feeding interventions to promote child health and development.

# Successfully involving parents in family lifestyle interventions. Where is the fun in that?

**Miss Lisa S.E. Harms<sup>1</sup>**, Assistant Professor Kathelijne M.H.H. Bessems<sup>1</sup>, Associate Professor Jessica S. Gubbels<sup>1</sup>, Associate Professor Patricia van Assema<sup>1</sup>, Assistant Professor Sanne M.P.L. Gerards<sup>1</sup>

<sup>1</sup>Department of Health Promotion, School of Nutrition and Translational Research in Metabolism (NUTRIM), Maastricht University, Maastricht, Netherlands

**SO.3.25 - How can parenting support healthy behaviours in children and adolescents?, UKK - K3+4 (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Families with young children are an important target group for prevention interventions. A relevant evolution has been the development of comprehensive multi-setting intervention approaches. Promising effects on child energy balance-related behaviours encourage the implementation of such interventions. Yet, a common barrier is the generally low reach and involvement of specifically parents. Therefore, we aimed to gain a better understanding of what works in involving parents, and why.

**Methods:** Multiple mixed method studies focused on two interventions targeted at children and families. The first, SuperFIT, is an effective intervention approach targeting families with young children (2-4 year olds) through increased attention for healthy nutrition and physical activity in the preschool and home setting. The second, Up for Cooking, targets families with children attending primary school (4-12 year olds) through an (online) food literacy cooking intervention. Three mixed-method studies with parents (n=38-54, total n=133) and implementers evaluated different elements of the interventions. An inductive approach used qualitative data (i.e., semi-structured interviews, open-ended questionnaires) to gain insight if, how and why parents applied newly acquired knowledge and skills in their daily family life, or why they did not. Quantitative data (i.e., over-time measurements of parenting practices, food literacy) was used to confirm perceived impact of the intervention.

**Findings:** Overall, the studies taught us that parents appreciated on-the-spot coaching for their child's behaviour, such as how to promote physical activity or the use of positive parenting practices. Having fun and receiving tangible materials were a major success factor in all activities. Children served as change agents, and their enthusiasm to take, for example, a mascot home was an important facilitator for parents to be involved in the intervention. In addition, parents liked to receive practical tips (i.e., child appropriate cutting techniques, simple games). At the same time, parents required more guidance and cues to change daily life routines consistently. There was room for improvement in accessibility, scheduling, and the use of narratives, to ensure fit with daily family routines.

**Conclusions:** This research adds to our knowledge on parental involvement in lifestyle interventions, by focusing on mixed-method approaches using qualitative and quantitative measurements.

# Parental and child characteristics are associated with low satiety responsiveness in children

**Ms. Catharina Sarkkola**<sup>1,2</sup>, Dr. Aino-Maija Eloranta<sup>3,4,5</sup>, Dr. Marja H Leppänen<sup>1,2</sup>, Dr. Heli Viljakainen<sup>1,2</sup>, Dr. Satu Männistö<sup>6</sup>

<sup>1</sup>Folkhälsan Research Center, Helsinki, Finland, <sup>2</sup>Faculty of Medicine, University of Helsinki, Helsinki, Finland, <sup>3</sup>Institute of Biomedicine, School of Medicine, University of Eastern Finland, Kuopio, Finland, <sup>4</sup>Institute of Public Health and Clinical Nutrition, University of Eastern Finland, Kuopio, Finland, <sup>5</sup>Department of Medicine, Endocrinology and Clinical Nutrition, Kuopio University Hospital, Kuopio, Finland, <sup>6</sup>Department of Public Health and Welfare, Finnish Institute for Health and Welfare, Helsinki, Finland

**SO.3.25 - How can parenting support healthy behaviours in children and adolescents?, UKK - K3+4 (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose** Low satiety responsiveness (SR) is thought to progress unhealthy weight development. SR evolves in early life, thus identifying children with a high risk of low SR is important. However, parental and child characteristics associated with low SR are not fully known. We therefore studied which family determinants increase the risk of low SR in school-aged children.

**Methods** This study included 5,973 children aged 9–12 years from the Finnish Health in Teens (Fin-HIT) cohort in 2011–2014. The parents filled in a questionnaire on their child's SR and parental feeding practices. Within the three-class variable, low SR was defined as parent agreeing or slightly agreeing with the statement "If I did not guide or regulate her eating she would eat too much". We had data on child characteristics: number of homes and siblings, age when entering daycare, food allergies, meal regularity, height and weight, and parental characteristics: age, socioeconomic status, depression, exhaustion, breastfeeding, height and weight. We used ordinal and stepwise logistic regression as statistical methods.

**Results** The frequency of low SR was 10.1% in the cohort. In the stepwise multivariate model, boys had an increased risk of low SR (OR 1.30, 95% CI 1.07–1.59) compared with girls. Children with overweight (12.1% of the cohort) and obesity (2.4%) had a 9- and 30-fold risk, respectively, for low SR, compared with normal weight children. Children whose parents cheered them up with something to eat if they were sad or upset had higher risk of low SR (OR 1.28, 95% CI 1.04–1.57). Parental depression was associated with higher risk of low SR in the children (OR 1.50, 95% CI 1.09–2.05). Eating breakfast and dinner irregularly and having two homes, a parent with overweight/obesity and with lower socioeconomic status were associated with low SR in the unadjusted model only.

**Conclusions** We identified parental feeding practices, e.g. cheering up the child with food, and parental depression as independent risk factors for low SR in school-aged children. The results contribute with new knowledge of determinants of SR, which could be targeted to manage overeating and prevent overweight in school-aged children.

# The role of supportive coparenting relationship quality in spillover from parental stress to family meals: An ecological momentary assessment study

Dr. Anna Hochgraf<sup>1</sup>, Dr. Allan Tate<sup>2</sup>, Dr. Katie Loth<sup>1</sup>, **Dr. Jerica Berge<sup>1</sup>**

<sup>1</sup>The University of Minnesota, Minneapolis, USA, <sup>2</sup>The University of Georgia, Athens, USA

**SO.3.25 - How can parenting support healthy behaviours in children and adolescents?, UKK - K3+4 (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Family meals are protective against the development of obesity and disordered eating among youth (Berge et al., 2015; Neumark-Sztainer et al., 2008). However, the extent to which family meals are protective may depend on meal atmosphere (Loth et al., 2015). Parents' experiences of daily stressors may hinder their capacity to facilitate family meals (Tate et al., 2020) and have implications for family meal atmosphere. We examined whether 1) family meals are less likely to occur and 2) meal atmosphere is less positive on days when parents experience higher-than-usual stress, and 3) whether coparenting support buffers these associations.

**Methods:** The analytic sample was 497 parents of children ages 5–7 years (racially stratified; Asian, Black, Hmong, Latinx, Somali, and White families) who participated in a mixed-methods study. Parents reported their coparenting relationship quality at baseline (Abidin & Brunner, 1995) and completed up to 8 days of ecological momentary assessments. Each day, parents reported their stress level, whether they ate dinner with their child, and how positive the meal atmosphere was. Multilevel logistic regression was used to address research questions.

**Results:** Findings suggested a trend such that on days when parents experienced higher-than-usual stress, odds of engaging in a family meal were lower (OR=0.92, 95% CI=[0.83, 1.01]). Coparenting support did not moderate this association. Higher-than-usual stress was associated with lower odds of positive meal atmosphere, and there was a trend for coparenting support predicting higher odds of positive atmosphere; however, these effects were qualified by an interaction between stress and coparenting (OR=0.89, 95% CI=[0.81, 0.97]). For each unit of stress above parents' usual level, the probability of positive meal atmosphere was 0.03 units lower for parents with high support and 0.02 units lower for parents with moderate support.

**Conclusions:** When parents experienced higher-than-usual stress, family meal atmosphere was less positive and higher coparenting support did not alleviate this. Although coparenting support is generally beneficial, it may be that when parents feel especially stressed and they have a highly involved coparent, negative emotions transmit more easily through families. Sources of stress and momentary perceptions of support may be key to elucidating these complex associations.

# Parental Controlling Feeding Practices Might Reduce Adolescents' Eating Competence. The STEPS Study.

**Mrs. Saija Tarro**<sup>1,2</sup>, Dr. Hanna Lagström<sup>1,2</sup>, Ms. Sabrina Granberg<sup>4</sup>, Dr. Mirkka Lahdenperä<sup>3</sup>

<sup>1</sup>Department of Public Health, University of Turku, Turku, Finland, <sup>2</sup>Centre for Population Health Research, University of Turku and Turku University Hospital, Turku, Finland, <sup>3</sup>Department of Biology, University of Turku, Turku, Finland, <sup>4</sup>The Faculty of Sport and Health Sciences, University of Jyväskylä, Jyväskylä, Finland

**SO.3.25 - How can parenting support healthy behaviours in children and adolescents?, UKK - K3+4 (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Eating competence concept, based on The Satter Eating Competence Model, includes eating attitudes, food acceptance, internal regulation and contextual skills. Competent eaters have natural and positive attitudes about eating and food. Parental feeding practices have been associated with child BMI status. However, the association of parental practices and eating competence are largely unknown among adolescents. We examined association between parental feeding practices and eating competence among adolescents aged 11-13 years.

**Methods:** We used data from a prospective Steps to Healthy Development follow-up study from South-West Finland, with 348 mother-adolescent dyads and 215 father-adolescent dyads. Eating competence was evaluated by using the Satter Eating Competence Inventory (ecSI 2.0) instrument filled by adolescents. Parental feeding practices were evaluated with Child Feeding Questionnaire filled by parents including following factors: Restriction, Pressure to Eat, Monitoring and Concern for adolescent's weight. Linear regression analyses were performed, with parental feeding practices as predictors and eating competence as dependent variables. Analyses were made separately for mother-adolescent pairs and father-adolescent pairs controlling for parental education and income, parent BMI, child BMI-SDS and child sex.

**Results:** We found that Restriction by mother but not by father, was associated negatively with adolescents' total eating competence score (Beta (95% CL): -1.95 (-3.15 – -0.75); p=0.002), eating attitudes (Beta (95% CL): -0.75 (-1.22 – -0.28); p=0.002) and food acceptance (Beta (95% CL): -0.58 (-0.93 – -0.22); p=0.002). In addition, higher scores in Pressure to Eat by mother and father, significantly reduced adolescent eating attitudes (p=0.03). In addition, mother's greater Concern for adolescent's weight was negatively associated with adolescent's total eating competence score (p=0.006), eating attitudes (p<0.001) and internal regulation (p=0.005).

**Conclusions:** The results indicate that food-related parenting practices may affect adolescents' eating competence. Especially Restriction and Pressure to Eat may be detrimental to adolescents' eating competence and positive eating attitudes. Further, Concern for adolescent's weight might be reflected in adolescent's eating competence. However, more studies are needed to further confirm this finding in more diverse samples and other food cultures.

# Do parents' intentions translate into behaviours?

## Examining parental support behaviours and device-measured physical activity among children and youth with disabilities

**Ms. Katerina Disimino**<sup>1</sup>, Ms. Maeghan E. James<sup>2</sup>, Dr. Christine Voss<sup>3</sup>, Dr. Rebecca L. Bassett-Gunter<sup>1</sup>, Dr. Kelly P. Arbour-Nicitopoulos<sup>2</sup>

<sup>1</sup>York University, Toronto, Canada, <sup>2</sup>University of Toronto, Toronto, Canada, <sup>3</sup>University of British Columbia, Vancouver, Canada

**SO.3.25 - How can parenting support healthy behaviours in children and adolescents?, UKK - K3+4 (Level 3), June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** G. Children and families

**Purpose:** Many children and youth with disabilities (CYD) do not engage in sufficient physical activity (PA), warranting the investigation of strategies to promote enhanced PA engagement. Limited research has explored the relationship between parental support for PA and child PA among families of CYD. Moreover, intentions to engage in parental support for PA often fail to translate into behaviour. The multi-process action control framework (M-PAC) serves as a tool for understanding this intention-behaviour gap and more optimally fostering parental support for PA. Guided by the M-PAC framework, this study examined the relationship between intentions, regulatory behaviours, and support behaviours with respect to parental support for PA and how, in turn, parental support for PA behaviours are related to child PA behaviours.

**Methods:** Data were collected cross-sectionally through the pan-Canadian National PA Measurement study. Parents (N=148; 89% mothers) of CYD aged 5 to 17 (71% boys; 51% developmental disabilities) completed an online questionnaire measuring variables related to parental support for PA on 5-point Likert scales (intentions, 1=strongly disagree to 5=strongly agree; regulatory behaviours, 1=never/rarely to 5=daily; support behaviours, 0=none to 4=daily). Child PA behaviours (i.e., step counts) were measured over a 28-day period via Fitbits. A regression (path) analysis was conducted using the statistical software R. Mean scale scores (intentions, regulatory behaviours, and support behaviours) and median step counts were the observed variables in the model.

**Results:** On average, parents had high intentions to support their children's PA (Med=4, IQR=1), engaged in regulatory behaviours once per month (Med=2, IQR=1.19), and provided support for their children's PA "sometimes" (Med=2, IQR=1.15), and children's step counts were 9654 steps per day (SD=3727). Aligning with the M-PAC framework, intentions ( $\beta=0.18$ ,  $p=0.009$ ) and regulatory behaviours ( $\beta=0.53$ ,  $p<0.001$ ) significantly predicted parental support for PA behaviours. In turn, parental support for PA behaviours significantly predicted child PA behaviours ( $\beta=0.18$ ,  $p=0.031$ ).

**Conclusions:** This is one of few studies to examine parental support for PA in families of CYD. Predictors of parental support for PA and child PA were identified, which will be necessary to effectively inform intervention targets that bridge the intention-behaviour gap and enhance PA behaviours among CYD.

# Community-Based Lifestyle Intervention Improves Behavioural and Health Outcomes for Singaporean Women

**Dr. Elaine Yee-Sing Wong<sup>1</sup>**, Prof. Andy H Lee<sup>1</sup>, Dr. Anthony P James<sup>1</sup>, Prof. Jonine Jancey<sup>1</sup>

<sup>1</sup>Curtin University, Perth, Australia

**SO.3.26 - Lessons learned from implementation in the community setting, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**PURPOSE:** Physical inactivity and unhealthy eating habits are behavioural risk factors leading to a rise in non-communicable diseases (NCDs) among Singaporean women. To address the escalating NCDs, the Singapore Physical Activity and Nutrition Study (SPANS) is the first clustered randomised controlled (RCT) to examine the impact of a culturally relevant lifestyle intervention to improve behavioural and health outcomes among women aged  $\geq 50$  years.

**METHODS:** Social Cognitive Theory underpinned the 6-month community-based RCT targeting women from 27 recreational centres in Singapore. 682 participants were randomised to either the intervention ( $n = 351$ ) group to engage in the SPANS program (PA classes, nutrition workshops and dietary counselling sessions), and received health resources, or the control ( $n = 331$ ) group that received only a falls prevention booklet. Outcome measures consisted of PA and dietary behaviours, anthropometric, blood pressure (BP) measurements and health-related quality of life (HR-QOL) indicators. Pre-post measurements were collected and analysed using univariate statistics and generalised estimating equations (GEE) modelling.

**RESULTS:** A final analysed sample of intervention (295) and control (285) participants completed the intervention. After controlling for confounders, the GEE analyses confirmed that the intervention group displayed statistically significant mean increases in PA: moderate-intensity, vigorous-intensity and total ( $p < 0.001$ ); increased mean intake frequency of fruit ( $p = 0.001$ ), vegetables ( $p = 0.049$ ) and wholegrains ( $p = 0.041$ ), mean reduction in salt and salty sauce intake ( $p = 0.042$ ) and sugary beverages ( $p = 0.019$ ) relative to the control group. Moreover, the intervention group had statistically significant mean reductions in systolic BP ( $p = 0.020$ ), diastolic BP ( $p = 0.001$ ), body fat percentage ( $p < 0.001$ ) and self-reported 'no bodily pain' ( $p = 0.039$ ) in the intervention group compared to the control group.

**CONCLUSIONS:** The GEE analyses confirmed that the program was effective in improving PA and dietary behaviours, reducing systolic and diastolic BP and body fat percentage, as well as self-reported 'no bodily pain' in the target group. This study could be replicated and upscaled in other community settings as a promising primary prevention initiative for chronic conditions.

# Selecting Implementation Strategies to Overcome Barriers to Delivering and Scaling Rural Healthy Eating and Active Living Policy, Systems, and Environmental Change Interventions

**Dr. Bailey Houghtaling<sup>1,2,3</sup>**, Dr. Laura Balis<sup>4</sup>

<sup>1</sup>School of Nutrition and Food Sciences, Louisiana State University (LSU) & LSU Agricultural Center, Baton Rouge, USA, <sup>2</sup>Department of Human Nutrition, Foods, and Exercise, Virginia Tech, Blacksburg, USA,

<sup>3</sup>Gretchen Swanson Center for Nutrition, Omaha, USA, <sup>4</sup>Pacific Institute for Research and Evaluation, Louisville, USA

**SO.3.26 - Lessons learned from implementation in the community setting, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** The aim of this work was to: 1) select Expert Recommendations for Implementing Change (ERIC) implementation strategies required to overcome Louisiana Cooperative Extension Services (LCES) Family and Consumer Sciences practitioners' barriers to delivering and scaling rural healthy eating and active living policy, systems, and environmental (PSE) interventions; and, 2) to document/disseminate the process to inform dissemination and implementation science methods for community public health contexts.

**Methods:** Formative research about LCES practitioners' multi-level barriers based on the updated 2022 Consolidated Framework for Implementation Research (2022 CFIR) (e.g., communications, knowledge/resources, organizational culture, partnerships, opportunity/capability, innovation complexity) were used as inputs to the CFIR-ERIC Implementation Strategy Matching Tool. The creation of the tool was based on a sample of implementation scientists/practitioners, largely reflecting a U.S. clinic or patientcare perspective, and involved the matching of CFIR constructs to 73 ERIC implementation strategies and ranking by importance. To enhance relevance in community—rather than clinical—contexts, the tool's implementation strategy outputs were replaced with community setting terminology/definitions to align with a recent commentary. Two expert implementation science and community public health researchers reviewed the adapted tool output against formative research findings, selected relevant strategies, and categorized strategies according to Leeman et al.'s classifications using discussion and agreement.

**Results:** The CFIR-ERIC Implementation Strategy Matching Tool recommended 45 high priority implementation strategies to overcome LCES practitioners' barriers to delivering and scaling rural healthy eating and active living PSE interventions. However, 16 of these strategies were excluded, mainly due to researchers' perceptions of poor fit to overcome barriers in the LCES and rural community context. Of 17 recommended lower priority implementation strategies, 8 were removed due to similar reasons. One implementation strategy not recommended by the tool was selected for inclusion to overcome identified barriers. Resulting, 39 ERIC implementation strategies were considered relevant in relation to formative research findings and were classified as: capacity building strategies (n=15); implementation process strategies (n=12); and integration strategies (n=12).

**Conclusions:** There was limited congruence between CFIR-ERIC Implementation Strategy Matching Tool recommendations and final selections. This indicates more work may be needed to improve implementation strategy and tool relevance for community public health contexts.

# Feasibility of a virtual health promoting intervention (Choose to Move) for older adults: A rapid adaptation in response to COVID-19

**Dr. Samantha M. Gray**<sup>1,2,3</sup>, Dr. Thea Franke<sup>2,3</sup>, Dr. Lindsay Nettlefold<sup>2,3</sup>, Associate Professor Dawn Mackey<sup>1,3</sup>, Dr. Joanie Sims Gould<sup>2,3,4</sup>, Prof. Heather McKay<sup>2,3,4</sup>

<sup>1</sup>Aging and Population Health Lab, Department of Biomedical Physiology and Kinesiology, Simon Fraser University, Burnaby, Canada, <sup>2</sup>Active Aging Research Team, University of British Columbia, Vancouver, Canada, <sup>3</sup>Centre for Hip Health and Mobility, Vancouver Coastal Health Research Institute, Vancouver, Canada, <sup>4</sup>Department of Family Practice, University of British Columbia, Vancouver, Canada

**SO.3.26 - Lessons learned from implementation in the community setting, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** E. Implementation and scalability

Public health directives to 'stay home' countered transmission of COVID-19 but exacerbated older adults' physical and social health challenges. Programs that supported older adults to remain mobile, independent, and socially connected—outside of high risk COVID-19 transmission spaces—became critical. Thus, we rapidly adapted an effective older adult health promoting intervention (Choose to Move; CTM) for virtual delivery in British Columbia (BC), Canada.

**Purpose:** To: 1) compare implementation outcomes of the CTM virtual program to pre-determined feasibility targets; and 2) describe the impact, facilitators, and barriers of the CTM virtual program on participants' mobility, physical activity (PA), loneliness, social network, and social isolation.

**Methods:** We conducted a 3-month, single-group, pre-post feasibility study. Activity coaches delivered 33 programs to a convenience sample of older adults (n=153; 86% female; 73±6 years) via Zoom during BC's 1<sup>st</sup> wave of COVID-19 (April-October 2020). We set feasibility targets for participant recruitment (50%), retention (80%), dose received (60%), and completion of virtual evaluation (80%). We collected survey data using validated tools to assess mobility, PA, loneliness, social network, and social isolation (0, 3-months). We used descriptive analyses to describe health outcomes. We conducted semi-structured telephone interviews with older adults (0, 3-months, & during 2<sup>nd</sup> COVID-19 wave). Deductive framework analysis was used in NVivo to identify themes.

**Results:** Most feasibility targets were met (dose received, retention, virtual evaluation). We fell short of our recruitment target—44% of those we contacted volunteered to participate. We retained 87% of participants at 3 months, who attended 74% of group meetings. Virtual evaluation completion rates were >85% across time points. Approximately 2/3 of older adults maintained or improved their mobility, PA, loneliness, social network, and social isolation at 3 months. Facilitators of participation were motivation; accountability; social connection. Barriers were lack of inclusive (age and ability) at-home exercise options; accessibility. Follow-up interviews suggested a decline in mobility, PA, and social connection when virtual program support was withdrawn.

**Conclusions:** It was feasible to implement and evaluate CTM virtually. Flexible, virtual interventions are an important mainstay as we navigate public health emergencies in future and seek to reach homebound older adults.

# From start-up to scale-up of a health-promoting intervention for older adults: The Choose to Move story

Dr. Lindsay Nettlefold<sup>1,2</sup>, **Dr. Samantha Gray**<sup>1,2,3</sup>, Dr. Joanie Sims Gould<sup>1,2,4</sup>, Prof. Heather McKay<sup>1,2,4</sup>

<sup>1</sup>Active Aging Research Team, University of British Columbia, Vancouver, Canada, <sup>2</sup>Centre for Hip Health and Mobility, Vancouver Coastal Health Research Institute, Vancouver, Canada, <sup>3</sup>Aging and Population Health Lab, Department of Biomedical Physiology and Kinesiology, Simon Fraser University, Burnaby, Canada,

<sup>4</sup>Department of Family Practice, University of British Columbia, Vancouver, Canada

**SO.3.26 - Lessons learned from implementation in the community setting, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 9:40 AM - 10:55 AM**

## **SIG - Primary Choice:** E. Implementation and scalability

Interventions shown to ‘work’ in efficacy or effectiveness trials can only improve population level health if they are successfully scaled-up outside of the research setting. However, few interventions are ever scaled-up. Factors such as the need to adapt interventions prior to implementing them in diverse settings at scale, retaining fidelity to the intervention, and cultivating the necessary community and funding partnerships can all present a challenge. Thus, we share an example of successful scale-up of an effective health-promoting intervention for older adults, Choose to Move (CTM).

**Purpose:** To: 1) describe the frameworks and processes adopted to implement, adapt, and scale-up CTM across British Columbia (BC), Canada; 2) provide an overview of the phased approach to scale-up; and 3) share lessons learned while implementing and scaling-up CTM with community delivery partners.

**Methods:** CTM delivery is guided by implementation (Framework for Effective Implementation; Interactive Systems Framework) and scale-up (Yamey; Simmons & Shiffman) frameworks and adaptation processes. Phased implementation and scale-up spanned 8 years from formative evaluation (2015) to Phases 1 & 2 (2016-2017; small scale) to Phase 3 (2018-2020; large scale) to Phase 4 (2020-present; optimized). We systematically adapted CTM between phases to respond to stakeholders (2017); to reach rural and remote communities (2018); to reduce costs (2019); and for the COVID-19 context (2020).

**Findings:** Across all phases, delivery partners implemented >450 CTM programs to >4300 older adults in 70 community sites in BC. CTM Phases 1, 2, and 3 increased older adults’ physical activity, mobility, and social connectedness. There was ‘voltage drop’ in some measures as scale-up proceeded but an approximately 2-fold benefit in social isolation after adaptations. Our delivery system deemed CTM implementation acceptable and feasible. Features critical for successful scale-up were: an evidence-based, flexible, and adaptable program; committed government and community partners; alignment with organizational priorities; active participation of stakeholders to design, adapt, and implement; strong leadership and governance by our support team.

**Conclusions:** It is critical to build scalability and adaptability into health promoting interventions by ‘beginning with the end in mind’ and forming trusted partnerships with key stakeholder groups (i.e., in the academic, community, and public sectors).

# Implementation barriers and facilitators for referral from the hospital to community-based lifestyle initiatives: a qualitative study

**Ms. Leonie M. Te Loo**<sup>1,2,3</sup>, Dr. Jasmijn Holla<sup>3,5</sup>, Dr. Joyce Vrijsen<sup>4</sup>, Ms. Anouk Driessen<sup>1,2,3</sup>, Ms. Marlinde L. **SO.3.26 - Lessons learned from implementation in the community setting, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 9:40 AM - 10:55 AM**

## **SIG - Primary Choice:** E. Implementation and scalability

**Purpose** A dedicated lifestyle front office in the hospital is a new approach to refer patients at increased risk for or with communicable diseases to community-based lifestyle initiatives. Successful implementation and adoption of such a lifestyle front office requires knowledge about implementation barriers and facilitators. Therefore the aim is to identify implementation barriers and facilitators for referral from the lifestyle front office in the hospital to community-based lifestyle initiatives.

**Methods** We conducted semi-structured interviews until data saturation, with 23 healthcare professionals working in the community (i.e. lifestyle coaches (n=11); dietician (n=1); care sport connectors (n=4); social domain health care professionals (n=3); health club managers (n=4)). A semi-structured topic guide was used, inquiring about (1) the professional's lifestyle initiative; (2) their views about referral from the hospital; and (3) their preferences, needs and recommendations for collaboration with the hospital. The online interviews lasted on average 45 minutes, were audio recorded and transcribed verbatim. A thematic content analysis was conducted in software package MAXQDA 2020.

## **Results**

Barriers and facilitators were divided into two main themes: 1) possible referral options in the community; and, 2) collaboration from the community with a lifestyle front office in the hospital. For possible referral options barriers were found regarding the financial, cultural or geographical accessibility of the referral options. Quality of referral options was also mentioned as barrier. For collaboration facilitators were found regarding a personal and equal relationship with regular contact with the lifestyle broker and a secure digital platform for communication. However, it was mentioned that the segregation between primary and secondary/tertiary care is a barrier for collaboration. Furthermore, guidelines on referral information and responsibility were mentioned as facilitators.

**Conclusions** Overall, the idea of collaboration with a lifestyle front office in the hospital was supported by community-based healthcare professionals. In order for a lifestyle front office in the hospital to be successful, some effort should be made to identify all possible referral options and to work closely and on a personal basis with community-based healthcare professionals. Extra attention is needed to facilitate collaboration between the hospital and the community.

# Workplace choice architecture cueing to healthy eating and physical activity: Acceptance among implementers and employees

**Ms. Eeva Rantala**<sup>1,2,3</sup>, Dr. Saara Vanhatalo<sup>2</sup>, Prof. Federico J. A. Perez-Cueto<sup>4</sup>, Prof. Jussi Pihlajamäki<sup>1,5</sup>, Prof. Kaisa Poutanen<sup>2</sup>, Dr. Leila Karhunen<sup>1</sup>, Prof. Pilvikki Absetz<sup>6</sup>

<sup>1</sup>Institute of Public Health and Clinical Nutrition, University of Eastern Finland, Kuopio, Finland, <sup>2</sup>VTT Technical Research Centre of Finland, Espoo, Finland, <sup>3</sup>Finnish Institute for Health and Welfare, Helsinki, Finland, <sup>4</sup>Department of Food, Nutrition and Culinary Science, Umeå University, Umeå, Sweden, <sup>5</sup>Department of Medicine, Endocrinology and Clinical Nutrition, Kuopio University Hospital, Kuopio, Finland, <sup>6</sup>Faculty of Social Sciences, Tampere University, Tampere, Finland

**SO.3.26 - Lessons learned from implementation in the community setting, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Redesigning choice architectures—the way available options are provided in decision-making contexts—appears a promising approach to promote healthy behaviours, but the acceptability of this approach keeps sparking discussion. Whilst some evidence suggests that people welcome choice architecture interventions for promoting health, acceptance at the workplace context remains unknown. This study evaluated the acceptability of a quasi-experimental implementation-effectiveness trial that targeted the choice architecture of the worksite environment.

**Methods:** Altogether 53 worksites from 16 organisations participated in the intervention. Over 12 months, the sites implemented in total 23 choice architecture strategies (Mdn 3 per site) for healthy eating and daily physical activity. The strategies applied numerous behaviour change mechanisms, including primes, prompts, and alterations to the availability, visibility, and accessibility of choice options. The acceptability evaluation covered the perspectives of site implementers and influenced employees. The evaluation built on 1) deductive qualitative content analysis of implementer interviews (n=65 informants) conducted at months six and twelve, and 2) quantitative analysis of an employee questionnaire (n=1124) conducted at month twelve. Qualitative analysis focused on implementers' thoughts and observations of the intervention and its implementation, considering six domains of acceptability as defined by the Theoretical Framework of Acceptability: ethicality, affective attitude, burden, intervention coherence, opportunity costs, and perceived effectiveness. Quantitative analysis used descriptive statistics to examine overall acceptance among employees of eight specific choice architecture strategies employed in the intervention (scale: 1=completely disapprove, 7=completely approve).

**Results:** Implementers considered the choice architecture approach ethical for workplace health promotion, expressed mostly positive affective attitudes to implemented strategies, and found the implementation to cause little burden. Understanding the rationale behind the intervention—i.e., intervention coherence—supported acceptance and implementation. Accepting opportunity costs appeared to depend on the perceived importance of the intervention and the intensity of implementation. Perceived effectiveness was mixed. Employees showed overall high acceptance of the evaluated strategies (M 6.5, SD 0.9, range 1–7), with little variation in the acceptability of individual strategies (M 6.3–6.6).

**Conclusions:** A range of choice architecture strategies appear generally acceptable for promoting healthy eating and daily physical activity at the workplace, as evaluated by implementers and employees across heterogeneous worksites.

# Tensions and Paradoxes of Scaling Up: A Critical Reflection on Physical Activity Promotion

**SO.3.26 - Lessons learned from implementation in the community setting, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Scaling up evidence-based interventions has been ubiquitously difficult in public health. Accelerating implementation of scalable solutions to address population physical inactivity is needed, although this requires reliable, dedicated resources, and establishment of strategic connections between stakeholders and policy priorities. Currently, we do not know why some interventions are successfully scaled over others, and how we can facilitate the process. This presentation discusses *tensions* (challenges and conflicts) and *paradoxes* (things contrary to expectations) that academics, practitioners and policymakers ('stakeholders') face when scaling up physical activity interventions.

**Methods:** A multidisciplinary two-day workshop involving stakeholders in physical activity scale-up (convened by the University of Newcastle, Australia, and the University of Ottawa, Canada; 2019). Objectives included exploring: (i) funding, evaluation and other challenges during scale-up; (ii) research designs, process and outcome measures, and costing; and (iii) collaboration between government and academic organisations. Workshop facilitators captured session notes, which were grouped into core topic areas. Core topics were organised and framed as '*tensions*' and '*paradoxes*' in the scale-up field.

**Results:** Tensions included: epistemology, methodology, time, and partnerships. Paradoxes included: 'reach without scale', 'planned serendipity' and 'simple complexity'. Tensions can impede scale-up progress. Paradoxes encourage a reframing of scaling mindsets. Implications and recommendations for future scale up research and practice included: (i) broadening theoretical approaches, (ii) re-thinking data sources, (iii) co-creation for planning and design, (iv) shared values and evaluation approaches, (v) improving research-practice roles and partnerships.

**Conclusions:** This presentation showcases new insights that extend what is already known from studies of scaling up. We explore challenging concepts such as whether we can improve scaling up and how the systems we work in (i.e., academic or government) contribute to the circumstances we face in population health. We adopted a unique approach to understanding scaling up, by synthesizing multiple viewpoints and framing these through a reflexive and critical lens of '*tensions*' and '*paradoxes*'. The originality of this work lies in the fact that

we delve deeper into stakeholders' assumptions, processes and expectations of scaling up, and challenge the ways we all contribute to desired or undesired scale up outcomes.

# Developing a Workplace Wide PA Intervention for Mental Health: Mapping of current physical activity and health behaviours

**Dr. Gemma Ryde<sup>1</sup>, Mr. Craig Tumblety<sup>1</sup>**, Dr. Evangelia Demou<sup>1</sup>, Mr. Paul Kelly<sup>2</sup>, Prof. Kate Hunt<sup>3</sup>, Mr. Michael Cusack<sup>4</sup>

<sup>1</sup>University of Glasgow, Glasgow, United Kingdom, <sup>2</sup>University of Edinburgh, Edinburgh, United Kingdom,

<sup>3</sup>University of Stirling, Stirling, United Kingdom, <sup>4</sup>ACS Clothing, Glasgow, United Kingdom

**SO.3.26 - Lessons learned from implementation in the community setting, Clarion Hotel Gillet - Room Gillesalen, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** E. Implementation and scalability

**Purpose:** Physical activity (PA) can improve both physical and mental health with evidence suggesting that PA can be as effective for mental health as antidepressants. Poor mental health is a key issue for the workplace with a significant proportion of absenteeism and burnout attributed to mental health and stress. This project aims to develop and evaluate a context sensitive, workplace wide PA intervention for mental health. The outcome from the mapping phase of this project will be discussed.

**Methods:** The project consists of four phases: 1) Review workplace PA interventions for improved mental health; 2) Map PA and mental health levels and health practices/policies across a whole workplace; 3) Develop an intervention using co-creation workshops assessing potential intervention strategies and; 4) Test the feasibility and acceptability of the intervention and measure PA and mental health outcomes. The project is based in a clothing rental and renewal company in Central Scotland (120 employees) with an embedded researcher at the organisation for a 4-year period. The workplace consists of both sedentary and hard physical labour occupations. For the mapping phase, all employees were offered an annual wellbeing assessment consisting of a health check (blood pressure, height, weight, hand grip and hair cortisol), online survey (demographics, mental health, stress, productivity), workplace audit (physical and social work environment and job profiles) and 24hr activity monitoring for 7 days (Actigraph accelerometer and heart rate). Activity profiles of the employees will be created and assessed against health outcomes.

**Results/findings:** Wellbeing assessments are due to finish in December 2022. To date 69 employees have participated in the wellbeing assessments. Data will be presented on the activity profiles of employees and health outcomes with a focus on mental health. Lessons learnt during this phase will also be reported.

**Conclusions:** Understanding current physical activity profiles in the workplace is an essential part of intervention development in this context. The findings from this study will help to provide key information on activity profiles in complex workplaces as part of the intervention development process.

# Co-design of a digital health intervention to engage childhood cancer survivors in physical activity

**Dr. Lauren Ha<sup>1,2</sup>**, Prof. Claire Wakefield<sup>1,2</sup>, Ms. Jacqueline Jacovou<sup>1,2</sup>, Dr. Suzanne Nevin<sup>1,2</sup>, Dr. David Mizrahi<sup>3,4</sup>, Dr. Christina Signorelli<sup>1,2</sup>

<sup>1</sup>School of Clinical Medicine, Faculty of Medicine and Health, The University of New South Wales, Sydney, Australia, <sup>2</sup>Behavioural Sciences Unit, Sydney Children's Hospital, Sydney, Australia, <sup>3</sup>The Daffodil Centre, The University of Sydney, a joint venture with Cancer Council NSW, Sydney, Australia, <sup>4</sup>Prince of Wales Clinical School, Faculty of Medicine and Health, The University of New South Wales, Sydney, Australia

**SO.3.27 - Novel interventions and studies on e & mHealth, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 9:40 AM - 10:55 AM**

## **SIG - Primary Choice:** D. e- & mHealth

Many childhood cancer survivors do not meet recommended physical activity guidelines, which exacerbates their already increased risk of developing cardiometabolic conditions. Previous research has highlighted the importance of using co-design methods to develop sustainable and acceptable health interventions. Our study aimed to collaborate with childhood cancer survivors, parents, and health professionals to explore their priorities and to co-design a digital health intervention to support childhood cancer survivors to be physically active. This abstract presents on the health professional data only.

We recruited Australian health professionals and community representatives working within paediatric oncology via social media. Participants completed a study-specific survey to rate the importance of certain features, content, modality, and functionality related to digital health and health behaviours. Guided by the survey responses, we conducted online semi-structured focus groups to discuss participants' perceived importance of different elements or features of digital health interventions. We transcribed the data verbatim and used inductive content analysis to identify common themes.

Participants (N=14) included exercise physiologists (n=7), nurses (n=3), physiotherapists (n=2), and representatives from community organisations (n=2). Participants reported that the most important elements of digital health interventions to engage survivors in physical activity were: 1) providing health behaviour education, 2) encouraging goal setting, 3) involving peers and parents, and 4) providing health professional support. The least endorsed features were: 1) facilitating engagement between cancer survivors, 2) using non-digital mediums, 3) providing wearable activity trackers, and 4) offering quizzes to test survivors' knowledge. Health professionals highlighted that intervention features such as physical activity comparisons or competitions with other survivors, monitoring step counts and quizzes may be distractions or barriers to survivors increasing their physical activity levels.

This project highlights health professionals' and community representatives' perceived importance of digital health elements to support childhood cancer survivors to be physically active. Co-design focus groups and interviews are underway with survivors and parents to explore their priorities of using digital health to support health behaviours. We will compare and integrate the multi-stakeholder perspectives to inform the co-development of a digital health program to facilitate an acceptable and sustainable intervention to support physical activity behaviours among survivors.

# Acceptability, use and usability of the mHealth app 'ecofit' promoting resistance training using outdoor gyms

**Dr. Anna Jansson**<sup>1,2</sup>, Prof. Mitch Duncan<sup>2,3</sup>, Prof. David Lubans<sup>1,2</sup>, Dr. Jordan Smith<sup>1,2</sup>, Prof. Adrian Bauman<sup>4</sup>, Prof. John Attia<sup>3</sup>, Prof. Ronald Plotnikoff<sup>1,2</sup>

<sup>1</sup>Centre for Active Living and Learning, University of Newcastle, Newcastle, Australia, <sup>2</sup>Active Living Research Program, Hunter Medical Research Institute, Newcastle, Australia, <sup>3</sup>School of Medicine and Public Health, University of Newcastle, Newcastle, Australia, <sup>4</sup>School of Public Health, University of Sydney, Sydney, Australia

**SO.3.27 - Novel interventions and studies on e & mHealth, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** This study describes the acceptability, use and usability of the smartphone application (app) developed for the *ecofit* effectiveness trial. The *ecofit* effectiveness trial aimed to determine the effects of an innovative multicomponent physical activity intervention promoting resistance and aerobic-based physical activity using mHealth, outdoor gym equipment, and social support.

**Methods:** We evaluated the 'ecofit' intervention using a two-arm cluster randomised controlled trial from September 2019 to March 2022 in two regional municipalities of New South Wales, Australia. We recruited a sample of 245 participants (72% female, mean age 53.4 years [SD = 13.9]) who were randomised to the *ecofit* intervention ( $n = 122$ ) or waitlist control ( $n = 123$ ) group. The intervention group received access to a smartphone app, which included standardised workouts tailored to 12 outdoor gym locations, self-monitoring functions and cognitive behavioural therapy resources. Participants in the intervention group also received one 90-minute introductory session where they were shown how to use the app, correctly perform some of the exercises, and encouraged to perform at least two *ecofit* workouts/week. Process evaluation data were collected using surveys ( $n=69$ ) and user data through the *ecofit* app. Data were analysed using descriptive statistics and presented as means (standard deviations [SD]), medians (interquartile ranks [IQR]) or counts (percentages) as appropriate.

**Results/findings:** Overall, 1,447 workouts were logged by participants in the app at 3-months (median=5.5, IQR = 19). The sit-to-stand self-assessment was the most frequently used self-assessment, (median completions = 1.0, IQR = 1.0, min = 0, max = 6). Overall, most participants (92.7%) found the information in the app provided them with enough detail to perform muscle-strengthening exercises and that the animated videos helped them perform the exercises correctly (84.0%). Approximately half (50.7%) agreed the goal setting function in the app encouraged them to complete workouts and most (86.9%) believed the app provided the flexibility to work out when it suited them.

**Conclusions:** This study demonstrates promise in using mHealth technology as a platform to promote muscle strengthening exercises using the outdoor environment in the community.

# Perceptions and expectations of an artificially intelligent physical activity chatbot – a focus group study

**Prof. Corneel Vandelanotte**<sup>1</sup>, Dr. Danya Hodgetts<sup>1</sup>, Dr. Quyen To<sup>1</sup>, Dr. Tasadduq Imam<sup>1</sup>, Dr. Mamunur Rashid<sup>1</sup>, Ms. Ashmita Karki<sup>1</sup>, Prof. Stewart Trost<sup>2</sup>, Prof. Carol Maher<sup>3</sup>

<sup>1</sup>Central Queensland University, Rockhampton, Australia, <sup>2</sup>The University of Queensland, Brisbane, Australia,

<sup>3</sup>University of South Australia, Adelaide, Australia

**SO.3.27 - Novel interventions and studies on e & mHealth, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Basic conversational agents or chatbots to support the adoption and maintenance of physical activity have demonstrated initial feasibility and efficacy. However, sophisticated physical activity chatbots that are truly intelligent and use the full spectrum of machine learning capabilities have not yet been developed. This study aimed to explore potential users' perceptions and expectations of using such a chatbot.

**Methods:** Six 90-minute online focus group meetings (n=45 adults) were conducted via Zoom in October 2022. Meetings were recorded and transcribed verbatim and content analysis was conducted to identify themes, categories, and sub-categories.

**Results:** While overall perceptions of current day chatbots were not positive, participants embraced the idea of a 'virtual assistant' providing physical activity support. Generally, participants indicated they would like to receive messages from the chatbot, but did not agree on the daily number, timing, tone and content of messages, which were all perceived needing to be highly individual. Participants agreed they would need to provide information to the chatbot to receive personalised messages from the chatbot, but they varied in the extent of information that they were willing to provide. Some wanted to provide minimal data (i.e., activity tracking data), while others were willing to share extensive information (e.g., GPS data, digital dairy data) to enhance chatbot functionality. Participants were not against the use of artificial intelligence or machine learning to produce a better chatbot, given that these technologies are already being used in many applications (e.g., social media). Participants agreed that the chatbot should have a specific personality, but didn't agree what that personality should be, with answers ranging from an 'exercise drill agent' to 'animal-based avatar'. Participants preferred the chatbot to use standalone software rather than being integrated in existing platforms (e.g., Facebook Messenger), due to data privacy concerns.

**Conclusions:** Participants were excited about the possibilities of using an artificially-intelligent chatbot to help them become more active, though simultaneously indicated the need for a large degree of personalisation. This poses challenges in terms of cost, development and functionality, especially for those participants who aren't willing to share much data with the platform.

# Using Design Thinking Process to develop a Digital Microlearning Responsive Feeding Intervention for Australian Families experiencing Food Insecurity: Eat, Learn, Grow

**Dr. Kimberley Baxter<sup>1</sup>**, Dr. Smita Nambiar<sup>1</sup>, Dr. Jeremy Kerr<sup>2</sup>, Dr. Danielle Gallegos<sup>1</sup>, Dr. Rebecca Byrne<sup>1</sup>

**SIG - Primary Choice:** D. e- & mHealth

**Purpose** Families experiencing economic hardship and food insecurity face multiple challenges in feeding their children. Feeding responsiveness may be negatively affected and how best to support families is unclear. Design Thinking and codesign is a consultative process which enables health researchers to respond to complex problems through a person-centric approach.

**Methods** From May2021-November2022, mixed methods were used to inform the development of a child feeding intervention, including parent codesign workshops, semi-structured interviews, home mealtime observations, an online survey and user testing sessions. Researchers drew on Design Thinking and codesign principles as a guiding framework to understand parents' perspectives on the topic. Parents/caregivers were recruited through various avenues and self-identified as experiencing economic hardship. The interviews were thematically analysed using the Framework Method to describe key themes and ideas. Codesign and user testing sessions were conducted, where parents engaged with three examples of intervention content to determine feasibility, acceptability, and accessibility of the content and digital delivery mode.

**Findings** Analysis of the data (workshops n=8; interviews n=29; home mealtime observations n=10) indicated mixed feeding practices, high mental load, lack of time and an overall preference for visual, short, and plain language information accessed via a mobile phone. In response, a child feeding intervention that utilised mobile first design was developed through a digital course creator platform. Researchers drew on cognitive load theory and social learning theory to create a series of short, interactive, and engaging content based on an educational strategy called microlearning. Codesign and user testing sessions (n=12) with parents, including fathers and mothers and those with diverse learning needs, indicated that the content was highly acceptable, and the information was accessible and engaging. The intervention will be evaluated in early 2023 with a pilot randomised controlled trial and follow up at 6 months.

**Conclusions** Collaborative codesign methods enable researchers to design interventions which respond to participant needs. Digital microlearning is a promising and innovative information delivery tool which can be applied to health intervention design. It utilises clear and concise messaging and leverages the high digital skills and the emerging technology at parents' fingertips through their mobile phone device.

# Chat-bot led lifestyle medicine program for Return-to-Work: a proof-of-concept study

**Dr. Jacinta Brinsley<sup>1</sup>**, Dr. Ben Singh<sup>1</sup>, Prof. Carol Maher<sup>1</sup>

<sup>1</sup>University of South Australia, Adelaide, Australia

**SO.3.27 - Novel interventions and studies on e & mHealth, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Work disability is a major public health burden. Being out of work is associated with increased morbidity and mortality. Technology-based interventions may provide an opportunity to address lifestyle risk-factors such as physical activity, diet, sleep and stress-management, offering opportunities to deliver accessible, and cost-efficient interventions. This proof-of-concept study aimed to analyze the engagement and adherence of a 6-week digital lifestyle program led by a virtual health coach “Lucy” for people on an active workers compensation claim and to evaluate preliminary efficacy for improving psychological distress and wellbeing.

**Methods:** Retrospective analyses of a single-arm non-randomized cohort ( $N = 78$ , mean age 46 years, 32% female) were completed. Primary outcomes included engagement, adherence and preliminary efficacy for improving psychological distress and wellbeing. Secondary outcomes were confidence and anxiety about returning to work and participant satisfaction. Analyses were undertaken on an intention-to-treat basis. Efficacy was assessed using Wilcoxon signed rank test for related samples. Wilcoxon effect sizes ( $r$ ) were interpreted as 0.1 - <0.3 small effect, 0.3 - <0.5 medium effect and 0.5+ large effect.

**Results/findings:** The dropout rate was 28% ( $N = 18$ ). Participants completed an average of 73% of the program and 95% of telehealth coaching sessions. Improvements in psychological distress (K10;  $p < .001$ ,  $r = .47$ ), depression (K10;  $p < .001$ ,  $r = .55$ ), anxiety (K10;  $p < .001$ ,  $r = .46$ ) and wellbeing (WHO-5;  $p < .001$ ,  $r = .62$ ) were observed from pre- to post-intervention. Confidence about returning to work increased ( $p < .001$ ,  $r = .51$ ) while anxiety about returning to work was unchanged. A significant improvement in return-to-work status was observed ( $\chi^2(4, N = 78) = 19.267$ ,  $p < .001$ ).

**Conclusions:** Findings from this study provide preliminary evidence indicating high engagement, high adherence and preliminary efficacy of a digital lifestyle medicine and psycho-education intervention for people on an active workers compensation claim. Artificial intelligence technology may be able to provide a practical, supportive and low-cost intervention to improve psychosocial outcomes among individuals on an active workers compensation claim.

# Personalized feedback messaging perspectives in a qualitative study among Black and Hispanic women: Implications for future mHealth behavioral interventions

**Dr. Grace Brannon**<sup>1</sup>, Ms. Hannah Affleck<sup>1</sup>, Ms. Sophia Mitchell<sup>1</sup>, Ms. Riley Wiland<sup>1</sup>, Ms. Victoria Munoz<sup>1</sup>, Dr. Kyras Brown<sup>1</sup>, Dr. Haleh Aghajani<sup>2</sup>, Dr. VP Nguyen<sup>1</sup>, Dr. Yue Liao<sup>1</sup>

SO.3.27 - Novel interventions and studies on e & mHealth, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 9:40 AM - 10:55 AM

## SIG - Primary Choice: D. e- & mHealth

**Purpose:** Behavioral interventions via providing personalized feedback messages are effective approaches towards adopting an active lifestyle. Most intervention messaging is generic and tested in primarily White populations. Given potential differences in cultural beliefs, it is critical to recognize specific needs that racial minority women must develop culturally sensitive mHealth interventions with personalized feedback. The objective of this study was to develop and test perceptions among minority women about feedback messages based on wearable activity tracker data that target physical activity, sedentary behavior, and sleep.

**Methods:** Fifty-three insufficiently active, obese women (33 Non-Hispanic Black [aged 20-45], 15 Hispanic [aged 18-43], and 5 Hispanic Black [aged 29-43]) participated in nine focus groups (February-May 2022) examining four sample feedback messages based on information from a wearable tracker (e.g., active minutes, steps, sleep) by a moderator. Participants discussed feelings about and preferences towards these messages. Coders analyzed transcribed data totaling 376 pages using Braun and Clark's thematic analysis method.

**Results:** Participants preferred shorter, data-based messages. Positive message valence and humor were perceived well. Participants reported that messages recommending social engagement (e.g., "chat-walk") or referencing spirituality with physical activity were motivational, for both Black and Hispanic women but especially for Hispanic women; Hispanic women also prioritized sleep in higher numbers than Black women. Hispanic women also indicated that their family, particularly children, and friends were primary motivators for them to engage in physical activity in greater numbers than Black women did.

**Conclusions:** Feedback messaging for mobile health interventions are not representative of Black and Hispanic women's preferences. Testing further personalized health messaging based on data from wearable sensors among Black and Hispanic women with obesity should be prioritized in order to prevent obesity-related chronic diseases. Further personalization can come through references to highly valued things (e.g., family and friends). Future physical activity interventions should integrate the target audience's cultural background and preferences for health communication messaging.

# A web app co-designed with parents improved feeding practices and toddler eating behaviours: results from a randomised controlled pilot.

**Ms. Brittany R Markides<sup>1</sup>**, Prof. Kylie D Hesketh<sup>1</sup>, Associate Professor Rachel Laws<sup>1</sup>, Prof. Ralph Maddison<sup>1</sup>, Prof. Elizabeth Denney-Wilson<sup>2</sup>, Prof. Karen J. Campbell<sup>1</sup>

<sup>1</sup>Institute of Physical Activity and Nutrition, Deakin University, Burwood, Australia, <sup>2</sup>Faculty of Medicine and Health, The University of Sydney, Sydney, Australia

**SO.3.27 - Novel interventions and studies on e & mHealth, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 9:40 AM - 10:55 AM**

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Although fussy eating is a developmentally normal behaviour, it is a source of anxiety and concern for up to half of parents of young children. Concern for fussy eating mediates parents' use of nonresponsive feeding practises, such as persuasive or unstructured feeding, which can lead to mealtime conflict, increase the intensity and/or duration of fussy eating, and may have negative impacts on food preferences and healthy growth and development that persist into adolescence and adulthood. Despite this, few interventions have been developed for this population. To address this gap, Fussy Eating Rescue, an app-based feeding intervention, was co-designed with parents concerned for fussy eating. The purpose of this study was to evaluate the app's impacts on parent feeding practices and children's eating behaviours in a randomised controlled pilot trial.

**Methods:** Fussy Eating Rescue consisted of a food offer tracker, information about fussy eating / feeding strategies, recipes, and SMS notifications. Parents concerned for the fussy eating behaviour of their toddlers (12 to 36 months) were recruited via Facebook and randomised to an intervention group (n=25, received app access for 6 weeks), or control (n=26, wait-listed). T-tests were used to measure differences between pre/post measures of parent feeding practices and child eating behaviours. An engagement index that summarised app usage was calculated and used in linear regression models to evaluate the impact of app engagement impact on intervention outcomes.

**Findings:** In the intervention group, there were significant decreases in child food fussiness ( $p = .04$ , Cohen  $D = .40$ ) and aggressive mealtime behaviours ( $p = .01$ , Cohen  $D = .55$ ). There were no pre/post differences in measures for the control group. Higher app engagement predicted decreased parental concern for fussy eating ( $R^2 = .77$ ,  $F = 24.48$ ,  $p = .03$ ) and increased structured parent feeding practises ( $R^2 = .52$ ,  $F = 6.71$ ,  $p = .0004$ ).

**Conclusion:** Fussy Eating Rescue has potential to help improve the feeding practices of parents concerned for fussy eating. A larger trial is warranted to examine long-term impacts.

# Changes in physical activity and other health-related behaviours among users of the Couch to 5K beginner's running app

**Prof. Stacy Clemes<sup>1</sup>**, Mr. Andrew Hamblen<sup>1</sup>, Dr. Carolyn Plateau<sup>1</sup>, Dr. Clare Stevinson<sup>1</sup>

<sup>1</sup>Loughborough University, Loughborough, United Kingdom

SO.3.27 - Novel interventions and studies on e & mHealth, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 9:40 AM - 10:55 AM

**SIG - Primary Choice:** D. e- & mHealth

**Purpose:** Recreational running is an effective way of developing health-related fitness. The Couch to 5K (C25K) programme delivered via a smartphone app is a freely available, accessible, and popular method of supporting beginner runners (receiving ~1 million downloads/year), yet limited research has assessed programme adherence, or outcomes associated with programme completion. This study investigated the potential effects of completing the C25K app-delivered programme on health-related behaviours (physical activity, sitting, sleep, and diet), and markers of physical and mental wellbeing.

**Methods:** 41 novice runners (73% female, mean±SD age: 37±12 years, BMI: 28.8±5.3 kg/m<sup>2</sup>) completed an online questionnaire containing validated measures of physical activity, sitting, sleep quality, dietary intake, and symptoms of anxiety and depression, prior to commencing the 9-week app-delivered C25K programme. Age, height, weight, and sex were also reported. Participants completed the same measures at the mid-point and after 9-weeks, plus additional questions on adherence and running-related injuries. Friedman's tests compared outcomes assessed across the three time points; significant findings were examined further using Bonferroni-corrected post hoc comparisons, and effect sizes (ES) calculated.

**Results:** 25 participants completed the study (61% retention). Participants reported completing an average of 18 (of 27) sessions (67% adherence). Significant differences across measurement time points were observed for total physical activity MET-minutes/week, vigorous intensity MET-minutes/week and depression symptoms (all p<0.01). Post hoc comparisons revealed total and vigorous intensity activity MET-minutes/week were significantly higher at the mid-point (total [median:IQR]: 1774(1491-2199); vigorous: 720(512-1260) MET-mins/week) and final assessments (total: 1386(968-2514); vigorous: 720(0-1080) MET-mins/week) compared to baseline (total: 876(495-1485); vigorous: 0(0-360) MET-mins/week), symptoms of depression were significantly lower at these time points relative to baseline (all p<0.01, all ES r>0.6). 14 (56%) participants reported experiencing a running-related injury.

**Conclusions:** Completion of the 9-week app-delivered C25K programme led to large increases in vigorous intensity physical activity and improvements in mental wellbeing. No changes in weight or health-related behaviours (sitting, sleep, diet) were observed. Injury rates were relatively high. The longer-term impact of completing the C25K programme on markers of health and health-related behaviours needs assessing; with further work also needed examining injury prevention strategies to supplement beginner running programmes.

# Blended lifestyle coaching for people with diabetes type 2 in secondary care: A feasibility study of the Diamter + Cool

**Dr. Anouk Middelweerd<sup>1</sup>**, Ms. Eclair Hietbrink<sup>1,2</sup>, Ms. Carine Gotink<sup>1</sup>, Dr. Annemieke Konijnendijk<sup>1,3</sup>, Prof. Goos Laverman<sup>1,2</sup>

<sup>1</sup>-Biomedical signals and systems (BSS), University of Twente, Enschede, Netherlands, <sup>2</sup>Nephrology, Internal medicine, Ziekenhuisgroep Twente (ZGT), Almelo, Netherlands, <sup>3</sup>ZGT Academie, Ziekenhuisgroep Twente (ZGT), Almelo, Netherlands

**SO.3.27 - Novel interventions and studies on e & mHealth, Clarion Hotel Gillet - Room Akademien, June 17, 2023, 9:40 AM - 10:55 AM**

## **SIG - Primary Choice:** D. e- & mHealth

**Purpose:** The Cool-intervention, a two-year lifestyle intervention, is considered to be an effective lifestyle intervention for overweight people with type 2 diabetes mellitus (T2DM). Combining face-to-face coaching (Cool) with an app (the Diameter) that supports patients between Cool-sessions can provide additional support in making healthy choices between the in-person meetings. The Diameter enables continuous monitoring of nutrition (diary), physical activity (PA; Fitbit) and glucose values (Freestyle libre) and provides tailored feedback, i.e. guided goal setting, daily informative and motivating coaching messages and weekly exercises aimed at learning to cope with barriers that arise in daily life to maintain a healthy lifestyle. The aim was to evaluate the feasibility of using the Diameter in combination Cool (Cool+Diameter) to change lifestyle behaviors in people with T2DM in secondary care from the perspectives of patients and healthcare professionals.

**Methods:** A mixed-method approach was used to explore the feasibility, e.g., acceptability, intervention usage, limited-efficacy testing, with regard to the Cool+Diameter intervention. Five patients with T2DM used the Diameter for three months and attended monthly group sessions with a lifestyle coach. Measurements on glycemic regulation, body composition, PA and nutritional intake were performed at baseline and at the three-month follow-up. Post-intervention semi-structured interviews were conducted with five patients and eight healthcare professionals.

**Results:** Patients and healthcare professionals saw the Diameter as a valuable addition to the Cool-program, mainly because of the glucose and lifestyle monitoring and discussing these behaviors during the meetings. However, the coaching content of the Diameter is not adapted to the Cool-program and should be more tailored to the user. Limited efficacy testing showed significant differences between baseline and follow-up for glucose levels ( $\Delta_{HbA1c} = 11 \text{ mmol/mol}$ , 95%CI=0.35 – 21.65) and BMI ( $\Delta_{BMI} = 0.78 \text{ kg/m}^2$ , 95%CI=0.28 – 1.28). In addition, promising results for hip ( $\Delta_{hip} = 1 \text{ cm}$ , 95%CI= -0.24 - 2.24) and waist ( $\Delta_{waist} = 2.6 \text{ cm}$ , 95%CI= -1.38 – 6.58) circumference were seen.

**Conclusion:** Cool+Diameter was predominantly perceived as a feasible intervention for T2DM patients in secondary care by both patients and healthcare professionals, but coaching content of the Diameter should be more tailored to the user and adapted to the Cool-program.
